CORNERSTONE EARTH GROUP

Type of Services	**Geotechnical Investigation**
Project Name	**Central Avenue Logistics Center**
Location	**6752 Central Avenue** **Newark, California**

SECTION 1: INTRODUCTION

This geotechnical report was prepared for the sole use of Prologis for the Central Avenue Logistics Center project in Newark, California. The location of the site is shown on the Vicinity Map, Figure 1. For our use, we were provided with the following documents:

- A topographic survey of the site titled, "ALTA/NSPS Land Title Survey," prepared by Kier + Wright, dated May 2, 2019.
- A preliminary landscape plan titled, "Preliminary Landscape Plan," provided by Green Design Landscape Architects, Inc., dated December 9, 2021.
- An untitled preliminary site plan prepared by Jackson Liles Architecture, dated February 11, 2022.
- A preliminary geotechnical investigation titled, "6756-6792 Central Avenue, Newark, California," published by Kleinfelder, dated November 4, 2019.
- A groundwater monitoring and request for site closure report provided by Farallon Consulting, dated March 24, 2022.

1.1 PROJECT DESCRIPTION

The project will consist of redeveloping the approximately 17.4-acre, multiple parcel site for a new logistics warehouse. The proposed warehouse will have a footprint of about 311,000 square feet and will include about 30,000 square feet of office space. We anticipate the structure will have an interior clear height of about 36 to 40 feet and be of concrete tilt-up construction. The truck court is located along the east side of the building and depressed about 3½ feet below the finished floor. At-grade auto and trailer parking and drive aisles will cover the remainder of the site. Appurtenant utilities, landscaping, storm water management areas, and other improvements necessary for overall site development will also be constructed.

Structural loads are not known at this time; however, loads are expected to be typical of this type of construction. Site grading with cuts and fills on the order of 2 to 5 feet are estimated.

1.2 SCOPE OF SERVICES

Our scope of services was presented in our proposal dated July 8, 2022, and consisted of field and laboratory programs to evaluate physical and engineering properties of the subsurface soils, engineering analysis to prepare recommendations for site work and grading, building foundations, flatwork, retaining walls, and pavements, and preparation of this report. Brief descriptions of our exploration and laboratory programs are presented below.

1.3 EXPLORATION PROGRAM

Field exploration consisted of eight borings drilled on August 16 through 19, 2022 with truck-mounted, hollow-stem auger drilling equipment and five Cone Penetration Tests (CPTs) advanced on August 10 and 11, 2022. The borings were drilled to depths of 25 to 80 feet; the CPTs were advanced to depths of 50 to 100 feet. Seismic shear wave velocity measurements were collected from CPT-5. Borings EB-1 through EB-4, and EB-7 were advanced adjacent to CPT-1 through CPT-5, respectively, for direct evaluation of physical samples to correlated soil behavior.

The borings and CPTs were backfilled with cement grout in accordance with local requirements; exploration permits were obtained as required by local jurisdictions.

The approximate locations of our exploratory borings are shown on the Site Plan, Figure 2. Details regarding our field program are included in Appendix A.

1.3 PREVIOUS FIELD EXPLORATION

Previous field exploration was performed by Kleinfelder in October 2019 and consisted of three Cone Penetration Test (CPT) soundings using truck-mounted exploration equipment. The approximate locations of the previous explorations are also shown on the Site Plan, Figure 2. Copies of the previous exploration logs are included in Appendix C.

1.4 LABORATORY TESTING PROGRAM

In addition to visual classification of samples, the laboratory program focused on obtaining data for foundation design and seismic ground deformation estimates. Testing included moisture contents, dry densities, washed sieve analyses, Plasticity Index tests, one-dimensional consolidation, and triaxial compression tests. Details regarding our laboratory program are included in Appendix B.

1.5 CORROSION EVALUATION

Five samples from our borings at depths between 3½ to 5½ feet were tested for saturated resistivity, pH, and soluble sulfates and chlorides. In general, the on-site soils can be

characterized as severely to very severely corrosive to buried metal, and non-corrosive to buried concrete. Please refer to Section 3 for further information.

1.6 ENVIRONMENTAL SERVICES

Environmental services were not requested for this project. If environmental concerns are determined to be present during future evaluations, the project environmental consultant should review our geotechnical recommendations for compatibility with the environmental concerns.

SECTION 2: REGIONAL SETTING

2.1 GEOLOGICAL SETTING

The site is located on the gently southwest sloping East Bay Plain between the East Bay Hills and San Francisco Bay. Soils in this area of the East Bay Plain were generally deposited by Alameda Creek. The majority of the site is mapped by Witter, et al. (2006) as being underlain by *older alluvial fan deposits* (Qhf3), which is described as "sediment deposited onto alluvial valley floors or alluvial plains…Alluvial fan sediments include sand, gravel, silt and clay, and is moderately to poorly sorted, and moderately to poorly bedded." Qhf3 is the oldest of the three mapped Holocene alluvial fan units. Witter et al.'s Qhf3 unit corresponds to the Qf unit described in CGS (2003) as *latest Pleistocene to Holocene alluvial fan deposits*.

The southern corner of the site is mapped by both Witter et al. and CGS as Holocene alluvial fan deposits, fine facies (Qhff), which is described by Witter et al. as "dominated by clay and silt, with interbedded lobes of coarser alluvium (sand and occasional gravel)."

2.2 REGIONAL SEISMICITY

While seismologists cannot predict earthquake events, geologists from the U.S. Geological Survey have recently updated (in 2015) earlier estimates from their 2014 Uniform California Earthquake Rupture Forecast (Version 3; UCERF3) publication. The estimated probability of one or more magnitude 6.7 earthquakes (the size of the destructive 1994 Northridge earthquake) expected to occur somewhere in the San Francisco Bay Area has been revised (increased) to 72 percent for the period 2014 to 2043 (Aagaard et al., 2016). The faults in the region with the highest estimated probability of generating damaging earthquakes between 2014 and 2043 are the Hayward (33%), Calaveras (26%), and San Andreas Faults (22%). In this 30-year period, the probability of an earthquake of magnitude 6.7 or larger occurring is 22 percent along the San Andreas Fault and 33 percent for the Hayward Fault.

The faults considered capable of generating significant earthquakes are generally associated with the well-defined areas of crustal movement, which trend northwesterly. The table below presents the State-considered active faults within 25 kilometers of the site.

Table 1: Approximate Fault Distances

Fault Name	Distance	
	(miles)	(kilometers)
Hayward (Total Length)	4.2	6.7
Hayward (Southeast Extension)	8.0	12.9
Calaveras	9.2	14.8
Monte Vista-Shannon	12.6	20.3
San Andreas (1906)	14.6	23.5

A regional fault map is presented as Figure 3, illustrating the relative distances of the site to significant fault zones.

SECTION 3: SITE CONDITIONS

3.1 SITE BACKGROUND

We reviewed historical aerial imagery provided online by Historical Aerials (http://www.historicaerials.com). A summary of pertinent surface changes at and near the site is as follows:

- 1946: The project site is occupied by agricultural fields and is bounded by Central Avenue to the northwest and railroad tracks to the southwest.
- 1956: The agricultural fields appear to have been redeveloped into an industrial facility with multiple buildings. A railroad spur bounds the site to the southeast.
- 1966: Adjacent parcels appear to have been developed into industrial facilities.
- 1988: A new warehouse on the northwestern side of the site appears to have been constructed and the central building appears to have been modified from original construction.
- 2009: The southwestern portion of the site appears to have been redeveloped for use as a landscaping materials storage yard.
- 2018: The site appears relatively unchanged since the 1988 and 2009 photos.

3.2 SURFACE DESCRIPTION

The approximately 17.4-acre site is currently occupied by a trench shoring supply facility and storage yard. At the time of our site visits, the eastern building had been demolished and the ground surface consisted of a dirt and grass field. The central building had also been

demolished down to the concrete floor slab. The southwestern materials yard was unoccupied, and the ground surface consisted of dirt and weeds with minor amounts of debris.

Surface pavements at the northern drive aisle generally consisted of 3 inches of asphalt concrete and 3 inches of Portland Cement Concrete over 10 inches of aggregate base. Based on visual observations, the pavement is in fair condition with localized areas of alligator cracking.

3.3 SUBSURFACE CONDITIONS

Below the existing ground surface, all our explorations except Boring EB-4 encountered undocumented fill to depths of about 1¼ to 9 feet. The undocumented fills were highly variable and consisted of stiff to hard lean clays with varying amounts of sand and loose to very dense clayey sands with varying amounts of gravel. Various amounts of debris were also encountered in the undocumented fills.

Below the undocumented fills or surface pavements where no fill was encountered, the native alluvial soils generally consisted of interbedded layers of soft to hard lean clays with varying amounts of sand and silt, soft to very stiff sandy silt, and loose to dense sands with varying amounts of silt, clay, and gravel to the terminal boring depths of about 26½ to 80 feet. Beneath the terminal boring depths, our CPTs generally encountered dense to very dense sands with varying amounts of sand and silt and very stiff to hard clays and silts with varying amounts of sand to the maximum depth explored of 110 feet below existing grades.

3.3.1 Plasticity/Expansion Potential

We performed six Plasticity Index (PI) tests on representative samples. Test results were used to evaluate expansion potential of surficial soils, and the plasticity of the fines in potentially liquefiable layers. The surficial PI tests resulted in PIs ranging from 16 to 21, indicating moderate expansion potential to wetting and drying cycles. Test results of the potentially liquefiable layers indicated PIs of non-plastic to 10.

3.3.2 In-Situ Moisture Contents

Laboratory testing indicated that the in-situ moisture contents within the upper 10 feet generally range from about 5 to 15 percent over the estimated laboratory optimum moisture.

3.4 GROUNDWATER

Groundwater was encountered in our exploratory borings at depths ranging from 6 to 12 feet below current grades. Groundwater was inferred at depths of approximately 5 to 10 feet below current grades in our CPTs based on pore pressure dissipation tests. All measurements were taken at the time of drilling and may not represent the stabilized levels that can be higher than the initial levels encountered.

We also reviewed groundwater data available online from the website GeoTracker, https://geotracker.waterboards.ca.gov/. Nearby monitoring well data indicates that groundwater has been measured at depths of approximately 5 to 10 feet at wells located at the site and approximately 500 feet northwest of the site between 1990 to 2020.

Based on the above, we recommend a design groundwater depth of 5 feet. Fluctuations in groundwater levels occur due to many factors including seasonal fluctuation, underground drainage patterns, regional fluctuations, and other factors.

3.5 CORROSION SCREENING

We tested five samples collected at depths of 3½ to 5½ feet for resistivity, pH, soluble sulfates, and chlorides. The laboratory test results are summarized in Table 2A.

Table 2A: Summary of Corrosion Test Results

Sample Location	Depth (feet)	Soil pH[1]	Resistivity[2] (ohm-cm)	Chloride[3] (mg/kg)	Sulfate[4,5] (mg/kg)
EB-1	3.5	7.2	1,440	15	102
EB-2	5.5	7.9	606	121	164
EB-4	5.5	7.5	1,446	22	60
EB-5	3.5	7.6	771	60	177
EB-7	5.0	7.6	965	63	127

Notes: [1]ASTM G51
[2]ASTM G57 - 100% saturation
[3]ASTM D3427/Cal 422 Modified
[4]ASTM D3427/Cal 417 Modified
[5]1 mg/kg = 0.0001 % by dry weight

Many factors can affect the corrosion potential of soil including moisture content, resistivity, permeability, and pH, as well as chloride and sulfate concentration. Typically, soil resistivity, which is a measurement of how easily electrical current flows through a medium (soil and/or water), is the most influential factor. In addition to soil resistivity, chloride and sulfate ion concentrations, and pH also contribute in affecting corrosion potential.

3.4.1 Preliminary Soil Corrosion Screening

Based on the laboratory test results summarized in Table 2A and published correlations between resistivity and corrosion potential, the soils may be considered severely to very severely corrosive to buried metallic improvements (Chaker and Palmer, 1989).

In accordance with the 2019 CBC Section 1904.1, alternative cementitious materials for different exposure categories and classes shall be determined in accordance with ACI 318-19 Table 19.3.1.1, Table R19.3.1, and Table 19.3.2.1. Based on sulfate test results, a cement type restriction is not required, although, in our opinion, it is generally a good idea to include some sulfate resistance and to maintain a relatively low water-cement ratio. We have summarized applicable exposure categories and classes from ACI 318-19, Table 19.3.1.1 below in Table 2B.

Table 2B: ACI 318-19 Table 19.3.1.1 Exposure Categories and Classes

Freezing and Thawing (F)	Sulfate (S, soil)	In Contact with Water (W)	Corrosion Protection of Reinforcement (C)
F0[1]	S0[2]	W0[3]	C0[4]

1 (F0) "Concrete not exposed to freezing-and-thawing cycles" (ACI 318-19)
2 (S0) "Water soluble sulfate in soil, percent by mass" (ACI 318-19)
3 (W0) "Concrete dry in service" (ACI 318-19)
4 (C0) "Concrete dry or protected from moisture" (ACI 318-19)

We recommend the structural engineer and a corrosion engineer be retained to confirm the above information and provide additional recommendations, as needed.

SECTION 4: GEOLOGIC HAZARDS

4.1 FAULT SURFACE RUPTURE

As discussed above several significant faults are located within 25 kilometers of the site. The site is not located within a State-designated Alquist Priolo Earthquake Fault Zone. As shown in Figure 3, no known surface expression of fault traces is thought to cross the site; therefore, fault surface rupture hazard is not a significant geologic hazard at the site.

4.2 ESTIMATED GROUND SHAKING

Moderate to severe (design-level) earthquakes can cause strong ground shaking, which is the case for most sites within the Bay Area. A site modified peak ground acceleration (PGA_M) was determined in accordance with the 2019 California Building Code (CBC) and Section 21.5 of ASCE 7-16. Therefore, we recommend a site-specific MCE_G peak ground acceleration, PGA_M, of 0.76g for this project.

4.3 LIQUEFACTION POTENTIAL

The site is within a State-designated Liquefaction Hazard Zone (CGS, Newark 7.5-Minute Quadrangle, 2003). Our field and laboratory programs addressed this issue by testing and sampling potentially liquefiable layers to depths of at least 50 feet, performing visual classification on sampled materials, evaluating CPT data, and performing various tests to further classify soil properties.

4.3.1 Background

During strong seismic shaking, cyclically induced stresses can cause increased pore pressures within the soil matrix that can result in liquefaction triggering, soil softening due to shear stress loss, potentially significant ground deformation due to settlement within sandy liquefiable layers as pore pressures dissipate, and/or flow failures in sloping ground or where open faces are present (lateral spreading) (NCEER 1998). Limited field and laboratory data is available regarding ground deformation due to settlement; however, in clean sand layers settlement on

the order of 2 to 4 percent of the liquefied layer thickness can occur. Soils most susceptible to liquefaction are loose, non-cohesive soils that are saturated and are bedded with poor drainage, such as sand and silt layers bedded with a cohesive cap.

4.3.2 Analysis

As discussed in the "Subsurface" section above, several sand layers were encountered below the design groundwater depth of 5 feet. Following the liquefaction analysis framework in the 2008 monograph, *Soil Liquefaction During Earthquakes* (Idriss and Boulanger, 2008), incorporating updates in *CPT and SPT Based Liquefaction Triggering Procedures* (Boulanger and Idriss, 2014), and in accordance with CDMG Special Publication 117A guidelines (CDMG, 2008) for quantitative analysis, these layers were analyzed for liquefaction triggering and potential post-liquefaction settlement. These methods compare the ratio of the estimated cyclic shaking (Cyclic Stress Ratio - CSR) to the soil's estimated resistance to cyclic shaking (Cyclic Resistance Ratio - CRR), providing a factor of safety against liquefaction triggering. Factors of safety less than or equal to 1.3 are considered to be potentially liquefiable and capable of post-liquefaction re-consolidation (i.e. settlement).

The CSR for each layer quantifies the stresses anticipated to be generated due to a design-level seismic event, is based on the peak horizontal acceleration generated at the ground surface discussed in the "Estimated Ground Shaking" section above, and is corrected for overburden and stress reduction factors as discussed in the procedure developed by Seed and Idriss (1971) and updated in the 2008 Idriss and Boulanger monograph.

The soil's CRR is estimated from the in-situ measurements from CPTs and laboratory testing on samples retrieved from our borings. SPT "N" values obtained from hollow-stem auger borings were not used in our analyses, as the "N" values obtained are less reliable in sands below groundwater. The tip pressures are corrected for effective overburden stresses, taking into consideration both the groundwater level at the time of exploration and the design groundwater level, and stress reduction versus depth factors. The CPT method utilizes the soil behavior type index (I_C) to estimate the plasticity of the layers.

The results of our CPT analyses (CPT-1 through CPT-8) are presented on Figures 4A through 4H of this report. Calculations for these CPTs are attached as Appendix D.

4.3.3 Summary

Our analyses indicate that several layers could potentially experience liquefaction triggering that could result in post-liquefaction total settlement at the ground surface ranging from about 1½ to 4 inches based on the Yoshimine (2006) method. As discussed in SP 117A, differential movement for level ground sites over deep soil sites will be up to about two-thirds of the total settlement between independent foundation elements. In our opinion, differential settlements are anticipated to be on the order of about 1 to 2⅔ inches over a horizontal distance of 30 to 50 feet.

4.3.4 Ground Deformation and Surficial Cracking Potential

The methods used to estimate liquefaction settlements assume that there is a sufficient cap of non-liquefiable material to prevent ground deformation or sand boils. For ground deformation to occur, the pore water pressure within the liquefiable soil layer will need to be great enough to break through the overlying non-liquefiable layer, which could cause significant ground deformation and settlement. Based on the work of Youd and Garris (1995) ground deformation and significant surficial cracking could theoretically occur due to the design-level shaking in the area of CPT-2, CPT-3, CPT-4, CPT-5, K-CPT-2, K-CPT-3, and K-CPT-4. If ground deformation or surficial cracking occurred, the estimated ground movement could be significantly increased from what was estimated above. Ground deformation mitigation recommendation measures are provided in the "Foundations" section of this report.

4.4 LATERAL SPREADING

Lateral spreading is horizontal/lateral ground movement of relatively flat-lying soil deposits towards a free face such as an excavation, channel, or open body of water; typically, lateral spreading is associated with liquefaction of one or more subsurface layers near the bottom of the exposed slope. As failure tends to propagate as block failures, it is difficult to analyze and estimate where the first tension crack will form.

There are no open faces within a distance considered susceptible to lateral spreading; therefore, in our opinion, the potential for lateral spreading to affect the site is low.

4.5 SEISMIC SETTLEMENT/UNSATURATED SAND SHAKING

Loose unsaturated sandy soils can settle during strong seismic shaking. As the soils encountered at the site above the design groundwater depth were predominantly stiff to very stiff clays and medium dense to very dense sandy fills, in our opinion, the potential for significant differential seismic settlement affecting the proposed improvements is low.

4.6 TSUNAMI/SEICHE

The terms tsunami or seiche are described as ocean waves or similar waves usually created by undersea fault movement or by a coastal or submerged landslide. Tsunamis may be generated at great distance from shore (far field events) or nearby (near field events). Waves are formed, as the displaced water moves to regain equilibrium, and radiates across the open water, similar to ripples from a rock being thrown into a pond. When the waveform reaches the coastline, it quickly raises the water level, with water velocities as high as 15 to 20 knots. The water mass, as well as vessels, vehicles, or other objects in its path create tremendous forces as they impact coastal structures.

Tsunamis have affected the coastline along the Pacific Northwest during historic times. The Fort Point tide gauge in San Francisco recorded approximately 21 tsunamis between 1854 and 1964. The 1964 Alaska earthquake generated a recorded wave height of 7.4 feet and drowned eleven people in Crescent City, California. For the case of a far-field event, the Bay area would

have hours of warning; for a near field event, there may be only a few minutes of warning, if any.

A tsunami or seiche originating in the Pacific Ocean would lose much of its energy passing through San Francisco Bay. Based on the mapping of tsunami inundation potential for the San Francisco Bay Area by CGS (conservation.ca.gov/cgs/tsunami/maps), areas most likely to be inundated are marshlands, tidal flats, and former bay margin lands that are now artificially filled, but are still at or below sea level, and are generally within 1½ miles of the shoreline. The site is approximately 2½ miles inland from the San Francisco Bay shoreline and is approximately 19 to 21 feet above mean sea level. Therefore, the potential for inundation due to tsunami or seiche is considered low.

4.7 FLOODING

Based on our internet search of the Federal Emergency Management Agency (FEMA) flood map public database, the site is located within Zone X, defined as "Areas determined to be outside the 0.2% annual chance floodplain." We recommend the project civil engineer be retained to confirm this information and verify the base flood elevation, if appropriate.

The Department of Water Resources (DWR), Division of Safety of Dams (DSOD) compiled a database of Dam Failure Inundation Hazard Maps (DSOD, 2015). The generalized hazard maps were prepared by dam owners as required by the State Office of Emergency Services; they are intended for planning purposes only. Based on our review of these maps, the site is located within a dam failure inundation area for the James H. Turner and New Calaveras Reservoirs.

SECTION 5: CONCLUSIONS

5.1 SUMMARY

From a geotechnical viewpoint, the project is feasible provided the concerns listed below are addressed in the project design. Descriptions of each concern with brief outlines of our recommendations follow the listed concerns.

- Potential for liquefaction-induced settlements and ground deformation
- Presence of soft to medium stiff clays
- Redevelopment considerations
- Shallow groundwater
- Presence of moderately expansive soils
- Presence of undocumented fill
- Soil Corrosion Potential

5.1.1 Potential for Liquefaction-Induced Settlements and Ground Deformation

As discussed, our liquefaction analysis indicates that there is a potential for liquefaction of localized sand layers during a significant seismic event. Our analysis indicates that liquefaction-induced settlement on the order of about 1¼ to 4 inches could occur, resulting in differential settlement on the order of 1 to 2⅔ inches. In addition, the potential for liquefied soils to vent to the ground surface through cracks in the surficial soils is moderate; therefore, the above estimates could be significantly increased during a strong seismic event. Foundations should be designed to tolerate the anticipated total and differential settlements. Detailed foundation recommendations are presented in the "Foundations" section.

5.1.2 Presence of Soft to Medium Stiff Clays

As discussed, our borings encountered soft to medium stiff clays starting at about 5 to 8 feet below existing grades. Based on assumed building loads ranging from 150 to 250 kips per column, depth to soft to medium stiff clays, and depth to groundwater, we anticipate static settlements on the order of about 1 to 1¾ inches as a result of these compressible clays. However, we anticipate foundations may bear on or near the soft to medium stiff clay layers resulting in a reduced allowable bearing capacity. Additional information and recommendations are provided in the "Foundations" section.

5.1.3 Redevelopment Considerations

As discussed, the site is currently occupied by existing buildings and appurtenant flatwork, site fixtures, and landscaping. We understand that the existing improvements will be demolished for the construction of the building additions. Potential issues that are often associated with redeveloping sites include demolition of existing improvements, abandonment of existing utilities, and undocumented fills. Please refer to the "Earthwork" section below for further recommendations.

5.1.4 Shallow Groundwater

Shallow groundwater was measured at depths ranging from approximately 5 to 12 feet below the existing ground surface. As discussed above, we recommend a design groundwater depth of 5 feet. Our experience with similar sites in the vicinity indicates that shallow groundwater could significantly impact grading and underground construction. These impacts typically consist of potentially wet and unstable pavement subgrade, difficulty achieving compaction, and difficult underground utility installation. Dewatering and shoring of utility trenches may be required in some isolated areas of the site. Detailed recommendations addressing this concern are presented in the "Earthwork" section of this report.

5.1.5 Presence of Moderately Expansive Soils

Moderately expansive surficial soils generally blanket the site. Expansive soils can undergo significant volume change with changes in moisture content. They shrink and harden when dried and expand and soften when wetted. To reduce the potential for damage to the planned

structures, slabs-on-grade should have sufficient reinforcement and be supported on a layer of non-expansive fill; footings should extend below the zone of seasonal moisture fluctuation. In addition, it is important to limit moisture changes in the surficial soils by using positive drainage away from buildings as well as limiting landscaping watering. Evaluation of potential import sources for the site should consider the acceptable range of plasticity. We recommend that a plug of low-permeability clay soil, sand-cement slurry, or lean concrete be placed within trenches just outside where the trenches pass into building and pavement areas. Detailed grading and foundation recommendations addressing this concern are presented in the following sections.

5.1.6 Undocumented Fill

As previously discussed, our exploratory boring encountered up to about 9 feet of undocumented fills. All fills should be properly mitigated or completely removed from within building areas and to a lateral distance of at least 5 feet beyond the building footprint or to a lateral distance equal to fill depth below the perimeter footing, whichever is greater. Provided the fills meet the "Material for Fill" requirements below, the fills may be reused when backfilling the excavations. Based on review of the samples collected from our borings, it appears that the fill may be reused. If materials are encountered that do not meet the requirements, such as debris, wood, trash, those materials should be screened out of the remaining material and be removed from the site. Backfill of excavations should be placed in lifts and compacted in accordance with the "Compaction" section below. Alternative mitigation techniques may also include dynamic compaction and deep soil mixing. Additional information is provided in subsequence sections of this report.

Provided undocumented fills are mitigated by removal and replacement as engineered fill or other approved methods, the potential impact due to undocumented fill should be low.

5.1.7 Soil Corrosion Potential

As discussed, we performed a preliminary corrosion screening based on the results of analytical tests on three samples from depths of 3½ to 5½ feet. Testing on these samples indicate sulfate exposure is low and therefore sulfate resistant concrete is not required per published ACI guidelines. Additionally, corrosion potential for buried metallic structures, such as metal pipes, is considered severely to very severely corrosive. Based on the results of the preliminary soil corrosion screening, special requirements for corrosion control will likely be required to protect buried metallic utilities and improvements. We recommend the structural engineer and corrosion engineer review the results, provide additional recommendations, and perform additional testing as necessary for the proposed site development.

5.2 PLANS AND SPECIFICATIONS REVIEW

We recommend that we be retained to review the geotechnical aspects of the project structural, civil, and landscape plans and specifications, allowing sufficient time to provide the design team with any comments prior to issuing the plans for construction.

5.3 CONSTRUCTION OBSERVATION AND TESTING

As site conditions may vary significantly between the small-diameter borings performed during this investigation, we also recommend that a Cornerstone representative be present to provide geotechnical observation and testing during earthwork and foundation construction. This will allow us to form an opinion and prepare a letter at the end of construction regarding contractor compliance with project plans and specifications, and with the recommendations in our report. We will also be allowed to evaluate any conditions differing from those encountered during our investigation and provide supplemental recommendations as necessary. For these reasons, the recommendations in this report are contingent of Cornerstone providing observation and testing during construction. Contractors should provide at least a 48-hour notice when scheduling our field personnel.

SECTION 6: EARTHWORK

6.1 SITE DEMOLITION

All existing improvements not to be reused for the current development, including all foundations, flatwork, pavements, utilities, and other improvements should be demolished and removed from the site. Recommendations in this section apply to the removal of these improvements, which are currently present on the site, prior to the start of mass grading or the construction of new improvements for the project.

Cornerstone should be notified prior to the start of demolition and should be present on at least a part-time basis during all backfill and mass grading as a result of demolition. Occasionally, other types of buried structures (wells, cisterns, debris pits, etc.) can be found on sites with prior development. If encountered, Cornerstone should be contacted to address these types of structures on a case-by-case basis.

6.1.1 Demolition of Existing Slabs, Foundations and Pavements

All slabs, foundations, and pavements should be completely removed from within planned building areas.

As an owner value-engineered option, existing slabs, foundations, and pavements that extend into planned flatwork, pavement, or landscape areas may be left in place provided there is at least 3 feet of engineered fill overlying the remaining materials, they are shown not to conflict with new utilities, and that asphalt and concrete more than 10 feet square is broken up to allow subsurface drainage. Future distress and/or higher maintenance may result from leaving these prior improvements in place. A discussion of recycling existing improvements is provided later in this report.

Special care should be taken during the demolition and removal of existing floor slabs, foundations, utilities and pavements to minimize disturbance of the subgrade. Excessive disturbance of the subgrade, which includes either native or previously placed engineered fill,

resulting from demolition activities can have serious detrimental effects on planned foundation and paving elements.

Existing foundations are typically mat-slabs, shallow footings, or piers/piles. If slab or shallow footings are encountered, they should be completely removed. If drilled piers are encountered, they should be cut off at an elevation at least 60-inches below proposed footings or the final subgrade elevation, whichever is deeper. The remainder of the drilled pier could remain in place. Foundation elements to remain in place should be surveyed and superimposed on the proposed development plans to determine the potential for conflicts or detrimental impacts to the planned construction. Following review, additional mitigation or planned foundation elements may need to be modified.

6.1.2 Abandonment of Existing Utilities

All utilities should be completely removed from within planned building areas. For any utility line to be considered acceptable to remain within building areas, the utility line must be completely backfilled with grout or sand-cement slurry (sand slurry is not acceptable), the ends outside the building area capped with concrete, and the trench fills either removed and replaced as engineered fill with the trench side slopes flattened to at least 1:1, or the trench fills are determined not to be a risk to the structure. The assessment of the level of risk posed by the particular utility line will determine whether the utility may be abandoned in place or needs to be completely removed. The contractor should assume that all utilities will be removed from within building areas unless provided written confirmation from both the owner and the geotechnical engineer.

Utilities extending beyond the building area may be abandoned in place provided the ends are plugged with concrete, they do not conflict with planned improvements, and that the trench fills do not pose significant risk to the planned surface improvements.

The risk for owners associated with abandoning utilities in place include the potential for future differential settlement of existing trench fills, and/or partial collapse and potential ground loss into utility lines that are not completely filled with grout.

6.2 SITE CLEARING AND PREPARATION

6.2.1 Site Stripping

The site should be stripped of all surface vegetation, and surface and subsurface improvements to be removed within the proposed development area. Demolition of existing improvements is discussed in the prior paragraphs. A detailed discussion of removal of existing fills is provided later in this report. Surface vegetation and topsoil should be stripped to a sufficient depth to remove all material greater than 3 percent organic content by weight.

6.2.2 Tree and Shrub Removal

Trees and shrubs designated for removal should have the root balls and any roots greater than ½-inch diameter removed completely. Mature trees are estimated to have root balls extending to depths of 2 to 4 feet, depending on the tree size. Significant root zones are anticipated to extend to the diameter of the tree canopy. Grade depressions resulting from root ball removal should be cleaned of loose material and backfilled in accordance with the recommendations in the "Compaction" section of this report.

6.3 MITIGATION OF UNDOCUMENTED FILLS

As discussed above, up to about 9 feet of undocumented fill was encountered in our exploratory borings. All undocumented fills should be completely removed from within building areas and to a lateral distance of at least 5 feet beyond the building footprint or to a lateral distance equal to fill depth below the perimeter footing, whichever is greater. Provided the fills meet the "Material for Fill" requirements below, the fills may be reused when backfilling the excavations. Based on review of the samples collected from our borings, it appears that the fill may be reused. If materials are encountered that do not meet the requirements, such as debris, wood, trash, those materials should be screened out of the remaining material and be removed from the site. Backfill of excavations should be placed in lifts and compacted in accordance with the "Compaction" section below.

As previously discussed, fills are anticipated to be present at or below the existing and design groundwater depths. Therefore, full removal and replacement as engineered fill may not be feasible. As an alternative to over-excavation and replacement, if ground improvement is implemented, we recommend the ground improvement program be designed to also mitigate the undocumented fills.

Fills extending into planned pavement and flatwork areas may be left in place provided they are determined to be a low risk for future differential settlement and that the upper 12 to 18 inches of fill below pavement subgrade is re-worked and compacted as discussed in the "Compaction" section below.

6.4 TEMPORARY CUT AND FILL SLOPES

The contractor is responsible for maintaining all temporary slopes and providing temporary shoring where required. Temporary shoring, bracing, and cuts/fills should be performed in accordance with the strictest government safety standards. On a preliminary basis, the upper 10 feet at the site may be classified as OSHA Soil Type C materials. A Cornerstone representative should be retained to confirm the preliminary site classification.

Excavations performed during site demolition and fill removal should be sloped at 3:1 (horizontal:vertical) within the upper 5 feet below building subgrade. Actual excavation inclinations should be reviewed in the field during construction, as needed. Excavations below building subgrade and excavations in pavement and flatwork areas should be sloped in accordance with OSHA soil classification requirements.

6.5 SUBGRADE PREPARATION

After site clearing and demolition is complete, and prior to backfilling any excavations resulting from fill removal or demolition, the excavation subgrade and subgrade within areas to receive additional site fills, slabs-on-grade and/or pavements should be scarified to a depth of 6 inches, moisture conditioned, and compacted in accordance with the "Compaction" section below.

6.6 WET SOIL STABILIZATION GUIDELINES

Native soil and fill materials, especially soils with high fines contents such as clays and silty soils, can become unstable due to high moisture content, whether from high in-situ moisture contents or from winter rains. As the moisture content increases over the laboratory optimum, it becomes more likely the materials will be subject to softening and yielding (pumping) from construction loading or become unworkable during placement and compaction.

As discussed in the "Subsurface" section in this report, the in-situ moisture contents are about 5 to 15 percent over the estimated laboratory optimum in the upper 10 of the soil profile. The contractor should anticipate drying the soils prior to reusing them as fill. In addition, repetitive rubber-tire loading will likely de-stabilize the soils.

There are several methods to address potential unstable soil conditions and facilitate fill placement and trench backfill. Some of the methods are briefly discussed below. Implementation of the appropriate stabilization measures should be evaluated on a case-by-case basis according to the project construction goals and the site conditions.

6.6.1 Scarification and Drying

The subgrade may be scarified to a depth of 10 to 12 inches and allowed to dry to near optimum conditions, if sufficient dry weather is anticipated to allow sufficient drying. More than one round of scarification may be needed to break up the soil clods.

6.6.2 Removal and Replacement

As an alternative to scarification, the contractor may choose to over-excavate the unstable soils and replace them with dry on-site or import materials. A Cornerstone representative should be present to provide recommendations regarding the appropriate depth of over-excavation, whether a geosynthetic (stabilization fabric or geogrid) is recommended, and what materials are recommended for backfill.

6.6.3 Chemical Treatment

Where the unstable area exceeds about 5,000 to 10,000 square feet and/or site winterization is desired, chemical treatment with quicklime (CaO), kiln-dust, or cement may be more cost-effective than removal and replacement. Recommended chemical treatment depths will typically range from 12 to 18 inches depending on the magnitude of the instability. If this option

is considered, additional laboratory tests should be performed during initial site grading to further evaluate the optimum percentage of quicklime required.

6.7 MATERIAL FOR FILL

6.7.1 Re-Use of On-site Soils

On-site soils with an organic content less than 3 percent by weight may be reused as general fill. General fill should not have lumps, clods or cobble pieces larger than 6 inches in diameter; 85 percent of the fill should be smaller than 2½ inches in diameter. Minor amounts of oversize material (smaller than 12 inches in diameter) may be allowed provided the oversized pieces are not allowed to nest together and the compaction method will allow for loosely placed lifts not exceeding 12 inches.

6.7.2 Re-Use of On-Site Site Improvements

We anticipate that minor to moderate quantities of asphalt concrete (AC) grindings and aggregate base (AB) may be generated during site demolition. If the AC grindings are mixed with the underlying AB to meet Class 2 AB specifications, they may be reused within the new pavement and flatwork structural sections. AC grindings may not be reused within the habitable building areas. Laboratory testing will be required to confirm the grindings meet project specifications.

6.7.3 Potential Import Sources

Imported and non-expansive material should be inorganic with a Plasticity Index (PI) of 15 or less, and not contain recycled asphalt concrete where it will be used within the habitable building areas. To prevent significant caving during trenching or foundation construction, imported material should have sufficient fines. Samples of potential import sources should be delivered to our office at least 10 days prior to the desired import start date. Information regarding the import source should be provided, such as any site geotechnical reports. If the material will be derived from an excavation rather than a stockpile, potholes will likely be required to collect samples from throughout the depth of the planned cut that will be imported. At a minimum, laboratory testing will include PI tests. Material data sheets for select fill materials (Class 2 aggregate base, ¾-inch crushed rock, quarry fines, etc.) listing current laboratory testing data (not older than 6 months from the import date) may be provided for our review without providing a sample. If current data is not available, specification testing will need to be completed prior to approval.

Environmental and soil corrosion characterization should also be considered by the project team prior to acceptance. Suitable environmental laboratory data to the planned import quantity should be provided to the project environmental consultant; additional laboratory testing may be required based on the project environmental consultant's review. The potential import source should also not be more corrosive than the on-site soils, based on pH, saturated resistivity, and soluble sulfate and chloride testing.

6.7.4 Non-Expansive Fill Using Lime Treatment

As discussed above, non-expansive fill should have a Plasticity Index (PI) of 15 or less. Due to the high clay content and PI of the on-site soil materials, it is not likely that sufficient quantities of non-expansive fill would be generated from cut materials. As an alternative to importing non-expansive fill, chemical treatment can be considered to create non-expansive fill. If this option is considered, additional laboratory tests should be performed during initial site grading to further evaluate the optimum percentage of quicklime required.

6.8 COMPACTION REQUIREMENTS

All fills, and subgrade areas where fill, slabs-on-grade, and pavements are planned, should be placed in loose lifts 8 inches thick or less and compacted in accordance with ASTM D1557 (latest version) requirements as shown in the table below. In general, clayey soils should be compacted with sheepsfoot equipment and sandy/gravelly soils with vibratory equipment; open-graded materials such as crushed rock should be placed in lifts no thicker than 18 inches and consolidated in place with vibratory equipment. Each lift of fill and all subgrade should be firm and unyielding under construction equipment loading in addition to meeting the compaction requirements to be approved. The contractor (with input from a Cornerstone representative) should evaluate the in-situ moisture conditions, as the use of vibratory equipment on soils with high moistures can cause unstable conditions. General recommendations for soil stabilization are provided in the "Wet Soil Stabilization Guidelines" section of this report. Where the soil's PI is 20 or greater, the expansive soil criteria should be used.

Table 3: Compaction Requirements

Description	Material Description	Minimum Relative[1] Compaction (percent)	Moisture[2] Content (percent)
General Fill (within upper 5 feet)	On-Site Expansive Soils	87 – 92	>3
	Low Expansion Soils	90	>1
General Fill (below a depth of 5 feet)	On-Site Expansive Soils	95	>3
	Low Expansion Soils	95	>1
Trench Backfill	On-Site Expansive Soils	87 – 92	>3
	Low Expansion Soils	90	>1
Trench Backfill (upper 6 inches of subgrade)	On-Site Low Expansion Soils	95	>1
Crushed Rock Fill	¾-inch Clean Crushed Rock	Consolidate In-Place	NA
Non-Expansive Fill	Imported Non-Expansive Fill	90	Optimum
Flatwork Subgrade	On-Site Expansive Soils	87 - 92	>3
	Low Expansion Soils	90	>1
Flatwork Aggregate Base	Class 2 Aggregate Base[3]	90	Optimum
Pavement Subgrade	On-Site Expansive Soils	87 - 92	>3
	Low Expansion Soils	95	>1
Pavement Aggregate Base	Class 2 Aggregate Base[3]	95	Optimum
Asphalt Concrete	Asphalt Concrete	95 (Marshall)	NA

1 – Relative compaction based on maximum density determined by ASTM D1557 (latest version)
2 – Moisture content based on optimum moisture content determined by ASTM D1557 (latest version)
3 – Class 2 aggregate base shall conform to Caltrans Standard Specifications, latest edition, except that the relative compaction should be determined by ASTM D1557 (latest version)

6.8.1 Construction Moisture Conditioning

Expansive soils can undergo significant volume change when dried then wetted. The contractor should keep all exposed expansive soil subgrade (and also trench excavation side walls) moist until protected by overlying improvements (or trenches are backfilled). If expansive soils are allowed to dry out significantly, re-moisture conditioning may require several days of re-wetting (flooding is not recommended), or deep scarification, moisture conditioning, and re-compaction.

6.9 TRENCH BACKFILL

Utility lines constructed within public right-of-way should be trenched, bedded and shaded, and backfilled in accordance with the local or governing jurisdictional requirements. Utility lines in private improvement areas should be constructed in accordance with the following requirements unless superseded by other governing requirements.

All utility lines should be bedded and shaded to at least 6 inches over the top of the lines with crushed rock (⅜-inch-diameter or greater) or well-graded sand and gravel materials conforming to the pipe manufacturer's requirements. Open-graded shading materials should be consolidated in place with vibratory equipment and well-graded materials should be compacted to at least 90 percent relative compaction with vibratory equipment prior to placing subsequent backfill materials.

General backfill over shading materials may consist of on-site native materials provided they meet the requirements in the "Material for Fill" section, and are moisture conditioned and compacted in accordance with the requirements in the "Compaction" section.

Where utility lines will cross perpendicular to strip footings, the footing should be deepened to encase the utility line, providing sleeves or flexible cushions to protect the pipes from anticipated foundation settlement, or the utility lines should be backfilled to the bottom of footing with sand-cement slurry or lean concrete. Where utility lines will parallel footings and will extend below the "foundation plane of influence," an imaginary 1:1 plane projected down from the bottom edge of the footing, either the footing will need to be deepened so that the pipe is above the foundation plane of influence or the utility trench will need to be backfilled with sand-cement slurry or lean concrete within the influence zone. Sand-cement slurry used within foundation influence zones should have a minimum compressive strength of 75 psi.

On expansive soils sites it is desirable to reduce the potential for water migration into building and pavement areas through the granular shading materials. We recommend that a plug of low-permeability clay soil, sand-cement slurry, or lean concrete be placed within trenches just outside where the trenches pass into building and pavement areas.

6.10 SITE DRAINAGE

6.10.1 Surface Drainage

Ponding should not be allowed adjacent to building foundations, slabs-on-grade, or pavements. Hardscape surfaces should slope at least 2 percent towards suitable discharge facilities; landscape areas should slope at least 3 percent towards suitable discharge facilities. Roof runoff should be directed away from building areas in closed conduits, to approved infiltration facilities, or on to hardscaped surfaces that drain to suitable facilities. Retention, detention or infiltration facilities should be spaced at least 10 feet from buildings, and preferably at least 5 feet from slabs-on-grade or pavements. However, if retention, detention or infiltration facilities are located within these zones, we recommend that these treatment facilities meet the requirements in the Storm Water Treatment Design Considerations section of this report.

6.11 LOW-IMPACT DEVELOPMENT (LID) IMPROVEMENTS

The Municipal Regional Permit (MRP) requires regulated projects to treat 100 percent of the amount of runoff identified in Provision C.3.d from a regulated project's drainage area with low impact development (LID) treatment measures onsite or at a joint stormwater treatment facility. LID treatment measures are defined as rainwater harvesting and use, infiltration,

evapotranspiration, or biotreatment. A biotreatment system may only be used if it is infeasible to implement harvesting and use, infiltration, or evapotranspiration at a project site.

Technical infeasibility of infiltration may result from site conditions that restrict the operability of infiltration measures and devices. Various factors affecting the feasibility of infiltration treatment may create an environmental risk, structural stability risk, or physically restrict infiltration. The presence of any of these limiting factors may render infiltration technically infeasible for a proposed project. To aid in determining if infiltration may be feasible at the site, we provide the following site information regarding factors that may aid in determining the feasibility of infiltration facilities at the site.

- The near-surface soils at the site are clayey and categorized as Hydrologic Soil Group D, and is expected to have infiltration rates of less than 0.2 inches per hour. In our opinion, these clayey soils will significantly limit the infiltration of stormwater.

- Locally, seasonal high groundwater is mapped at a depth of less than 10 feet, and therefore is expected to be within 10 feet of the base of the infiltration measure.

- The site has a known geotechnical hazard consisting of soils subject to liquefaction; therefore, stormwater infiltration facilities may not be feasible.

- In our opinion, infiltration locations within 10 feet of the buildings would create a geotechnical hazard.

6.11.1 Storm Water Treatment Design Considerations

If storm water treatment improvements, such as shallow bio-retention swales, basins or pervious pavements, are required as part of the site improvements to satisfy Storm Water Quality (C.3) requirements, we recommend the following items be considered for design and construction.

6.11.1.1 GENERAL BIOSWALE DESIGN GUIDELINES

- If possible, avoid placing bioswales or basins within 10 feet of the building perimeter or within 5 feet of exterior flatwork or pavements. If bioswales must be constructed within these setbacks, the side(s) and bottom of the trench excavation should be lined with 10-mil visqueen to reduce water infiltration into the surrounding expansive clay.

- Bioswales constructed within 3 feet of proposed buildings may be within the foundation zone of influence for perimeter wall loads. Therefore, where bioswales will parallel foundations and will extend below the "foundation plane of influence," an imaginary 1:1 plane projected down from the bottom edge of the foundation, the foundation will need to be deepened so that the bottom edge of the bioswale filter material is above the foundation plane of influence.

- The bottom of bioswale or detention areas should include a perforated drain placed at a low point, such as a shallow trench or sloped bottom, to reduce water infiltration into the surrounding soils near structural improvements, and to address the low infiltration capacity of the on-site clay soils.

6.11.1.2 BIOSWALE INFILTRATION MATERIAL

- Gradation specifications for bioswale filter material, if required, should be specified on the grading and improvement plans.

- Compaction requirements for bioswale filter material in non-landscaped areas or in pervious pavement areas, if any, should be indicated on the plans and specifications to satisfy the anticipated use of the infiltration area.

- If bioswales are to be vegetated, the landscape architect should select planting materials that do not reduce or inhibit the water infiltration rate, such as covering the bioswale with grass sod containing a clayey soil base.

- Due to the relatively loose consistency and/or high organic content of many bioswale filter materials, long-term settlement of the bioswale medium should be anticipated. To reduce initial volume loss, bioswale filter material should be wetted in 12-inch lifts during placement to pre-consolidate the material. Mechanical compaction should not be allowed, unless specified on the grading and improvement plans, since this could significantly decrease the infiltration rate of the bioswale materials.

- It should be noted that the volume of bioswale filter material may decrease over time depending on the organic content of the material. Additional filter material may need to be added to bioswales after the initial exposure to winter rains and periodically over the life of the bioswale areas, as needed.

6.11.1.3 BIOSWALE CONSTRUCTION ADJACENT TO PAVEMENTS

If bio-infiltration swales or basins are considered adjacent to proposed parking lots or exterior flatwork, we recommend that mitigative measures be considered in the design and construction of these facilities to reduce potential impacts to flatwork or pavements. Exterior flatwork, concrete curbs, and pavements located directly adjacent to bio-swales may be susceptible to settlement or lateral movement, depending on the configuration of the bioswale and the setback between the improvements and edge of the swale. To reduce the potential for distress to these improvements due to vertical or lateral movement, the following options should be considered by the project civil engineer:

- Improvements should be setback from the vertical edge of a bioswale such that there is at least 1 foot of horizontal distance between the edge of improvements and the top edge of the bioswale excavation for every 1 foot of vertical bioswale depth, or

- Concrete curbs for pavements, or lateral restraint for exterior flatwork, located directly adjacent to a vertical bioswale cut should be designed to resist lateral earth pressures in accordance with the recommendations in the "Retaining Walls" section of this report, or concrete curbs or edge restraint should be adequately keyed into the native soil or engineered to reduce the potential for rotation or lateral movement of the curbs.

6.12 LANDSCAPE CONSIDERATIONS

Since the near-surface soils are [moderately/highly] expansive, we recommend greatly reducing the amount of surface water infiltrating these soils near foundations and exterior slabs-on-grade. This can typically be achieved by:

- Using drip irrigation
- Avoiding open planting within 3 feet of the building perimeter or near the top of existing slopes
- Regulating the amount of water distributed to lawns or planter areas by using irrigation timers
- Selecting landscaping that requires little or no watering, especially near foundations.

We recommend that the landscape architect consider these items when developing landscaping plans.

SECTION 7: 2019 CBC SEISMIC DESIGN CRITERIA

7.1 SEISMIC DESIGN CRITERIA

We developed site-specific seismic design parameters in accordance with Chapter 16, Chapter 18 and Appendix J of the 2019 California Building Code (CBC) and Chapters 11, 12, 20, and 21 and Supplement No. 1 of ASCE 7-16.

7.1.1 Site Location and Provided Data For 2019 CBC Seismic Design

The project is located at latitude 37.524923° and longitude -121.027577°, which is based on Google Earth (WGS84) coordinates at the approximate center of the project site located in Newark, California. We have assumed that a Seismic Importance Factor (I_e) of 1.00 has been assigned to the structure in accordance with Table 1.5-2 of ASCE 7-16 for structures classified as Risk Category II. The building period has not been provided by the project structural engineer.

7.2 2019 CBC SEISMIC DESIGN CRITERIA

As discussed in the "Subsurface" of our report, our CPT and exploratory borings encountered loose to dense sands and soft to hard clay and silt deposits to a depth of 110 feet, the maximum

depth explored. Shear wave velocity (V_S) measurements were performed while advancing CPT-5, resulting in a time-averaged shear wave velocity for the top 30 meters (V_{S30}) of 250 meters per second (819 feet per second), for the upper 100 feet.

7.2.1 2019 CBC Seismic Design

As our borings encountered deep alluvial soils with shear wave velocity for the upper 30 meters between 600 and 1200 feet per second, per section 20.3.2 of ASCE 7-16, we have classified the site as Soil Classification D, which is described as a "stiff soil" profile. Because we used site specific data from our explorations and laboratory testing, the site class should be considered as "determined" for the purposes of estimating the seismic design parameters from the code. Our site-specific ground motion hazard analysis considered a V_{S30} of 250 m/s (819 ft/s).

In accordance with Section 11.4.8 of ASCE 7-16, we performed a ground motion hazard analysis following Chapter 21, Section 21.2 of ASCE 7-16. We evaluated both Probabilistic MCE_R Ground Motions in accordance with Method 1 and Deterministic MCE_R Ground Motions to generate our recommended design response spectrum for the project, see Figure 6. The recommended design spectral accelerations and associated periods are provided in graphically on Figure 5.

SECTION 8: FOUNDATIONS

8.1 SUMMARY OF RECOMMENDATIONS

Due to the estimated total and differential seismic and static settlement, the potential for ground rupture, undocumented fill, and the presence of shallow soft to medium stiff clays and silts, the proposed structure should be supported on shallow foundations overlying ground improvement. Ground improvement can be used to mitigate the settlement to tolerable levels and increase bearing capacity. Provided the recommendations in the "Earthwork" section and subsequent sections below are followed, the proposed structures may be supported on shallow foundations overlying ground improvement. We recommend a design-build ground improvement contractor design the mitigation using an appropriate ground improvement technique to meet the project requirements. Foundation recommendations are presented in the following sections.

8.2 SHALLOW FOUNDATIONS OVERLYING GROUND IMPROVEMENT

8.2.1 Conventional Shallow Footings

Conventional shallow footings should bear on natural, undisturbed soil or engineered fill, be at least 12 inches wide, and extend at least 18 inches below the lowest adjacent grade. Lowest adjacent grade is defined as the deeper of the following: 1) bottom of the adjacent interior slab-on-grade, or 2) finished exterior grade, excluding landscaping topsoil.

Bearing pressures will be dependent on the final ground improvement technique and spacing; however, substantial improvement in bearing capacity would be expected. On a preliminary

basis, we expect allowable bearing pressures on the order of 4,000 to 5,000 psf for combined dead plus live loads would be feasible.

Ground improvement should be designed to reduce total settlement due to static and seismic conditions to tolerable levels and mitigate potential lateral displacement and ground deformation as described below.

8.2.2 Footing Settlement

As discussed in the "Ground Improvement" section below, the ground improvement design should be such that the total foundation settlement (static and seismic) is reduced to about 1 to 1½ inch, or less, with no more than 1 inch for either the static or seismic component.

8.2.3 Lateral Loading

Lateral loads may be resisted by friction between the bottom of footing and the supporting subgrade, and also by passive pressures generated against footing sidewalls. An ultimate frictional resistance of 0.45 applied to the footing dead load, and an ultimate passive pressure based on an equivalent fluid pressure of 450 pcf may be used in design. The structural engineer should apply an appropriate factor of safety (such as 1.5) to the ultimate values above. Where footings are adjacent to landscape areas without hardscape, the upper 12 inches of soil should be neglected when determining passive pressure capacity.

8.2.4 Conventional Shallow Footing Construction Considerations

Where utility lines will cross perpendicular to strip footings, the footing should be deepened to encase the utility line, providing sleeves or flexible cushions to protect the pipes from anticipated foundation settlement, or the utility lines should be backfilled to the bottom of footing with sand-cement slurry or lean concrete. Where utility lines will parallel footings and will extend below the "foundation plane of influence," an imaginary 1:1 plane projected down from the bottom edge of the footing, either the footing will need to be deepened so that the pipe is above the foundation plane of influence or the utility trench will need to be backfilled with sand-cement slurry or lean concrete within the influence zone. Sand-cement slurry used within foundation influence zones should have a minimum compressive strength of 75 psi.

Footing excavations should be filled as soon as possible or be kept moist until concrete placement by regular sprinkling to prevent desiccation. A Cornerstone representative should observe all footing excavations prior to placing reinforcing steel and concrete. If there is a significant schedule delay between our initial observation and concrete placement, we may need to re-observe the excavations.

8.3 GROUND IMPROVEMENT

As discussed above, conventional shallow spread footings supporting the building may be used in combination with ground improvement. We recommend that ground improvement be performed in the upper 15 to 20 feet over the building footprint to mitigate liquefaction

settlement, static settlement, undocumented fills, ground rupture, and increase bearing capacity. Ground improvement can be used to improve the subsurface soils such that the total combined static and seismic settlements are reduced to less than 1½ inches with ½- to ¾-inch differential settlement over a horizontal distance of 30 to 50 feet, enabling the structures to be supported on spread footings. Ground improvement should provide adequate confining improvement around all foundations. Ground improvement options should also include an increase in allowable bearing pressures and should reduce settlement to within the tolerances stated above.

8.3.1 General

Ground improvement should consist of densification techniques to improve the ground's resistance to liquefaction, reduce static settlement, improve undocumented fills, and improve bearing capacity and seismic performance. Densification techniques could potentially consist of vibro replacement (i.e. stone columns), grouted displacement columns (i.e. CLSM), deep dynamic compaction, soil surcharge, deep soil mixing, or similar densification techniques. The intent of the ground improvement design beneath the proposed building would be to increase the density of the potentially liquefiable sands, improving the deep undocumented fills, and improving the soft clays and silts within 15 to 20 feet from the surface by laterally displacing and/or densifying the existing in-place soils. One, or combination of the above ground improvement techniques may also be feasible.

Drilled displacement columns are formed in displaced soil cavities and displace liquefiable and compressible soil with cemented Controlled Low Strength Material. CLSM column ground improvement can mitigate liquefaction and settlement of heavy foundations and slabs. CLSM columns are ideal for sensitive project sites such as those near critical structures that require low noise and no vibration construction methods, unreinforced masonry walls, occupied offices, sensitive soil (e.g. Bay Mud), and hazardous/contaminated soil sites where deep ground improvement is required.

The CLSM columns are separated from the bottom of the footing using a minimum 6-inch layer of crushed rock or other material "cushion". No connectivity of the CLSM columns and overlying structural element is allowed. In some cases, a Ground Anchor may be used in a higher strength column to resist uplift forces. Lateral resistance is provided by footing, mat, or slab bottom friction at the concrete to cushion layer interface or passive resistance of the side walls. The target strengths of the CLSM are usually between 500 to 1,000 psi at 28 days, depending on load demands. The CLSM strength is tested using standard sampling and loading methods.

Vibro replacement and granular compaction piles are similar in that a probe is vibrated into the ground to the design depth and a compacted open-graded gravel column is constructed from the bottom up. The surrounding soils are densified by the displacement of the soil as well as the vibrations from consolidating and expanding the gravel column laterally. One of the disadvantages of these densification pile types are the noise and vibration (and sometimes dust) produced during construction. The vibrations may cause noise and vibrations that can be heard or felt off-site. Pre-drilling through surficial materials may reduce noise and vibration, and should be anticipated for improvement areas adjacent to the site that may be sensitive to vibrations.

Deep dynamic compaction (DDC) is a ground improvement technique that densifies granular soils by dropping a large drop weight onto the ground surface over the desired improvement area. The typically steel drop weight is lifted by a crane and repeatedly dropped onto the ground surface. The energy (vibrations) transfer to the underlying granular soils to densify them in-place. The drop locations (treated areas) are typically located on a grid pattern, the spacing of which is determined by the subsurface conditions and foundation loading and geometry. The treated granular soils should have increased density, friction angle, and stiffness.
Soil surcharge is a ground improvement technique that pre-consolidates the underlying compressible soil to expedite long-term settlements. Wick drains can also be incorporated to further expedite settlement. This program should be designed and performed by a design-build ground improvement contractor with extensive experience in surcharging, wick drain installation, and monitoring. We should work with them to provide a monitoring program, which should include, at a minimum, settlement plates and piezometers. Plate and piezometer locations and depths should be coordinated with the contractor. The monitoring program should be in place well in advance prior to constructing the surcharge fill. It is critical that these be installed prior to any grading or placing of fill, and baseline readings taken. This will provide data to accurately evaluate and estimate settlements. All instrumentation should be protected by the grading contractor during fill placement. The actual fill thickness, wick spacing, and quantity should be determined by the contractor and forwarded to us for review. Regular monitoring with frequent data collection should be expected and planned for. In addition, modification to our estimates should be expected based on the actual field condition encountered and performance at the time of construction.

Based on the chosen ground improvement technique, the upper 1 to 2 feet of the working pad will likely need to be re-compacted after ground improvement installation, due to surface disturbance, potential ground heave and removal and re-compaction of undocumented fill. For this reason, we do not recommend preparation of the building pad or the construction of utilities prior to ground improvement.

The diameter of these ground improvement elements would be 24 to 30 inches and spacing would be proposed by the ground improvement contractors based on their experience and documented case histories of improvement performed on other projects with similar soil conditions which we would review as part of their submittal. The spacing would be estimated to improve the sands to obtain a post treatment $(N_1)_{60cs}$ of at least 20 to 25 blows/foot. The spacing would also be selected to reduce the total static and seismic settlement to 1½ inches with no more than 1-inch of static nor 1-inch of seismic settlement allowed as a component of the total settlement. We would recommend a modulus test at the on-set of construction to verify that the ground improvement will control the static settlement. This recommendation is predicated on our working with and reviewing the ground improvement contractor's submittal documentation on their proposed spacing and installation methodology and case histories from other similar projects. We would also independently observe installation in the field and prepare a signed and stamped close-out letter with confirms that installed ground improvement meets our recommendations.

8.3.2 Ground Improvement Design Guidelines

We recommend that the ground improvement design include, but not be limited to: 1) drawings showing the ground improvement layout, spacing and diameter, 2) the foundation layout plan, 3) proposed ground improvement length, 4) top and bottom elevations, 5) case histories showing pre and post improvement $(N_1)_{60cs}$ or Q_{C1cs} values for projects with similar site conditions, 6) estimate of static settlement and modulus to meet settlement goals. We recommend that all displacement columns be capped with a minimum 6-inch-thick compacted gravel pad to facilitate load transfer and to decouple the footings from underlying ground improvement elements. The actual gravel pad thickness should be confirmed by the design-build contractor. We should be retained to review the ground improvement contractor's plan and densification estimates prior to construction, and to review and confirm that the contractor's ground improvement design will satisfactorily meet the design criteria based on the previous performance testing. Ground improvement would generally be constructed as follows: 1) clear the site of existing demolition debris, 2) mass grading to the building pad subgrade elevation, 3) install the ground improvement on the approved layout, and 4) over-excavation and re-compact top of building pad, as required, prior to construction of remainder of pad and the foundations.

The degree to which the soil density is increased will depend on the improvement method and spacing. Even though the above methods are designed to mitigate different existing soil conditions, ground improvement should provide an additional increase in bearing capacity and soil stiffness at the individual improvement locations.

8.3.3 Ground Improvement Performance Testing

Foundation areas must meet the above total settlement criteria, which will include all settlement estimated from static loads. Analysis of settlement for static loading should include compression within the treatment area due to structural loads, and seismic settlement estimated for below the zone of treatment. Ground improvement must also provide adequate support for the design bearing capacity.

Verification testing should include at least one modulus tests within the building footprint. To validate the parameters selected for a specific project, a modulus load test is performed on a test pier typically constructed in locations chosen in coordination with the geotechnical engineer. Modulus tests are conducted to a pressure equal to at least 150% of the maximum design top of column stress to assure a reasonable level of safety which supports long term settlement control and demonstrates that the ground improvement element has adequate strength. Modulus testing should be performed in general accordance with ASTM D1143.

We recommend that at least four test arrays including pre- and post-installation CPT testing be performed. Performance testing typically consists of CPTs performed within each test array to confirm soil strength and density increases were achieved to meet the settlement criteria. We should observe and monitor installation of the test arrays and production ground improvement on a full-time basis and review the post-test array settlement analyses provided by the contractor.

8.4 ALTERNATIVE FOUNDATION

As an alternative to shallow spread footings and slab-on-grade underlain entirely by ground improvement, provided the potential for ground deformation is mitigated, the building may also potentially be supported by deep foundations and structural slabs supported on engineered fill prepared in accordance with the "Earthwork" section of this report, and designed in accordance with the 2019 California Building Code. Please be advised this foundation alternative may also require mitigating the potential for ground deformation and undocumented fill. If this option is desired, we should be provided additional information, including column loadings, to provide additional recommendations.

SECTION 9: CONCRETE SLABS AND PEDESTRIAN PAVEMENTS

9.1 INTERIOR OFFICE SLABS-ON-GRADE

Due to the moderate expansion potential of the surficial soils, the proposed slabs-on-grade should be supported on at least 12 inches of non-expansive fill (NEF) to reduce the potential for slab damage due to soil heave. The NEF layer should be constructed over subgrade prepared in accordance with the recommendations in the "Earthwork" section of this report. If moisture-sensitive floor coverings are planned, the recommendations in the "Interior Slabs Moisture Protection Considerations" section below may be incorporated in the project design if desired. If significant time elapses between initial subgrade preparation and slab-on-grade NEF construction, the subgrade should be proof-rolled to confirm subgrade stability, and if the soil has been allowed to dry out, the subgrade should be re-moisture conditioned to at least 3 percent over the optimum moisture content.

The structural engineer should determine the appropriate slab reinforcement for the loading requirements and considering the expansion potential of the underlying soils. For unreinforced concrete slabs, ACI 302.1R recommends limiting control joint spacing to 24 to 36 times the slab thickness in each direction, or a maximum of 18 feet.

9.2 WAREHOUSE SLABS-ON-GRADE

Warehouse slabs-on-grade should be at least 6 inches thick, should have a minimum compressive strength of 3,500 psi, and should be designed for the specific warehouse loading (i.e.. forklifts, rack loads, etc.). At this time, rack loading information, etc. was not available. The slab should also be designed to accommodate potential slab settlement beneath heavily loaded slab areas.

Warehouse slabs-on-grade should also be supported on at least 6 inches of crushed granular base having an R-value of at least 50 and no more than 10 percent passing the No. 200 sieve, such as Class 2 aggregate base. Due to the moderate plasticity of the surficial soils, an additional 6 inches of non-expansive fill (NEF) should underlie the upper granular base.

To summarize, the warehouse slab-on-grade should be underlain by the materials and alternatives outlined below. Additional details follow these points.

- Zone A Fill Material – Upper 6 inches of pad subgrade should consist of crushed granular base having an R-value of at least 50 and no more than 10 percent passing the No. 200 sieve, such as Class 2 aggregate base

- Zone B Fill Material – from 6 to 10 inches below pad subgrade (or below the Zone A noted above), the soil/material should also consist of a non-expansive fill (NEF) with a Plasticity Index (PI) of 15, or less

- Zone B Fill Material Alternative 1 – from 6 to 10 inches below pad subgrade (or below the Zone A noted above), the non-expansive fill material also can consist of the same material used for Zone A

- Zone B Fill Material Alternative 2 – from 6 to 10 inches below pad subgrade (or below the Zone A noted above), the onsite material also can be chemical-treated to meet non-expansive requirement with a PI of 15, or less

All base and subbase materials should be placed and compacted in accordance with the "Compaction" section of this report. If there will be areas within the warehouse that are moisture sensitive, such as equipment and elevator rooms, a vapor barrier may be placed over the upper granular base prior to slab construction. Please refer to the recommendations in the "Interior Slabs Moisture Protection Considerations" section for vapor barrier construction. Consideration should be given to limiting the control joint spacing to a maximum of about 2 feet in each direction for each inch of concrete thickness.

9.3 INTERIOR SLABS MOISTURE PROTECTION CONSIDERATIONS

The following general guidelines for concrete slab-on-grade construction where floor coverings are planned are presented for the consideration by the developer, design team, and contractor. These guidelines are based on information obtained from a variety of sources, including the American Concrete Institute (ACI) and are intended to reduce the potential for moisture-related problems causing floor covering failures, and may be supplemented as necessary based on project-specific requirements. The application of these guidelines or not will not affect the geotechnical aspects of the slab-on-grade performance.

- Place a minimum 15-mil vapor retarder conforming to ASTM E 1745, Class C requirements or better directly below the concrete slab; the vapor retarder should extend to the slab edges and be sealed at all seams and penetrations in accordance with manufacturer's recommendations and ASTM E 1643 requirements. A 4-inch-thick capillary break, consisting of crushed rock should be placed below the vapor retarder and consolidated in place with vibratory equipment. The mineral aggregate shall be of such size that the percentage composition by dry weight as determined by laboratory sieves will conform to the following gradation:

Sieve Size	Percentage Passing Sieve
1"	100
¾"	90 – 100
No. 4	0 – 10
No. 200	0 – 5

The capillary break rock may be considered as the upper 4 inches of the non-expansive fill previously recommended.

- The concrete water:cement ratio should be 0.45 or less. Mid-range plasticizers may be used to increase concrete workability and facilitate pumping and placement.
- Water should not be added after initial batching unless the slump is less than specified and/or the resulting water:cement ratio will not exceed 0.45.
- Polishing the concrete surface with metal trowels is not recommended.
- Where floor coverings are planned, all concrete surfaces should be properly cured.
- Water vapor emission levels and concrete pH should be determined in accordance with ASTM F1869-98 and F710-98 requirements and evaluated against the floor covering manufacturer's requirements prior to installation.

9.4 EXTERIOR FLATWORK

9.4.1 Pedestrian Concrete Flatwork

Exterior concrete flatwork subject to pedestrian and/or occasional light pick up loading should be at least 4 inches thick and supported on at least 6 inches of Class 2 aggregate base overlying subgrade prepared in accordance with the "Earthwork" recommendations of this report. Flatwork that will be subject to heavier or frequent vehicular loading should be designed in accordance with the recommendations in the "Vehicular Pavements" section below. To help reduce the potential for uncontrolled shrinkage cracking, adequate expansion and control joints should be included. Consideration should be given to limiting the control joint spacing to a maximum of about 2 feet in each direction for each inch of concrete thickness. Flatwork should be isolated from adjacent foundations or retaining walls except where limited sections of structural slabs are included to help span irregularities in retaining wall backfill at the transitions between at-grade and on-structure flatwork.

SECTION 10: VEHICULAR PAVEMENTS

10.1 ASPHALT CONCRETE

The following asphalt concrete pavement recommendations tabulated below are based on the Procedure 608 of the Caltrans Highway Design Manual, estimated traffic indices for various pavement-loading conditions, and on a design R-value of 5. The design R-value was chosen

based on engineering judgement considering the variable and expansive soil conditions. Additionally, due to the presence of moderate expansive soils, we have also included an option for lime-treated subgrade soils using an estimated design R-value of 50.

Table 4: Asphalt Concrete Pavement Recommendations

Design Traffic Index (TI)	Asphalt Concrete (inches)	Class 2 Aggregate Base[1] (inches)	Total Pavement Section Thickness (inches)
4.0	2.5	7.5	10.0
4.5	2.5	9.5	12.0
5.0	3.0	10.0	13.0
5.5	3.0	12.0	15.0
6.0	3.5	13.0	16.5
6.5	4.0	13.5	17.5
7.0	4.0	15.5	19.5
7.5	4.5	16.5	21.0
8.0	5.0	17.5	22.5
8.5	5.0	19.5	24.5
9.0	5.5	20.5	26.0
9.5	6.0	21.5	27.5
10.0	6.5	23.0	29.5
10.5	6.5	24.5	31.0
11.0	7.0	25.5	32.5

[1]Caltrans Class 2 aggregate base; minimum R-value of 78; subgrade R-value of 5

Table 5: Asphalt Concrete Pavement Recommendations (Chemical Treated Subgrade)

Design Traffic Index (TI)	Asphalt Concrete (inches)	Class 2 Aggregate Base[1] (inches)	Total Pavement Section Thickness (inches)
4.0/4.5	2.5	4.0	6.5
5.0/5.5	3.0	4.0	7.0
6.0	3.5	4.0	7.5
6.5	4.0	4.0	8.0
7.0	4.0	4.5	8.5
7.5	4.5	5.0	9.5
8.0	5.0	5.0	10.0
8.5	5.0	6.5	11.5
9.0	5.5	6.5	12.0
9.5	6.0	7.0	13.0
10.0	6.0	8.0	14.0
10.5	6.5	8.5	15.0
11.0	7.0	8.5	15.5

[1]Caltrans Class 2 aggregate base; minimum R-value of 78; subgrade R-value of 50 assuming chemical-treatment the upper 12 inches of subgrade

Frequently, the full asphalt concrete section is not constructed prior to construction traffic loading. This can result in significant loss of asphalt concrete layer life, rutting, or other pavement failures. To improve the pavement life and reduce the potential for pavement distress through construction, we recommend the full design asphalt concrete section be constructed prior to construction traffic loading. Alternatively, a higher traffic index may be chosen for the areas where construction traffic will use the pavements.

Asphalt concrete pavements constructed on expansive subgrade where the adjacent areas will not be irrigated for several months after the pavements are constructed may experience longitudinal cracking parallel to the pavement edge. These cracks typically form within a few feet of the pavement edge and are due to seasonal wetting and drying of the adjacent soil. The cracking may also occur during construction where the adjacent grade is allowed to significantly dry during the summer, pulling moisture out of the pavement subgrade. Any cracks that form should be sealed with bituminous sealant prior to the start of winter rains. One alternative to reduce the potential for this type of cracking is to install a moisture barrier at least 24 inches deep behind the pavement curb.

10.2 PORTLAND CEMENT CONCRETE

The exterior Portland Cement Concrete (PCC) pavement recommendations tabulated below are based on methods presented in "Concrete Pavement for Trucking Facilities" by the American Concrete Pavement Association (ACPA, 1995), and the Portland Cement Association (PCA)

design manual (PCA, 1984). We have provided a few pavement alternatives as an anticipated Average Daily Truck Traffic (ADTT) was not provided. The following table presents minimum PCC pavements thicknesses for various traffic loading categories and the anticipated maximum Average Daily Truck Traffic (ADTT).

Table 6: PCC Pavement Recommendations

Traffic Category	Minimum PCC Thickness[1] (inches)	Class 2 Aggregate Base (inches)
Maximum ADTT = 20	7.0	6.0
Maximum ADTT = 80	7.5	6.0
Maximum ADTT = 400	8.0	6.0

[1]Subgrade design R-Value = 5

The PCC thickness recommended above are based on a concrete flexural strength of at least 550 psi, minimum 28-day compressive strength of 4,000 psi, and supporting the PCC on at least 6 inches of Class 2 aggregate base compacted to a minimum relative compaction of 95 percent (ASTM D1557) as recommended in the "Earthwork" section of our report, and laterally restraining the PCC with curbs or concrete shoulders. The aggregate base should be constructed over compacted subgrade prepared in accordance with "Compaction" section of this report. The PCC should have a low water-cement ratio (industry standards), and in no case exceed a water-cement plus pozzolan ratio of 0.53.

Adequate expansion and control joints should be included. Joint spacing should not exceed about 24 times the pavement thickness, in approximately square panels for unreinforced concrete. Joint spacing can be increased somewhat for reinforced concrete where light reinforcing steel is provided to help hold together intermediate cracks that may form in panels. Construction and expansion joints, and dowels, should be designed in accordance with industry standards.

If the subgrade soils are to be chemically treated (e.g. cement), we have provided some pavement alternatives below. For chemically treated subgrade, we recommend the upper 12 inches of subgrade soil be treated and the treated subgrade should obtain a minimum R-value of 50. If chemical treatment of the subgrade is performed, the underlying Class 2 aggregate base section may be reduced from 6 inches to 4 inches, provided it is compacted to a minimum relative compaction of 95 percent (ASTM D1557) as recommended in the "Earthwork" section of our report. Additional testing will need to be performed to determine the appropriate lime/cement percentage to be mixed with the subgrade soil to achieve an estimated R-value of 50. The remaining design and construction details should be consistent with the above recommendations for PCC pavements over untreated subgrade.

Table 7: PCC Pavement Recommendations (Chemical-Treated Subgrade)

Traffic Category	Minimum PCC Thickness[1] (inches)
Trucks per day per lane = 20	6.5
Trucks per day per lane = 80	7.0
Trucks per day per lane = 400	7.5

1 – Subgrade design R-Value = 50 with minimum 4 inches of Class 2 aggregate base

10.2.1 Stress Pads for Trash Enclosures

Pads where trash containers will be stored, and where garbage trucks will park while emptying trash containers, should be constructed on Portland Cement Concrete. We recommend that the trash enclosure pads and stress (landing) pads where garbage trucks will store, pick up, and empty trash be increased to a minimum PCC thickness of 7 inches. The compressive strength, underlayment, and construction details should be consistent with the above recommendations for PCC pavements.

10.3 PAVEMENT CUTOFF

Surface water penetration into the pavement section can significantly reduce the pavement life, due to the native expansive clays. While quantifying the life reduction is difficult, a normal 20-year pavement design could be reduced to less than 10 years; therefore, increased long-term maintenance may be required.

It would be beneficial to include a pavement cut-off, such as deepened curbs, redwood-headers, or "Deep-Root Moisture Barriers" that are keyed at least 4 inches into the pavement subgrade. This will help limit the additional long-term maintenance.

SECTION 11: RETAINING WALLS

11.1 STATIC LATERAL EARTH PRESSURES

The structural design of any site retaining wall should include resistance to lateral earth pressures that develop from the soil behind the wall, any undrained water pressure, and surcharge loads acting behind the wall. Provided a drainage system is constructed behind the wall to prevent the build-up of hydrostatic pressures as discussed in the section below, we recommend that the walls with level backfill be designed for the following pressures:

Table 7: Recommended Lateral Earth Pressures

Wall Condition	Lateral Earth Pressure*	Additional Surcharge Loads
Unrestrained – Cantilever Wall	45 pcf	⅓ of vertical loads at top of wall
Restrained – Braced Wall	45 pcf + 8H** psf	½ of vertical loads at top of wall

* Lateral earth pressures are based on an equivalent fluid pressure for level backfill conditions
** H is the distance in feet between the bottom of footing and top of retained soil

If adequate drainage cannot be provided behind the wall, an additional equivalent fluid pressure of 40 pcf should be added to the values above for both restrained and unrestrained walls for the portion of the wall that will not have drainage. Damp proofing or waterproofing of the walls may be considered where moisture penetration and/or efflorescence are not desired.

11.2 SEISMIC LATERAL EARTH PRESSURES

11.2.1 Site Walls

The 2019 CBC states that lateral pressures from earthquakes should be considered in the design of basements and retaining walls. At this time, we are not aware of any retaining walls for the project. However, minor landscaping walls (i.e. walls 6 feet or less in height) may be proposed. In our opinion, design of these walls for seismic lateral earth pressures in addition to static earth pressures is not warranted.

11.3 WALL DRAINAGE

11.3.1 At-Grade Site Walls

Adequate drainage should be provided by a subdrain system behind all walls. This system should consist of a 4-inch minimum diameter perforated pipe placed near the base of the wall (perforations placed downward). The pipe should be bedded and backfilled with Class 2 Permeable Material per Caltrans Standard Specifications, latest edition. The permeable backfill should extend at least 12 inches out from the wall and to within 2 feet of outside finished grade. Alternatively, ½-inch to ¾-inch crushed rock may be used in place of the Class 2 Permeable Material provided the crushed rock and pipe are enclosed in filter fabric, such as Mirafi 140N or approved equivalent. The upper 2 feet of wall backfill should consist of compacted on-site soil. The subdrain outlet should be connected to a free-draining outlet or sump.

Miradrain, Geotech Drainage Panels, or equivalent drainage matting can be used for wall drainage as an alternative to the Class 2 Permeable Material or drain rock backfill. Horizontal strip drains connecting to the vertical drainage matting may be used in lieu of the perforated pipe and crushed rock section. The vertical drainage panel should be connected to the perforated pipe or horizontal drainage strip at the base of the wall, or to some other closed or through-wall system such as the TotalDrain system from AmerDrain. Sections of horizontal drainage strips should be connected with either the manufacturer's connector pieces or by pulling back the filter fabric, overlapping the panel dimples, and replacing the filter fabric over

the connection. At corners, a corner guard, corner connection insert, or a section of crushed rock covered with filter fabric must be used to maintain the drainage path.

Drainage panels should terminate 18 to 24 inches from final exterior grade. The Miradrain panel filter fabric should be extended over the top of and behind the panel to protect it from intrusion of the adjacent soil.

11.4 BACKFILL

Where surface improvements will be located over the retaining wall backfill, backfill placed behind the walls should be compacted to at least 95 percent relative compaction using light compaction equipment. Where no surface improvements are planned, backfill should be compacted to at least 90 percent. If heavy compaction equipment is used, the walls should be temporarily braced.

11.5 FOUNDATIONS

Retaining walls may be supported on a continuous and or spread footing underlain by ground improvement in accordance with the recommendations presented in the "Foundations" section of this report.

At this time, we are not aware of any site retaining walls. If retaining walls are present and not supported on ground improvement, we should review the location of any site retaining walls prior to design and provide additional recommendations as needed.

SECTION 12: LIMITATIONS

This report, an instrument of professional service, has been prepared for the sole use of Prologis specifically to support the design of the Central Avenue Logistics Center project in Newark, California. The opinions, conclusions, and recommendations presented in this report have been formulated in accordance with accepted geotechnical engineering practices that exist in Northern California at the time this report was prepared. No warranty, expressed or implied, is made or should be inferred.

Recommendations in this report are based upon the soil and groundwater conditions encountered during our subsurface exploration. If variations or unsuitable conditions are encountered during construction, Cornerstone must be contacted to provide supplemental recommendations, as needed.

Prologis may have provided Cornerstone with plans, reports and other documents prepared by others. Prologis understands that Cornerstone reviewed and relied on the information presented in these documents and cannot be responsible for their accuracy.

Cornerstone prepared this report with the understanding that it is the responsibility of the owner or his representatives to see that the recommendations contained in this report are presented to other members of the design team and incorporated into the project plans and specifications,

and that appropriate actions are taken to implement the geotechnical recommendations during construction.

Conclusions and recommendations presented in this report are valid as of the present time for the development as currently planned. Changes in the condition of the property or adjacent properties may occur with the passage of time, whether by natural processes or the acts of other persons. In addition, changes in applicable or appropriate standards may occur through legislation or the broadening of knowledge. Therefore, the conclusions and recommendations presented in this report may be invalidated, wholly or in part, by changes beyond Cornerstone's control. This report should be reviewed by Cornerstone after a period of three (3) years has elapsed from the date of this report. In addition, if the current project design is changed, then Cornerstone must review the proposed changes and provide supplemental recommendations, as needed.

An electronic transmission of this report may also have been issued. While Cornerstone has taken precautions to produce a complete and secure electronic transmission, please check the electronic transmission against the hard copy version for conformity.

Recommendations provided in this report are based on the assumption that Cornerstone will be retained to provide observation and testing services during construction to confirm that conditions are similar to that assumed for design, and to form an opinion as to whether the work has been performed in accordance with the project plans and specifications. If we are not retained for these services, Cornerstone cannot assume any responsibility for any potential claims that may arise during or after construction as a result of misuse or misinterpretation of Cornerstone's report by others. Furthermore, Cornerstone will cease to be the Geotechnical-Engineer-of-Record if we are not retained for these services.

DESIGN RESPONSE SPECTRA	FIGURE 6
Central Avenue Logistics Center 6752 Central Ave Newark, CA	PROJECT NO. 555-26-1
	September 12, 2022 | MFR

APPENDIX A: FIELD INVESTIGATION

The field investigation consisted of a surface reconnaissance and a subsurface exploration program using truck-mounted, hollow-stem auger drilling equipment and 25-ton truck-mounted Cone Penetration Test equipment. Eight 8-inch-diameter exploratory borings were drilled on August 16 through 19, 2022 to depths of 25 to 80 feet. Five CPT soundings were also performed in accordance with ASTM D 5778-95 (revised, 2002) on August 10 and 11, 2022 to depths ranging from 50 to 110 feet. The approximate locations of exploratory borings and CPTs are shown on the Site Plan, Figure 2. The soils encountered were continuously logged in the field by our representative and described in accordance with the Unified Soil Classification System (ASTM D2488). Boring logs, as well as a key to the classification of the soil and bedrock, are included as part of this appendix.

Boring and CPT locations were approximated using existing site boundaries, a hand-held GPS unit, and other site features as references. Boring and CPT elevations were not determined. The locations of the borings and CPTs should be considered accurate only to the degree implied by the method used.

Representative soil samples were obtained from the borings at selected depths. All samples were returned to our laboratory for evaluation and appropriate testing. The standard penetration resistance blow counts were obtained by dropping a 140-pound hammer through a 30-inch free fall. The 2-inch O.D. split-spoon sampler was driven 18 inches and the number of blows was recorded for each 6 inches of penetration (ASTM D1586). 2.5-inch I.D. samples were obtained using a Modified California Sampler driven into the soil with the 140-pound hammer previously described. Relatively undisturbed samples were also obtained with 2.875-inch I.D. Shelby Tube sampler which were hydraulically pushed. Unless otherwise indicated, the blows per foot recorded on the boring log represent the accumulated number of blows required to drive the last 12 inches. The various samplers are denoted at the appropriate depth on the boring logs.

The CPT involved advancing an instrumented cone-tipped probe into the ground while simultaneously recording the resistance at the cone tip (q_c) and along the friction sleeve (f_s) at approximately 5-centimeter intervals. Based on the tip resistance and tip to sleeve ratio (R_f), the CPT classified the soil behavior type and estimated engineering properties of the soil, such as equivalent Standard Penetration Test (SPT) blow count, internal friction angle within sand layers, and undrained shear strength in silts and clays. A pressure transducer behind the tip of the CPT cone measured pore water pressure (u_2). Graphical logs of the CPT data is included as part of this appendix.

Field tests included an evaluation of the unconfined compressive strength of the soil samples using a pocket penetrometer device. The results of these tests are presented on the individual boring logs at the appropriate sample depths.

Attached boring and CPT logs and related information depict subsurface conditions at the locations indicated and on the date designated on the logs. Subsurface conditions at other locations may differ from conditions occurring at these boring and CPT locations. The passage of time may result in altered subsurface conditions due to environmental changes. In addition,

any stratification lines on the logs represent the approximate boundary between soil types and the transition may be gradual.

UNIFIED SOIL CLASSIFICATION (ASTM D-2487-98)

APPENDIX B: LABORATORY TEST PROGRAM

The laboratory testing program was performed to evaluate the physical and mechanical properties of the soils retrieved from the site to aid in verifying soil classification.

Moisture Content: The natural water content was determined (ASTM D2216) on 86 samples of the materials recovered from the borings. These water contents are recorded on the boring logs at the appropriate sample depths.

Dry Densities: In place dry density determinations (ASTM D2937) were performed on 71 samples to measure the unit weight of the subsurface soils. Results of these tests are shown on the boring logs at the appropriate sample depths.

Washed Sieve Analyses: The percent soil fraction passing the No. 200 sieve (ASTM D1140) was determined on eight samples of the subsurface soils to aid in the classification of these soils. Results of these tests are shown on the boring logs at the appropriate sample depths.

Plasticity Index: Six Plasticity Index determinations (ASTM D4318) were performed on samples of the subsurface soils to measure the range of water contents over which this material exhibits plasticity. The Plasticity Index was used to classify the soil in accordance with the Unified Soil Classification System and to evaluate the soil expansion potential. Results of these tests are shown on the boring logs at the appropriate sample depths.

Undrained-Unconsolidated Triaxial Shear Strength: The undrained shear strength was determined on three relatively undisturbed sample(s) by unconsolidated-undrained triaxial shear strength testing (ASTM D2850). The results of this test are included as part of this appendix.

Consolidation: Two consolidation tests (ASTM D2435) were performed on relatively undisturbed samples of the subsurface clayey soils to assist in evaluating the compressibility property of this soil. Results of the consolidation tests are presented graphically in this appendix.

Corrosion: Five soluble sulfate determinations (ASTM D4327), resistivity tests (ASTM G57), chloride determinations (ASTM D4327), and pH determinations (ASTM G51) were performed on five representative samples of the subsurface soils. Results of these tests are attached to this appendix.

Plasticity Index (ASTM D4318) Testing Summary

Results of Cone Penetration Tests

GREGG DRILLING, LLC.
GEOTECHNICAL AND ENVIRONMENTAL INVESTIGATION SERVICES

10/15/19

Kleinfelder
Attn: Andre Ashour

Subject: CPT Site Investigation
Prologis – 6756 Central Avenue
Newark, California
GREGG Project Number: D2194074MA

Dear Mr. Ashour:

The following report presents the results of GREGG Drilling Cone Penetration Test investigation for the above referenced site. The following testing services were performed:

1	Cone Penetration Tests	(CPTU)	☒
2	Pore Pressure Dissipation Tests	(PPD)	☒
3	Seismic Cone Penetration Tests	(SCPTU)	☒
4	UVOST Laser Induced Fluorescence	(UVOST)	☐
5	Groundwater Sampling	(GWS)	☐
6	Soil Sampling	(SS)	☐
7	Vapor Sampling	(VS)	☐
8	Pressuremeter Testing	(PMT)	☐
9	Vane Shear Testing	(VST)	☐
10	Dilatometer Testing	(DMT)	☐

A list of reference papers providing additional background on the specific tests conducted is provided in the bibliography following the text of the report. If you would like a copy of any of these publications or should you have any questions or comments regarding the contents of this report, please do not hesitate to contact me at 714-863-0988.

Sincerely,
GREGG Drilling, LLC.

Frank Stolfi
HRSC Division Manager, Gregg Drilling, LLC.

Cone Penetration Test Sounding Summary

Cone Penetration Testing Procedure (CPT)

Gregg Drilling carries out all Cone Penetration Tests (CPT) using an integrated electronic cone system, *Figure CPT*.

The cone takes measurements of tip resistance (q_c), sleeve resistance (f_s), and penetration pore water pressure (u_2). Measurements are taken at either 2.5 or 5 cm intervals during penetration to provide a nearly continuous profile. CPT data reduction and basic interpretation is performed in real time facilitating on-site decision making. The CPT parameters are stored electronically for further analysis and reference. All CPT soundings are performed in accordance with revised ASTM standards (D 5778-12).

The 5mm thick porous plastic filter element is located directly behind the cone tip in the u_2 location. A new saturated filter element is used on each sounding to measure both penetration pore pressures as well as measurements during a dissipation test (*PPDT*). Prior to each test, the filter element is fully saturated with oil under vacuum pressure to improve accuracy.

When the sounding is completed, the test hole is backfilled according to client specifications. If grouting is used, the procedure generally consists of pushing a hollow tremie pipe with a "knock out" plug to the termination depth of the CPT hole. Grout is then pumped under pressure as the tremie pipe is pulled from the hole. Disruption or further contamination to the site is therefore minimized.

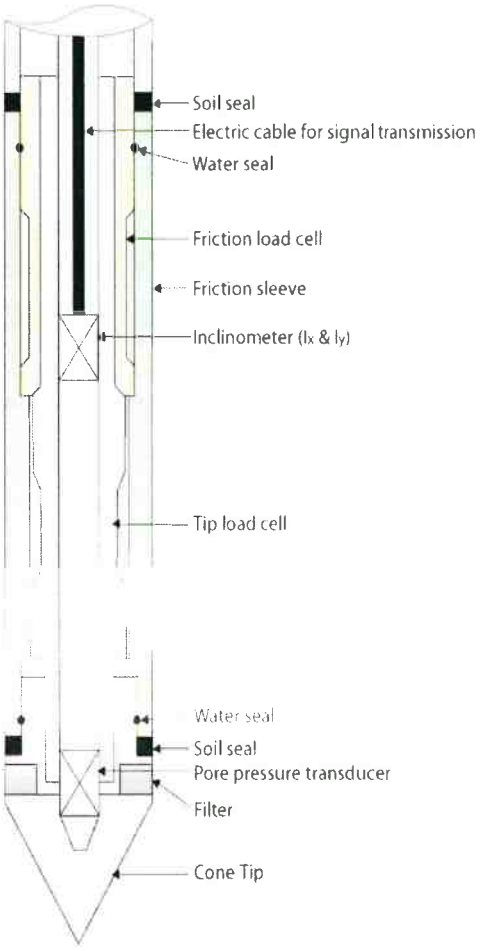

Figure CPT

Gregg 15cm^2 Standard Cone Specifications

Dimensions	
Cone base area	15 cm^2
Sleeve surface area	225 cm^2
Cone net area ratio	0.85
Specifications	
Cone load cell	
Full scale range	180 kN (20 tons)
Overload capacity	150%
Full scale tip stress	120 MPa (1,200 tsf)
Repeatability	120 kPa (1.2 tsf)
Sleeve load cell	
Full scale range	31 kN (3.5 tons)
Overload capacity	150%
Full scale sleeve stress	1,400 kPa (15 tsf)
Repeatability	1.4 kPa (0.015 tsf)
Pore pressure transducer	
Full scale range	7,000 kPa (1,000 psi)
Overload capacity	150%
Repeatability	7 kPa (1 psi)

Note: The repeatability on site will depend somewhat on ground conditions, abrasion, maintenance and zero load stability.

Cone Penetration Test Data & Interpretation

The Cone Penetration Test (CPT) data collected are presented in graphical and electronic form in the report. The plots include interpreted Soil Behavior Type (SBT) based on the charts described by Robertson (2009 & 2010). Typical plots display SBT based on the non-normalized charts of Robertson (2010). For CPT soundings deeper than 30m, we recommend the use of the normalized charts of Robertson (2009) which can be displayed as SBTn, upon request. The report can also include spreadsheet output of computer calculations of basic interpretation in terms of SBT and SBTn and various geotechnical parameters using current published correlations based on the comprehensive review by Lunne, Robertson and Powell (1997), as well as recent updates by Robertson and Cabal (Guide to Cone Penetration Testing, 2015). The interpretations are presented only as a guide for geotechnical use and should be carefully reviewed. Gregg Drilling does not warranty the correctness or the applicability of any of the geotechnical parameters interpreted by the software and does not assume any liability for use of the results in any design or review. The user should be fully aware of the techniques and limitations of any method used in the software. Some interpretation methods require input of the groundwater level to calculate vertical effective stress. An estimate of the in-situ groundwater level has been made based on field observations and/or CPT results, but should be verified by the user.

A summary of locations and depths is available in Table 1. Note that all penetration depths referenced in the data are with respect to the existing ground surface. Note that it is not always possible to clearly identify a soil type based solely on q_t, f_s, and u_2. In these situations, experience, judgment, and an assessment of the pore pressure dissipation data should be used to infer the correct soil behavior type.

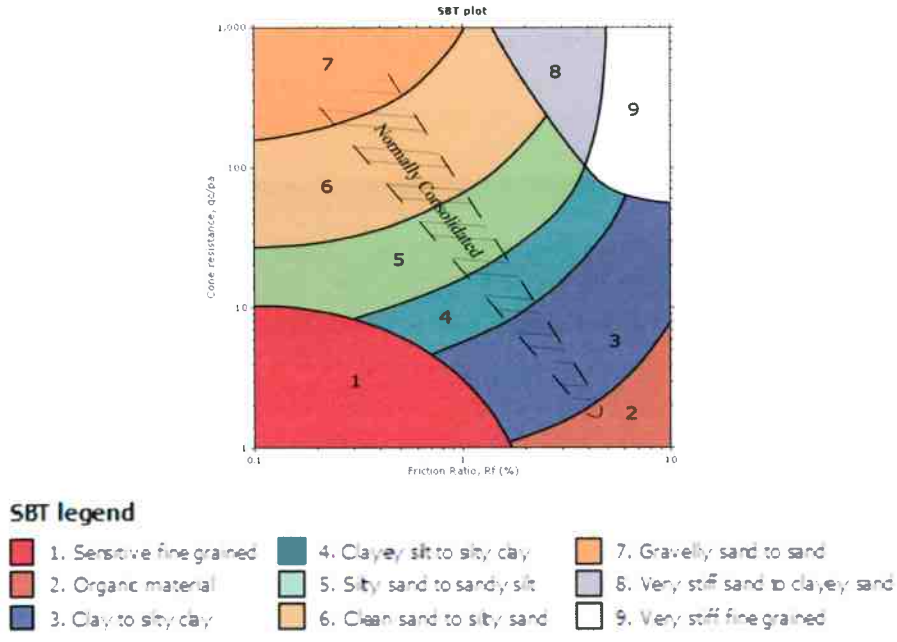

Figure SBT (After Robertson, 2010) – Note: Colors may vary slightly compared to plots

Cone Penetration Test (CPT) Interpretation

Gregg uses a commercial CPT interpretation and plotting software (CPeT-IT https://geologismiki.gr/products/cpet-it/). The software takes the CPT data and performs basic interpretation in terms of soil behavior type (SBT) and various geotechnical parameters using current published empirical correlations based on the comprehensive review by Lunne, Robertson and Powell (1997) and updated by Robertson and Cabal (2015). The interpretation is presented in tabular format. The interpretations are presented only as a guide for geotechnical use and should be carefully reviewed. Gregg does not warranty the correctness or the applicability of any of the geotechnical parameters interpreted by the software and does not assume any liability for any use of the results in any design or review. The user should be fully aware of the techniques and limitations of any method used in the software.

The following provides a summary of the methods used for the interpretation. Many of the empirical correlations to estimate geotechnical parameters have constants that have a range of values depending on soil type, geologic origin and other factors. The software uses 'default' values that have been selected to provide, in general, conservatively low estimates of the various geotechnical parameter.

Presented below is a list of formulas used for the estimation of various soil properties. The formulas are presented in SI unit system and assume that all components are expressed in the same units.

:: Unit Weight, g (kN/m³) ::

$$g = g_w \left[0.27 \log(R_f) - 0.36 \log\left(\frac{q_t}{p_a}\right) - 1.236 \right]$$

where g_w = water unit weight

:: Permeability, k (m/s) ::

$I_c \leq 3.27$ and $I_c > 1.00$ then $k = 10^{0.952 - 3.04 I_c}$

$I_c \geq 4.00$ and $I_c > 3.27$ then $k = 10^{-4.52 - 1.37 I_c}$

:: N_{SPT} (blows per 30 cm) ::

$$N_{60} = \left(\frac{q_c}{p_a}\right) \frac{1}{10^{1.1268 - 0.2817 I_c}}$$

$$N_{1(60)} = Q_{tn} \frac{1}{10^{1.1268 - 0.2817 I_c}}$$

:: Young's Modulus, Es (MPa) ::

$(q_t - \sigma_{vo})\ 0.015\ 10^{0.55 I_c + 1.68}$

(applicable only to $I_c < I_{c(cut\text{-}off)}$)

:: Relative Density, Dr (%) ::

$100 \sqrt{\frac{Q_{tn}}{k_{DR}}}$ (applicable only to SBT: 5, 6, 7 and 8 or $I_c > I_{c(cut\text{-}off)}$)

:: State Parameter, ψ ::

$\psi = 0.56 - 0.33 \log(Q_{tn,cs})$

:: Drained Friction Angle, φ (°) ::

$\phi = \phi_{cv} + 15.94 \log(Q_{tn,cs}) - 26.88$

(applicable only to SBT: 5, 6, 7 and 8 or $I_c < I_{c(cut\text{-}off)}$)

:: 1-D constrained modulus, M (MPa) ::

If $I_c > 2.20$
$\alpha = 14$ for $Q_{tn} > 14$
$\alpha = Q_{tn}$ for $Q_{tn} \leq 14$
$M_{(1-D)} = \alpha \cdot (q_t - \sigma_v)$

If $I_c \geq 2.20$

$M_{(1-D)} = 0.03\ (q_t - \sigma_v)\ 10^{0.55 I_c + 1.68}$

:: Small strain shear Modulus, Go (MPa) ::

$G_0 = (q_t - \sigma_v)\ 0.0188\ 10^{0.55 I_c + 1.68}$

:: Shear Wave Velocity, Vs (m/s) ::

$$V_s = \left[\frac{G_0}{\rho}\right]^{0.50}$$

:: Undrained peak shear strength, Su (kPa) ::

$N_{kt} = 10.50 + 7 \log(F_r)$ or user defined

$$S_u = \frac{(q_t - \sigma_v)}{N_{kt}}$$

(applicable only to SBT: 1, 2, 3, 4 and 9 or $I_c > I_{c(cut\text{-}off)}$)

:: Remolded undrained shear strength, Su(rem) (kPa) ::

$S_{u(rem)} = f_s$ (applicable only to SBT: 1, 2, 3, 4 and 9 or $I_c > I_{c(cut\text{-}off)}$)

:: Overconsolidation Ratio, OCR ::

$k_{OCR} = \frac{Q_{tn}}{[0.25\ (10.50 + 7 \log(F_r))]}$ or user defined

$OCR = k_{OCR} Q_{tn}$

(applicable only to SBT: 1, 2, 3, 4 and 9 or $I_c > I_{c(cut\text{-}off)}$)

:: In situ Stress Ratio, Ko ::

$K_o = (1 - \sin\phi')\ OCR^{\sin\phi'}$

(applicable only to SBT: 1, 2, 3, 4 and 9 or $I_c > I_{c(cut\text{-}off)}$)

:: Soil Sensitivity, S_t ::

$$S_t = \frac{N_k}{F_r}$$

(applicable only to SBT: 1, 2, 3, 4 and 9 or $I_c > I_{c(cut\text{-}off)}$)

:: Peak Friction Angle, φ (°) ::

$\phi = 29.5^\circ\ B_q^{0.121}\ (0.256 + 0.336\ B_q + \log Q_t)$

(applicable for $0.10 < B_q < 1.00$)

PORE PRESSURE DISSIPATION

Pore Pressure Dissipation Tests (PPDT

Pore Pressure Dissipation Tests (PPDT's) conducted at various intervals can be used to measure equilibrium water pressure (at the time of the CPT). If conditions are hydrostatic, the equilibrium water pressure can be used to determine the approximate depth of the ground water table. A PPDT is conducted when penetration is halted at specific intervals determined by the field representative. The variation of the penetration pore pressure *(u)* with time is measured behind the tip of the cone and recorded.

Pore pressure dissipation data can be interpreted to provide estimates of:

- Equilibrium piezometric pressure
- Phreatic Surface
- In-situ horizontal coefficient of consolidation (c_h)
- In-situ horizontal coefficient of permeability (k_h)

In order to correctly interpret the equilibrium piezometric pressure and/or the phreatic surface, the pore pressure must be monitored until it reaches equilibrium, *Figure PPDT*. This time is commonly referred to as t_{100}, the point at which 100% of the excess pore pressure has dissipated.

A complete reference on pore pressure dissipation tests is presented by Robertson et al. 1992 and Lunne et al. 1997.

A summary of the pore pressure dissipation tests is summarized in Table 1.

SEISMIC DATA

Seismic Cone Penetration Testing (SCPT)

Seismic Cone Penetration Testing (SCPT) can be conducted at various intervals during the Cone Penetration Test. Shear wave velocity (Vs) can then be calculated over a specified interval with depth. A small interval for seismic testing, such as 1-1.5m (3-5ft) allows for a detailed look at the shear wave profile with depth. Conversely, a larger interval such as 3-6m (10-20ft) allows for a more average shear wave velocity to be calculated. Gregg's cones have a horizontally active geophone located 0.2m (0.66ft) behind the tip.

To conduct the seismic shear wave test, the penetration of the cone is stopped and the rods are decoupled from the rig. An automatic hammer is triggered to send a shear wave into the soil. The distance from the source to the cone is calculated knowing the total depth of the cone and the horizontal offset distance between the source and the cone. To calculate an interval velocity, a minimum of two tests must be performed at two different depths. The arrival times between the two wave traces are compared to obtain the difference in time (Δt). The difference in depth is calculated (Δd) and velocity can be determined using the simple equation: $v = \Delta d/\Delta t$

Multiple wave traces can be recorded at the same depth to improve quality of the data.

A complete reference on seismic cone penetration tests is presented by Robertson et al. 1986 and Lunne et al. 1997.

A summary the shear wave velocities, arrival times and wave traces are provided with the report.

ENVIRONMENTAL PROFESSIONAL STATEMENT

I declare that, to the best of my professional knowledge and belief, I meet the definition of Environmental Professional as established in Part 312.10 of Title 40 of the Code of Federal Regulations (40 CFR 312.10) and I have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the Subject Property. I have developed and performed all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR 312.

Name Scott Allin, R.E.P.A.
Title Principal Environmental Scientist

EXECUTIVE SUMMARY

Farallon Consulting, L.L.C. (Farallon) has prepared this Phase I Environmental Site Assessment (ESA) Report for the 6756 and 6792 Central Avenue property in Newark, California (herein referred to as the Subject Property). The Phase I ESA was conducted by Laura Mosqueda and was reviewed and approved by Scott Allin. The Phase I ESA Report was prepared for Prologis, L.P. and its subsidiaries, affiliates, related parties (specifically including any 1031 exchange entities), successors, and assigns ("Prologis") (User) in general conformance with the scope and limitations of the following: 1) ASTM International Standard E1527-21, Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process (ASTM E1527-21) (and any and all subsequent amendments thereto); 2) the U.S. Environmental Protection Agency standards for All Appropriate Inquiries; and 3) the Master Services Agreement between Prologis and Farallon dated August 4, 2011, revised December 27, 2022 (Authorization). There were no deviations from ASTM E1527-21 during this Phase I ESA.

The Subject Property consists of Alameda County Parcel Nos. 92A-2165-14 (2.03 acres), 92A-2165-15 (8.18 acres), 92A-2165-16 (2.79 acres), and 92A-2165-17 (4.23 acres), which total approximately 17.23 acres of land according to the Alameda County Assessor. The northwestern portion of the Subject Property is developed with a rectangular industrial building completed in the early 1980s using the address 6792 Central Avenue. The remainder of the Subject Property consists of vegetated yard areas, former building concrete foundations, and crushed concrete and soil piles from former building demolition activities. Access to the Site is gained from Central Avenue, west of the Subject Property. At the time of the site reconnaissance, the Subject Property was vacant with minor hazardous material storage.

Historically, the Subject Property was undeveloped land until developed with various commercial-industrial buildings between 1954 and 1987. The buildings were occupied for various commercial-industrial occupants prior to demolition between 2000 and 2023.

Two 1,000-gallon underground storage tanks (USTs) containing bunker fuel and gasoline, respectively, and one 20,000-gallon diesel aboveground storage tank (AST) and associated fuel islands and piping were removed from the Subject Property between 1991 and 1993. A soil and groundwater investigation was conducted in September 1999 to determine the

extent of petroleum hydrocarbon contamination from the 20,000-gallon diesel AST and to assess the 1,000-gallon gasoline UST area. Based on the results of the investigation, an excavation was conducted north of the former AST in June 2000 and approximately 311 tons of soil and 2,300 gallons of groundwater were removed from the Site. Confirmation samples collected at the conclusion of the excavation did not contain detectable concentrations of petroleum hydrocarbons, and the tanks were issued case closure in 2000. The former ASTs and USTs at the Site that have received regulatory closure represent a historical recognized environmental condition in connection with the Subject Property.

The Subject Property was historically used by tenants for industrial purposes, and numerous previous environmental studies were performed that suggested chemical releases had occurred at the Subject Property. The potential for surrounding property use to have contributed to the residual chemical impact to groundwater beneath the Subject Property was also identified. The Subject Property owner is currently pursuing regulatory closure under the oversight of the Alameda County Water District. Based on Farallon's review of previous environmental studies, releases related to historical use of the Subject Property represent a recognized environmental condition in connection with the Subject Property. Available information suggests the releases will be issued regulatory closure in the near future, at which time the releases will represent a controlled recognized environmental condition in connection with the Subject Property that will require future management during subsurface improvements.

Adjoining properties at the time of the site reconnaissance included Mission Linen and Uniform Service to the northeast; a railroad spur, beyond which was Pabco Gypsum (a gypsum wallboard manufacturer since the early 1970s) to the east; a railroad track, beyond which was Cargill/Morton Salt Company to the south; and Central Avenue, beyond which were Mattheson Tri-Gas, HB Fuller, and multiple commercial and light industrial facilities to the west.

The Environmental Risk Information Services (ERIS) *Database Report* dated April 5, 2024, prepared for the Subject Property (ERIS Report), identified the Subject Property and numerous adjoining properties in several databases. Previous environmental studies were performed on the Subject Property to investigate these listings.

During the site reconnaissance, Farallon observed de minimis petroleum staining throughout the Subject Property that appeared to be from parked vehicles on the Subject

Property. De minimis staining was also observed proximate to a hydraulic oil drum on the southeastern portion of the Subject Property.

Based on review of the Subject Property history, interviews with persons knowledgeable about the Subject Property, reconnaissance of the Subject Property, and review of the ERIS Report, this Phase I ESA identified the following recognized environmental condition in connection with the Subject Property:

- The known chemical releases to soil and groundwater from historical use that are currently being evaluated for regulatory closure.

1.0 INTRODUCTION

Farallon Consulting, L.L.C. (Farallon) has prepared this Phase I Environmental Site Assessment (ESA) Report for the property at 6756 and 6792 Central Avenue in Newark, California (herein referred to as the Subject Property) (Figure 1). This section discusses the project authorization and scope of work, the qualifications of the Environmental Professional who conducted and reviewed the Phase I ESA work, the project purpose and objective, the shelf life of records per the All Appropriate Inquiries (AAI) Final Rule established in Part 312.10 of Title 40 of the Code of Federal Regulations (40 CFR 312.10), deviations, and data gaps.

1.1 PROJECT AUTHORIZATION AND SCOPE OF WORK

This Phase I ESA Report was prepared for Prologis, L.P., and its subsidiaries, affiliates, related parties (specifically including any 1031 exchange entities), successors, and assigns ("Prologis") (Client and User) in accordance with the Proposal for Phase I Environmental Site Assessment, 6756 and 6792 Central Avenue, Newark, California dated April 3, 2024, from Scott Allin of Farallon to Gavin Polite Fisco of Prologis; and the Master Services Agreement between Prologis and Farallon dated August 4, 2011, revised December 27, 2022 (Authorization). The scope of work for this Phase I ESA included a records review, literature research and review, a site reconnaissance, interviews with individuals familiar with the Subject Property, interviews with local governmental officials, and preparation of this report. The scope of work is consistent with ASTM International Standard E1527-21, *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* (ASTM E1527-21).

1.2 PROFESSIONAL QUALIFICATIONS

The Phase I ESA was conducted by Laura Mosqueda and was reviewed and approved by Scott Allin. Scott Allin has an understanding of surface and subsurface environmental conditions and the processes used to evaluate these conditions, and the ability to develop opinions regarding conditions indicative of a release or a threatened release of hazardous substances and petroleum products. AAI has been performed in conformance with the standards and practices set forth in 40 CFR 312.10. The professional qualifications of the Environmental Professional are provided in Appendix A.

1.3 PROJECT PURPOSE AND OBJECTIVE

The purpose of the Phase I ESA was to identify, as practicable, recognized environmental conditions at the Subject Property and within the appropriate study area that have caused and/or may cause an adverse environmental impact. ASTM E1527-21 is intended to permit a user to satisfy one of the requirements to qualify for protection from potential liability under the Comprehensive Environmental Response, Compensation, and Liability Act as the innocent landowner, contiguous property owner, or bona fide prospective purchaser. ASTM E1527-21 constitutes "all appropriate inquiry" into the previous ownership, uses, and environmental conditions of a property consistent with good commercial or customary practice, as defined in Section 9601(35)(B) of Title 42 of the U.S. Code.

The objective of the Phase I ESA was to perform an appropriate inquiry into past and present ownership and uses of the Subject Property, consistent with good commercial and/or customary practice. This Phase I ESA Report is to be used as a risk management tool to meet AAI Final Rule requirements and the Comprehensive Environmental Response, Compensation, and Liability Act liability defense. The Phase I ESA does not guarantee that there are no impacts to the Subject Property.

For the purpose of this Phase I ESA Report, the term "recognized environmental condition" is defined as (1) the presence of hazardous substances or petroleum products in, on, or at the Subject Property due to a release to the environment; (2) the likely presence of hazardous substances or petroleum products in, on, or at the Subject Property due to a release or likely release to the environment; or (3) the presence of hazardous substances or petroleum products in, on, or at the Subject Property under conditions that pose a material threat of a future release to the environment. A de minimis condition is not a recognized environmental condition.

The term "controlled recognized environmental condition" is defined as a recognized environmental condition affecting the Subject Property that has been addressed to the satisfaction of the applicable regulatory authority or authorities, with hazardous substances or petroleum products allowed to remain in-place subject to implementation of required controls.

The term "historical recognized environmental condition" is defined as a previous release of hazardous substances or petroleum products affecting the Subject Property that has been

addressed to the satisfaction of the applicable regulatory authority or authorities and meeting unrestricted use criteria established by the applicable regulatory authority or authorities without subjecting the Subject Property to any controls (e.g., activity and use limitations or other property use limitations). A historical recognized environmental condition is not a recognized environmental condition.

1.4 SHELF LIFE OF ALL APPROPRIATE INQUIRIES RECORDS

The AAI Final Rule prepared by the U.S. Environmental Protection Agency (EPA)[1] specifies that AAI must be conducted within 1 year prior to the date of acquisition of the Subject Property. EPA has defined the date of acquisition as the date a person acquires title to the property. To ensure full coverage under the AAI Final Rule, a valid Phase I ESA Report must be completed within 1 year prior to the date of acquisition of title.

The following Phase I ESA Report components and supporting information sources must be updated if they were completed more than 6 months (180 days) prior to acquisition of title. The Phase I ESA components with a 180-day shelf life consist of:

- Site reconnaissance;
- Site interview(s);
- User-provided information;
- Review of government regulatory records; and
- Declaration/signature of certifying Environmental Professional.

The date on the cover of this Phase I ESA Report is the production date of the written report. The dates various components of this Phase I ESA were completed are as follows:

- Site reconnaissance: April 12, 2024.
- Subject Property interview: April 24, 2023.
- User-provided information: April 3, 2024.
- Review of government regulatory records: April 5, 2024.
- Declaration/signature of certifying Environmental Professional: April 30, 2024.

[1] Part 312 of Subchapter J of Chapter I of Title 40 of the Code of Federal Regulations.

1.5 DEVIATIONS

There were no deviations from ASTM E1527-21 during this Phase I ESA.

1.6 DATA GAPS

Data gaps may affect the ability to identify recognized environmental conditions and Farallon's ability to render opinions and conclusions for presentation in the Phase I ESA Report. Farallon did not identify significant data gaps during this Phase I ESA.

2.0 SUBJECT PROPERTY OVERVIEW

This section presents the Subject Property location, description, and operations. A description of adjoining and surrounding land use is also provided.

2.1 SUBJECT PROPERTY LOCATION

The Subject Property is east of the intersection of Central Avenue and Sycamore Street, at 6756 and 6792 Central Avenue in Newark, Alameda County, California. The Subject Property is in a commercial and industrial area approximately 1 mile south of downtown Newark. The nearest residential community is located approximately 0.20 miles north of the Subject Property. The Subject Property vicinity is shown on Figure 1.

2.2 SUBJECT PROPERTY DESCRIPTION

The Subject Property consists of Alameda County Parcel Nos. 92A-2165-14 (2.03 acres), 92A-2165-15 (8.18 acres), 92A-2165-16 (2.79 acres), and 92A-2165-17 (4.23 acres), which total approximately 17.23 acres of land according to the Alameda County Assessor. The northwestern portion of the Subject Property is developed with a rectangular industrial building completed in the early 1980s using the address 6792 Central Avenue. The remainder of the Subject Property consists of vegetated yard areas, former building and tank concrete foundations, and crushed concrete and soil piles from former building demolition activities. Access to the Subject Property is gained from Central Avenue, west of the Subject Property.

Figure 2 presents a plan map of the Subject Property. Additional details pertaining to the Subject Property are provided in Section 4.5, Previous Environmental Studies, and Section 9, Site Reconnaissance. Subject Property photographs are presented in Appendix B.

2.3 SUBJECT PROPERTY OPERATIONS

At the time of the site reconnaissance, the Subject Property building was vacant. The most recent tenants at the Subject Property and their operations are identified below:

- **6756 Central Avenue:** Former buildings on the north-central and northeastern portions of the Subject Property were previously occupied by Auto Expo, Bay Area Grinding, Set Right Tile, Tri-City Marble, Gonzalez Pools, and other tenants for office, showroom, and equipment storage.

- **6792 Central Avenue:** The large industrial building at 6792 Central Avenue and the western portion of the Subject Property were previously occupied by Trench Plate Rental Company for its facility operations, offices, and storage yard.
- **Southern Portion of Subject Property**: The southern portion of the Subject Property was previously occupied by Vision Recycling for landscaping and mulch-recycling operations.
- **Southernmost Building**: The southernmost building was previously occupied by All Good Pallets.

The above tenants vacated the Subject Property between 2020 and 2023 in preparation for commercial redevelopment.

2.4 ADJOINING AND SURROUNDING LAND USE

Adjoining properties at the time of the site reconnaissance included Mission Linen and Uniform Service to the northeast; a railroad spur, beyond which was Pabco Gypsum (a gypsum wallboard manufacturer since the early 1970s) to the east; a railroad track, beyond which was Cargill/Morton Salt Company to the south; and Central Avenue, beyond which were Matheson Tri-Gas, HB Fuller, and multiple commercial and light industrial facilities to the west.

Observations were restricted to areas readily observable from the Subject Property and to public rights-of-way. No evidence of recognized environmental conditions was observed on abutting or nearby properties during the site reconnaissance.

3.0 PHYSICAL SETTING

The topography, geology, and hydrogeology of the Subject Property are described in this section. Farallon's assessment of sensitive receptors in the area is also discussed. Farallon reviewed the following physical setting sources as part of this Phase I ESA:

- U.S. Geological Survey (USGS) topographic map of Newark, California dated 2021.
- The Environmental Risk Information Services (ERIS) *Physical Setting Report* dated April 5, 2024, prepared for the Subject Property (ERIS PSR); and/or
- Documentation of previous environmental studies referenced in Section 4.5, Previous Environmental Studies, and/or documents cited in Section 7, Records Review.

3.1 TOPOGRAPHY

Farallon reviewed the USGS topographic maps for the Subject Property area provided by ERIS. The maps depict the Subject Property at an elevation of approximately 19 feet above mean sea level. Subject Property topography is relatively flat. Regional topography is generally flat, with a slight slope down to the south toward the San Francisco Bay.

3.2 GEOLOGY AND HYDROGEOLOGY

According to the ERIS Physical Setting Report prepared for the Subject Property dated February 28, 2019 (ERIS PSR), surface soil at the Subject Property consists primarily of Pescadero clay loam, which is poorly drained and water movement through soil is restricted. Soils were mapped as Quaternary alluvium and marine deposits.

The Subject Property is located along the southeastern coast of the San Francisco Bay of California, the main water body in Newark. The Subject Property is characterized by Quaternary alluvium and marine deposits. These are composed of sequences of interbedded silts, sands, and clays to depths over 200 feet below grade surface. Alluvial deposits range in age from Pliocene to Holocene.

Shallow groundwater flow direction typically can be estimated by examination of surface topography or by nearby surface water bodies. Based on the topography of the Subject Property and its vicinity, groundwater is expected to flow generally to the south toward the San Francisco Bay. During Farallon's 2019 subsurface investigation of the Subject Property,

groundwater was encountered at depths of 11.0 to 13.0 feet below ground surface. Based on previous groundwater monitoring events, the groundwater flow direction is toward the southwest with a gradient of 0.001 to 0.004 foot per foot.

3.3 OIL AND GAS RECORDS

According to the California Department of Conservation, Division of Oil, Gas, and Geothermal Resources Well Finder online database, there are no permitted oil or gas wells on the Subject Property or adjoining properties.

3.4 SENSITIVE RECEPTORS

Sensitive receptors are areas such as hospitals, schools, day care facilities, and elderly housing or convalescent facilities where occupants are more susceptible to the adverse effects of exposure to toxic chemicals, pesticides, and other pollutants. Extra care must be taken when dealing with contaminants and pollutants proximate to areas recognized as sensitive receptors. Farallon's limited assessment for sensitive receptors on or adjoining the Subject Property consisted of a review of properties where occupants are more susceptible to adverse effects of exposure to toxic chemicals, pesticides, and other pollutants; observation of apparent features such as surface water bodies (e.g., low-lying wet areas, streams, ponds) and residential and recreational areas; and review of readily ascertainable information relating to the presence of private, semiprivate, public, and industrial water-supply wells on or in the vicinity of the Subject Property.

No sensitive receptors were identified on or adjoining the Subject Property at the time of the site reconnaissance. According to the 2019 ERIS PSR, the Subject Property is in an area of minimal flood hazard. The nearest federally designated wetlands were identified approximately 100 feet south of the Subject Property. Two public water supply wells were identified within 1 mile of the Subject Property, one approximately 0.6 miles northeast and one approximately 0.7 miles south of the Subject Property. The water bodies nearest the Subject Property were identified as Plummer Creek approximately 0.25 mile west and the San Francisco Bay approximately 2.5 miles south of the Subject Property.

4.0 USER-PROVIDED INFORMATION

Farallon understands that the User of this report is seeking to follow the standards set forth in ASTM E1527-21 to complete an environmental assessment of the Subject Property. The User has specific responsibilities for fulfilling ASTM E1527-21 requirements to help identify the possibility of recognized environmental conditions in connection with the Subject Property. These responsibilities do not require the technical expertise of an Environmental Professional, and were not performed by Farallon.

To facilitate fulfillment of the ASTM E1527-21 requirements identified below, Farallon provided the User with a copy of the *Phase I Environmental Site Assessment User Questionnaire* (User Questionnaire) to complete. Information from the completed User Questionnaire is summarized below in Sections 4.1 through 4.3. The completed User Questionnaire is provided in Appendix C of this Phase I ESA Report.

4.1 TITLE AND LIEN RECORDS

The User was not aware of environmental liens against the Subject Property.

4.2 EXPERIENCE AND SPECIALIZED KNOWLEDGE

The User has no experience or specialized knowledge regarding the Subject Property.

4.3 COMMONLY KNOWN INFORMATION

The User is not aware of commonly known information that would lead to identification of recognized environmental conditions in connection with the Subject Property.

4.4 PHASE I ENVIRONMENTAL SITE ASSESSMENT REPORT USERS

The User will rely on this Phase I ESA Report.

4.5 PREVIOUS ENVIRONMENTAL STUDIES

Farallon was provided with and prepared numerous environmental reports and letters associated with the Subject Property. These documents consist of previous environmental due diligence and subsurface investigations to evaluate historical use of the Subject Property. The Subject Property is currently under a voluntary cleanup agreement with the Alameda County Water District (ACWD) related to limited chemical releases, and is pursuing a regulatory case closure from the regulatory agency. The following primary previous

environmental studies were reviewed during this Phase I ESA and summarize historical conditions and the current regulatory status of those conditions. Text, figures, and tables from select documents are included in Appendix D as referenced.

- The letter regarding Recommendation for Spills, Leaks, Investigation and Cleanup Case Closure of Bay Mirror, 6756 Central Avenue, Newark (Site #20) dated September 14, 2000, from Paul Piraino of the Alameda County Water District (ACWD) to Dr. Lawrence P. Kolb of the California Regional Water Quality Control Board, San Francisco Region (Regional Board) (2000 NFA Letter);
- *Phase II Subsurface Investigation of Bay Mirror, Incorporated, 6792 Central Avenue, Newark, California dated May 8, 2001*, prepared by GaiaTech, Inc. (2001 Phase II Report);
- The letter regarding Confirmation Soil and Groundwater Investigation Report, Former Arch Mirror West Site, 6792 Central Avenue, Newark, California dated November 19, 2007, from Gary R. Mulkey of Compliance & Closure, Inc. to Doug Young of ACWD (2007 Investigation Letter);
- The draft letter regarding ASTM Phase I Environmental Site Assessment, 6756 and 6792 Central Avenue, Newark, California dated October 29, 2012, from Josephine Kimura and Kit Soo and Voytek Bajsarowicz of Haley & Aldrich, Inc. to John W. Greer of Trammell Crow Company (2012 Phase I Report);
- *Phase I Environmental Site Assessment Report, 6756 and 6782 Central Avenue, Newark, California* dated June 12, 2019, prepared by Farallon (2019 Phase I Report);
- The letter regarding Comprehensive Phase II Environmental Site Assessment Findings, 6756 and 6782 Central Avenue, Newark, California dated June 12, 2019, from Gavin Polite Fisco and Scott Allin of Farallon to Jeffrey Dack of Ice Miller (2019 Phase II Report);
- Letter Regarding Data Gap Investigation and Request for Site Closure, 6756 and 6782 Central Avenue, Newark, California dated September 13, 2023, from Scott Allin and Peter Sims of Farallon to Ava Lazor of Alameda County Water District (2023 Data Gap Investigation); and

- *Media Management Plan, 6756 and 6792 Central Avenue, Newark, California*, prepared by Farallon dated December 28, 2023 (2023 Media Management Plan).

According to the 2000 NFA Letter, two 1,000-gallon underground storage tanks (USTs) containing bunker fuel and gasoline, respectively, and one 20,000-gallon diesel aboveground storage tank (AST) and associated fuel islands and piping were removed from the Subject Property between 1991 and 1993. A soil and groundwater investigation was conducted in September 1999 to determine the extent of petroleum hydrocarbon contamination from the 20,000-gallon diesel AST and to assess the 1,000-gallon gasoline UST area. Based on the results of the investigation, an excavation was conducted north of the former AST in June 2000 and approximately 311 tons of soil and 2,300 gallons of groundwater were removed from the Subject Property. Confirmation samples collected at the conclusion of the excavation did not contain detectable concentrations of petroleum hydrocarbons. The former AST and USTs at the Subject Property that have received regulatory closure represent a historical recognized environmental condition in connection with the Subject Property. The 2000 NFA Letter is provided in Appendix D.

GaiaTech, Inc. conducted a Phase I ESA for 6792 Central Avenue in 2001. Following the Phase I ESA, GaiaTech, Inc. recommended a soil and groundwater investigation be conducted to investigate several potential environmental concerns identified, including the presence of a paint room and associated sumps, a chemical storage area, a debris storage area, and the potential for off-site properties to impact the Subject Property. The 2001 Phase II Report detailed the soil and groundwater investigation performed in 2001. Arsenic and chromium were detected at elevated concentrations; however, the 2001 Phase II Report concluded that the concentrations were within regional background concentrations.

The 2007 Investigation Letter detailed a soil and groundwater investigation conducted at 6792 Central Avenue to determine the extent of contamination associated with the unauthorized removal of a silver treatment system. Concentrations of volatile organic compounds (VOCs) and dissolved metals were detected in samples collected and analyzed during the investigation; however, the 2007 Investigation Report concluded that the VOC impact likely was associated with regional impacts because no VOC concentrations were detected in soil, and that the metals concentrations detected in soil were unlikely to mobilize, were of low solubility, and did not pose a threat to the surrounding area.

The 2012 Phase I Report identified several recognized environmental conditions that had the potential to impact soil and groundwater at the Subject Property, including: current and former industrial operations, metals impact to soil and groundwater, the presence of an unknown AST, chlorinated solvent and petroleum hydrocarbon impacts to groundwater at adjoining facilities, and the former presence of USTs and an AST at the Subject Property. The 2012 Phase I Report recommended a soil and groundwater investigation be conducted at the Subject Property to assess the potential impacts to soil and groundwater.

The 2019 Phase I Report identified the Subject Property occupied by numerous commercial and light industrial tenants, and concluded historical use represented a recognized environmental condition in connection with the Subject Property. At the request of Ice Miller, Farallon performed a Phase II ESA to further assess several potential environmental concerns identified in the 2019 Phase I Report. A copy of the 2019 Phase II Report is included in Appendix D.

The 2019 Phase II ESA included collection of soil and reconnaissance groundwater samples from 25 locations for laboratory analysis. According to the 2019 Phase II Report, releases of total petroleum hydrocarbons as diesel-range organics (DRO) and as oil-range organics (ORO) from historical operations had occurred at several locations throughout the Subject Property. Soil sources for the impact to groundwater were not identified; however, the concentration gradient in groundwater across the Subject Property suggested soil sources exist on the Subject Property. The 2019 Phase II Report also identified the potential for contribution to the identified impact to groundwater by surrounding property releases. Volatile constituents associated with petroleum hydrocarbons were not detected at concentrations exceeding the laboratory reporting limits in groundwater samples.

Between 2020 and 2023, Farallon performed numerous investigations that included installation of eight monitoring wells on the Subject Property and collection of numerous samples over time from the monitoring wells for laboratory analysis, and installation of three temporary monitoring wells on the down-gradient Cargill Salt property to evaluate groundwater quality down-gradient of the Subject Property. The comprehensive findings from these investigations are summarized in the 2023 Data Gap Investigation report, a copy

of which is included in Appendix D. The 2023 Data Gap Investigation report concluded the following:

- The concentrations of constituents of concern in groundwater beneath the Subject Property are less than applicable regulatory standards;
- Shallow groundwater beneath the Subject Property is not considered potable, and no migration pathways to sensitive receptors were identified;
- Residual chemical impact beneath the Subject Property does not pose an unacceptable risk to human health, ecological health, or sensitive receptors, considering current and identifiable future land and water uses; and
- The conceptual site model for the Subject Property meets the criteria for low-threat regulatory closure.

At the request of the ACWD, Farallon prepared the 2023 Media Management Plan to provide procedures for handling known and potential residual chemically impacted media beneath the Subject Property during future improvements. The 2023 Media Management Plan was required by the ACWD in support of regulatory closure. A copy of the 2023 Media Management Plan is included in Appendix D.

At the time of this Phase I ESA Report, the request for case closure for the Subject Property was going through the final review process at the ACWD, and according to the ACWD case manager, the findings from recent investigations are believed to support case closure.

Based on Farallon's review of previous environmental studies, releases related to historical use of the Subject Property represent a recognized environmental condition in connection with the Subject Property. Available information suggests the releases will be issued regulatory closure in the near future, at which time the releases will represent a controlled recognized environmental condition in connection with the Subject Property that will require future management during subsurface improvements.

5.0 SUBJECT PROPERTY AND ADJOINING PROPERTY HISTORY

Farallon reviewed the historical sources listed below as part of this Phase I ESA. The historical sources documented were reasonably ascertainable and practically reviewable during this Phase I ESA. Farallon is not responsible for the accuracy or completeness of the historical sources reviewed.

- Aerial photographs of the Subject Property and its vicinity dated 1928, 1938, 1946, 1954, 1960, 1968, 1974, 1981, 1987, 1993, 2004, 2009, 2010, 2012, 2014, and 2016 obtained from ERIS; and dated 1993, 2002 through 2018, and 2022 obtained from Google Earth;
- Digital Business, Haines, and Street Address Directories of Newark, California dated 1956, 1962, 1969, 1976, 1981, 1985, 1990, 1995, 1996, 1998, 2003, 2008, 2013, and 2018 obtained from ERIS; and
- USGS topographic maps of Newark and Hayward, California dated 1899, 1915, and 1959; and Newark, California dated 1947, 1948, 1959, 1968, 1973, 1980, 1996, 1997, and 2015 obtained from ERIS.

A search for fire insurance maps resulted in notification that there was no coverage for the Subject Property. Copies of historical sources are included in Appendix E.

5.1 SUBJECT PROPERTY

The Subject Property appeared undeveloped from the late 1890s through the 1940s. By 1954, 6756 Central Avenue appeared to be developed with a large industrial building and a small office building on the northwestern portion of the Subject Property. A medium-sized building on the southern portion of the Subject Property was present between 1954 and 1960, and by 1968, a small building on the northeastern portion of the Subject Property was present. The large warehouse at 6792 Central Avenue was developed between 1981 and 1987.

City directory listings for the Subject Property address included Orangeburg MFG Co. in 1962; Flintkote Co. Pipe Products Group in 1969; Bermico Co. in 1976; BHJ Products, Bay Cities Metal Products, Circo Glass, Gale Corp., M and M Pallet Co., Mason Ltd., and Mobile Facilities in 1981; BHJ Driveline, BHJ Products, BHJ Specialty Parts, Bay Cities Metal Products, Bay Mirrors Inc., Bay Temp Safety Glass, Ledawn Construction, M and M Pallet Co., and Mas On Ltd. in 1985; Hill D Trucking, Bay Cities Metal Products, Bay Mirror Inc., and

J and J Pallet Co. in 1990; Hill D Trucking, R H Waste Recyclers, R H Wood Products, Rhema Stairs and Trim, and Western States Glass in 1995 and 1996; Hill D Trucking, R H Waste Recyclers, and R H Wood Products in 1998; D Hill Trucking, Edward S. Bay Area Grinding, R H Wood Products, Tenant Interiors, and Tri-City Marble from 2003 through 2008; All Good Pallets Inc., Edward S. Bay Area Grinding, Remodeling by TCM Inc., Set Right Tile Marble, and Tenant Interiors in 2013; and All Good Pallets Inc., Do It Yourself Granite Countertops, Edward S. Bay Area Grinding, Remodeling by TCM Inc., Tenant Interiors, and Villa Pallets in 2018.

City directory listings for 6792 Central Avenue at the Subject Property included Bay Mirror Inc. from 1995 to 2003 and Trench Plate Rental in 2018.

Additional information regarding the Subject Property history is provided in Section 4.5, Previous Environmental Studies; Section 6.2, County Agencies; and Section 7.1, Subject Property Listings.

5.2 ADJOINING PROPERTIES

Adjoining properties appeared to be undeveloped from the 1890s through the 1930s. In 1946, the south-adjoining property appeared developed with several buildings and man-made ponds. By 1960, all adjoining properties appeared to be improved with commercial and industrial buildings. Between the 1960s and 2000s, additional infill development continued and the adjoining properties appeared similar to the present by 2004.

City directory listings for adjoining properties included Pabco Gypsum, Matheson Tri-Gas, and other commercial and industrial businesses. Additional information regarding adjoining properties is provided in Section 7.2, Adjoining Facility Listings.

6.0 STATE AND LOCAL GOVERNMENT AGENCY INTERVIEWS

The objective of interviews with state and/or local government agencies is to obtain information related to recognized environmental conditions in connection with the Subject Property. The interviews consist of questions asked in person, or by email, telephone, and/or online request for records.

6.1 COUNTY AGENCIES

Farallon contacted ACWD on April 3, 2024 to inquire whether notices of violations and/or reported hazardous spills at the Subject Property were on file, and regarding previous and current ASTs and USTs at the Subject Property. On April 5, 2024, Farallon was provided with the following records from a representative of ACWD: several soil and groundwater investigation work plans and reports; UST and AST removal, over-excavation, and closure documentation, City of Newark administrative citations; and correspondence regarding the Leaking Underground Fuel Tank case. Findings from these records are summarized in Section 4.5, Previous Environmental Studies.

6.2 CITY OF NEWARK

Farallon contacted the City of Newark on April 3, 2024 to inquire whether notices of violations and/or reported hazardous spills at the Subject Property were on file, and regarding previous and current ASTs and USTs at the Subject Property. On April 8, 2024, Farallon was provided with the following records from the City of Newark: several building permits for general improvement; a record for the installation of a 500-gallon propane AST associated with Trench Plate Rental Company; several fire inspection documents from 2012 through 2017, which indicated multiple fire code violations; and two permits for building demolition. These records were reviewed and did not indicate evidence of recognized environmental conditions in connection with the Subject Property.

6.3 HEALTH DEPARTMENT

Farallon contacted the Alameda County Department of Environmental Health (ACDEH) on April 3, 2024 to inquire whether notices of violations and/or reported hazardous spills at the Subject Property were on file, and regarding previous and current ASTs and USTs at the Subject Property. On April 8, 2024, a representative of the ACDEH stated that it had no records of storage tanks, hazardous material storage, or spills associated with the Subject Property. During Farallon's 2019 Phase I ESA, Farallon was provided with the following

records from the ACDEH: hazardous materials business plans, facility inspection records, hazardous material inspection records, historical photographs, tiered permit documents pertaining to treatment system discharge, and violations that have since been closed. These records were reviewed and did not indicate evidence of recognized environmental conditions in connection with the Subject Property.

6.4 FIRE DEPARTMENT

Farallon contacted the Newark Fire Department on April 3, 2024 to inquire whether notices of violations and/or reported hazardous spills at the Subject Property were on file, and regarding previous and current ASTs and USTs at the Subject Property. No response was received prior to completion of this Phase I ESA Report. During Farallon's 2019 Phase I ESA, the Newark Fire Department referred the request to the City of Newark. Based on the volume of information obtained from other regulatory agencies and previous environmental studies, records from the Newark Fire Department are not anticipated to affect the conclusions of this report.

7.0 RECORDS REVIEW

ERIS conducted a review of environmental regulatory agency database listings to identify reported environmental issues related to the Subject Property and facilities in the Subject Property vicinity. Pertinent regulatory files and/or records associated with the listings were reviewed by Farallon. Farallon used the greater of each approximate minimum search distance from the Subject Property for each of the referenced federal and state environmental databases, as specified in ASTM E1527-21.

Farallon reviewed the ERIS *Database Report* dated April 5, 2024, prepared for the Subject Property (2024 ERIS Report), to note reported facilities in the vicinity of the Subject Property that were considered to have a potential to adversely impact the Subject Property (i.e., are known to have resulted in or are expected to result in a recognized environmental condition). Reported facilities were evaluated with respect to the nature and extent of a given release, the distance of the reported facility from the Subject Property, the geology of the area, and the topographic position of a reported facility with respect to known or expected local and/or regional groundwater flow direction.

The complete database names for the abbreviations used in this Phase I ESA Report, the descriptions of the databases searched, and the associated search distances from the Subject Property are provided in the 2024 ERIS Report presented in Appendix F.

7.1 SUBJECT PROPERTY LISTINGS

The 2024 ERIS Report, and findings from the 2019 Phase I ESA Report, identified the following listings for the Subject Property at the addresses shown:

- **6756 Central Avenue,** located on the Subject Property, was identified in the CERS HAZ, EMISSIONS, FINDS/FRS, CLEANUP SITES, HHSS, HIST MANIFEST, HIST TANK, HAZNET, RCRA NON GEN, RCRA SQG, C&D DEBRIS RECY, TRIS, HAZ GEN, UST SWEEPS, CONT ALAMEDA, and SWF/LF databases. According to the ERIS Report, the Subject Property was listed for violations associated with hazardous material business plan preparation, updates, and submittal; and hazardous material handling and storage for multiple tenants between 2013 and 2018. Violations were generally administrative in nature and corrective actions were completed within a reasonable time frame. A leak was reported by Bay Mirror, Inc. related to Stoddard solvent, mineral spirits, and distillates that affected soil in 1985, and remedial activities were

conducted in 1991. Case closure for the leak was granted by the Regional Board in December 2000. Tri-City Marble was listed for air emissions between 2001 and 2016 with no violations recorded; currently was listed as a Resource Conservation and Recovery Act small quantity generator with no violations recorded as of December 2018; and was identified as an air emitter. The Subject Property contained a 20,000-gallon diesel AST, a 1,000-gallon bunker fuel UST, and a 1,000-gallon unleaded gasoline UST that were removed as detailed in Section 4.5, Previous Environmental Studies. Valley Recycling/Earth Tones Mulch Company was listed as a solid waste landfill that undertakes chipping and grinding activities. Several toxic off-site releases of copper compounds and lead compounds, xylene in fugitive and on-site stack air, were reported by Arch Mirror West. A release of styrene in fugitive and on-site stack air was also reported in 2004 by Tri-City Marble.

- 6792 Central Avenue, located on the Subject Property, was identified in the FINDS/FRS, ENVIROSTOR, CHMIRS, HIST MANIFEST, HAZNET, ICIS, EMISSIONS, RCRA SQG, and RCRA TSD databases. According to the ERIS Report, Arch Mirror West appears on the RCRA TSD and RCRA SQG for a reported violation in 2004. Bay Mirror Inc. appears in the FINDS/FRS database as a hazardous air discharger. According to the CHMIRS database, a chemical spill was reported by the Union Sanitary District for an incident in which a mixture of styrene and tap water reached a storm drain due to a slip line leak, but did not reach a waterway.
- 6756 and 6792 Central Avenue, located on the Subject Property, was identified in the DELISTED LST, RCRA NON GEN, HAZ GEN, CLEANUP SITES, and FINDS/FRS databases. These listings primarily relate to the current cleanup actions currently being performed under the ACWD oversight, as summarized in Section 4.5, Previous Environmental Studies.

Farallon searched the California State Water Resources Control Board GeoTracker Database (GeoTracker database) and the California Department of Toxic Substances Control EnviroStor database (EnviroStor database) for records related to the Subject Property. The Subject Property was identified in the EnviroStor database as holding a tiered permit that is inactive and needs evaluation. According to the Tiered Permitting Phase I Environmental Assessment Checklist completed for the Subject Property in 1996, no further investigation is necessary for the Subject Property. Listings for the Subject Property under GeoTracker relate

to historical closure of USTs in 2000, and the current open release case under ACWD oversight, as summarized in Section 4.5, Previous Environmental Studies.

Farallon also searched the California DTSC Hazardous Waste Tracking System (HWTS) for records related to the Subject Property. Farallon searched the DTSC-HWTS for toxic waste generated at the Subject Property. The database contained waste manifests from Jaffe Witkin Properties in 2019; and from 6756-6792 Central Ave. Newark CA LLC in 2022, which indicated the removal of asbestos containing product from the Subject Property, likely related to building material disposal during building demolition.

7.2 ADJOINING FACILITY LISTINGS

ASTM defines "adjoining" as "any real property or properties the border of which is contiguous or partially contiguous with that of the Subject Property, or that would be contiguous or partially contiguous with that of the Subject Property but for a street, road, or other public thoroughfare separating them." The ERIS Report identified the following adjoining facilities in the databases reviewed:

- Pacbo Gypsum at 37851 Cherry Street, an industrial gypsum product manufacturer northeast-adjoining and up- to cross-gradient of the Subject Property with respect to documented groundwater flow, was identified in the ERNS, FINDS/FRS, LUST, AST, CERS TANK, EMISSIONS, HHSS, HAZNET, PRP, HIST MANIFEST, HIST TANK, RCRA NON GEN, TRIS, AST SWRCB, UST SWEEPS, AST ALAMEDA, CONT ALAMEDA, HAZ GEN, and RCRA SQG databases. According to the ERIS Report and GeoTracker database, the facility is an air emitter and currently has a 10,000-gallon petroleum AST. The facility was identified as an air emitter and formerly had several USTs. Multiple USTs reportedly failed tank tightness tests in May 1991 and were subsequently removed. During removal, petroleum impacts to soil and groundwater were identified and a leaking UST case was opened. An investigation was conducted and remedial efforts included free product removal, pumping and treatment of groundwater, and soil excavation between 1992 and 2009. The case was granted closure in September 2013 by the Regional Board; however, several post-closure requirements remain in-place, including no excavation of contaminated soil, no groundwater extraction, and notification to the Regional Board prior to land use changes or development.

- **Matheson Tri-Gas Inc.** at 6775 Central Avenue, an industrial gas cylinder processing facility west-adjoining and cross-gradient of the Subject Property with respect to documented groundwater flow, was identified in the CERS HAZ, CHMIRS, CLEANUP SITES, EMISSIONS, ENVIROSTOR, ERNS, FINDS/FRS, HIST CHMIRS, HHSS, HIST MANIFEST, HIST TANK, HWP, ICIS, HAZNET, CONT ALAMEDA, RCRA LQG, and RCRA TSD databases. According to the ERIS Report and GeoTracker database, the facility was identified as a large quantity generator of hazardous waste. This facility is an air emitter, with multiple small-quantity releases of vapor contaminants due to faulty containment cylinders between 1995 and 2017. A large-quantity release occurred in October 2001, resulting in 25,000 gallons of 0.2 percent sodium hydroxide solution being released into an unnamed flood channel of the San Francisco Bay and 300 gallons of 1 percent sodium hydroxide solution to a storm drain leading to an unnamed flood channel of the San Francisco Bay. According to previous investigations performed at the facility, groundwater and soil vapor have been impacted by VOCs. Investigations are ongoing, and impacted media have been identified as extending beyond the facility boundaries toward the south-southwest. The facility currently is regulated by the Regional Board and semiannual groundwater monitoring indicates that VOCs are present at concentrations exceeding cleanup levels in groundwater at the facility and south-adjacent facility.

- **HB Fuller** at 6925 Central Avenue, a manufacturer of polymers and water-based adhesives west-adjoining and cross-gradient of the Subject Property with respect to documented groundwater flow, was identified in the CERCLIS, CERCLIS NFRAP, CDO/CAO, FINDS/FRS, HHSS, HIST TANK,HIST MANIFEST, RCRA NON GEN, HAZNET, SEMS ARCHIVE, CLEANUP SITES, and ENVIROSTOR databases. According to the ERIS Report and GeoTracker database, the facility was identified as having impacted soil and groundwater from storage tanks at the facility. Soil and groundwater investigations conducted at the facility in 1982 revealed the presence of VOCs in soil and groundwater. Groundwater extraction and air stripping were initiated in 1986 and the remedial system operated until 1997, when the Regional Board granted a request to terminate the remedial system. The facility currently is regulated by the Regional Board. Annual groundwater monitoring conducted in 2023 indicated that VOCs are present at concentrations exceeding cleanup levels in groundwater at the facility, with concentrations decreasing, stable, or showing no trend. According to a 2015 Annual Groundwater Monitoring Report, the lateral and vertical extents of VOC

contamination in groundwater have been delineated and VOCs have not been detected in down-gradient monitoring wells off the property.

- **Mission Linen Supply** at 6590 Central Avenue, an active dry cleaning facility north-adjoining and up-gradient of the Subject Property with respect to documented groundwater flow, was identified in the CERS HAZ, EMISSIONS, and DRYCLEANERS databases. Neither major violations nor incidents regarding an environmental release were associated with this business.

- **Milprint Packaging/Bemis Company/Pechiney Plastic/American National Can** at 6590 Central Avenue, north-adjacent and up-gradient of the Subject Property with respect to documented groundwater flow, was identified in the CLEANUP SITES, EMISSIONS, HHSS, HIST TANK, RCRA LQG, CONT ALAMEDA, and RCRA NON GEN databases. The property has been in industrial use since 1957, during which time toluene, benzene, methyl-ethyl-ketone, tetrachloroethylene, trichloroethylene, and other solvents historically were used and stored on the property. USTs were known to have existed on the property; however, no additional information regarding the USTs could be found. During the removal of hydraulic rams and a concrete sump on the property in July 1990, impacted soil was encountered. In October 1999, soil excavation and bioremediation soil treatment activities were used in the cleanup of the ORO- and grease-impacted soil, which was then spread out on the southwestern portion of the property. Based on low detections of analyte concentrations in soil samples and non-detectable concentrations in groundwater samples, ACWD concluded that the property did not appear to pose a threat to the beneficial uses of groundwater and the Regional Board closed the case. According to Regional Board records, a No Further Action determination was issued for this property on April 18, 2000. Alcan Plastic Packaging Plant had an entry on GeoTracker for a leak of total petroleum hydrocarbons from a hydraulic lift. Impacted soil was excavated and impacted water was removed, and the case was closed in 2008.

Based on the information provided in the ERIS Report and regulatory files, their topographic location and/or distance relative to the Subject Property, and subsurface data obtained from the Subject Property, none of the adjoining facilities identified was considered to represent a recognized environmental condition in connection with the Subject Property, although

releases on the adjoining properties may have contributed to low-level impact to groundwater beneath the Subject Property.

7.3 SURROUNDING FACILITY LISTINGS

Reported facilities within 0.25 mile up-gradient or 0.125 mile cross-gradient of the Subject Property are considered to have a potential to have impacted the Subject Property, depending on the depth and the directional flow of groundwater. Facilities that were listed in the ERIS Report but not identified as a reported facility (e.g., a facility listed as a hazardous waste generator but not as having had a release), and facilities that were listed as "Closed" were not considered to have a potential to have impacted the Subject Property.

Based on Farallon's review of the ERIS Report, in conjunction with subsurface data obtained from the Subject Property, none of the surrounding facilities identified was considered to represent a recognized environmental condition in connection with the Subject Property.

7.4 UNPLOTTABLE LISTINGS

Listings or facilities that cannot be mapped due to inaccurate or inadequate address information are identified as "unplottable" in the ERIS Report.

The ERIS Report identified 26 unplottable facilities. Farallon located these unplottable facilities as practical and, according to the information provided by ERIS, the unplottable facilities located do not represent a recognized environmental condition in connection with the Subject Property.

8.0 SUBJECT PROPERTY INTERVIEW

Farallon attempted to interview individuals familiar with the Subject Property, including owners, operators, and occupants, to obtain additional Subject Property information. Interviews were conducted in person, in writing, or by telephone. The individual(s) interviewed, and their responses are discussed in the following sections.

8.1 INTERVIEW WITH SUBJECT PROPERTY REPRESENTATIVE

On April 24, 2024, Farallon interviewed Gavin Fisco of Prologis, representative of the Subject Property. The following information was obtained from this interview:

- Gavin Fisco is the owner representative and has been involved with the Subject Property since 2019.
- The Subject Property is currently vacant and is planned for commercial redevelopment.
- No known ASTs or USTs are present at the Subject Property.
- Historical releases on the Subject Property are currently undergoing cleanup under regulatory oversight by the ACWD.
- Utilities are provided by local municipalities.
- Roll up doors for the Subject Property building were sealed shut and blocked off, which prevented rainwater from discharging to the storm drains in the truck loading area and resulted in flooding.
- Historical use of hazardous materials is documented in prior assessment documents.
- Soil and concrete stockpiles on the Subject Property were generated during building demolition activities.

Gavin Fisco stated on behalf of the Subject Property owner that with the possible exception of current cleanup actions, there have not been any pending, threatened, or past:

- Litigation relevant to hazardous substances or petroleum products in, on, or from the Subject Property;
- Administrative proceedings relevant to hazardous substances or petroleum products in, on, or from the Subject Property; or

- Notices from a governmental entity regarding violations of environmental laws or liability relating to hazardous substances or petroleum products.

9.0 SITE RECONNAISSANCE

Farallon conducted a site reconnaissance on April 12, 2024 to observe the Subject Property for physical evidence of recognized environmental conditions. The methodology used for the site reconnaissance and the observations made and limiting conditions encountered are discussed below. Photographs taken during the site reconnaissance are presented in Appendix B.

9.1 SITE RECONNAISSANCE METHODOLOGY

Weather conditions at the time of the reconnaissance were sunny, with a temperature of approximately 72 degrees Fahrenheit. Farallon conducted a walk around the entire perimeter of the Subject Property and inspected accessible interior portions of the Subject Property buildings.

9.1.1 Limiting Conditions

Limiting conditions encountered during this Phase I ESA were the presence of an office trailer and an encampment on exterior portions of the Subject Property that prevented Farallon from observing the entire ground surface of the Subject Property, and the presence of furniture and equipment in the Subject Property buildings that prevented Farallon from observing entire interior floor surfaces. Based on information obtained from the Subject Property representative, these limiting conditions are not expected to affect the conclusions of this Phase I ESA Report.

9.2 INTERIOR OBSERVATIONS

Farallon's comments related to observations of the interior of the Subject Property building during the site reconnaissance are provided in Section 9.2.1.

INTERIOR OBSERVATIONS	YES	NO
Odor(s)		X
Heating/Cooling System(s)	X	
Drain(s) and/or Sump(s)	X	
Staining and/or Corrosion		X
Storage Tank(s), Vent Pipe(s), Fuel Port(s), and/or Fill Pipe(s)		X

INTERIOR OBSERVATIONS	YES	NO
Clarifier(s)		X
Drum(s) and/or Other Container(s)		X
Pool(s) of Liquid	X	
Automobile Lift(s)		X
Well(s)		X
Hazardous Material(s) and/or Petroleum Product(s)		X
Hazardous Waste(s)		X
Polychlorinated Biphenyl-Containing Item(s)	X	

9.2.1 Interior Observation Comments

Heating/Cooling System(s)

The Subject Property building is heated by natural gas, which is provided by Pacific Gas and Electric Company.

Drain(s) and/or Sump(s)

Farallon observed several floor drains in the warehouse of the Subject Property building, which reportedly discharge to the sanitary sewer system.

Pool(s) of Liquid

Farallon observed storm water pooling on the floor of the truck loading dock inside the Subject Property building. According to the Subject Property representative, the roll up doors were previously sealed shut and blocked off, which prevented the rainwater from discharging to the storm drains in the truck loading area.

Polychlorinated Biphenyl-Containing Item(s)

Farallon observed wall-mounted transformers in the Subject Property building. The transformers appeared to be in good condition, with no evidence of release noted.

9.3 EXTERIOR OBSERVATIONS

Farallon's comments related to observations of the exterior of the Subject Property during the site reconnaissance are provided in Section 9.3.1.

EXTERIOR OBSERVATIONS	YES	NO
Odor(s)		X
Staining and/or Corrosion	X	
Storage Tank(s), Vent Pipe(s), and/or Fuel Port(s)		X
Clarifier(s)		X
Drum(s) and/or Other Container(s)	X	
Pool(s) of Liquid		X
Hazardous Material(s) and/or Petroleum Product(s)	X

Stormwater	X	
Polychlorinated Biphenyl-Containing Item(s)		X
Significant Amount of Fill Material	X	

9.3.1 Exterior Observation Comments

Staining and/or Corrosion

Farallon observed de minimis petroleum staining throughout the Subject Property that appeared to be from parked vehicles on the Subject Property. De minimis staining was also observed proximate to a hydraulic oil drum on the southeastern portion of the Subject Property.

Drum(s) and/or Other Container(s)

Farallon observed two 55-gallon drums that appear to contain investigation derived waste on the eastern portion of the Subject Property, and a single 55-gallon drum containing hydraulic oil on the southeastern portion of the Subject Property. The drums appeared to be

in good condition with no evidence of spills, although de minimis staining was observed proximate to the hydraulic oil drum.

Hazardous Material(s) and/or Petroleum Product(s)

Farallon observed a 55-gallon drum containing hydraulic oil on the eastern portion of the Subject Property as described above.

Solid (Nonhazardous) Waste(s)—Evidence of Dumping

Municipal wastes were observed in the encampment area located on the southeastern portion of the Subject Property.

Domestic Water

Domestic water is supplied to the Subject Property buildings by the ACWD.

Well(s)

Farallon observed eight groundwater monitoring wells on the Subject Property related to current investigate actions under the ACWD oversight. The well head for one of the monitoring wells was observed to be damaged.

Septic/Sewer System(s)

Sanitary sewage generated at the Subject Property discharges to the municipal sanitary sewer system.

Stormwater

Stormwater generated at the Subject Property infiltrates the ground surface or is directed into catch basins in the driveway and loading dock area which likely discharge to the local municipal storm sewer system.

Significant Amount of Fill Material

Farallon observed several crushed concrete and soil stockpiles on the northeastern portion of the Subject Property. According to the Subject Property representative, the soil and concrete stockpiles were generated during building demolition activities and will be used during redevelopment.

10.0 FINDINGS AND OPINIONS

Farallon performed a Phase I ESA in accordance with ASTM E1527-21 and the Authorization. Significant findings are identified below.

Farallon observed de minimis petroleum staining throughout the Subject Property that appeared to be from parked vehicles on the Subject Property. De minimis staining was also observed proximate to a hydraulic oil drum on the southeastern portion of the Subject Property.

Two 1,000-gallon USTs containing bunker fuel and gasoline, respectively, and one 20,000-gallon diesel AST and associated fuel islands and piping were removed from the Subject Property between 1991 and 1993. A soil and groundwater investigation was conducted in September 1999 to determine the extent of petroleum hydrocarbon contamination from the 20,000-gallon diesel AST and to assess the 1,000-gallon gasoline UST area. Based on the results of the investigation, an excavation was conducted north of the former AST in June 2000 and approximately 311 tons of soil and 2,300 gallons of groundwater were removed from the Subject Property. Confirmation samples collected at the conclusion of the excavation did not contain detectable concentrations of petroleum hydrocarbons, and the tanks were issued case closure in 2000. The former ASTs and USTs at the Subject Property that have received regulatory closure represent a historical recognized environmental condition in connection with the Subject Property.

The Subject Property was historically used by tenants for industrial purposes, and numerous previous environmental studies were performed that suggested chemical releases had occurred at the Subject Property. The potential was also identified for surrounding property use to have contributed to the residual chemical impact to groundwater beneath the Subject Property. Based on Farallon's review of previous environmental studies, releases related to historical use of the Subject Property represent a recognized environmental condition in connection with the Subject Property. Available information suggests the releases will be issued regulatory closure in the near future, at which time the releases will represent a controlled recognized environmental condition in connection with the Subject Property that will require future management during subsurface improvements.

11.0 CONCLUSIONS

Farallon conducted a Phase I ESA for the property at 6756 and 6792 Central Avenue in Newark, California in conformance with the scope and limitations of ASTM E1527-21. Any exceptions to or deletions from this practice are described in Section 1.5, Deviations.

This assessment identified the following recognized environmental condition in connection with the Subject Property:

- The known chemical releases to soil and groundwater from historical use that are currently being evaluated for regulatory closure.

13.0 LIMITATIONS

13.1 GENERAL LIMITATIONS

The conclusions contained in this report/assessment are based on professional opinions with regard to the subject matter. These opinions have been arrived at in accordance with currently accepted hydrogeologic and engineering standards and practices applicable to this location. The conclusions contained herein are subject to the following inherent limitations:

- **Accuracy of Information.** Farallon obtained, reviewed, and evaluated certain information used in this report/assessment from sources that were believed to be reliable. Farallon's conclusions, opinions, and recommendations are based in part on such information. Farallon's services did not include verification of its accuracy or authenticity. Should the information upon which Farallon relied prove to be inaccurate or unreliable, Farallon reserves the right to amend or revise its conclusions, opinions, and/or recommendations.
- **Reconnaissance and/or Characterization.** Farallon performed a reconnaissance and/or characterization of the Subject Property that is the subject of this report/assessment to document current conditions. Farallon focused on areas deemed more likely to exhibit hazardous materials conditions. Contamination may exist in other areas of the Subject Property that were not investigated or were inaccessible. Subject Property activities beyond Farallon's control could change at any time after the completion of this report/assessment.

For the foregoing reasons, Farallon cannot and does not warrant or guarantee that the Subject Property is free of hazardous or potentially hazardous substances or conditions, or that latent or undiscovered conditions will not become evident in the future. Farallon's observations, findings, and opinions can be considered valid only as of the date of the report.

This report/assessment has been prepared in accordance with the contract for services between Farallon and Prologis, L.P., and currently accepted industry standards. No other warranties, representations, or certifications are made.

13.2 LIMITATION ON RELIANCE BY THIRD PARTIES

Reliance by third parties is prohibited. This report/assessment has been prepared for the exclusive use of Prologis, L.P to address the unique needs of Prologis, L.P. at the Subject Property at a specific point in time.

This is not a general grant of reliance. No one other than Prologis, L.P. may rely on this report unless Farallon agrees in advance to such reliance in writing. Any unauthorized use, interpretation, or reliance on this report/assessment is at the sole risk of that party, and Farallon will have no liability for such unauthorized use, interpretation, or reliance.

FARALLON CONSULTING

SCOTT ALLIN, R.E.P.A.
Principal Environmental Scientist

BS Physical Science (Hydrology)
30 years' experience

Scott Allin has 30 years of project and program management experience in the evaluation and reporting of environmental liability associated with the sale or Brownfield redevelopment of impaired properties. He has supported the needs of developers and others in the acquisition of Cost Cap and Finite Risk environmental insurance to manage long-term environmental risks. He has provided clients with value-added due diligence services for single properties and large multimillion-dollar mixed-use portfolios, both nationally and internationally. Scott has provided guidance for evaluating environmental risks during complex mergers and acquisitions; and management services for implementation of remedial actions, asbestos abatement, environmental audit programs, and environmentally sensitive property improvements.

APPENDIX C
USER QUESTIONNAIRE

PHASE I
ENVIRONMENTAL SITE ASSESSMENT REPORT
6756 and 6792 Central Avenue
Newark, California

Farallon PN: 1071-105

User Questionnaire

Subject Property: _____

_____

User Representative: _____

Title: _____

Date: _____

Reason for Phase I ESA: _____

To qualify for one of the Landowner Liability Protections (LLPs) offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the "Brownfields Amendments"), the Phase I Environmental Site Assessment ("Phase I ESA") User must provide the following information (if available) to the environmental professional. Failure to provide this information could result in a determination that "all appropriate inquiry" has not been completed.

This document is designed to comply with Section 6 and Appendix X3, User Questionnaire, of ASTM E1527-21, Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process, and the USEPA AAI regulations (40 CFR §312).

1) Environmental cleanup liens that have been filed or recorded against the Subject Property (Part 312.25 of Title 40 of the Code of Federal Regulations [40 CFR 312.25]).

   Are you aware of any environmental cleanup liens against the Subject Property that have been filed or recorded under federal, tribal, state, or local law?

   ☐ Yes ☐ No

   If Yes, explain and/or provide information:

2) Activity and land use limitations that are in place at the Subject Property or that have been filed or recorded in a registry (40 CFR 312.26).

Are you aware of any activity and land use limitation (such as engineering controls, land use restrictions, or institutional controls) that are in place at the Subject Property and/or have been filed or recorded in a registry under federal, tribal, state, or local law?

☐ Yes ☐ No

If Yes, explain and/or provide information:

3) Specialized knowledge or experience of the person seeking to qualify for the LLPs (40 CFR 312.28).

As the User of the Phase I ESA Report, do you have any specialized knowledge or experience related to the Subject Property or nearby properties? For example, are you involved in the same line of business as the current or former occupant(s) of the Subject Property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business?

☐ Yes ☐ No

If Yes, explain and/or provide information:

4) Relationship of the purchase price to the fair market value of the Subject Property if it were not contaminated (40 CFR 312.29).

Does the purchase price being paid for this property reasonably reflect the fair market value of the Subject Property? If you conclude that there is a difference between the purchase price and the fair market value, have you considered whether the lower purchase price is because contamination is known or believed to be present at the Subject Property?

☐ Yes ☐ No

If No, explain and/or provide information:

5) Commonly known or reasonably ascertainable information about the Subject Property (40 CFR 312.30).

Are you aware of commonly known or reasonably ascertainable information about the Subject Property that would help the Environmental Professional to identify conditions indicative of releases or threatened releases? For example:

a) Do you know the past use of the Subject Property?
b) Do you know specific chemicals that are present or once were present at the Subject Property?
c) Do you know of spills or other chemical releases that have taken place at the Subject Property?
d) Do you know of any environmental cleanups that have taken place at the Subject Property?

☐ Yes ☐ No to all

If Yes, explain and/or provide information:

6) The degree of obviousness of the presence or likely presence of contamination at the Subject Property, and the ability to detect the contamination by appropriate investigation (40 CFR 312.31).

As the user of the Phase I ESA Report, based on your knowledge and experience related to the Subject Property, is there any obvious indicator(s) that point to the presence or likely presence of contamination at the Subject Property?

☐ Yes ☐ No

If Yes, explain and/or provide information:

7) Previous Environmental Reports.

Are previous environmental reports available for the Subject Property, provided by the User for review?

☐ Yes ☐ No

RE: CITY DIRECTORY RESEARCH
6756 and 6792 Central Avenue
6756 and 6792 Central Avenue Newark, CA

Thank you for contacting ERIS for an City Directory Search for the site described above. Our staff has conducted a reverse listing City Directory search to determine prior occupants of the subject site and adjacent properties. We have provided the nearest addresses(s) when adjacent addresses are not listed. If we have searched a range of addresses, all addresses in that range found in the Directory are included.

Note: Reverse Listing Directories generally are focused on more highly developed areas. Newly developed areas may be covered in the more recent years, but the older directories will tend to cover only the "central" parts of the city. To complete the search, we have either utilized the ACPL, Library of Congress, State Archives, and/or a regional library or history center as well as multiple digitized directories. These do not claim to be a complete collection of all reverse listing city directories produced.

ERIS has made every effort to provide accurate and complete information but shall not be held liable for missing, incomplete or inaccurate information. To complete this search we used the general range(s) below to search for relevant findings. If you believe there are additional addresses or streets that require searching please contact us at 866-517-5204.

Search Criteria:
6500-7050 of Central Avenue
37600-38300 of Cherry Street
All of Redeker Place
37600-37900 of Sycamore Street
6650-7000 of Clark Avenue
6550-7000 of Smith Avenue

  Summary....13
  Detail Report....15
Radon Information....45
Appendix....46
Liability Notice....48

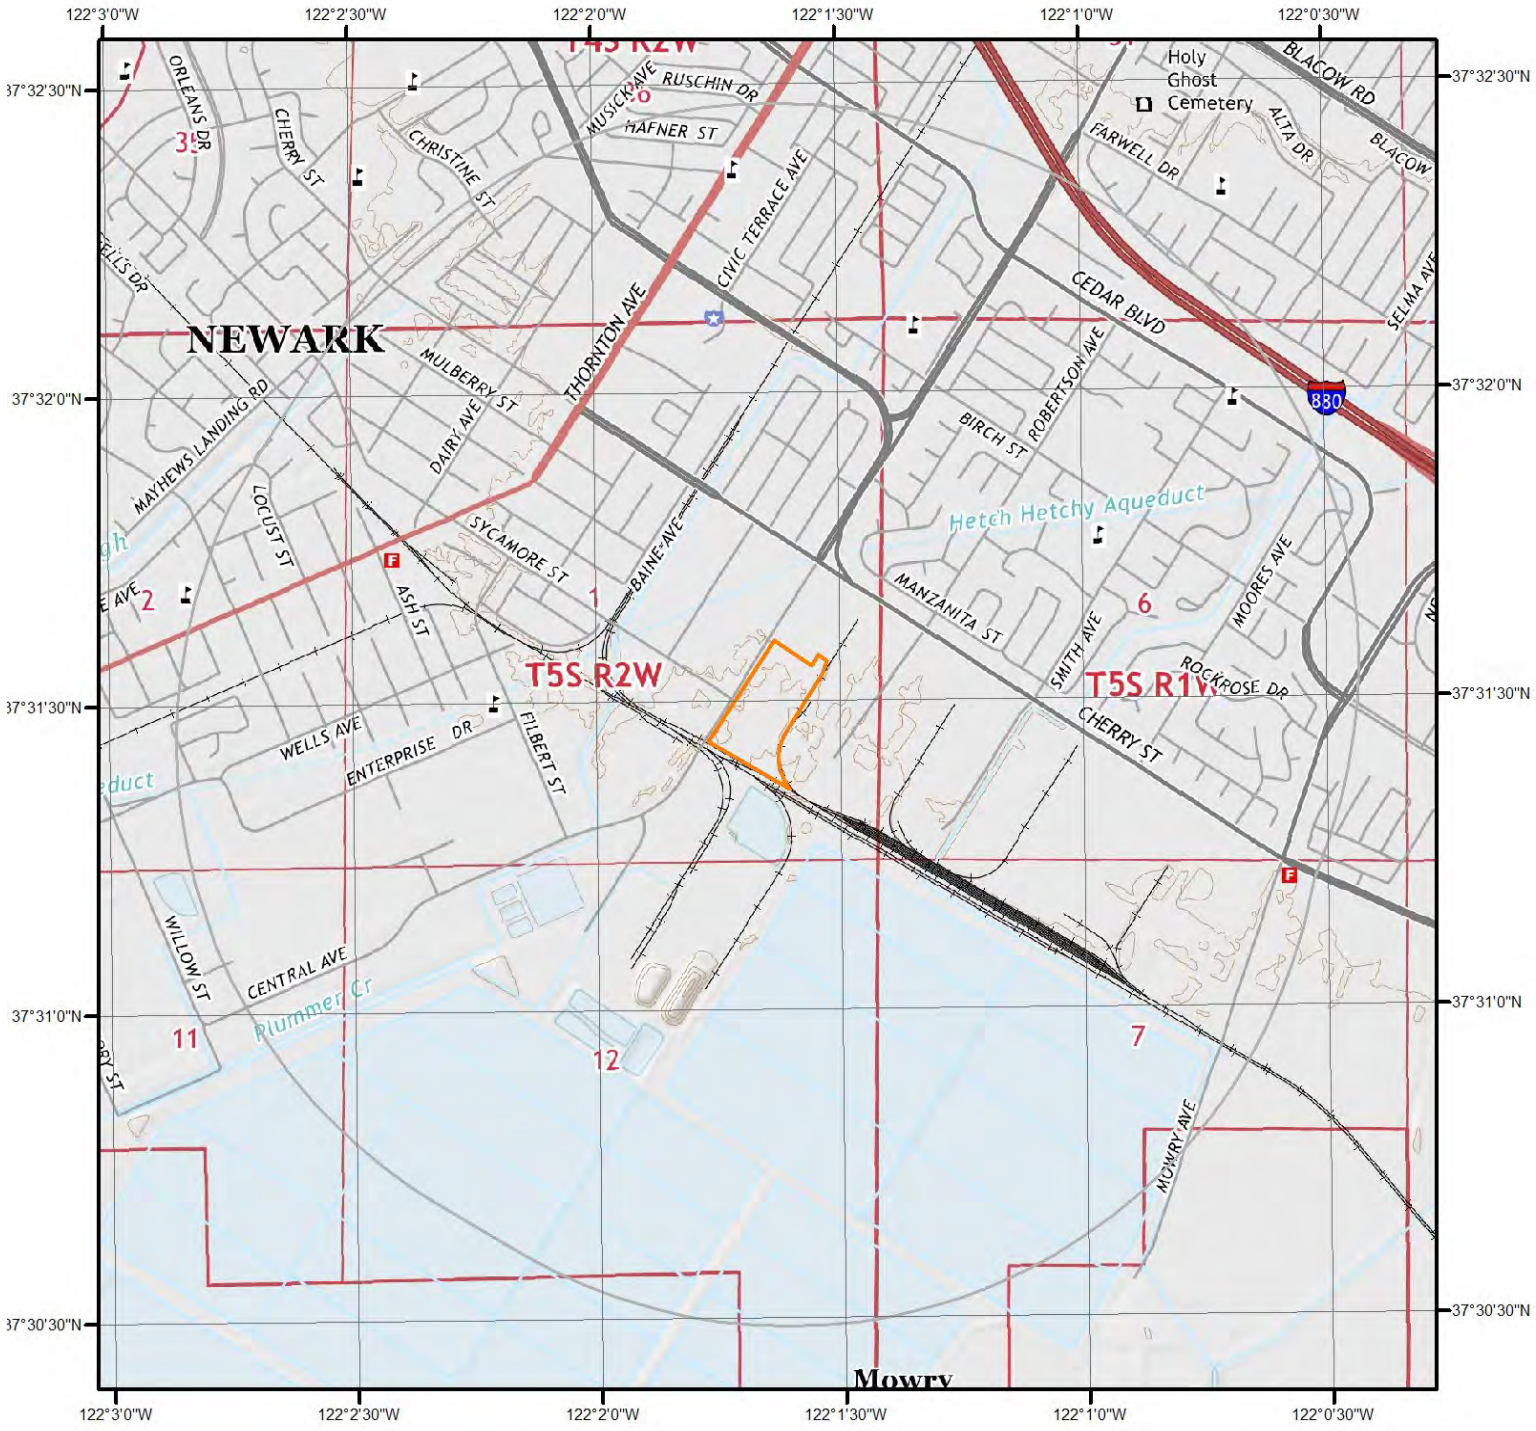
The ERIS ***Physical Setting Report - PSR*** provides comprehensive information about the physical setting around a site and includes a complete overview of topography and surface topology, in addition to hydrologic, geologic and soil characteristics. The location and detailed attributes of oil and gas wells, water wells, public water systems and radon are also included for review.

The compilation of both physical characteristics of a site and additional attribute data is useful in assessing the impact of migration of contaminants and subsequent impact on soils and groundwater.

Disclaimer

This Report does not provide a full environmental evaluation for the site or adjacent properties. Please see the terms and disclaimer at the end of the Report for greater detail.

Topographic Information



Current USGS Topo

Quadrangle(s): Newark,CA

Geologic Units

This maps shows geologic units in the area. Please refer to the report for detailed descriptions.

ERIS
ENVIRONMENTAL RISK INFORMATION SERVICES

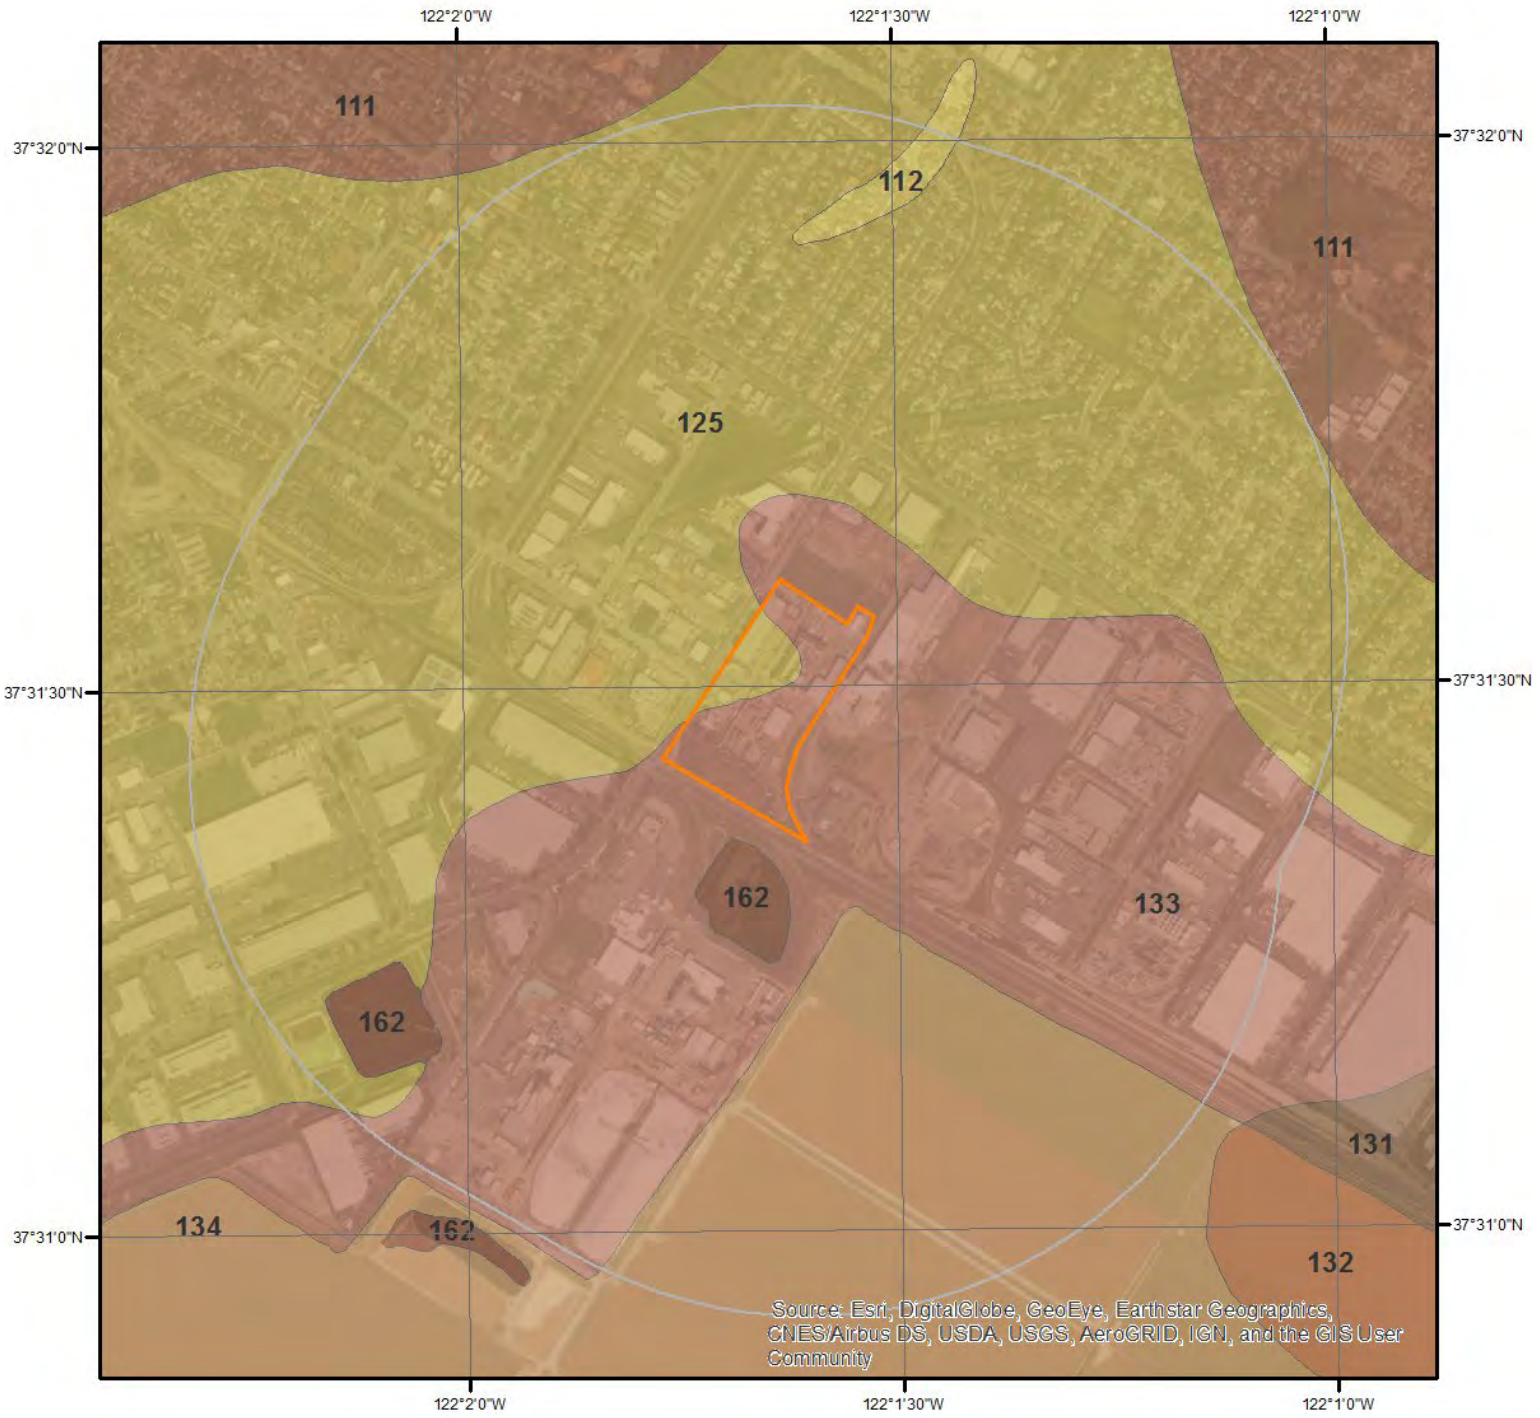
Geologic Information

The previous page shows USGS geology information. Detailed information about each unit is provided below.

Geologic Unit Q

Unit Name:	Quaternary alluvium and marine deposits
Unit Age:	Pliocene to Holocene
Primary Rock Type:	alluvium
Secondary Rock Type:	terrace
Unit Description:	Alluvium, lake, playa, and terrace deposits; unconsolidated and semi-consolidated. Mostly nonmarine, but includes marine deposits near the coast.

Soil Information



SSURGO Soils

0 0.2 0.4 Miles

N

This maps shows SSURGO soil units around the target property. Please refer to the report for detailed soil descriptions.

ERIS
ENVIRONMENTAL RISK INFORMATION SERVICES

Soil Information

The previous page shows a soil map using SSURGO data from USDA Natural Resources Conservation Service. Detailed information about each unit is provided below.

Map Unit 112

Map Unit Name:	Danville silty clay loam, 2 to 9 percent slopes
Bedrock Depth - Min:	null
Watertable Depth - Annual Min:	null
Drainage Class - Dominant:	Well drained
Hydrologic Group - Dominant:	C - Soils in this group have moderately high runoff potential when thoroughly wet. Water transmission through the soil is somewhat restricted.
Major components are printed below	
Danville(85%)	
horizon H1(0cm to 53cm)	Silty clay loam
horizon H2(53cm to 135cm)	Silty clay
horizon H3(135cm to 203cm)	Silty clay loam

Map Unit 125

Map Unit Name:	Marvin silt loam, saline-alkali
Bedrock Depth - Min:	null
Watertable Depth - Annual Min:	145cm
Drainage Class - Dominant:	Somewhat poorly drained
Hydrologic Group - Dominant:	C - Soils in this group have moderately high runoff potential when thoroughly wet. Water transmission through the soil is somewhat restricted.
Major components are printed below	
Marvin(85%)	
horizon H1(0cm to 10cm)	Silt loam
horizon H2(10cm to 91cm)	Clay
horizon H3(91cm to 152cm)	Clay loam

Map Unit 133

Map Unit Name:	Pescadero clay, drained
Bedrock Depth - Min:	null
Watertable Depth - Annual Min:	153cm
Drainage Class - Dominant:	Poorly drained
Hydrologic Group - Dominant:	D - Soils in this group have high runoff potential when thoroughly wet. Water movement through the soil is restricted or very restricted.
Major components are printed below	
Pescadero(85%)	
horizon H1(0cm to 5cm)	Clay loam
horizon H2(5cm to 76cm)	Clay
horizon H3(76cm to 152cm)	Clay loam

Map Unit 134

Soil Information

Map Unit Name:	Pescadero clay, ponded
Bedrock Depth - Min:	null
Watertable Depth - Annual Min:	85cm
Drainage Class - Dominant:	Poorly drained
Hydrologic Group - Dominant:	D - Soils in this group have high runoff potential when thoroughly wet. Water movement through the soil is restricted or very restricted.
Major components are printed below	
Pescadero(85%)	
horizon H1(0cm to 5cm)	Clay loam
horizon H2(5cm to 76cm)	Clay
horizon H3(76cm to 152cm)	Clay loam

Map Unit 162

Map Unit Name:	Water

Radon Information

This section lists any relevant radon information found for the target property.

Federal EPA Radon Zone for *ALAMEDA* County: **2**

Zone 1: Counties with predicted average indoor radon screening levels greater than 4 pCi/L
Zone 2: Counties with predicted average indoor radon screening levels from 2 to 4 pCi/L
Zone 3: Counties with predicted average indoor radon screening levels less than 2 pCi/L

Federal Area Radon Information for *ALAMEDA* County

No Measures/Homes:	60
Geometric Mean:	0.5
Arithmetic Mean:	0.8
Median:	0.7
Standard Deviation:	1
Maximum:	4
% >4 pCi/L:	0
% >20 pCi/L:	0
Notes on Data Table:	TABLE 1. Screening indoor radon data from the EPA/State Residential Radon Survey of California conducted during 1989-90. Data represent 2-7 day charcoal canister measurements from the lowest level of each home tested.

Appendix

Federal Sources

FEMA National Flood Hazard Layer — **FEMA FLOOD**

The National Flood Hazard Layer (NFHL) data incorporates Flood Insurance Rate Map (FIRM) databases published by the Federal Emergency Management Agency (FEMA), and any Letters Of Map Revision (LOMRs) that have been issued against those databases since their publication date. The FIRM Database is the digital, geospatial version of the flood hazard information shown on the published paper FIRMs. The FIRM Database depicts flood risk information and supporting data used to develop the risk data. The FIRM Database is derived from Flood Insurance Studies (FISs), previously published FIRMs, flood hazard analyses performed in support of the FISs and FIRMs, and new mapping data, where available.

Indoor Radon Data — **INDOOR RADON**

Indoor radon measurements tracked by the Environmental Protection Agency(EPA) and the State Residential Radon Survey.

Public Water Systems Violations and Enforcement Data — **PWSV**

List of drinking water violations and enforcement actions from the Safe Drinking Water Information System (SDWIS) made available by the Drinking Water Protection Division of the US EPA's Office of Groundwater and Drinking Water. Enforcement sensitive actions are not included in the data released by the EPA. Address information provided in SWDIS may correspond either with the physical location of the water system, or with a contact address.

Radon Zone Level — **RADON ZONE**

Areas showing the level of Radon Zones (level 1, 2 or 3) by county. This data is maintained by the Environmental Protection Agency (EPA).

Safe Drinking Water Information System (SDWIS) — **SDWIS**

The Safe Drinking Water Information System (SDWIS) contains information about public water systems as reported to US Environmental Protection Agency (EPA) by the states. Addresses may correspond with the location of the water system, or with a contact address.

Soil Survey Geographic database — **SSURGO**

The Soil Survey Geographic database (SSURGO) contains information about soil as collected by the National Cooperative Soil Survey at the Natural Resources Conservation Service (NRCS). Soil maps outline areas called map units. The map units are linked to soil properties in a database. Each map unit may contain one to three major components and some minor components.

U.S. Fish & Wildlife Service Wetland Data — **US WETLAND**

The U.S. Fish & Wildlife Service Wetland layer represents the approximate location and type of wetlands and deepwater habitats in the United States.

USGS Current Topo — **US TOPO**

US Topo topographic maps are produced by the National Geospatial Program of the U.S. Geological Survey (USGS). The project was launched in late 2009, and the term "US Topo" refers specifically to quadrangle topographic maps published in 2009 and later.

USGS Geology — **US GEOLOGY**

Seamless maps depicting geological information provided by the United States Geological Survey (USGS).

USGS National Water Information System — **FED USGS**

The U.S. Geological Survey (USGS)'s National Water Information System (NWIS) is the nation's principal repository of water resources data. This database includes comprehensive information of well-construction details, time-series data for gage height, streamflow, groundwater level, and precipitation and water use data.

State Sources

Oil and Gas Wells — **OGW**

A list of Oil and Gas well locations. This is provided by California's Department of Conservation Division of

Appendix

Oil, Gas and Geothermal Resources.

Public Water Supply Wells **PWSW**

List of community water supply wells in California. This data was made available by California Department of Water Resources, Division of Statewide Integrated Water Management, who indicates that the management of the data in an ongoing project, and some county data is not represented. Location information is provided using the Public Land Survey System (PLSS) and is subject to the accuracy limitations inherent to the PLSS system.

Water Wells **WATER WELLS**

A list of water wells maintained by the Department of Water Resources (DWR) Water Data Library.

Well Investigation Program Case List **WIP**

The Well Investigation Program (WIP) was developed by the State Water Resources Control Board (SWRCB) to locate, assess and remediate sources of solvent contamination impacting drinking water wells. This list contains WIP cases (active and historical) for the San Gabriel and San Fernando Valley area and was provided by the Los Angeles Regional Water Quality Control Board.

Liability Notice

Reliance on information in Report: The Physical Setting Report (PSR) DOES NOT replace a full Phase I Environmental Site Assessment but is solely intended to be used as a review of environmental databases and physical characteristics for the site or adjacent properties.

License for use of information in Report: No page of this report can be used without this cover page, this notice and the project property identifier. The information in Report(s) may not be modified or re-sold.

Your Liability for misuse: Using this Service and/or its reports in a manner contrary to this Notice or your agreement will be in breach of copyright and contract and ERIS may obtain damages for such mis-use, including damages caused to third parties, and gives ERIS the right to terminate your account, rescind your license to any previous reports and to bar you from future use of the Service.

No warranty of Accuracy or Liability for ERIS: The information contained in this report has been produced by ERIS Information Inc. ("ERIS") using various sources of information, including information provided by Federal and State government departments. The report applies only to the address and up to the date specified on the cover of this report, and any alterations or deviation from this description will require a new report. This report and the data contained herein does not purport to be and does not constitute a guarantee of the accuracy of the information contained herein and does not constitute a legal opinion nor medical advice. Although ERIS has endeavored to present you with information that is accurate, ERIS Information Inc. disclaims, any and all liability for any errors, omissions, or inaccuracies in such information and data, whether attributable to inadvertence, negligence or otherwise, and for any consequences arising therefrom. Liability on the part of ERIS is limited to the monetary value paid for this report.

Trademark and Copyright: You may not use the ERIS trademarks or attribute any work to ERIS other than as outlined above. This Service and Report(s) are protected by copyright owned by ERIS Information Inc. Copyright in data used in the Service or Report(s) (the "Data") is owned by ERIS or its licensors. The Service, Report(s) and Data may not be copied or reproduced in whole or in any substantial part without prior written consent of ERIS.

RE: COMPREHENSIVE PHASE II ENVIRONMENTAL SITE ASSESSMENT FINDINGS
6756 AND 6792 CENTRAL AVENUE
NEWARK, CALIFORNIA
FARALLON PN: 2057-002

Dear Mr. Dack:

Farallon Consulting, L.L.C. (Farallon) has prepared this letter to summarize the comprehensive findings from the Phase II Environmental Site Assessment (Phase II ESA) performed for Ice Miller LLP (Ice Miller) for the property at 6756 and 6792 Central Avenue in Newark, California (herein referred to as the Site) (Figure 1). The Phase II ESA was performed in phases in accordance with: the scope of work outlined in the Technical Memorandum regarding Phase I Environmental Site Assessment Preliminary Findings and Recommendations, 6756 and 6792 Central Avenue, Newark, California dated March 14, 2019 from Mr. Scott Allin of Farallon to Mr. Jeffrey Dack of Ice Miller; and the scope of work outlined in the letter regarding Proposal for Additional Phase II Environmental Site Assessment, 6756 and 6792 Central Avenue, Newark, California dated April 25, 2019 from Messrs. Gavin Polite Fisco and Allin of Farallon to Mr. Dack of Ice Miller.

This letter provides a brief background of the Site, summarizes the comprehensive Phase II ESA findings, and presents Farallon's conclusions based on the findings.

SITE BACKGROUND

The Site is in a mixed industrial and commercial area in Newark, Alameda County, California and consists of Alameda County Parcel Nos. 92A-2165-14 (2.03 acres), 92A-2165-15 (8.18 acres), 92A-2165-16 (2.79 acres) and 92A-2165-17 (4.23 acres), which together total approximately 17.23 acres of land, according to the Alameda County Assessor's Office. The Site owner is Jaffe Witkin Properties. A Site plan depicting the Site boundary and current features is provided on Figure 2.

6756 Central Avenue is developed with four buildings (one building consisting of multiple conjoined structures, one medium-size building, and two smaller buildings) constructed in phases between 1946 and 1968 and occupied by various industrial tenants. At the time of Farallon's site reconnaissance, the southernmost building, previously occupied by All Good Pallets, exhibited extreme heat damage from a recent fire.

6792 Central Avenue is developed with one large industrial building occupied by Trench Plate Rental Company. The northern and east-central portions of the Site are used by various commercial trucking companies for truck parking. Remaining areas of the Site consist of an equipment storage area on the west-central portion of the Site occupied by Trench Plate Rental Company, a pallet storage area on the south-central portion of the Site occupied by All Good Pallets, and a landscaping- and mulch-recycling operation on the southern portion of the Site occupied by Vision Recycling. Access to the Site is gained from multiple locations on Central Avenue, west of the Site.

During performance of a Phase I ESA, Farallon identified the following potential environmental concerns in connection with the Site, which were further investigated during the Phase II ESA.

- **Volatile Organic Compound Impacts to Groundwater:** 1,1-dichloroethane was detected in groundwater samples collected in the vicinity of a former chemical drum-storage area at the Site during sampling events conducted in 2001 and 2007.
- **Potential Impacts from Adjacent Properties:** Several properties in the vicinity of the Site have been identified as having groundwater impacted with chlorinated solvents and petroleum hydrocarbons.
- **Current and Former Operations at the Site:** The Site is occupied by various industrial tenants that use hazardous materials, including paints, degreasers, automotive fluids, and motor oil, in their operations, and have received multiple notices of violations from the Alameda County Department of Environmental Health regarding poor housekeeping. Multiple generations of industrial tenants have occupied the Site buildings since their construction.

SUMMARY OF PHASE II ESA

The Phase II ESA was performed by Farallon in phases, on April 2 and April 3, 2019, and May 7, 2019, and consisted of collecting soil and reconnaissance groundwater samples from borings F-1 through F-25 on the Site for laboratory analysis. Boring locations are shown on Figure 2. The final sampling and analysis plan, including laboratory methodologies used for the Phase II ESA, is summarized in Table 1.

Prior to commencement of drilling, Farallon obtained Alameda County Water District Drilling Permit 2019-0199 and 2019-0217 from the Alameda County Water District. The approved permits are provided in Attachment A.

Prior to drilling, boring locations were cleared by a private utility locator. In general, borings were advanced with a hand-auger to a depth of 5 feet below ground surface (bgs), then advanced using a direct-push drill rig to a depth of approximately 3 feet below first-encountered groundwater. Groundwater samples were collected from temporary polyvinyl chloride wells constructed in the boreholes. The samples were extracted using a peristaltic pump. During drilling, soil samples were screened for volatile constituents using a photoionization detector. Industry-standard methodologies were used for sample preservation and transport.

Lithologic conditions encountered during drilling generally consisted of fill material in the upper 2.5 feet bgs, grading to clayey sand or sandy clay to the total depth explored of 22 feet bgs. First-encountered groundwater occurred at depths ranging from approximately 4 to 18 feet bgs. No elevated photoionization detector readings indicative of chemical impact to soil were identified during drilling.

During the initial phase of investigation total petroleum hydrocarbons (TPH) as diesel-range organics (DRO) and as oil-range organics (ORO), polycyclic aromatic hydrocarbons (PAHs), and volatile organic compounds (VOCs) were detected at concentrations exceeding regulatory screening guidelines in soil and groundwater at the Site, which warranted further characterization, completed during the second phase of investigation. Analytical results from the Phase II ESA are summarized in Tables 2 through 10; the laboratory analytical reports are provided in Attachment B. The analytical results for soil and reconnaissance groundwater samples were compared to the San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels for soil and groundwater dated January 2019 (ESLs), for both unrestricted land use (Tier 1) and other commercial/industrial or exposure values, as referenced in Tables 2 through 10. ESLs are conservative regulatory screening guidelines for determining whether further evaluation is warranted, and are not considered specific regulatory cleanup criteria. Soil and groundwater analytical results from the Phase II ESA are summarized below.

SOIL ANALYTICAL RESULTS

- TPH as gasoline-range organics, DRO, and/or ORO were detected in various soil samples at concentrations less than or equal to the Tier 1 ESLs.
- VOCs were not detected at a concentration exceeding laboratory reporting limits, with the exception of naphthalene, detected in the soil sample collected from borings F-4, F-19, and F-20; and tetrachloroethene, detected in the soil sample collected from boring F-4. Naphthalene was detected at a concentration exceeding the Tier 1 ESL but less than the commercial/industrial ESL in only the soil sample collected from boring F-4. Tetrachloroethene was detected at a concentration less than the Tier 1 ESL.
- Polychlorinated biphenyls (PCBs) were not detected at concentrations exceeding the laboratory reporting limits.
- Several PAHs were detected at concentrations exceeding laboratory reporting limits, two exceeding Tier 1 ESLs in the soil sample collected from boring F-13. However, all detected PAH concentrations were less than commercial/industrial ESLs.
- Arsenic, barium, nickel, and vanadium were the only metals detected at a concentration exceeding the Tier 1 ESL. Arsenic was detected at concentrations exceeding the commercial/industrial ESL in all soil samples collected at the Site. Arsenic is known to occur naturally in California soil at concentrations exceeding the commercial/industrial ESL. The San Francisco Bay Regional Water Quality Control Board has identified 11 milligrams per kilogram of arsenic in soil as an acceptable background concentration. The arsenic concentrations detected at the Site were less than this background concentration, with the exception of a concentration of 12 milligrams per kilogram detected

in one soil sample collected from boring F-12. Barium, nickel, and vanadium were detected at concentrations exceeding Tier 1 ESLs; however, these metal concentrations were less than commercial/industrial ESLs. Based on the relatively consistent metal concentrations detected throughout the Site, they likely are representative of naturally occurring conditions.

GROUNDWATER ANALYTICAL RESULTS

- GRO was not detected at a concentration exceeding laboratory reporting limits. DRO and/or ORO was detected at concentrations exceeding laboratory reporting limits in several groundwater samples, with concentrations of DRO exceeding Tier 1 and Direct Exposure Human Health Risk Level ESLs. No ESLs have been established for ORO.
- Several VOCs were detected at concentrations exceeding laboratory reporting limits, only naphthalene and vinyl chloride at concentrations exceeding Tier 1 ESLs. Naphthalene was detected at concentrations exceeding the Tier 1 ESL in the groundwater samples collected from borings F-3, F-4, and F-12. Vinyl chloride was detected at a concentration exceeding the Tier 1 ESL in the groundwater sample collected from boring F-9. All concentrations detected were less than commercial/industrial ESLs.
- Several PAHs were detected at concentrations exceeding laboratory reporting limits in groundwater samples analyzed for PAHs. Many PAHs were detected at concentrations exceeding Tier 1 and Direct Exposure Human Health Risk Level ESLs in borings F-3, F-12, and F-13.
- Several metals were detected at concentrations exceeding laboratory reporting limits in the groundwater samples analyzed. Some metals, including cadmium, cobalt, copper, mercury, nickel, selenium, and vanadium, were detected at concentrations exceeding Tier 1 ESLs. Mercury was detected also in the associated method blank.

BORING COMPLETION

At the completion of the sampling activities, the boreholes were tremie-grouted with neat cement under the supervision of an Alameda County Water District representative.

INVESTIGATION-DERIVED WASTE DISPOSAL

Investigation-derived waste, including soil cuttings and decontamination water, was containerized on the Site in two 55-gallon U.S. Department of Transportation–rated drums. The analytical results from the investigation will be used to profile the waste for appropriate disposal. The waste will be transported by a certified waste management contractor to be disposed of at an appropriate disposal facility in accordance with applicable state and federal laws.

CONCLUSIONS

The results from the Phase II ESA suggest that a release of DRO and/or ORO from historical operations occurred at several locations throughout the Site. Although soil sources for the impact to groundwater were not identified, the concentration gradient in groundwater across the Site

suggests that soil sources exist on the Site. Data also suggest the potential for contribution to the identified impact to groundwater by surrounding property releases. Volatile constituents associated with petroleum hydrocarbons were not detected in groundwater samples at concentrations exceeding laboratory reporting limits, suggesting that the Site is a candidate for low-risk closure under a continued commercial-industrial use. The elevated metals and PAH concentrations detected in groundwater samples may be a result of excessive dissolved solids that commonly occur when reconnaissance groundwater sampling methodology is used.

CLOSING

Farallon appreciates the opportunity to provide Ice Miller LLP with environmental consulting services for this project. Please contact Scott Allin at (916) 616-8113 if you have questions or need additional information.

Sincerely,

Farallon Consulting, L.L.C.

Scott Allin, R.E.P.A.
Principal Environmental Scientist

Gavin Polite Fisco, P.G.
Associate Geologist

43885 South Grimmer Boulevard
Fremont, California 94538

RE: DATA GAP INVESTIGATION AND REQUEST FOR SITE CLOSURE
6756 AND 6792 CENTRAL AVENUE
NEWARK, CALIFORNIA
FARALLON PN: 1071-105

Dear Ava Lazor:

Farallon Consulting, L.L.C. (Farallon) has prepared this letter report on behalf of 6756-6792 Central Ave Newark CA LLC (aka Prologis) to present findings from the data gap investigation performed by Farallon and to request case closure for the property at 6756 and 6792 Central Avenue in Newark, California (herein referred to as the Site) (Figure 1). Industrial constituents were identified in soil and groundwater beneath the Site during environmental due diligence activities, as summarized in the Phase I Environmental Site Assessment Report dated June 12, 2019 (2019 Phase I Report).[1] 6756-6792 Central Ave Newark CA LLC became the Site owner in July 2019 and intends to further evaluate Site conditions to determine what actions, if any, are required to remedy the identified industrial impact. The Site was originally entered into the Leaking Underground Storage Tank program under Alameda County Water District (ACWD) oversight, but at the request of ACWD was transferred to the Site Cleanup Program.

This letter report provides a brief background of the Site; a current conceptual site model (CSM); a summary of the scope of work and the results from the temporary groundwater monitoring well installation and groundwater monitoring event conducted on March 2, 2023 in accordance with the ACWD-approved Data Gap Investigation Work Plan[2] prepared by Farallon and the Sampling and Analysis Plan presented as Table 1; Farallon's conclusions

[1] Farallon. 2019. *Phase I Environmental Site Assessment Report, 6756 and 6792 Central Avenue, Newark, California.* Prepared for Prologis. June 12 (2019 Phase I Report).
[2] Farallon. 2022. Letter Report Regarding Data Gap Investigation Work Plan, 6756 and 6792 Central Avenue, Newark, California. From Peter Sims and Scott Allin. To Ava Lazor, ACWD. September 28 (Data Gap Investigation Work Plan).

including a comparison of Site conditions with the Assessment Tool for Closure[3] criteria; and Farallon's recommendations, which include a recommendation for No Further Action status and regulatory case closure for the Site.

SITE BACKGROUND

The Site consists of Alameda County Assessor's Parcel Nos. 92A-2165-14 (2.03 acres), 92A-2165-15 (8.18 acres), 92A-2165-16 (2.79 acres), and 92A-2165-17 (4.23 acres), which total approximately 17.23 acres of land. At the time of the 2019 Phase I Report, the Site was developed with five buildings (a large building consisting of conjoined structures, a large industrial building along Central Avenue, a medium-sized building, and two smaller buildings) constructed in phases between 1946 and 1968 and occupied by industrial tenants. Between 2019 and 2022, all Site buildings except the large industrial building along Central Avenue were demolished in preparation for Site redevelopment with an industrial logistics building. Access to the Site is gained from Central Avenue, west of the Site. Former Site operations included use of two 1,000-gallon underground storage tanks containing bunker fuel and gasoline, and a 20,000-gallon diesel fuel aboveground storage tank and associated fuel islands and piping, all of which were removed from the Site between 1991 and 1993. Evidence of a release was not detected during the removal of the underground storage tanks. A release from the aboveground storage tank was detected and remediated via removal of approximately 311 tons of impacted soil and 2,300 gallons of impacted groundwater. Confirmation samples collected following excavation and dewatering did not contain detectable concentrations of petroleum constituents.

As summarized in the 2019 Phase I Report, Farallon performed an environmental investigation at the Site in phases in April and May 2019, which consisted of collecting soil and reconnaissance groundwater samples for laboratory analysis. The results from the investigation suggested that a release of total petroleum hydrocarbons (TPH) as diesel-range organics (DRO) and as oil-range organics (ORO) from historical operations occurred at the Site. Volatile constituents were not detected in groundwater samples at concentrations exceeding San Francisco Bay Regional Water Quality Control Board (Water Board) vapor intrusion human health risk Environmental Screening Levels (ESLs) for commercial/industrial properties. Previous boring locations are shown on Figure 2.

[3] San Francisco Bay Regional Water Quality Control Board (Water Board). 2009. *Assessment Tool for Closure of Low-Threat Chlorinated Solvent Sites.* July 31 (Assessment Tool for Closure).

After the completion of the 2019 Phase I Report, eight groundwater monitoring wells (MW-1 through MW-8) were installed at the Site, as documented in the letter regarding Groundwater Monitoring Well Installation and Sampling dated April 20, 2020.[4] DRO was detected at a concentration of 3,400 milligrams per kilogram (mg/kg) in the soil sample collected from boring MW-8 at a depth of 3 feet below ground surface (bgs), which exceeds the commercial/industrial ESL of 1,200 mg/kg. ORO and naphthalene were detected at concentrations of 9,700 and 2.7 mg/kg, respectively, in the soil sample collected from boring MW-8 at a depth of 3 feet bgs, which is less than the commercial/industrial ESLs of 180,000 and 17 mg/kg, respectively. The lithology beneath the Site consists of sand and gravel from the surface to depths of approximately 2 to 4 feet bgs, followed by clay and silt to depths of approximately 7.5 to 11 feet bgs, and by silt and sand to depths of approximately 13 to 14 feet bgs, where first-encountered groundwater was observed. This shallow water-bearing zone consists of silty sand and sand, and extends to depths of 19 to 22 feet bgs. Beneath the shallow water-bearing zone, an aquitard of silt and clay corresponding to the Newark Aquiclude was identified, extending to the total depth explored of 25 feet bgs. Monitoring well locations are shown on Figure 2.

Groundwater monitoring data were obtained during four groundwater monitoring events, with the findings summarized in the letter regarding First and Second Quarter 2021 Groundwater Monitoring and Request for Site Closure dated March 24, 2022.[5] Groundwater data collected using low-flow sampling procedures at the Site in 2020 and 2021 indicated that Site groundwater has not been adversely impacted by DRO or polycyclic aromatic hydrocarbons (PAHs) at concentrations exceeding the maximum contaminant level (MCL), with the exception of the results from groundwater samples collected from monitoring wells MW-5 and MW-8 on January 13 and April 6, 2021, which indicated that groundwater impacts appeared to be low threat and limited in areal extent. Data suggest that the DRO impact in groundwater may be from natural organic compounds (NOCs) or hydrocarbon oxidation products (HOPs) at concentrations less than the MCL for HOPs. Data suggest the potential for releases from surrounding properties to have contributed to groundwater impacts at the Site. According to data obtained during five groundwater monitoring events conducted in 2020, 2021, and 2023, the groundwater flow direction at the Site is southwest, with a gradient of 0.001 to 0.004 foot per foot. Groundwater elevation contours

[4] Farallon. 2020. Letter Regarding Groundwater Monitoring Well Installation and Sampling, 6756 and 6792 Central Avenue, Newark, California. From Henry Pietropaoli and Scott Allin. To Douglas Young, ACWD. April 20.
[5] Farallon. 2022. Letter Regarding First and Second Quarter 2021 Groundwater Monitoring and Request for Site Closure, 6756 and 6792 Central Avenue, Newark, California. From Peter Sims and Scott Allin. To Ava Lazor, ACWD. March 24.

and flow direction are shown on Figure 3. Historical laboratory analytical results, monitoring well construction details, and groundwater elevation measurements are presented in Tables 2 through 13. Based on the findings of the previous investigations and groundwater monitoring, Farallon requested case closure under the Water Board Low-Threat Closure Policy.

In the letter regarding Denial of Low-Threat Underground Storage Tank Case Closure Request dated May 20, 2022,[6] ACWD identified four criteria where additional data are required to qualify for case closure:

1) Update the CSM to include a description of the Newark Aquifer, the shallowest regional aquifer in the Site vicinity and a source of drinking water, and describe the potential impacts to the Newark Aquifer from releases at the Site;
2) Conduct additional sampling to delineate the down-gradient extent of the contaminant plume exceeding water quality objectives, and evaluate whether petroleum hydrocarbons detected in groundwater are hydrocarbon oxidation products;
3) Update the vapor intrusion to indoor air risk assessment; and
4) Update the CSM to address the potential discharge of impacted groundwater from the Site to the nearby aquatic habitats of the San Francisco Bay and/or salt ponds.

To fulfill ACWD's four criteria, Farallon prepared the Data Gap Investigation Work Plan, which was revised via email to Ava Lazor of ACWD on October 28, 2022.[7] In addition, because the evidence of a release at the Site originated primarily from the former 10,000-gallon aboveground storage tank, the case was transferred to the Site Cleanup Program, and ACWD stated that suitability for closure of the Site should be evaluated using the Assessment Tool for Closure. Although the criteria outlined in the Assessment Tool for Closure are intended for chlorinated solvent impacted properties, they are applicable to other contaminated properties such as the Site.

The Data Gap Investigation Work Plan included advancing three borings (F-26, F-27, and F-28) on the southwest-adjoining Cargill, Inc. (Cargill) property at 7220 Central Avenue in

[6] ACWD. 2022. Letter Regarding Denial of Low-Threat Underground Storage Tank Case Closure Request, 6756 and 6792 Central Avenue, Newark, California (ACWD Site #0692). From Michelle Myers. To Gavin Polite Fisco, 6756-6792 Central Ave Newark CA LLC. May 20.
[7] Farallon. 2022. Email Regarding 6756 and 6792 Central Avenue, Newark Work Plan. From Peter Sims. To Ava Lazor, ACWD. October 28.

Newark, California identified as Alameda County Assessor's Parcel Nos. 537-0751-007-01, 537-0751-008, and 0920253-002-01. Prologis entered into an access agreement with Cargill to advance borings F-26, F-27, and F-28 at the Cargill property. Cargill provided to Prologis a Soil Removal and Closure Report[8] that documented the removal of soil and groundwater impacted by a release of bunker fuel from three aboveground storage tanks formerly located at the Cargill property. The three former bunker fuel aboveground storage tanks were removed from the Cargill property by approximately 1959. A 1959 aerial photograph reportedly showed an area of dark stained soil around the positions of the former bunker fuel aboveground storage tanks. In the 1960s, a single-story building identified as the Cargill admin building (Figure 2) was built on top of the location of one of the former bunker fuel aboveground storage tanks. Approximately 2,900 tons of soil and 2,000 gallons of water were removed from two remedial excavations proximate to the north and east of the Cargill admin building. Excavation of impacted soil was limited by the presence of the Cargill admin building. Residual bunker fuel impacts left in-place beneath the Cargill admin building were demonstrated by concentrations of TPH in soil samples collected from locations adjoining the Cargill admin building. TPH were detected in sidewall soil samples CSEX1-#1, CSEX1-#7, CSEX2-#1, and CSEX2-#2 at concentrations of 2,200, 3,000, 6,400, and 6,400 mg/kg, respectively, at a depth of approximately 7.5 feet bgs. There is not an ESL established for bunker fuel. Samples CSEX1-#1 and CSEX1-#7 were located north of the Cargill admin building, and samples CSEX2-#1 and CSEX2-#2 were located east of the Cargill admin building.

DATA GAP INVESTIGATION

The following sections provide a summary of the scope of work and results for the implementation of the Data Gap Investigation Work Plan.

1) AND 4) UPDATE THE CONCEPTUAL SITE MODEL

A CSM is presented in Table 14. The CSM presents a set of working hypotheses regarding all aspects of the contaminant release at the Site, including regional and Site geology and hydrogeology; a review of sensitive receptors; constituents of concern (COCs); the release source; a review of contamination identified in soil and groundwater; source removal activities; and a risk evaluation. The CSM presented in Table 14 has been updated to discuss the Newark Aquifer and the nearby aquatic habitats of the salt ponds and San Francisco Bay. The potential for negative impacts to the Newark Aquifer and aquatic

[8] Hydrologic Consultants, Inc. of Colorado. 1998. *Soil Removal and Closure Report, 5.4 Acre Parcel, Cargill Salt, Newark, California Facility.* Prepared for Cargill Salt. July 7.

habitats from historical releases at the Site is evaluated in the CSM and found to be unlikely. As summarized in Table 14, the CSM indicates that significant characterization data gaps do not exist.

2) CONDUCT ADDITIONAL SAMPLING TO DELINEATE THE DOWN-GRADIENT EXTENT OF THE CONTAMINANT PLUME EXCEEDING WATER QUALITY OBJECTIVES, AND EVALUATE WHETHER PETROLEUM HYDROCARBONS DETECTED IN GROUNDWATER ARE HYDROCARBON OXIDATION PRODUCTS

The following sections provide a summary of the scope of work and results for the implementation of the temporary groundwater monitoring well installation and groundwater monitoring event presented in the Data Gap Investigation Work Plan.

Permitting

Prior to commencing drilling activities, Farallon obtained ACWD Drilling Permit No. 2023-023 from ACWD. The approved permit is provided in Attachment A.

Health and Safety Plan

Per Section 3203 of Title 8 of the California Code of Regulations (8 CCR 3203), a Health and Safety Plan (HASP) is required for all field activities, due to the potential for exposure to hazardous substances. Farallon prepared a HASP prior to commencement of any field activities. The HASP complied with the requirements of the Occupational Safety and Health Act of 1970 and 8 CCR 3203.

March 2, 2023 Temporary Groundwater Monitoring Well Installation and Destruction

On March 2, 2023, three temporary groundwater monitoring wells (F-26 , F-27, and F-28) were installed for the collection of groundwater samples at the property south-adjacent and down-gradient of the Site. Boring locations for installation of temporary groundwater monitoring wells are shown on Figure 2.

The borings for installation of temporary monitoring wells were advanced by Cascade Drilling, L.P., a California-licensed C-57 contractor, using a hand auger to depths ranging from 6 to 8 feet bgs. A Farallon Scientist observed subsurface conditions during drilling and recorded Unified Soil Classification System descriptions, soil moisture, occurrence of groundwater, physical indications of potential contamination (e.g., odor, staining), and field-screening results obtained using a photoionization detector on Farallon's Log of Boring, presented in Attachment B. Soil cuttings generated during the drilling for installation of temporary monitoring wells were containerized pending characterization for off-Site disposal.

Temporary groundwater monitoring wells F-26, F-27, and F-28 were constructed using prepacked 3/4-inch polyvinyl chloride with 5 feet of 0.010-inch slotted screen and 20/40 sand contained within a steel mesh. Farallon collected groundwater level measurements and groundwater samples as described below. After sampling, the temporary groundwater monitoring wells F-26 through F-28 were destroyed by removing the pre-packed well casing and sand, and backfilling the boring with neat cement in accordance with ACWD permit requirements.

March 2, 2023 Groundwater Monitoring

Groundwater samples were collected from temporary groundwater monitoring wells F-26 through F-28 and existing monitoring wells MW-3 through MW-8. Groundwater samples were collected from temporary groundwater monitoring wells F-26 through F-28 to evaluate potential impacts to shallow groundwater down-gradient of the Site. Groundwater samples were collected from existing monitoring wells MW-3, MW-4, MW-6, and MW-7 to evaluate background concentrations; MW-5 to evaluate DRO and PAHs, which were detected in historical groundwater samples at concentrations greater than their respective commercial/industrial ESLs; and MW-8 to evaluate PAHs, which were detected in historical groundwater samples at concentrations greater than commercial/industrial ESLs.

Groundwater-level measurements and groundwater samples were collected using low-flow groundwater sampling procedures on March 2, 2023. Groundwater sampling was conducted in accordance with Farallon's standard operating procedures, provided in Attachment C. Groundwater samples were submitted to McCampbell Analytical Inc. of Pittsburg, California, accredited under the California State Environmental Laboratory Accreditation Program for analysis in accordance with the Data Gap Investigation Work Plan and the Sampling and Analysis Plan provided in Table 1.

March 2, 2023 Groundwater Monitoring Results

Groundwater monitoring well construction information is summarized in Table 7; current and historical groundwater elevations are summarized in Table 8. Current and historical groundwater analytical results for TPH including HOPs, VOCs, PAHs, metals, and total dissolved solids (TDS) are summarized in Tables 9 through 13, respectively. The analytical results were compared with Tier 1 ESLs, MCLs, and other commercial/industrial values. Field forms used for the groundwater monitoring events are provided in Attachment D. The laboratory analytical reports are provided in Attachment E. The measured groundwater elevations and calculated groundwater flow direction for the March 2, 2023 groundwater monitoring event are shown on Figure 3.

The depth to water varied between 2.70 and 5.25 feet below the ground surface or top of the monitoring well casing (Table 1). The water-level elevation was calculated to be between 14.40 and 17.12 feet above mean sea level (Table 8). The groundwater flow direction was calculated to be southwest at a gradient of approximately 0.004 foot per foot, as illustrated on Figure 3.

DRO analyzed without and with silica gel cleanup was detected at concentrations of 200 and 130 micrograms per liter (µg/l), respectively, in reconnaissance groundwater sample F-26, which exceed the Tier 1 ESL of 100 µg/l but are equal to or less than the MCL of 200 µg/l. In the laboratory report, the fuel pattern for reconnaissance groundwater sample F-26 was qualified as "diesel range compounds are detected; no recognizable pattern." However, the analytical laboratory stated via email (May 12, 2023 email)[9] that reconnaissance groundwater sample F-26 showed a "…possible degraded bunker [fuel] oil pattern. It's missing the characteristic alkane peaks but does show pattern across [the] entire [bunker fuel oil] BO range" in the DRO analyses without and with silica gel cleanup. The potential exists for residual bunker fuel impacts left in-place beneath the Cargill admin building to have contributed to impact identified in the sample from F-26. DRO analyzed without silica gel cleanup was detected at a concentration of 120 µg/l in reconnaissance sample F-27, which is greater than the Tier 1 ESL of 100 µg/l but less than the MCL of 200 µg/l. The analytical laboratory stated via the May 12, 2023 email that DRO detected without silica gel cleanup in reconnaissance groundwater sample F-27 did not match diesel or bunker fuel patterns. DRO analyzed with silica gel cleanup was not detected at a concentration exceeding laboratory reporting limit in reconnaissance groundwater sample F-27. Detections of DRO in sample F-27 likely represent HOPs, as discussed below. DRO analyzed without or with silica gel cleanup was not detected at a concentration exceeding laboratory reporting limits in reconnaissance groundwater sample F-28. DRO analyzed with or without silica gel cleanup was not detected at a concentration exceeding laboratory reporting limits in the groundwater samples collected from monitoring wells MW-3 through MW-8. Concentrations of DRO analyzed with or without silica gel cleanup were less than the saltwater ECOTOX ESLs in reconnaissance groundwater samples F-26, F-27, and F-28, and groundwater samples collected from monitoring wells MW-3 through MW-8.

[9] McCampbell Analytical Inc. (McCampbell). 2023. Email Regarding REVISED Analytical Report for Project: 1071-105; 6756-6792 Central Ave [MAI WO#: 2303198]. From Angela Rydelius. To Peter Sims, Farallon. May 12.

The following formula provided in the ESL User's Guide[10] was used to calculate HOPs present in reconnaissance samples F-26, F-27, and F-28 and samples collected from monitoring wells MW-3 through MW-8 during the March 2, 2023 groundwater monitoring event.

[HOPS] = [Total Organics] – [PHCs] – [NOCs]

Where:
[] = Concentration
[Total Organics] = Plume sample analyzed for DRO C10-C28 without silica gel cleanup
[PHCs] = Petroleum hydrocarbons; the same plume sample analyzed for DRO C10-C28 with silica gel cleanup
[NOCs] = Natural organic compounds; a sample from an unimpacted (background) area with similar vegetative and hydrogeologic characteristics as plume sample analyzed for DRO C10-C28 without silica gel cleanup

For the calculation of HOPs, the NOCs value was determined to be zero based on non-detect values for DRO C10-C28 without silica gel cleanup in groundwater samples collected from up-gradient monitoring wells MW-3 and MW-4. In addition, the HOPs calculations conservatively used zero for the PHCs value when concentrations of DRO C10-C28 with silica gel cleanup were less than the laboratory detection limit of 100 µg/l. Concentrations of HOPs were calculated to be 170 and 140 µg/l in reconnaissance groundwater samples F-26 and F-27, respectively, which exceed the Tier 1 ESL of 100 µg/l but are less than the MCL of 410 µg/l. HOPs were not detected in the reconnaissance groundwater sample F-28 or the samples collected from groundwater monitoring wells MW-3 through MW-8. Calculated HOPs concentrations were less than the saltwater ECOTOX ESL of 510 µg/l in reconnaissance samples F-26, F-27, and F-28 and samples collected from monitoring wells MW-3 through MW-8. The calculation of HOPs for sample MW-5 resulted in a negative value. The analytical laboratory stated via email[11] that both the MW-5 analysis without and with silica gel cleanup were performed on the same gas chromatograph and calibration run. No carryover for samples treated with silica gel was found as the samples were analyzed after the method blank. The analytical laboratory had disposed of sample MW-5 by the time this was discovered and was not able to re-extract the sample for further investigation of the issue. The issue was found to not be significant due to the relatively low concentration of

[10] Water Board. 2019. *User's Guide: Derivation and Application of ESLs* (ESL User's Guide).
[11] McCampbell. 2023. Email Regarding Analytical Report for Project: 251-230302; W&J Enterprises [MAI WO#: 2303185]. From Christine Askari. To Peter Sims, Farallon. May 24.

DRO C10-C28 with silica gel cleanup detected in the sample collected from monitoring well MW-5.

ORO analyzed without and with silica gel cleanup was detected at concentrations of 860 and 430 µg/l, respectively, in reconnaissance groundwater sample F-26. ORO analyzed without or with silica gel cleanup was not detected at a concentration exceeding laboratory reporting limits in the reconnaissance groundwater samples F-27 and F-28 or in groundwater samples collected from monitoring wells MW-3 through MW-8. ESLs have not been established for ORO.

Several PAHs were detected at concentrations exceeding laboratory detection limits in the groundwater samples. PAHs were not detected at concentrations exceeding Tier 1 ESLs in reconnaissance groundwater samples collected from temporary monitoring wells F-26, F-27, and F-28 or groundwater samples collected from monitoring wells MW-3, MW-4, MW-6, and MW-7. Benzo(a)pyrene, benzo(b)fluoranthene, chrysene, and indeno(1,2,3-cd)pyrene were detected at concentrations exceeding Tier 1 ESLs but less than the MCLs in groundwater samples from monitoring well MW-5. Benzo(a)pyrene was detected at a concentration exceeding the Tier 1 ESL but less than the MCL in groundwater samples from monitoring well MW-8. Concentrations of benzo(a)anthracene and naphthalene, the only PAHs with established vapor intrusion human health risk level ESLs for commercial/industrial properties, were either not detected or detected at concentrations significantly less than the vapor intrusion ESLs in groundwater samples collected during the March 2023 sampling event. Concentrations of PAHs were less than the saltwater ECOTOX ESL of 510 µg/l in reconnaissance samples F-26, F-27, and F-28 and samples collected from monitoring wells MW-3 through MW-8.

TDS were detected at a maximum concentration of 11,300 mg/l in the reconnaissance groundwater sample F-27. However, the laboratory noted that the reconnaissance groundwater samples F-26, F-27, and F-28 were aqueous solutions containing greater than approximately 1 percent sediment by volume, which likely contributed to the high TDS concentrations. TDS in groundwater monitoring wells at the Site were detected at a maximum concentration of 1,960 mg/l in the groundwater sample collected from monitoring well MW-8. The Secondary MCL range for TDS is 500 mg/l (recommended) to 1,000 mg/l (upper).[12] Detected TDS concentrations in groundwater monitoring wells installed in shallow

[12] California State Water Resources Control Board. 2018. California Code of Regulations, Title 22, Division 4, Chapter 15, Article 16, *Secondary Drinking Water Standards*. October 1.

water-bearing zones at the Site are indicative of brackish water. Shallow groundwater at the Site is contained in shallow water-bearing zones of the Newark Aquiclude, which are not expected to have beneficial use, and the presence of the Newark Aquiclude prevents significant downward migration of impacted groundwater from shallow water-bearing zones to the Newark Aquifer.

Waste Disposal

Disposable sampling and health and safety supplies and equipment were disposed of in an appropriate waste dumpster. Soil cuttings, excess groundwater, and decontamination water were stored in 55-gallon drums pending receipt of laboratory analytical results. Drums were stored on the Site in coordination with the Site owner. Laboratory analytical results from a sample collected from the drum of soil cuttings and groundwater monitoring results from this data gap investigation were used to profile the waste and identify appropriate disposal options. Contents of the drums were classified as nonhazardous and the drums were removed from the Site by Belshire Environmental Services, Inc. for disposal on May 8, 2023. Waste manifests are provided in Appendix F.

3) UPDATE THE VAPOR INTRUSION TO INDOOR AIR RISK ASSESSMENT

The vapor intrusion to indoor air risk assessment has been updated to include the most recent data collected during implementation of the Data Gap Investigation Work Plan. The cumulative vapor intrusion exposure risk and hazard were calculated by entering maximum concentrations of volatile COCs detected in groundwater samples collected from monitoring wells into the Water Board ESL Tier 2 – Site-Specific Cumulative Risk and Hazard Calculator,[13] presented in Attachment G. Only COCs that contribute to vapor intrusion exposure risk and hazard were included in the risk assessment calculations. For example, DRO was detected in groundwater, but because it does not have a commercial/industrial vapor intrusion human health risk level ESL, it does not contribute to the calculation for cumulative vapor intrusion exposure risk and hazard, and was not included in the calculation of vapor intrusion exposure risk and hazard. A review of historical data collected at the Site found detections of four COCs that contribute to the calculation for cumulative vapor intrusion exposure risk and hazard: methyl ethyl ketone, methyl tertiary-butyl ether, benzo(a)anthracene, and naphthalene. The maximum detected concentration in groundwater monitoring well samples for each of the four COCs was entered into the calculation presented in Appendix F. Cumulative cancer risk and noncancer hazard due to

[13] Water Board. 2019. *Environmental Screening Levels, Table T2-2: Tier 2 – Site-Specific Cumulative Risk and Hazard Calculator.* Rev. 2.

vapor intrusion were 6.3E-09 and 1.5E-04, respectively, which are less than the cancer risk and the noncancer hazard thresholds of 1.0E-6 and 1.0, respectively. Although no soil gas samples have been collected at the Site, the plethora of soil and groundwater samples with concentrations of all COCs less than commercial/industrial vapor intrusion human health risk level ESLs, and the cumulative cancer risk and noncancer hazard less than thresholds illustrate that subsurface conditions do not expose commercial workers to unacceptable health risks under continued commercial use.

CONCLUSIONS

The groundwater flow direction at the Site was calculated to be southwest at a gradient of approximately 0.004 foot per foot during the March 2, 2023 groundwater monitoring event, which is consistent with previous results.

Analytical results indicate that concentrations of COCs in groundwater at the Site are less than MCLs. The concentrations of DRO and PAHs detected in groundwater at the Site have decreased from slightly greater than the MCLs to less than the MCLs in the most recent groundwater monitoring event. COCs were not detected at concentrations exceeding the MCLs in the reconnaissance groundwater samples F-26, F-27, and F-28, and the contaminant plume exceeding water quality goals has been delineated in the down-gradient direction. The concentrations of volatile COCs detected in groundwater samples collected from on-Site monitoring wells MW-3 through MW-8 on March 2, 2023 were less than the commercial/industrial ESL for vapor intrusion human health risk level. The concentrations of COCs detected in reconnaissance samples F-26, F-27, and F-28 and samples collected from monitoring wells MW-3 through MW-8 were less than saltwater ECOTOX ESLs.

The Site is in the Niles Cone Groundwater Basin, where groundwater is considered to have beneficial use, per the Basin Plan.[14] However, groundwater quality within the Newark Aquifer near the San Francisco Bay has been degraded by saltwater intrusion. Detected TDS concentrations in groundwater monitoring wells installed in shallow water-bearing zones at the Site are indicative of brackish water, which is expected given the proximity of the Site to the San Francisco Bay and salt ponds. Shallow groundwater at the Site is contained in shallow water-bearing zones of the Newark Aquiclude, which are not expected to have beneficial use, and the presence of the Newark Aquiclude prevents significant downward

[14] Water Board. 2019. *Water Quality Control Plan (Basin Plan) for the San Francisco Bay Basin.* Updated March 7, 2023. November 5 (Basin Plan).

migration of impacted groundwater from shallow water-bearing zones to the Newark Aquifer. The down-gradient salt ponds and the San Francisco Bay were identified approximately 100 feet southwest and 2.5 miles southwest of the Site, respectively, and it is highly unlikely that they have been impacted by historical releases at the Site because COCs were not detected at concentrations exceeding aquatic habitat ESLs in the down-gradient groundwater samples F-26, F-27, and F-28. The nearest down-gradient water-supply well is approximately 1,600 feet southwest of the Site. Based on the distance to the water-supply well from the Site and the low concentrations of COCs detected in groundwater at the Site, it is highly unlikely that historical releases at the Site have impacted water-supply wells or have the potential to impact water-supply wells in the future.

Based on the findings of this data gap investigation, the CSM is complete, with no remaining data gaps. Pollutant sources have been remediated to the extent feasible. Residual chemical impact beneath the Site does not pose an unacceptable risk to human health, ecological health, or sensitive receptors, considering current and identifiable future land and water uses. Residual chemical impact does not pose an unacceptable threat to groundwater and surface water resources, considering current and identifiable future beneficial uses. Detections of COCs in the groundwater plume have decreased from slightly exceeding the MCLs to less than the MCLs in the most recent groundwater monitoring event performed on March 2, 2023, and cleanup standards have been met. Based on a review of Site conditions compared with the Assessment Tool for Closure, as summarized in Table 15, it is Farallon's opinion that the closure criteria have been met.

RECOMMENDATIONS

It is Farallon's opinion that the Site qualifies for closure under the Assessment Tool for Closure. Farallon recommends that the Site be granted No Further Action status and regulatory case closure. Upon receipt of concurrence from ACWD, Farallon will arrange for destruction of the Site monitoring wells.

CLOSING

Please contact Peter Sims at (949) 338-8317 or Scott Allin at (916) 616-8113 if you have questions regarding the information provided in this letter report.

Sincerely,

Farallon Consulting, L.L.C.

LIMITATIONS

The conclusions contained in this report/assessment are based on professional opinions with regard to the subject matter. These opinions have been arrived at in accordance with currently accepted hydrogeologic and engineering standards and practices applicable to this location. The conclusions contained herein are subject to the following inherent limitations:

- Accuracy of Information. Farallon reviewed certain information used in this report/assessment from sources that were believed to be reliable. Farallon's conclusions, opinions, and recommendations are based in part on such information. Farallon's services did not include verification of its accuracy. Should the information upon which Farallon relied prove to be inaccurate, Farallon may revise its conclusions, opinions, and/or recommendations.
- Reconnaissance and/or Characterization. Farallon performed a reconnaissance and/or characterization of the Site that is the subject of this report/assessment to document current conditions. Farallon focused on areas deemed more likely to exhibit hazardous materials conditions. Contamination may exist in other areas of the Site that were not investigated or were inaccessible. Site activities beyond Farallon's control could change at any time after the completion of this report/assessment.

Farallon does not guarantee that the Site is free of hazardous or potentially hazardous substances or conditions, or that latent or undiscovered conditions will not become evident in the future. Farallon's observations, findings, and opinions are as of the date of the report.

This report/assessment has been prepared in accordance with the contract for services between Farallon and Prologis. No other warranties, representations, or certifications are made.

Water Board Tier 1 ESLs for Groundwater[3]			**100**	**100**	**100**				**100**	**NE**	**NE**
Water Board Direct Exposure: MCL Priority[4]			**760**	**200**	**200**				**410**	**NE**	**NE**
Water Board ESLs Vapor Intrusion Human Health Risk Levels: Commercial/Industrial[5]			**NE**	**NE**	**NE**				**NE**	**NE**	**NE**
Water Board ESLs Aquatic Habitat Goal: Saltwater Ecotox[6]			**3,700**	**640**	**640**				**510**	**NE**	**NE**

NOTES:

Green highlight denotes concentrations exceeding the laboratory reporting limit.

Results in **bold** and highlighted **green** denote concentrations exceeding Tier 1 ESLs.

Results in **bold** and highlighted **yellow** denote concentrations exceeding Priority MCLs.

Results in **bold** and highlighted **orange** denote concentrations exceeding Priority MCLs and Aquatic Habitat Saltwater Ecotox Goals.

Gray text denotes reconnaissance groundwater sample.

--- denotes sample not analyzed.

< denotes analyte not detected at or exceeding the reporting limit listed.

* denotes aqueous sample containing greater than approximately 1 percent sediment by volume.

[1]Analyzed by U.S. Environmental Protection Agency Method 8015B.

[2]HOPs = Total Organics - PHCs - NOCs. For PHC or NOC concentrations reported at less than the laboratory reporting limit, zero (0) was used in the HOPs formula.

[3]San Francisco Bay Regional Water Quality Control Board (Water Board) Tier 1 ESLs for groundwater, dated 2019 (Rev. 2).

[4]Water Board Groundwater Direct Exposure Human Health Risk Levels (Table GW-1), dated 2019 (Rev. 2).

[5]Water Board Groundwater Vapor Intrusion Human Health Risk Levels (Table GW-3), dated 2019 (Rev. 2).

[6]Water Board Groundwater Aquatic Habitat Goal Levels (Table GW-2), dated 2019 (Rev. 2).

DRO = total petroleum hydrocarbons (TPH) as diesel-range organics

E2 = no recognizable pattern

ESL = Environmental Screening Level

GRO = TPH as gasoline-range organics

HOPS = hydrocarbon oxidation products

J = result is an estimate

MCL = Maximum Contaminant Level

NE = not established

NOCs = natural organic compounds; background sample analyzed for DRO C10-C28 with SC

ORO = TPH as oil-range organics

PHCs = petroleum hydrocarbons; plume sample analyzed for DRO C10-C28 with SGC

SGC = silica gel cleanup

Total Organics = plume sample analyzed for DRO C10-C28 without SGC

NOTES:

Green highlight denotes concentrations exceeding the laboratory reporting limit.

Results in **bold** and highlighted **green** denote concentrations exceeding Tier 1 ESLs.

Results in **bold** and highlighted **yellow** denote concentrations exceeding Priority MCLs.

Results in **bold** and highlighted **orange** denote concentrations exceeding Aquatic Habitat Saltwater Ecotox Goals and potentially Priority MCLs.

Gray text denotes reconnaissance groundwater sample.

< denotes analyte not detected at or exceeding the reporting limit listed.

--- denotes sample not analyzed.

* denotes aqueous sample containing greater than approximately 1 percent sediment by volume.

B = analyte detected in the associated method blank

ESL = Environmental Screening Levels

MCL = Maximum Contaminant Level

J = result is an estimate

NE = not established

PAHs = polycyclic aromatic hydrocarbons

Table 14
Conceptual Site Model
6756 and 6792 Central Avenue
Newark, California
Farallon PN: 1071-040

Conceptual Model Element	Conceptual Model Sub-Element	Description
Geology and Hydrogeology	Regional	The Site is in Newark, California along the southeastern coast of the San Francisco Bay, the main water body in Newark. The Site is characterized by Quaternary alluvium and marine deposits, which are composed of sequences of interbedded silts, sands, and clays to depths greater than 200 feet below ground surface (bgs). Alluvial deposits range in age from Pliocene to Holocene. The Site is in the Niles Cone Groundwater Basin, and groundwater flow beneath the region is predominantly to the west-southwest. As described in the Urban Water Management Plan,[1] the shallowest aquifer of the Niles Cone Groundwater Basin is the Newark Aquifer, which consists of gravel and sand between depths of approximately 40 and 140 feet bgs. The Newark Aquifer is overlain in most of the basin by the Newark Aquiclude, consisting of silt and clay. Layers of sand and silt within the Newark Aquiclude can act as non-regional shallow water-bearing zones. Beneath the Newark Aquifer is a clay aquitard that separates the Newark Aquifer from the Centerville Aquifer, Fremont Aquifer, and the Deep Aquifer. The Newark Aquifer is generally confined except in the area immediately west of the Hayward fault, where the overlying aquitard is absent in the forebay area. Groundwater in the Niles Cone Groundwater Basin has beneficial use per the Basin Plan.[2] The Newark Aquifer is a source of drinking water among other beneficial uses. However, groundwater quality within the Newark Aquifer near the San Francisco Bay has been degraded by saltwater intrusion. Aquifer reclamation wells up-gradient of the Site prevent further saltwater intrusion to protect drinking water as a beneficial use. As a result of the Site's location relative to the San Francisco Bay and up-gradient aquifer reclamation wells, groundwater within the Newark Aquifer beneath the Site is expected to be brackish and is not expected to be used for drinking water. Shallow water-bearing zones within the Newark Aquiclude are also expected to be brackish and are not expected to have beneficial use. The presence of the Newark Aquiclude prevents significant downward migration of impacted groundwater from shallow water-bearing zones within the Newark Aquiclude to the Newark Aquifer.
Geology and Hydrogeology	Site	According to investigations conducted by Farallon Consulting, L.L.C. (Farallon), the lithology beneath the Site consists of sand and gravel from the surface to depths of approximately 2 to 4 feet bgs, followed by clay and silt to depths of approximately 7.5 to 11 feet bgs, and by silt and sand to depths of approximately 13 to 14 feet bgs, where first-encountered groundwater was observed. This shallow water-bearing zone consists of silty sand and sand, and extends to depths of 19 to 22 feet bgs. Beneath the shallow water-bearing zone, an aquitard of silt and clay corresponding to the Newark Aquiclude was identified, extending to the total depth explored of 25 feet bgs. According to data obtained during five groundwater monitoring events conducted in 2020, 2021, and 2023, the groundwater flow direction at the Site is southwest, with a gradient of 0.001 to 0.004 foot per foot.

Table 14
Conceptual Site Model
6756 and 6792 Central Avenue
Newark, California
Farallon PN: 1071-040

Conceptual Model Element	Conceptual Model Sub-Element	Description
Sensitive Receptors	Surface Water Bodies	The federally designated wetlands nearest the Site are salt ponds that were identified approximately 100 feet southwest of the Site on the southwest-adjacent Cargill Salt property at 7220 Central Avenue. The water body nearest the Site was identified as the San Francisco Bay, approximately 2.5 miles southwest of the Site.
Sensitive Receptors	Nearby Wells	Water-supply wells within a 1-mile radius of the Site were identified in the California State Water Resources Control Board Groundwater Ambient Monitoring and Assessment Program database. Two wells were identified approximately 3,168 and 4,800 feet northeast and up-gradient of the Site. Five wells were identified approximately 1,600 to 4,200 feet southwest and down-gradient of the Site. Based on the distance of these wells from the Site and/or the direction of groundwater flow, it is highly unlikely that historical releases at the Site have impacted these water-supply wells or have the potential to impact water-supply wells in the future.
Constituents of Concern		Historical industrial use of the Site indicated the need for investigations at the Site. Previous investigations included laboratory analysis for: total petroleum hydrocarbons (TPH) as diesel-range organics (DRO), as oil-range organics (ORO), and as gasoline-range organics (GRO); polycyclic aromatic hydrocarbons (PAHs); polychlorinated biphenyls; metals; and volatile organic compounds (VOCs). The constituents of concern (COCs) for the Site are compounds that have been detected at concentrations exceeding Tier 1 Environmental Screening Levels (ESLs), which were identified during investigations as DRO, ORO, VOCs, PAHs, and select metals. Groundwater monitoring well sampling results confirmed that historical reconnaissance groundwater sample analytical results are not representative of groundwater conditions at the Site.
Release Source		Two 1,000-gallon underground storage tanks (USTs) containing bunker fuel and gasoline, and a 20,000-gallon diesel fuel aboveground storage tank (AST) and associated fuel islands and piping were removed from the Site between 1991 and 1993. Visual inspection and soil sampling at the time of removal indicated that a release had not occurred from the two USTs. Although visual inspection of the AST, associated fuel islands, and piping did not indicate that a release had occurred, DRO was detected at a maximum concentration of 2,800 milligrams per kilogram (mg/kg) in soil samples collected. A soil and groundwater investigation was conducted in September 1999 to determine the extent of petroleum hydrocarbon contamination from the AST. Based on the results from the investigation, an excavation was conducted north of the former location of the AST in June 2000, and approximately 311 tons of soil and 2,300 gallons of groundwater were removed from the Site. Confirmation samples collected following excavation did not contain detectable concentrations of TPH. Historical industrial operations at the Site may have been a potential source of impacts to soil and groundwater. Data obtained during five groundwater monitoring events using low-flow sampling procedures at the Site in 2020, 2021, and 2023 indicated that Site groundwater has not been adversely impacted by DRO or PAHs at concentrations exceeding the maximum contaminant level (MCL), with the exception of the results from groundwater samples collected from monitoring wells MW-5 and MW-8 on January 13 and April 6, 2021, which indicated that groundwater impacts appeared to be low threat and limited in areal extent. The March 2, 2023 groundwater monitoring event found that detections of DRO and PAHs in samples collected from off-Site down-gradient

Table 14
Conceptual Site Model
6756 and 6792 Central Avenue
Newark, California
Farallon PN: 1071-040

Conceptual Model Element	Conceptual Model Sub-Element	Description
		temporary groundwater monitoring wells F-26, F-27, and F-28 and Site monitoring wells MW-3 through MW-8 were less than MCLs. Groundwater impacts at the Site have been characterized and are low threat. Data suggest the potential for releases from surrounding properties to have contributed to groundwater impacts at the Site.
Constituents of Concern in Soil		COC detections in soil samples collected by Farallon are summarized below: • DRO was not detected at a concentration exceeding Tier 1 ESLs, with the exception of a detection of DRO in the sample collected from boring MW-8, which also exceeded the commercial/industrial ESL. • ORO was not detected at a concentration exceeding Tier 1 ESLs, with the exception of a detection of ORO in the sample collected from boring MW-8, which was less than the commercial/industrial ESL. • VOCs were not detected at a concentration exceeding Tier 1 ESLs, with the exception of naphthalene, which was detected at concentrations less than the commercial/industrial ESL in samples collected from borings F-4, F-20, and MW-8. • PAHs were not detected at a concentration exceeding Tier 1 ESLs, with the exception of two compounds detected at concentrations less than the commercial/industrial ESL in a sample collected from boring F-13. • Arsenic, barium, nickel, and vanadium were the only metals detected at concentrations exceeding Tier 1 ESLs; all concentrations were less than commercial/industrial ESLs. Arsenic is known to occur naturally at concentrations exceeding the commercial/industrial ESL in California soil. The San Francisco Bay Regional Water Quality Control Board has identified 11 mg/kg of arsenic as an acceptable background concentration in soil. The arsenic concentrations detected at the Site were less than this background concentration, with the exception of a detection of 12 mg/kg in a sample collected from boring F-12.

Table 14
Conceptual Site Model
6756 and 6792 Central Avenue
Newark, California
Farallon PN: 1071-040

Conceptual Model Element	Conceptual Model Sub-Element	Description
Constituents of Concern in Groundwater		COC detections in groundwater samples collected by Farallon are summarized below: • DRO was detected in two samples collected from monitoring well MW-5, with the maximum concentration of 220 micrograms per liter (µg/l) in the sample collected on April 6, 2021 slightly exceeding the MCL of 200 µg/l. DRO was not detected at a concentration exceeding the laboratory reporting limit in the sample collected from monitoring well MW-5 and analyzed for DRO with silica gel cleanup, which is indicative of the presence of natural organic compounds or hydrocarbon oxidation products (HOPs) in groundwater. Subsequent results of groundwater monitoring at monitoring well MW-5 found DRO without or with silica gel cleanup was not detected exceeding the laboratory reporting limit. DRO without and with silica gel cleanup was detected in off-Site reconnaissance groundwater sample F-26 collected on March 2, 2023, at concentrations equal or less than the MCL, respectively. The chromatograph pattern of the DRO detected in sample F-26 matched a degraded bunker fuel pattern, rather than diesel, which is consistent with residual bunker fuel impacts remaining beneath the Cargill admin building south of the Site. The concentration of HOPs calculated for sample F-26 was less than the MCL. DRO without silica gel cleanup was detected in off-Site reconnaissance groundwater sample F-27 at a concentration less than the MCL. The concentration of HOPs calculated for sample F-27 was less than the MCL. • ORO was detected in the sample collected on January 13, 2021 from monitoring well MW-5. ORO was detected in reconnaissance groundwater sample F-26 collected on March 2, 2023. An ESL has not been established for ORO. • VOCs were not detected at a concentration exceeding Tier 1 ESLs or MCLs. • Historically, select PAHs were detected at concentrations exceeding Tier 1 ESLs and benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene and dibenzo(a,h)anthracene were detected at maximum concentrations of 0.096, 0.28, 0.36, and 0.049 µg/l, respectively, which slightly exceeded the MCLs of 0.017, 0.2, 0.25 and 0.025 µg/l, respectively. During the most recent groundwater monitoring event on March 2, 2023, PAHs were not detected at concentrations exceeding the MCLs.
Source Removal Activities		USTs formerly present at the Site consisted of two 1,000-gallon USTs containing bunker fuel and gasoline, and a 20,000-gallon diesel fuel AST. The former USTs, AST, and associated fuel islands and piping were removed from the Site between 1991 and 1993, stopping any releases that may have occurred. An excavation was conducted north of the former location of the AST in June 2000, and approximately 311 tons of soil and 2,300 gallons of groundwater were removed from the Site. Confirmation samples collected following excavation did not contain detectable concentrations of petroleum hydrocarbons.

Table 14
Conceptual Site Model
6756 and 6792 Central Avenue
Newark, California
Farallon PN: 1071-040

Risk Evaluation	Potential Receptors	The Site is used for commercial/industrial purposes, with no changes in Site use planned for the future. Potential receptors are commercial/industrial workers and construction workers. Potential exposure pathways evaluated were incidental ingestion, dermal contact, dust inhalation, and vapor inhalation. An assessment of whether an exposure pathway is potentially complete, incomplete, or insignificant follows. For direct contact with contaminated soil, the exposure pathways for incidental ingestion, dermal contact, and dust inhalation for commercial/industrial workers are considered complete. However, shallow soil throughout the Site has been sampled and analyzed, demonstrating concentrations of COCs less than commercial/industrial ESLs, which reflect the intended use of the Site. The only exceptions were a detection of arsenic that slightly exceeded the acceptable background concentration, and a detection of DRO that exceeded the commercial/industrial ESL. For direct contact with contaminated groundwater, the ingestion and dermal pathways for groundwater are considered incomplete. Shallow groundwater from permanent groundwater monitoring wells across the Site was sampled and analyzed during five sampling events conducted from March 2020 to March 2023. Free-product was not encountered during the five sampling events. Concentrations of COCs detected in groundwater samples were less than the direct exposure human health risk level ESLs, with the exceptions of a concentration of DRO detected in a groundwater sample collected from monitoring well MW-5 on April 6, 2021, and concentrations of select PAHs detected in samples collected from monitoring wells MW-5 and MW-8 on March 5, 2020 and January 13 and April 6, 2021. DRO was not detected at a concentration exceeding the laboratory reporting limit in the groundwater sample collected concurrently from monitoring well MW-5 on April 6, 2021 and analyzed by U.S. Environmental Protection Agency Method 8015 with silica gel cleanup, which is indicative of the presence of natural organic compounds or HOPs in groundwater. Subsequent groundwater monitoring performed on March 2, 2023 found concentrations of DRO without and with silica gel cleanup were not detected exceeding laboratory reporting limits in samples collected from monitoring wells MW-3 through MW-8 at the Site. Calculated HOPs concentrations were not detected in samples collected from monitoring wells MW-3 through MW-8 at the Site. The detected concentrations of DRO and PAHs historically detected in samples collected from monitoring wells MW-5 and MW-8 appear to be decreasing. Down-gradient and off-Site reconnaissance groundwater samples collected from temporary monitoring wells F-26, F-27, and F-28 have delineated the down-gradient extent of the contaminant plume. The Site is in the Niles Cone Groundwater Basin, proximate to the San Francisco Bay and the large system of salt ponds present along the San Francisco Bay's margin. Groundwater in the Niles Cone Groundwater Basin is known to experience saltwater intrusion, especially closer to the San Francisco Bay. Groundwater in the Niles Cone Groundwater Basin, including the Newark Aquifer, is considered to have beneficial use per the Basin Plan, regardless of total dissolved solids (TDS) concentrations. Concentrations of TDS detected in shallow groundwater at the Site have historically been as high as 3,160 milligrams per liter (mg/l) and generally exceed the Secondary MCL range for TDS of 500 mg/l (recommended) to 1,000 mg/l (upper). According to the Basin Plan, groundwater that contains TDS at a concentration exceeding 3,000 mg/l is not reasonably expected to supply a public water system. It is not anticipated that shallow groundwater beneath the Site would be used as a source of drinking water as part of a public water system. Shallow groundwater at the Site is contained in silt and sand zones within the Newark Aquiclude, which prevents significant migration of shallow groundwater into the Newark Aquifer below. Groundwater in the Newark aquifer is identified for beneficial uses including drinking water, but because of the presence of the Newark Aquiclude,

Table 14
Conceptual Site Model
6756 and 6792 Central Avenue
Newark, California
Farallon PN: 1071-040

Conceptual Model Element	Conceptual Model Sub-Element	Description
		impacts to shallow groundwater are unlikely to migrate to the Newark Aquifer. The down-gradient salt ponds and San Francisco Bay were identified approximately 100 feet southwest and 2.5 miles southwest of the Site, respectively, and it is unlikely that they have been impacted by historical releases at the Site because COCs were not detected at concentrations exceeding aquatic habitat ESLs in the down-gradient groundwater samples F-26, F-27, and F-28. The down-gradient water-supply well nearest the Site was identified approximately 1,600 feet southwest of the Site. Based on the distance to this well from the Site and the low concentrations of COCs detected in groundwater at the Site, it is highly unlikely that historical releases at the Site have impacted water-supply wells or have the potential to impact water-supply wells in the future. For volatilization from soil or groundwater to indoor and outdoor air, the vapor inhalation pathway is considered incomplete. The concentrations of volatile COCs detected in shallow soil and groundwater at the Site were less than the commercial/industrial vapor intrusion human health risk level ESLs. In addition, cumulative vapor intrusion exposure risk and hazard were calculated by entering maximum concentrations of volatile COCs detected in samples collected from groundwater monitoring wells into the Tier 2 – Site-Specific Cumulative Risk and Hazard Calculator.[3] Only COCs that contribute to vapor intrusion exposure risk and hazard were included in the risk assessment calculations. For example, DRO was detected in groundwater, but because it does not have a commercial/industrial vapor intrusion human health risk level ESL, it does not contribute to the calculation for cumulative vapor intrusion exposure risk and hazard, and was not included in the calculation of vapor intrusion exposure risk and hazard. A review of historical data collected at the Site found detections of four COCs that contribute to the calculation for cumulative vapor intrusion exposure risk and hazard: methyl ethyl ketone, methyl tertiary-butyl ether, benzo(a)anthracene, and naphthalene. The maximum detected concentration in groundwater monitoring well samples for each of the four COCs was entered into the calculation presented in Appendix F. Cumulative cancer risk and cumulative noncancer hazard due to vapor intrusion were 6.3E-09 and 1.5E-04, respectively, which are less than the cancer risk and noncancer hazard thresholds of 1.0E-6 and 1.0, respectively. Although no soil gas samples have been collected at the Site, the plethora of soil and groundwater samples with concentrations of volatile COCs less than commercial/industrial vapor intrusion human health risk level ESLs, and the cumulative cancer risk and noncancer hazard less than thresholds illustrate that subsurface conditions do not expose commercial workers to unacceptable health risks under continued commercial use.

Table 15
Assessment Tool for Closure Checklist
6756 and 6792 Central Avenue
Newark, California
Farallon PN: 1071-040

CRITERIA	DISCUSSION	CRITERIA SATISFIED?
1. Develop a complete conceptual site model (CSM).		**Yes**
1a) Pollutant sources are identified and evaluated.	Former underground storage tanks (USTs) at the Site consisted of two 1,000-gallon USTs containing bunker fuel and gasoline and a 20,000-gallon diesel fuel aboveground storage tank (AST). The USTs, AST, and associated fuel islands and piping were removed from the Site between 1991 and 1993, stopping any releases that may have occurred. Visual inspection and soil sampling at the time of removal indicated that a release had not occurred from the two USTs. Soil and groundwater sampling at the time of the removal of the AST and associated fuel islands and piping indicated that a release had occurred.	
1b) The Site is adequately characterized.	The constituents of concern (COCs) at the Site in soil are total petroleum hydrocarbons (TPH) as diesel-range organics (DRO), TPH as oil-range organics (ORO), naphthalene, polycyclic aromatic hydrocarbons (PAHs), and metals. Only a single detection of arsenic that slightly exceeded the acceptable background concentration, and a detection of DRO that exceeded the San Francisco Bay Regional Water Quality Control Board (Water Board) commercial/industrial Environmental Screening Level (ESL) were reported in soil samples. The COCs at the Site in groundwater are: DRO, ORO, and PAHs. During the most recent groundwater monitoring event performed on March 2, 2023, detections of COCs in groundwater were less than the maximum contaminant levels (MCLs).	
1c) Exposure pathways, receptors, and potential, risks, threats, and other environmental concerns are identified and assessed.	Potential exposure pathways evaluated were incidental ingestion, dermal contact, dust inhalation, and vapor inhalation. Potential receptors are commercial/industrial workers and construction workers. Potential impacts to surface waters, groundwater with beneficial uses, and nearby water supply wells were evaluated.	

Table 15
Assessment Tool for Closure Checklist
6756 and 6792 Central Avenue
Newark, California
Farallon PN: 1071-040

CRITERIA	DISCUSSION	CRITERIA SATISFIED?
2. Control sources and mitigate risks and threats.		**Yes**
2a) Pollutant sources are remediated to the extent feasible.	In June 2000, approximately 311 tons of soil and 2,300 gallons of groundwater were removed from an excavation conducted to remove secondary source material on the northern side of the former location of the 20,000-gallon diesel AST at the Site. Confirmation samples collected following excavation did not contain detectable concentrations of TPH. Concentrations of DRO and ORO detected in the soil sample collected from boring MW-8 exceeded the Water Board Tier 1 ESLs. Groundwater samples collected from monitoring well MW-8 have not shown detectable concentrations of DRO or ORO, indicating that the soil impacts are not acting as a secondary source of impacts to groundwater in the vicinity of monitoring well MW-8.	

Table 15
Assessment Tool for Closure Checklist
6756 and 6792 Central Avenue
Newark, California
Farallon PN: 1071-040

CRITERIA	DISCUSSION	CRITERIA SATISFIED?
2b) Unacceptable risks to human health, ecological health, and sensitive receptors, considering current and future land and water uses, are mitigated.	A risk evaluation for potential receptors was conducted, and it was demonstrated that human health and the environment is protected: • For direct contact with contaminated soil, the exposure pathways for incidental ingestion, dermal contact, and dust inhalation for commercial/industrial workers are considered complete; however, concentrations of COCs were less than commercial/industrial ESLs, with the exceptions of a single detection of arsenic that slightly exceeded the acceptable background concentration, and a single detection of DRO that exceeded the commercial/industrial ESL, which are considered low threat. • Groundwater monitoring results from the most recent event on March 2, 2023 showed that COCs in groundwater samples collected from the Site are less than the MCLs, with concentrations decreasing from historical levels. The down-gradient extent of the contaminant plume has been delineated by the off-Site down-gradient reconnaissance groundwater samples F-26, F-27, and F-28. Groundwater in the Newark Aquifer is identified for beneficial uses including drinking water, but because of the presence of the Newark Aquiclude, impacts to shallow groundwater are unlikely to migrate to the Newark Aquifer. Down-gradient surface waters are highly unlikely to have been impacted because concentrations of COCs were not detected at concentrations exceeding aquatic habitat ESLs in the down-gradient groundwater samples F-26, F-27, and F-28. Due to the distance from the Site, groundwater supply wells are unlikely to have been impacted. • For volatilization from soil or groundwater to indoor and outdoor air, the vapor inhalation pathway is considered incomplete; the concentrations of volatile COCs detected in shallow soil and groundwater at the Site were less than the commercial/industrial vapor intrusion human health risk level ESLs; and cumulative cancer risk and cumulative noncancer hazard due to vapor intrusion were 6.3E-09 and 1.5E-04, respectively, which are less than the cancer risk and noncancer hazard thresholds of 1.0E-6 and 1.0, respectively.	
2c) Unacceptable threats to groundwater and surface water resources, considering existing and potential beneficial uses, are mitigated.	Unacceptable threats to groundwater and surface water resources due to the release at the Site have been evaluated and found to be highly unlikely because detections of COCs in groundwater are less than the MCLs and aquatic habitat ESLs as of the most recent groundwater monitoring event performed on March 2, 2023.	

Table 15
Assessment Tool for Closure Checklist
6756 and 6792 Central Avenue
Newark, California
Farallon PN: 1071-040

CRITERIA	DISCUSSION	CRITERIA SATISFIED?
3. Demonstrate that residual pollution in all media will not adversely affect present and anticipated land and water uses		**Yes**
3a) Groundwater plumes are decreasing.	Detections of COCs in groundwater have decreased from slightly greater than the MCLs to less than the MCLs in the most recent groundwater monitoring event performed on March 2, 2023.	
3b) Cleanup standards can be met in a reasonable timeframe.	Detections of COCs in groundwater are less than the MCLs as of the most recent groundwater monitoring event performed on March 2, 2023.	
3c) Risk management measures are appropriate, documented, and do not require future Water Board oversight.	Risk management measures are not required for the Site.

Attention: Ade Fagorala

Subject: Recommendation for Spills, Leaks, Investigation and Cleanup Case Closure of Bay Mirror, 6756 Central Avenue, Newark (Site #20)

After reviewing the Alameda County Water District (ACWD) file on the fuel release which occurred at the Bay Mirror site located at 6756 Central Avenue, Newark, it does not appear that further monitoring, investigation or remedial actions are necessary to protect the beneficial uses of our groundwater basin. Therefore, as specified in our June 27, 1996 Cooperative Agreement, ACWD recommends that no further action be required and that the Regional Water Quality Control Board close this case with a case closure letter.

Enclosed is our Spills, Leaks, Investigation and Cleanup case closure summary for this site. If you have any questions regarding this matter, please contact Steven Inn at (510) 659-1970, Extension 441.

Sincerely,

Paul Piraino
General Manager

TOG	***3,600***	★	–	–

★= Confirmation soil samples were not analyzed for Total Oil & Grease, however Total Petroleum Hydrocarbons as Diesel were reduced to non-detectable concentrations in the final samples.

Comments (Depth of Remediation, etc.): ***The Bay Mirror, Inc. facility is located at 6756 Central Avenue Newark, California. Portions of the Bay Mirror, Inc. property are leased out to several other businesses, including truck and equipment storage and maintenance, metals shop, wood pallet maker, and cultured marble manufacturer. A total of two Underground Storage Tanks (USTs) and one Aboveground Storage Tank (AST) were once in place at the Bay Mirror property before they were removed in 1991 and 1993.***

On June 14, 1991, The Environmental Construction Company (TECC) removed one 20,000 gallon single-walled, steel diesel AST in the vicinity of the wooden pallet manufacturing factory. The tank was removed under the supervision of the City of Newark Fire Department. The AST did not show any signs of pitting nor rusting; six soil samples were collected around the AST and its pipeline for Total Petroleum Hydrocarbon as diesel (TPH-d) and Benzene, Toluene, Ethylbenzene, and Xylenes (BTEX) analyses. Four samples were collected beneath the AST and two samples from below the pipeline. Soil samples S-1, S-2, S-4, and PL-2 documented TPH-d concentrations at 630 ppm, 190 ppm,

III. Release and Site Characterization Information (Continued)

2,400 ppm, and 2,800 ppm, respectively. Soil sample S-3 and PL-1 did not contain any detectable TPH-d. Sample S-4 contained 5.4 ppb of Toluene, 88 ppb of ethylbenzene, and 590 ppb of xylenes; sample PL-2 contained 19 ppb of ethylbenzene and 150 ppb of xylenes. Samples S-4 and PL-2 were also analyzed for oil and grease and the results were 3,600 ppm and 3,100 ppm, respectively.

On June 27, 1991, one 1,000 gallon single-walled, steel bunker fuel UST was removed without an on-site inspector. Visual inspection by TECC of the tank indicated signs of rust scaling and pitting; however, no evidence of punctures or cracks were noted. The product line appeared to be slightly rusted and corroded, but no holes were noted. Soil samples were collected from the excavated tank pit and soil stockpiles on July 3, 1991. Analytical results for TPH-g (Total Petroleum Hydrocarbon as gas), TPH-d, and BTEX were all below their respective detection limits. Metal analyses for cadmium, chromium, lead, nickel, and zinc were all at concentrations below their respective Total Threshold Limit Concentration (TTLC) and Soluble Threshold Limit Concentration (STLC) values. Total oil and grease concentrations were found to be at 13 ppm for T-1, 140 ppm for GS-1, and 52 ppm for GS-2.

On June 5, 1993, a 1,000 gallon steel single-wall unleaded fuel UST was removed by GEMS Management. All pipelines were drained before removal. Visual inspection of the external surfaces and the associated piping indicated no evidence of holes, leakage, or electrolysis. The tank was transported to Erickson Inc. in Richmond for cleaning, destruction, and recycling. The piping was recycled at Levins Metals. Two soil samples from each end of the excavation and one from the soil stockpile were collected for TPH-g and BTEX analyses. All sample results were below their respective detection limits.

A reconnaissance soil and groundwater investigation was conducted by Compliance & Closure, Inc. (CCI) in September 1999 to determine the extent of petroleum hydrocarbon contamination from the 20,000 gallon AST and to assess the 1,000 gallon unleaded gasoline UST area. A total of 15 soil samples and 5 water samples were collected. GP-3 had the highest grab groundwater sampling results of benzene at 0.6 ppb, toluene at 0.8 ppb, and total xylenes at 3 ppb and the highest soil sampling results of TPH-d at 320 ppm at a depth of 10 feet. Sample GP-1, which was collected near previously TOG contaminated soil sample S-4 at 3,600 ppm, indicated a non-detectable Total Extractable Petroleum Hydrocarbon (TEPH) concentration.

Based on a request for closure, ACWD proposed two methods that would allow ACWD to recommend case closure. The two options included installing one groundwater well near boring GP-3 and monitoring the well on a quarterly basis for a period of at least one year. The second option involved conducting limited soil excavation in and around boring GP-3 and collecting confirmatory soil and groundwater samples after it had been de-watered. Bay Mirror decided to excavate soil near GP-3, north of the former AST, and collect confirmatory soil and water samples.

Excavation began on June 8, 2000 with visible soil contamination in the southwest side starting at approximately 7 feet bgs down to the water table at 12 feet bgs. The depth of the excavation extended down to a depth of 13 feet bgs where the soil appeared to be clean. Four soil samples were collected on the four sidewalls at an approximate depth of 10 feet bgs and 2 feet above the groundwater table in order to determine residual contamination levels. A groundwater sample, W-1, was also collected from the standing water within the excavation using a disposable bailer. On June 9, 2000, a visible sheen was noted on the groundwater on the south and southwest sides of the excavation pit, and excavation continued beyond the proposed excavation limits after standing water

Case Closure Summary (Page 4)
Spill, Leaks, Investigation and Cleanup Program

III. Release and Site Characterization Information (Continued)

was pumped out. Four confirmatory soil samples(S-5, S-6, S-7 and S-8) were collected from the sidewalls and all sample results were below their respective detection limits. Although sample PL-2 collected during the AST removal on June 15, 1991 had a TOG concentration of 3,100 ppm, soil samples collected at and around PL-2 on June 9, 2000 after the excavation activities did not detect any TEPH concentrations. In addition, a second groundwater sample was collected from the excavation and the results were below the detection limits for TPH-d, benzene, toluene, and ethylbenzene. Xylenes were detected just above the detection limit at 2 ppb, but does not pose a threat to the beneficial uses of groundwater.

IV. Closure

Does completed corrective action protect potential beneficial uses per the Regional Board Basin Plan? ***Yes***

SUBJECT: Case Closure for Spills, Leaks, Investigation and Cleanup Site at 6756 Central Avenue, Newark, Alameda County

Dear Mr. & Mrs. Witkin and Mr. & Mrs. Jaffe:

This letter confirms the completion of site investigation and remedial action for the pollutant releases at the subject site. Thank you for your cooperation throughout this investigation.

Attached, please find Spill, Leaks, Investigation, and Cleanup Program (SLIC) Case Closure Summary.

Based upon the available information, including the current land use, and with the provision that the information provided to this agency was accurate and representative of site conditions, no further action related to the pollutant release at the subject site is required.

If you have any questions, please contact Ade Fagorala of my staff at (510) 622-2342 or e-mail aof@rb2.swrcb.ca.gov.

Sincerely,

Loretta K. Barsamian
Executive Office

Waste Code Details

Hazardous Waste Code: D001
Waste Code Description: IGNITABLE WASTE

Hazardous Waste Code: F003
Waste Code Description: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NONHALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS, AND A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Hazardous Waste Code: U239
Waste Code Description: BENZENE, DIMETHYL- (I,T) (OR) XYLENE (I)

Tanner Information

State Waste Code: 214
Year: 1984
Tons: 3.44
Method Code: H01
State Waste Code Desc: Unspecified solvent mixture
Method Description:
Generator County:
Tsd Epa ID: CAD009452657
Tsd County: San Mateo

Tanner Information

State Waste Code: 171
Year: 1985
Tons: 8.75
Method Code: T02
State Waste Code Desc: Metal sludge (see 121)
Method Description:
Generator County:
Tsd Epa ID: CAT000646117
Tsd County: Kings

Regulated Programs

EI ID: 10738216
EI Description: Hazardous Waste Generator

EI ID: 10738216
EI Description: Chemical Storage Facilities

Violations

Violation Date: 06/23/2023 ***Violation Source:*** CERS
Violation Program: HW ***Violation Division:*** Alameda County Environmental Health
Citation: 40 CFR 1 265.174 - U.S. Code of Federal Regulations, Title 40, Chapter 1, Section(s) 265.174
Violation Notes:

Returned to compliance on 08/19/2023. Employees are not inspecting the hazardous waste storage containers for evidence of leaks or corrosion at least once per week, as evidenced by: • Open waste oil containers in the drum storage area along the northern fence line. • Unlabeled waste oil containers in the drum storage area area along the northern fence line. • Unattended waste oil spills on the 55-gallon drums, on the ground, and in the secondary containment units in the drum storage area along the northern fence line. Conduct (and document) weekly inspections of the hazardous waste containers to ensure they are not leaking or corroding. Submit a copy of the corresponding inspection logs to Alameda County CUPA by 8/20/2023 to close this violation.

Violation Description:

Failure to inspect hazardous waste storage areas at least weekly and look for leaking and deteriorating containers.

Violations

Violation Date: 12/05/2022 ***Violation Source:*** CERS
Violation Program: HMRRP ***Violation Division:*** Alameda County Environmental Health
Citation: HSC 6.95 25508.2 - California Health and Safety Code, Chapter 6.95, Section(s) 25508.2
Violation Notes:

Returned to compliance on 12/08/2022.

Violation Description:

Failure to annually review and electronically certify that the business plan is complete and accurate on or before the annual due date.

Violations

Violation Date: 06/23/2023 ***Violation Source:*** CERS
Violation Program: HW ***Violation Division:*** Alameda County Environmental Health
Citation: 40 CFR 1 265.31 - U.S. Code of Federal Regulations, Title 40, Chapter 1, Section(s) 265.31
Violation Notes:

Returned to compliance on 07/28/2023. Unattended waste oil spills were observed in the following areas: • On the ground next to a pallet of 5-gallon oil containers near the heavy machinery in the yard (moderate spill). • On the 5-gallon oil containers sitting on the pallet mentioned above (moderate spill). • On the ground in approximately fifteen (15) places where maintenance had occurred throughout the yard (small spills). • On the 55-gallon drums used for waste oil storage near the northwestern fence line (small spills). • On the ground around the 55-gallon drums near the northwestern fence line (moderate spills). • Inside the secondary containment units for the 55 drums used for waste oil storage near the northwestern fence line (moderate spills). This is a repeated Class II violation that is being elevated to a Class I violation, which may be subject to further enforcement action. Clean up all spilled oil and manage any solids (dirt) contaminated with used oil as a haza... [TRUNCATED: Refer to full Inspection Report]

Violation Description:

Failure to maintain and operate the facility to minimize the possibility of a fire, explosion, or any unplanned sudden or non-sudden release of hazardous waste or hazardous waste constituents to air, soil, or surface water which could threaten human health or the environment.

Violations

Violation Date: 06/23/2023 ***Violation Source:*** CERS
Violation Program: HMRRP ***Violation Division:*** Alameda County Environmental Health
Citation: HSC 6.95 25508(a)(3) - California Health and Safety Code, Chapter 6.95, Section(s) 25508(a)(3)
Violation Notes:

Returned to compliance on 08/23/2023. The site map in CERS does not include the location of the emergency shut offs (for power, water, gas, etc.), emergency response equipment (fire extinguishers), or evacuation staging area. Add the missing items to the site map in CERS no later than 8/20/2023. A complete site map includes: • A north orientation arrow • Internal roads • Adjacent streets • Loading areas • Storm and sewer drains • Access and exit points • Hazardous material handling and storage areas • Emergency response equipment • Emergency shutoffs (power, water, gas) • Evacuation staging areas

Violation Description:

Failure to complete and electronically submit a site map with all required content.

Violations

Violation Date: 11/19/2019 ***Violation Source:*** CERS
Violation Program: HMRRP ***Violation Division:*** Alameda County Environmental Health
Citation: HSC 6.95 25508(a)(1) - California Health and Safety Code, Chapter 6.95, Section(s) 25508(a)(1)
Violation Notes:

Returned to compliance on 12/05/2019. The business failed to complete and electronically submit chemical inventory information for all reportable hazardous materials on site at or above reportable quantities for the following materials: a. 55 gallon drum of used oil observed in hazardous material/hazardous waste storage area b. eight 55 gallon drums of various new oils observed in hazardous material/hazardous waste storage area Complete and electronically submit the chemical inventory information for all reportable hazardous materials on site at or above reportable quantities in CERS within 30 days.

Violation Description:

Failure to complete and electronically submit hazardous material inventory information for all reportable hazardous materials on site at or above reportable quantities.

Violations

Violation Date: 11/19/2019 ***Violation Source:*** CERS
Violation Program: HW ***Violation Division:*** Alameda County Environmental Health
Citation: HSC 6.5 25160(b)(1)(C) - California Health and Safety Code, Chapter 6.5, Section(s) 25160(b)(1)(C)
Violation Notes:

Returned to compliance on 12/05/2019. The generator has not sent a legible copy of each Uniform Hazardous Waste Manifest to the DTSC within 30 days of shipment. A copy of manifest #011252532 was not sent to DTSC. Send a copy of all uniform hazardous waste manifests to the DTSC and submit proof of correctio to ACDEH within 30 days.

Violation Description:

Failure to send a legible copy of each hazardous waste manifest to the Department within 30 days of each shipment of hazardous waste.

Violations

Violation Date: 06/23/2023 ***Violation Source:*** CERS
Violation Program: HMRRP ***Violation Division:*** Alameda County Environmental Health
Citation: HSC 6.95 25508.1(a)-(f) - California Health and Safety Code, Chapter 6.95, Section(s) 25508.1(a)-(f)
Violation Notes:

Returned to compliance on 08/23/2023. The facility failed to update their hazardous materials inventory within 30 days of handling of the previously undisclosed hazardous materials at or above reportable quantities: • Approximately 220 gallons of waste oil stored in 55-gallon drums along the northwestern fence line. • Approximately 70 gallons of liquid oxygen stored in a cryogenic tank (a dewar) inside the shop. This is a repeated violation that is being elevated to a Class II violation. Add the undisclosed hazardous materials to the hazardous materials inventory in the California Environmental Reporting System (CERS) no later than 8/20/2023 (and within 30 days of handling a previously undisclosed hazardous material at or above reportable quantities moving forward).

Violation Description:

Failure to electronically update business plan within 30 days of any one of the following events:
A 100 percent or more increase in the quantity of a previously disclosed material.
Any handling of a previously undisclosed hazardous materials at or above reportable quantities.
A change of business address, business ownership, or business name.
A substantial change in the handler's operations that requires modification to any portion of the business plan.

Violations

Violation Date: 11/19/2019 ***Violation Source:*** CERS

Violation Program: HMRRP ***Violation Division:*** Alameda County Environmental Health
Citation: HSC 6.95 25505(a)(4) - California Health and Safety Code, Chapter 6.95, Section(s) 25505(a)(4)
Violation Notes:

Returned to compliance on 11/19/2019. The business failed to maintain training records for the Hazardous Material Business Plan (HMBP) program for a minimum of three years. Observed no written training records during the inspection. Per Safety Manager, training is provided to all employees in the HMBP. Establish and electronically submit an employee training program containing provisions to ensure initial and annual training for all employees in safety procedures in the event of a release or threatened release of a hazardous material and document and maintain training records for a minimum of three years. Submit training record to ACDEH within 30 days.

Violation Description:

Failure to provide initial and annual training to all employees in safety procedures in the event of a release or threatened release of a hazardous material or failure to document and maintain training records for a minimum of three years.

Citation: 22 CCR 12 66262.40(a) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.40(a)
Violation Notes:

Returned to compliance on 12/04/2019. Uniform Hazardous Waste Manifest #011252532 signed by the Designated Facility for Non-RCRA Hazardous Waste Solid (Oily Debris) on 7/11/2019 was for was not available at the time of inspection. Locate manifest #011252532 signed by the Designated Facility and submit a copy to ACDEH within 30 days.

Violation Description:

Failure to keep a copy of each properly signed manifest for at least three years from the date the waste was accepted by the initial transporter. The manifest signed at the time the waste was accepted for transport shall be kept until receiving a signed copy from the designated facility which received the waste.

Violations

Violation Date: 11/19/2019 ***Violation Source:*** CERS
Violation Program: HW ***Violation Division:*** Alameda County Environmental Health
Citation: 40 CFR 1 265.31 - U.S. Code of Federal Regulations, Title 40, Chapter 1, Section(s) 265.31
Violation Notes:

Returned to compliance on 11/26/2019. Used oil was observed in the hazardous waste containment in the hazardous waste storage area. Submit photos/documentation to the ACDEH demonstrating the spill has been properly removed and managed.

Violation Description:

Failure to maintain and operate the facility to minimize the possibility of a fire, explosion, or any unplanned sudden or non-sudden release of hazardous waste or hazardous waste constituents to air, soil, or surface water which could threaten human health or the environment.

Citation: HSC 6.95 25508(a)(1) - California Health and Safety Code, Chapter 6.95, Section(s) 25508(a)(1)
Violation Notes:

Returned to compliance on 08/15/2019.

Violation Description:

Failure to annually review and electronically certify that the business plan is complete and accurate on or before the annual due date.

Violations

Violation Date: 06/23/2023 ***Violation Source:*** CERS
Violation Program: HW ***Violation Division:*** Alameda County Environmental Health
Citation: 22 CCR 12 66262.34(f) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.34(f)
Violation Notes:

Returned to compliance on 08/25/2023. The 55-gallon drums used to store waste oil were not properly labeled as hazardous waste (approximately 25 drums were observed onsite, but the yard supervisor (Mike Steele) stated only 3-4 were being used to store waste oil). Label all 55-gallon drums used to store waste oil as hazardous waste no later than 8/20/2023. Hazardous waste labels must include: • The words "Hazardous Waste" • The name and address of the facility • The accumulation start date • The contents of the hazardous waste container (contaminate rags) • The physical state of the wastes (liquids or solids) • The hazardous properties of the waste (flammable, reactive, corrosive, or toxic) Submit a picture of this to Alameda County CUPA to close this violation.

Violation Description:

Failure to properly label hazardous waste accumulation containers and portable tanks with the following requirements: "Hazardous Waste", name and address of the generator, physical and chemical characteristics of the Hazardous Waste, and starting accumulation date.

Violations

Violation Date: 06/23/2023 ***Violation Source:*** CERS
Violation Program: HW ***Violation Division:*** Alameda County Environmental Health
Citation: 22 CCR 12 66262.11 - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.11
Violation Notes:

Returned to compliance on 08/24/2023. The facility has not made a hazardous waste determination for the fine metal powders generated by the Dayton bench grinder. These powders were observed on the floor around the bench grinder and the storage unit on the northeastern boundary of the property. Complete one (1) of the following options no later than 8/20/2023: 1. Manage fine metal powders as hazardous waste. This includes collecting them and storing them in closed, labeled containers, and disposing of them within 180 days of their accumulation start date. 2. Prove that the fine metal powders are not hazardous waste by tested them at a State-certified laboratory. To do this: contact a State-certified laboratory to request a sieve analysis for 100-micron fines and a TTLC/STLC (WET) test for CAM 17 metals, send them a sample of the metal powders for testing, compare the test results to the regulatory thresholds for hazardous waste, and submit a copy of the test results to Alameda County CUPA.

Violation Description:

Failure to determine if wastes generated are hazardous waste by using generator knowledge or applying testing method.

Violations

Violation Date: 11/19/2019 ***Violation Source:*** CERS
Violation Program: HMRRP ***Violation Division:*** Alameda County Environmental Health
Citation: HSC 6.95 25508.1(a)-(f) - California Health and Safety Code, Chapter 6.95, Section(s) 25508.1(a)-(f)
Violation Notes:

Returned to compliance on 12/05/2019. The business failed to update business plan within 30 days when one of the following occurs: a 100 percent or more increase in the quantity of a previously disclosed material; any handling of a previously undisclosed hazardous material; a change of business address, business ownership, or business name; or a substantial change in the handler's operations that requires modification to any portion of the business plan. Observed the following new material: a. 55 gallon drum of used oil observed in hazardous material/hazardous waste storage area b. eight 55 gallon drums of various new oils observed in hazardous material/hazardous waste storage area Update all submittal elements effected by the change (s) and electronically submit the update in CERS within 30 days.

Violation Description:

Failure to electronically update business plan within 30 days of any one of the following events:
A 100 percent or more increase in the quantity of a previously disclosed material.
Any handling of a previously undisclosed hazardous materials at or above reportable quantities.
A change of business address, business ownership, or business name.
A substantial change in the handler's operations that requires modification to any portion of the business plan.

Violations

Violation Date: 06/23/2023 ***Violation Source:*** CERS
Violation Program: HMRRP ***Violation Division:*** Alameda County Environmental Health
Citation: HSC 6.95 25505(a)(4) - California Health and Safety Code, Chapter 6.95, Section(s) 25505(a)(4)
Violation Notes:

Returned to compliance on 08/19/2023. Employee training records pertaining to the Hazardous Materials Business Plan (HMPB) program were not available onsite. The yard supervisor (Mike Steele) said that training is provided annually, but that he could not find the corresponding training records. This is a repeated violation that is being elevated to a Class II violation. Provide HMBP training to all facility employees and submit the corresponding training records to Alameda County CUPA no later than 8/20/2023. HMBP training must include: • Procedures for the mitigation of a release or threatened release of hazardous materials. • Evacuation plans and procedures, including immediate notice, for the business site. • Immediate notification to the appropriate local emergency response personnel and to the unified program agency (in the event of a release of hazardous materials). HMBP training must be refreshed annually and training records must be kept onsite for a minimum of three (3) years.

Violation Description:

Failure to provide initial and annual training to all employees in safety procedures in the event of a release or threatened release of a hazardous material or failure to document and maintain training records for a minimum of three years.

Violations

Violation Notes:

Returned to compliance on 11/26/2019. Emergency information is not posted next to the telephone. Complete and post all required emergency information next to the telephone.

Violation Description:

Failure to post the following information next to the telephone:
(A) The name and telephone number of the emergency coordinator;
(B) Location of fire extinguishers and spill control material, and, if present, fire alarm; and
(C) The telephone number of the fire department, unless the facility has a direct alarm.

Violations

Violation Date: 06/23/2023 ***Violation Source:*** CERS
Violation Program: HW ***Violation Division:*** Alameda County Environmental Health
Citation: 40 CFR 1 265.173 - U.S. Code of Federal Regulations, Title 40, Chapter 1, Section(s) 265.173
Violation Notes:

Returned to compliance on 08/25/2023. One (1) of the 55-gallon drums used to store waste oil was observed with an open bung cap. Replace the bung cap for this waste oil drum and keep all hazardous waste containers closed except when adding or removing wastes. Submit a picture of the closed waste oil drum to Alameda County CUPA no later than 8/20/2023 to close this violation.

Violation Description:

Failure to meet the following container management requirements:
(a) A container holding hazardous waste must always be closed during storage, except when it is necessary to add or remove waste.
(b) A container holding hazardous waste must not be opened, handled, or stored in a manner which may rupture the container or cause it to leak.

Violations

Violation Date: 06/23/2023 ***Violation Source:*** CERS

Citation: HSC 6.95 25508(a)(3) - California Health and Safety Code, Chapter 6.95, Section(s) 25508(a)(3)
Violation Notes:

Returned to compliance on 08/23/2023. The following hazardous materials were observed onsite above the reportable threshold quantities, but were not accounted for in the hazardous materials inventory in CERS: • Approximately 220 gallons of waste oil stored in 55-gallon drums along the northwestern fence line. • Approximately 70 gallons of liquid oxygen stored in a cryogenic tank (a dewar) inside the shop. Add these hazardous materials to the hazardous materials inventory in CERS no later than 8/20/2023.

Violation Description:

Failure to complete and electronically submit hazardous material inventory information for all reportable hazardous materials on site at or above reportable quantities.

Violations

Violation Date: 06/23/2023 ***Violation Source:*** CERS
Violation Program: HMRRP ***Violation Division:*** Alameda County Environmental Health
Citation: HSC 6.95 25508(a)(3) - California Health and Safety Code, Chapter 6.95, Section(s) 25508(a)(3)
Violation Notes:

Returned to compliance on 08/18/2023. The 24-hour phone numbers listed for the primary and secondary emergency contacts in CERS are for the main office in San Jose, CA. Update these phones numbers so that the primary and secondary emergency contacts can be contacted directly in the event of an emergency. Correct no later than 8/20/2023.

Violation Description:

Failure to report program data electronically.

Violations

Violation Date: 06/23/2023 ***Violation Source:*** CERS
Violation Program: HW ***Violation Division:*** Alameda County Environmental Health
Citation: 40 CFR 1 265.35 - U.S. Code of Federal Regulations, Title 40, Chapter 1, Section(s) 265.35
Violation Notes:

Returned to compliance on 08/23/2023. The facility failed to maintain adequate aisle space around the 55-gallon drums used to store waste oil. The waste oil drums were comingled with non-hazardous waste drums and stored in 2x2 and 3x3 grids along the northwestern fence line. Separate the waste oil drums and maintain enough aisle space around them to allow for unobstructed access of emergency personnel and equipment no later than 8/20/2023. Submit pictures of this to Alameda County CUPA to close this violation.

Violation Description:

Failure to maintain aisle space to allow the unobstructed movement of personnel, fire protection equipment, spill control equipment, and decontamination equipment to any area of facility operation in an emergency, unless aisle space is not needed for any of these purposes.

Violations

Violation Date: 06/23/2023 ***Violation Source:*** CERS
Violation Program: HW ***Violation Division:*** Alameda County Environmental Health
Citation: 40 CFR 1 262.34(d)(5)(iii) - U.S. Code of Federal Regulations, Title 40, Chapter 1, Section(s) 262.34(d)(5)(iii)
Violation Notes:

Returned to compliance on 08/24/2023. Employees were not thoroughly familiar with proper hazardous waste storage/handling procedures, as evidenced by: • Open waste oil containers in the drum storage area. • Unlabeled waste oil containers in the drum storage area. • Unattended waste oil spills on the ground and containers throughout the facility. Provide onsite employees with hazardous waste training and submit the corresponding training records to Alameda County CUPA no later than 8/20/2023. Hazardous waste training must include: • Storage and labeling requirements • Spill control and mitigation procedures • Container and tank inspection requirements • Accumulation time limits Submit the corresponding training records to Alameda County CUPA to close this violation.

Violation Description:

Failure to ensure that all employees are thoroughly familiar with proper waste handling and emergency procedures, relevant to their responsibilities during normal facility operations and emergencies.

Violations

Violation Date: 10/17/2017 ***Violation Source:*** CERS
Violation Program: HMRRP ***Violation Division:*** Alameda County Environmental Health
Citation: HSC 6.95 25507 - California Health and Safety Code, Chapter 6.95, Section(s) 25507
Violation Notes:

Returned to compliance on 11/08/2017. OBSERVATIONS: Two drums of waste sodium hydroxide 50% solution are currently stored on the stair landing blocking the exit door in Room #2 Sodium Hydroxide. CORRECTIVE ACTIONS: Remove these two drums and do not store hazardous waste on any stair landing that would block an emergency exit. Submit a written statement on how hazardous waste will be stored in the future. OBSERVATION: Employee training records on hazardous materials handling and emergency response procedures was not available. CORRECTIVE ACTION: Submit documentation to the CUPA demonstrating that employees have received training on safe handling of hazardous materials and the Emergency Response Plan. If training has not occurred in the last year, conduct the training immediately and submit a copy of the training documentation.

Violation Description:

Failure to adequately establish and implement a business plan when storing/handling a hazardous material at or above reportable quantities.

Violations

Violation Date: 03/10/2022 ***Violation Source:*** CERS
Violation Program: CalARP ***Violation Division:*** Alameda County Environmental Health
Citation: 19 CCR 4.5 2755.4(a) - California Code of Regulations, Title 19, Chapter 4.5, Section(s) 2755.4(a)
Violation Notes:

Returned to compliance on 08/08/2022. The owner/operator failed to ensure that each employee presently operating a process, and each employee newly assigned to a covered process has been trained or tested competent in the operating procedures provided in Section 2755.3 that pertain to their duties. Training documentation provided shows a date of 2018 and has not been done in three years. Submit documentation to the CUPA demonstrating that each employee presently operating a process, and each employee newly assigned to a covered process has been trained or tested competent in the operating procedures that pertain to their duties. Refresher training needs to be conducted.

Violation Description:

Failure to ensure that each employee presently operating a process, and each employee newly assigned to a covered process has been trained or tested competent in the operating procedures provided in Section 2755.3 that pertain to their duties.

Violations

Violation Date: 10/17/2017 ***Violation Source:*** CERS
Violation Program: HW ***Violation Division:*** Alameda County Environmental Health
Citation: 40 CFR 1 265.35 - U.S. Code of Federal Regulations, Title 40, Chapter 1, Section(s) 265.35
Violation Notes:

Returned to compliance on 11/09/2017. OBSERVATIONS: Two drums of waste sodium hydroxide 50% solution are currently stored on the stair landing blocking the exit door in Room #2 Sodium Hydroxide. CORRECTIVE ACTIONS: Remove these two drums and do not store hazardous waste on any stair landing that would block an emergency exit. Submit a written statement on how hazardous waste will be stored in the future.

Violation Description:

Failure to maintain aisle space to allow the unobstructed movement of personnel, fire protection equipment, spill control equipment, and decontamination equipment to any area of facility operation in an emergency, unless aisle space is not needed for any of these purposes.

Violations

Violation Date: 03/10/2022 ***Violation Source:*** CERS
Violation Program: CalARP ***Violation Division:*** Alameda County Environmental Health

Citation: 19 CCR 4.5 2755.1(b) - California Code of Regulations, Title 19, Chapter 4.5, Section(s) 2755.1(b)
Violation Notes:

Returned to compliance on 08/08/2022. The owner/operator failed to ensure that the process is designed in compliance with recognized and generally accepted good engineering practices. Applicable standards are mentioned but failed to include the year of the standards. Submit documentation to the CUPA demonstrating you have ensured that the process is designed in compliance with recognized and generally accepted good engineering practices. Provide the year the system was installed and the applicable standards for that year.

Violation Description:

Failure to ensure that the process is designed in compliance with recognized and generally accepted good engineering practices.

Violations

Violation Date: 03/18/2014 ***Violation Source:*** CERS
Violation Program: HMRRP ***Violation Division:*** Alameda County Environmental Health
Citation: HSC 6.95 25504(a) - California Health and Safety Code, Chapter 6.95, Section(s) 25504(a)
Violation Notes:

Returned to compliance on 04/28/2014.

Violation Description:

Failure to complete and/or submit hazardous material inventory forms for all reportable hazardous materials on site.

Violations

Violation Date: 10/17/2017 ***Violation Source:*** CERS
Violation Program: HW ***Violation Division:*** Alameda County Environmental Health
Citation: 22 CCR 18 66268.7(a) - California Code of Regulations, Title 22, Chapter 18, Section(s) 66268.7(a)
Violation Notes:

Returned to compliance on 11/09/2017. OBSERVATION: The facility does not have land disposal restriction (LDR) certificates for two manifests: #014380286JJK dated 7/31/15 and #016098970JJK dated 5/15/17. CORRECTIVE ACTION: Obtain and submit a copy of the LDR certifications to the CUPA for the above listed manifests.

Violation Description:

Failure to determine if the waste has to be treated before it can be land disposed and retain the documentation at least three years from the date that the waste was last sent to on-site or off-site treatment, storage, or disposal.

Violations

Citation: 19 CCR 4.5 2755.6(d) - California Code of Regulations, Title 19, Chapter 4.5, Section(s) 2755.6(d)
Violation Notes:

Returned to compliance on 08/08/2022. The owner/operator failed to promptly determine and document an appropriate response to each of the findings of the compliance audit and document the completion dates when deficiencies have been corrected. Facility conducted it at 1.5 years. It should be conducted at 1 year Submit documentation to the UPA demonstrating the owner/operator has documented an appropriate response to each of the findings of the compliance audit including completion dates for deficiencies that have been corrected.

Violation Description:

Failure to:

1. Promptly determine and document an appropriate response to each of the findings of the compliance audit;

2. Enter into an agreement with the UPA on a timetable for resolution of these findings. Otherwise these responses shall be completed one and one-half (1.5) years after performing the compliance audit, or the next planned turnaround for items requiring a turnaround (these timelines shall not apply to any compliance audit completed prior to January 1, 2015);

3. Document the actual completion dates when deficiencies were corrected.

Violation Notes:

Returned to compliance on 04/07/2018. OBERVATIONS: Facility chemical inventory in CERS is incomplete. Inventory for DSA-J: Update the amount of lubricants submitted to CERS. Observed at least eight 55 gallon drums of lubricant. Only two 55 gallon drums of lubricants are listed in CERS. Inventory for DSA-E: No chemical inventory submitted to CERS. Inventory for DSA-F: No chemical inventory submitted to CERS. Inventory for the southwest corner of the lot: No chemical inventory submitted to CERS. Inventory for DSA-G: No chemical inventory submitted to CERS. Inventory for DSA-I: Grease is listed as a 40 gallon container but observed a 55 gallon drum. Inventory is missing waste absorbent, gear lube and argon/carbon dioxide mixed gas. CORRECTIVE ACTIONS: Update the chemical inventory in CERS with the following: DSA-J – update the amount of lubricants stored (at least eight 55 gallon drums), add oxygen (at least 3 small cylinders), acetylene (at least 2 small cylinders) and used oil (at [Truncated]

Violation Description:

Failure to complete and electronically submit hazardous material inventory information for all reportable hazardous materials on site at or above reportable quantities.

Violation Notes:

Returned to compliance on 04/09/2018. OBSERVATIONS: Drum of waste coolant in DSA-I is missing the accumulation start date. CORRECTIVE ACTIONS: Label this drum with the accumulation start date. Submit a written statement or photo showing that this was completed.

Violation Description:

Failure to properly label hazardous waste accumulation containers and portable tanks with the following requirements: "Hazardous Waste", name and address of the generator, physical and chemical characteristics of the Hazardous Waste, and starting accumulation date.

Violations

Violation Date: 03/08/2018 ***Violation Source:*** CERS
Violation Program: APSA ***Violation Division:*** Alameda County Environmental Health
Citation: HSC 6.67 25270.4.5 (a) - California Health and Safety Code, Chapter 6.67, Section(s) 25270.4.5 (a)
Violation Notes:

Returned to compliance on 04/09/2018. OBSERVATION: No records were found for the inspection of drainage from diked areas. CORRECTIVE ACTION: Maintain adequate records of drainage from diked areas.

Violation Description:

Failure to maintain adequate records of drainage when there is drainage of uncontaminated rainwater from liked areas into a storm drain or open watercourse; for example, records required under NPDES permit.

Violations

Violation Date: 03/08/2018 ***Violation Source:*** CERS
Violation Program: APSA ***Violation Division:*** Alameda County Environmental Health
Citation: HSC 6.67 25270.4.5(a) - California Health and Safety Code, Chapter 6.67, Section(s) 25270.4.5(a)
Violation Notes:

Returned to compliance on 05/03/2018. OBSERVATION: Failure to test or inspect aboveground tanks for integrity by a person qualified in accordance with industry standards. The age of the diesel motor oil and waste oil tanks listed in Aboveground Petroleum Storage Tank Facility Statement dated 3/1/18, have not been updated since 1/8/14. Both the 3/1/18 and 1/8/14 Statement show the age of the diesel tank as 17 years, the motor oil tank as 26 and the used oil tank as 31+ years. According to the Steel Tank Institute, the diesel tank should have a formal external inspection by a Certified Inspector every 20 years. It is unknown if the diesel tank has had integrity testing. CORRECTIVE ACTION: Obtain a qualified person to perform tank integrity testing in accordance with industry standards. Submit a copy of the testing results.

Violation Description:

Failure to ensure that tanks are inspected and tested by an appropriately qualified person in accordance with industry standards.

Violations

Violation Date: 05/07/2014 ***Violation Source:*** CERS
Violation Program: HW ***Violation Division:*** Alameda County Environmental Health
Citation: 22 CCR 15 66265.195(a) - California Code of Regulations, Title 22, Chapter 15, Section(s) 66265.195(a)
Violation Notes:

Returned to compliance on 07/23/2014.

Violation Description:

Failure of the owner or operator to conduct inspections and maintain inspection records at the facility of the following tank equipment:
1) Overfill/spill control equipment (e.g., waste-feed cutoff systems, bypass systems, and drainage systems) to ensure that it is in good working order;
2) The aboveground portions of the tank system, if any, to detect corrosion or releases of waste;
3) Data gathered from monitoring equipment and leak-detection equipment, (e.g., pressure and temperature gauges, monitoring wells) to ensure that the tank system is being operated according to its design;
4) The construction materials and the area immediately surrounding the externally accessible portion of the tank system including secondary containment structures (e.g., dikes) to detect erosion or signs of releases of hazardous waste (e.g., wet spots, dead vegetation); and
5) For uncovered tanks, the level of waste in the tank, to ensure compliance with section 66265.194(b)(3).

Violations

Violation Date: 06/23/2021 ***Violation Source:*** CERS
Violation Program: APSA ***Violation Division:*** Alameda County Environmental Health
Citation: HSC 6.67 25270.4.5(a) - California Health and Safety Code, Chapter 6.67, Section(s) 25270.4.5(a)
Violation Notes:

Returned to compliance on 07/23/2021. Failure to provide and maintain secondary containment for bulk storage tank installations sufficient to hold the capacity of the largest container and sufficient freeboard for precipitation. The 500-gallon new oil tank has no secondary containment. The secondary

containment is listed in the SPCC plan as being inside an enclosed building. However, no secondary containment calculations are provided by the engineer and no berm is located at eh exits to the building to prevent oil from exiting the building if the tank ruptures. Update SPCC plan with calculations to show that the building provides secondary containment or provide secondary containment for the 500-gallon tank.

Violation Description:

Failure to provide and maintain secondary containment for bulk storage tank installations (except for mobile refuelers and other non-transportation-related tank trucks) sufficient to hold the capacity of the largest container and sufficient freeboard for precipitation.

Violations

Violation Date: 03/08/2018 ***Violation Source:*** CERS
Violation Program: APSA ***Violation Division:*** Alameda County Environmental Health
Citation: HSC 6.67 25270.4.5(a) - California Health and Safety Code, Chapter 6.67, Section(s) 25270.4.5(a)
Violation Notes:

Returned to compliance on 04/06/2018. OBSERVATION: The SPCC Plan does not adequately discuss the facility layout, all of the petroleum containers and storage capacities at each location, transfer operations, pumping, and the facility processes and discharge prevention methods for all petroleum storage containers above 55 gallons. The Facility Description/Operations section has not been updated to reflect the new operating conditions of the facility. Facility Storage is outdated. CORRECTIVE ACTION: Adequately discuss the facility layout, containers and storage capacity, transfer operations, pumping, and the facility processes and discharge prevention methods for all petroleum storage containers in the SPCC Plan.

Violation Description:

Failure to address in the SPCC Plan discharge prevention measures, including procedures for routine handling of products such as loading/unloading and facility transfers.

Violations

Violation Date: 03/08/2018 ***Violation Source:*** CERS
Violation Program: HW ***Violation Division:*** Alameda County Environmental Health
Citation: 40 CFR 1 265.173 - U.S. Code of Federal Regulations, Title 40, Chapter 1, Section(s) 265.173
Violation Notes:

Returned to compliance on 04/09/2018. OBSERVATIONS: The 55 gallon drum of waste coolant in DSA-I was open. CORRECTIVE ACTIONS: Close the waste coolant drum. All hazardous waste containers must be kept closed at all times except when adding or removing waste. Submit a written statement saying this has been completed.

Violation Description:

Failure to meet the following container management requirements:
(a) A container holding hazardous waste must always be closed during storage, except when it is necessary to add or remove waste.
(b) A container holding hazardous waste must not be opened, handled, or stored in a manner which may rupture the container or cause it to leak.

Violations

Citation: HSC 6.67 25270.4.5(a) - California Health and Safety Code, Chapter 6.67, Section(s) 25270.4.5(a)
Violation Notes:

Returned to compliance on 04/09/2018. OBSERVATION: Facility has failed to comply with all of the following requirements: 1. Failure to conduct inspections and tests on all petroleum storage containers in accordance with written procedures in the SPCC Plan. 2. Failure to keep written procedures and/or a record of inspections and/or customary business records with the plan. Reviewed tank inspection for November and December 2017 and February 2018 for the diesel tank only. No other records of inspections were observed for the other petroleum storage containers. CORRECTIVE ACTION: Conduct inspections in accordance with written procedures and maintain records for 3 years. Submit a copy of the March and April inspection records for all petroleum storage containers included in the SPCC plan.

Violation Description:

Failure to comply with one or more of the following requirements:

1. Have record of inspections and integrity tests signed by the appropriate supervisor or inspector.
2. Keep written procedures and records of inspections and integrity tests for at least three years.
3. Keep comparison records.

Violations

Violation Date: 03/08/2018 ***Violation Source:*** CERS
Violation Program: HMRRP ***Violation Division:*** Alameda County Environmental Health
Citation: HSC 6.95 25508.1(a)-(f) - California Health and Safety Code, Chapter 6.95, Section(s) 25508.1(a)-(f)
Violation Notes:

Returned to compliance on 04/07/2018. OBSERVATIONS: The chemical inventory is inadequate and several site maps need to be updated in CERS. CORRECTIVE ACTIONS: See violation #4 and #6 for corrective actions. Ensure that if any significant changes occur during the year, the HMBP in CERS must be updated within 30 days.

Violation Description:

Failure to electronically update business plan within 30 days of any one of the following events:
A 100 percent or more increase in the quantity of a previously disclosed material.
Any handling of a previously undisclosed hazardous materials at or above reportable quantities.
A change of business address, business ownership, or business name.
A substantial change in the handler's operations that requires modification to any portion of the business plan.

Violation Date: 03/08/2018 ***Violation Source:*** CERS
Violation Program: APSA ***Violation Division:*** Alameda County Environmental Health
Citation: HSC 6.67 25270.4.5(a) - California Health and Safety Code, Chapter 6.67, Section(s) 25270.4.5(a)
Violation Notes:

Returned to compliance on 04/06/2018. OBSERVATIONS: The SPCC Plan does not include information on the 500 gallon new oil tank, the 55 gallon drums of lubricants or the 55 gallon drums of used oil. For example, on page 11, under 112.8, only the diesel tank is described. There is no mention of the other oil containers at this facility. This is a repeat violation. CORRECTIVE ACTIONS: All sections of the SPCC Plan must reference all petroleum containers greater than 55 gallons. OBSERVATIONS: Inspections of all required SPCC petroleum storage containers are not being inspected as required. This is a repeat violation. CORRECTIVE ACTIONS: Immediately begin inspecting all SPCC required containers. Submit an inspection log for March and April for all of these containers/areas.

Violation Description:

Failure to prepare a Spill Prevention, Control, and Countermeasures (SPCC) Plan.

Violations

Violation Program: APSA ***Violation Division:*** Alameda County Environmental Health
Citation: HSC 6.67 25270.4.5(a) - California Health and Safety Code, Chapter 6.67, Section(s) 25270.4.5(a)
Violation Notes:

Returned to compliance on 04/09/2018. OBSERVATION: The 9,900 diesel tank has a overfill alarm, however, it is broken. There is a clock gauge on the diesel tank but it is difficult to see from the fill port. The 500 gallon new oil tank in DSA-I does not have a high level monitoring device. The last two diesel tank inspection logs have the overfill alarm line item crossed off. CORRECTIVE ACTION: Replace the overfill alarm on the diesel tank and install a high level monitoring device on the new oil tank. Submit documentation that this has occurred. Submit an inspection log for both the diesel and the new oil tank with a line item to test the device.

Violation Description:

Failure to regularly test liquid level sensing devices to ensure proper operation.

Violations

Violation Date: 03/08/2018 ***Violation Source:*** CERS
Violation Program: APSA ***Violation Division:*** Alameda County Environmental Health
Citation: HSC 6.67 25270.4.5(a) - California Health and Safety Code, Chapter 6.67, Section(s) 25270.4.5(a)

Violation Notes:

Returned to compliance on 04/09/2018. OBSERVATION: Facility failed to engineer or update each container installation to avoid discharges by providing at least one of the following devices: 1. An audible or visual high liquid level alarm. 2. High liquid level pump cutoff devices. 3. Audible or code signal communications between tank gauge and pumping station. 4. A fast response system for determining liquid levels, such as computers, telepulse or direct vision gauges. The 9,900 diesel tank has a overfill alarm, however, it is broken. There is a clock gauge on the diesel tank but it is difficult to see from the fill port. The 500 gallon new oil tank in DSA-I does not have a high level monitoring device. CORRECTIVE ACTION: Replace the overfill alarm on the diesel tank and install a high level monitoring device on the new oil tank. Submit documentation that this has occurred.

Violation Description:

Failure to engineer or update each container installation in accordance with good engineering practice to avoid discharges and/or failure to by provide at least one of the following devices on each container installation:
1. An audible or visual high liquid level alarm.
2. High liquid level pump cutoff devices.
3. Audible or code signal communications between tank gauger and pumping station.
4. A fast response system for determining liquid levels, such as computers, telepulse or direct vision gauges.

Violations

Violation Date: 03/08/2018 ***Violation Source:*** CERS
Violation Program: HW ***Violation Division:*** Alameda County Environmental Health
Citation: HSC 6.5 25123.3(h)(1) - California Health and Safety Code, Chapter 6.5, Section(s) 25123.3(h)(1)
Violation Notes:

Returned to compliance on 04/09/2018. OBSERVATIONS: One drum of used oil in DSA-J has an accumulation start date of 1/10/17 and the waste coolant in DSA-I has no accumulation start date and according to Mr. Rocha, has probably not been disposed of in several years. CORRECTIVE ACTIONS: Immediately dispose of the used oil and waste coolant. As a Small Quantity Generator (SQG) you must dispose of all hazardous waste at least every six months. Submit copies of the disposal receipts for the used oil and waste coolant.

Violation Description:

Failure to send hazardous waste offsite for treatment, storage, or disposal within 180 days (or 270 days if waste is transported over 200 miles) for a generator who generates less than 1000 kilogram per month if all of the following conditions are met:
(1) The quantity of hazardous waste accumulated onsite never exceeds 6,000 kilograms.

(2) The generator complies with the requirements of 40 Code of Federal Regulations section 262.34(d), (e) and (f).

(3) The generator does not hold acutely hazardous waste or extremely hazardous waste in an amount greater than one kilogram for more than 90 days.

Violations

Violation Date: 03/08/2018 ***Violation Source:*** CERS
Violation Program: APSA ***Violation Division:*** Alameda County Environmental Health
Citation: HSC 6.67 25270.4.5(a) - California Health and Safety Code, Chapter 6.67, Section(s) 25270.4.5(a)
Violation Notes:

Returned to compliance on 11/16/2018. OBSERVATION: The SPCC Plan does not include all petroleum containers that are 55 gallons or more in the prediction of the extent of a discharge that could result from equipment failure. No discussion of piping, valves and product transfer areas. CORRECTIVE ACTION: Predict in the SPCC the extent that could result from a discharge due to an equipment failure for all petroleum storage containers, piping, valves and product transfer areas.

Violation Description:

Failure to include in the SPCC Plan a prediction of the direction, rate of flow, and total quantity of oil that could be discharged for each type of major equipment failure where experience indicates a reasonable potential for equipment failure.

The rate of flow is not required on a Tier I qualified facility SPCC Plan.

Violations

Citation: HSC 6.67 25270.4.5(a) - California Health and Safety Code, Chapter 6.67, Section(s) 25270.4.5(a)

Violation Notes:

Returned to compliance on 04/09/2018. OBSERVATION: Failure to include inspections of tank supports/foundation, deterioration, discharges and/or accumulations of oil inside diked areas, and comparison records in the records of inspections (or customary business records). Failure to include inspections of tank supports/foundation, deterioration, discharges and/or accumulations of oil inside diked areas, and comparison records in the records of inspections (or customary business records). Only three months of records for the diesel tank were available. CORRECTIVE ACTION: Tank inspections include supports/foundation, deterioration, discharges and/or accumulations of oil inside diked areas, and comparison records in the records of inspections (or customary business records). Ensure that all petroleum storage areas are included in the inspections.

Violation Description:

Failure to discuss in the SPCC Plan procedures to test or inspect each aboveground container for integrity in accordance with industry standards:

1. On a regular schedule.

2. After material repairs are made.

3. By qualified personnel.

4. The frequency and type of testing and inspections based on container size, configuration, and design.

Calenviroscreen 3 Score:	66-70%
Calenviroscreen 4 Score:	60-65%
File Location:	All Files are on GeoTracker or in the Local Agency Database
Site History:	

The Site is located in the southwestern part of the City of Newark, in a mixed commercial, light to heavy industrial area approximately 15 to 20 feet above sea level. Groundwater (GW) depth ranged between 6.89 and 8.40 feet below top of casing in last monitoring report, 2015. GW flow direction is toward the west. The Site was vacant prior to 1959, when it was developed by Paisley Products Company, which occupied until 1975. In 1962, Paisley began using volatile organic compounds (VOCs). H.B. Fuller purchased the Site in 1975 and occupied it until 1989. H.B. Fuller produced and stored industrial polymers and water-based adhesives. Industrial uses of the Site included several above-grade chemical storage tanks, one 16,000 gallon below-grade tank used exclusively for storing vinyl acetate monomer (VAM), and a 3,000-gallon buried wastewater clarifier. An outdoor yard was used for storing drums and portable tanks. Active industrial operations at the Site ceased in 1989 when H.B. Fuller sold the property. The tanks are no longer present. Shallow groundwater underlying the Site currently contains low concentrations of VOCs including benzene, tetrachloroethene (PCE), trichloroethene (TCE), 1,1-dichloroethene (1,1-DCE), cis-1,2-dichloroethene (cis-1,2-DCE), 1-dichloroethene (1,1-DCE), 1,1-dichloroethane (1,1-DCA), chloroethane (CA), and vinyl chloride (VC). Groundwater monitoring has confirmed that the concentrations of these chemicals are slowly decreasing. Soil gas concentrations in the subslab and vadose zone currently contain elevated concentrations of VOCs, including benzene, chloroform, PCE, TCE, 1,1-DCE, cis-1,2-DCE, 1,1-DCE, 1,1-DCA, and VC. Additional soil vapor sampling events will be conducted to further evaluate seasonal trends at the Site. In 2022, an off-site soil gas investigation in the downgradient direction of the Site will be conducted to define the extent of subsurface soil gas contamination.

Action Date: 9/13/2019
Received Issue Date: 9/13/2019
Doc Link:
Title Description Comments:

Call w/ Environmental Manager, Kristin Colberg (KC) to discuss HB Fuller's non-compliance situation: missing groundwater reports since 2015. Also communicated that potential vapor intrusion concerns associated with any residual CVOCs need to be assessed at the site before considering closure. KC stated the willingness to address upcoming requirement and reconnect with consultants. KC will let us know if an access agreement letter is needed to help with property access.

Site History:

The HB Fuller Site (Fuller/Site) is currently occupied by Stanford Designs, a furniture manufacturer and custom designer. The Site was vacant until 1959. Paisley Products Company (Paisley), a part of Nabisco Brands, owned and occupied the property from 1959 to 1975. In 1962, Paisley started producing and utilizing chemicals that included benzene, toluene, and 1,1,1-trichloroethane (1,1,1-TCA). Fuller purchased the property in 1975 and occupied it from that time until 1989. Fuller produced and stored industrial adhesives at the site for commercial packaging. Fuller was known to have used or stored at the site toluene, tetrachloroethene (PCE), trichloroethene (TCE), and 1,1,1-TCA. Fuller relocated its manufacturing operations to Roseville, California in 1989; Stanford Designs leases the property from Fuller. Soil and groundwater investigations conducted at the Site in 1982 revealed the presence of volatile organic compounds (VOCs) in soil and groundwater. Remediation was conducted in 1986 under the oversight of the San Francisco Regional Water Quality Control Board (SFRWQCB) and included excavation and offsite disposal of approximately 100 cubic yards of contaminated soil. Groundwater remediation was also initiated in 1986; a groundwater pump and treat system has been installed and groundwater monitoring is still being conducted.

Violations

Violation Date: 10/16/2018 ***Violation Source:*** CERS
Violation Program: HMRRP ***Violation Division:*** Alameda County Environmental Health
Citation: HSC 6.95 25505.1 - California Health and Safety Code, Chapter 6.95, Section(s) 25505.1
Violation Notes:

Returned to compliance on 11/19/2018. OBSERVATION: The facility representatives are not sure if the business has notified the property owner in writing that the business is subject to the business plan program and has complied with its provisions. Property owner is listed at Michael Beckley in CERS. CORRECTIVE ACTION: Notify the property owner in writing that the business is subject to the business plan program and has complied with its provisions. Submit documentation of correction to the unified program agency.

Violation Description:

Failure to notify property owner in writing that the business is subject to the business plan program and has complied with its provisions.

Violations

Violation Date: 10/25/2018 ***Violation Source:*** CERS
Violation Program: HW ***Violation Division:*** Alameda County Environmental Health
Citation: HSC 6.5 25250.22 - California Health and Safety Code, Chapter 6.5, Section(s) 25250.22
Violation Notes:

Returned to compliance on 11/21/2018. OBSERVATION: Provide appropriate container to store used oil filters located adjacent to the helium compressor. Label container "drained used oil filters" and accumulation start date. CORRECTIVE ACTION: Submit photos to the CUPA demonstrating that the used oil filters are being properly managed or submit a bill of lading to this department demonstrating proper disposal.

Violation Description:

Failure to properly manage used oil and/or fuel filters in accordance with the requirements.

Violations

Violation Date: 10/25/2018 ***Violation Source:*** CERS
Violation Program: HW ***Violation Division:*** Alameda County Environmental Health
Citation: HSC 6.5 Multiple - California Health and Safety Code, Chapter 6.5, Section(s) Multiple
Violation Notes:

Returned to compliance on 11/21/2018. OBSERVATION: Facility has a current Alameda County Dept. of Environmental Health (ACDEH) operating permit for Hazardous Materials Business Plan (HMBP), although is not permitted for hazardous waste generator. Facility representative states that used oil and drained used oil filters are generated from onsite maintenance activities of the helium compressor, and used oil generated is approximately 5 gallons every two to three months. CORRECTIVE ACTION: After the facility updates the Hazardous Materials Business Plan (HMBP) regarding the change in business activities (generating hazardous waste), an invoice will be sent to the financial contact provided through the California Environmental Reporting System (CERS) website. 1. The facility will obtain a valid ACDEH Operating Permit for hazardous waste generator program by paying the invoice. 2. Provide documentation to ACDEH within 30 days.

Violation Description:

Hazardous Waste Generator Program - Administration/Documentation - General

Violations

Violation Date: 10/25/2018 ***Violation Source:*** CERS
Violation Program: HW ***Violation Division:*** Alameda County Environmental Health
Citation: 22 CCR 12 66262.34(f) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.34(f)
Violation Notes:

Returned to compliance on 11/21/2018. OBSERVATION: Three five gallon poly containers of used oil located adjacent to the helium compressor was observed without a hazardous waste label. CORRECTIVE ACTION: Submit a photo to Alameda County Dept. of Environmental Health (CUPA) demonstrating that the container listed above has been properly labeled. ACDEH to provide example label and markings.

Violation Description:

Failure to properly label hazardous waste accumulation containers and portable tanks with the following requirements: "Hazardous Waste", name and address of the generator, physical and chemical characteristics of the Hazardous Waste, and starting accumulation date.

Violations

Violation Date: 10/25/2018 ***Violation Source:*** CERS

Citation: HSC 6.5 25189.5(a),25201(a) - California Health and Safety Code, Chapter 6.5, Section(s) 25189.5(a),25201(a)
Violation Notes:

Returned to compliance on 11/21/2018. OBSERVATION: Owner/Operator failed to dispose of hazardous waste at a facility which has a permit from DTSC or disposed of hazardous waste at a point which is not authorized pursuant to HSC chapter 6.5. Facility representative states that used oil and drained used oil filters are generated from onsite maintenance activities of the helium compressor, and used oil generated is approximately 5 gallons every two to three months and then is self transported to Matheson location at 6775 Central Ave Newark for recycle. CORRECTIVE ACTION: Immediately discontinue disposing of hazardous waste at any facility not permitted by DTSC or causing hazardous waste to be disposed of at any point which is not authorized pursuant to HSC chapter 6.5. Submit a statement to the CUPA indicating how the facility's hazardous waste will be properly managed, and that all hazardous wastes will only be disposed at facilities permitted by DTSC in the future.

Violation Description:

Failure to dispose of hazardous waste at a facility which has a permit from DTSC or disposing of hazardous waste at any point which is not authorized according to HSC 6.5.

Violations

Violation Date: 10/16/2018 ***Violation Source:*** CERS
Violation Program: HMRRP ***Violation Division:*** Alameda County Environmental Health
Citation: HSC 6.95 25508(a)(1) - California Health and Safety Code, Chapter 6.95, Section(s) 25508(a)(1)
Violation Notes:

Returned to compliance on 11/16/2018. OBSERVATION: The business failed to complete and electronically submit chemical inventory information for all reportable hazardous materials on site at or above reportable quantities: 1. Two hydrogen compressed gas cylinders approximately 250 cubic feet each. 2. Seven mixed gas methane/helium cylinders approximately 150 cubic feet each and one 250 cubic feet. 3. Two mixed gas oxygen/helium cylinders approximately 150 cubic feet each. 4. Two mixed gas oxygen/nitrogen cylinders approximately 150 cubic feet each. HMBP hazardous materials or hazardous waste reportable quantities are greater than or equal to 200 cubic feet of a compressed gas, 55 gallons of a liquid, or 500 pounds of a solid substance. CORRECTIVE ACTION: Complete and electronically submit the chemical inventory information for all reportable hazardous materials on site at or above reportable quantities. Submit electronically through CERS website at http://cers.calepa.ca.gov/ within 30 days.

Violation Description:

Failure to complete and electronically submit hazardous material inventory information for all reportable hazardous materials on site at or above reportable quantities.

Violations

Violation Date: 06/09/2015 ***Violation Source:*** CERS
Violation Program: HMRRP ***Violation Division:*** Alameda County Environmental Health
Citation: HSC 6.95 25508(a)(1) - California Health and Safety Code, Chapter 6.95, Section(s) 25508(a)(1)
Violation Notes:

Returned to compliance on 07/17/2015. OBSERVATIONS: The chemical inventory in CERS must be updated. CORRECTIVE ACTIONS: Update CERS with the following: liquid helium must include the dewars in the maximum daily amount stored onsite; the liquid nitrogen tank amount must be updated to 13,000 gallons; propane must be updated to 287 cubic feet for the largest container size and 2009 cubic feet for maximum stored onsite and include separate line items for the inert mixes.

Violation Description:

Failure to complete and electronically submit hazardous material inventory information for all reportable hazardous materials on site at or above reportable quantities.

Evaluations

Eval Date: 06/09/2015
Violations Found: Yes
Eval General Type: Compliance Evaluation Inspection
Eval Type: Routine done by local agency
Eval Division: Alameda County Environmental Health
Eval Program: HMRRP
Eval Source: CERS
Eval Notes:

Onsite today with James Chamberlain, Operations Manager for Matheson Tri-Gas. This facility transfills liquid and compressed helium. Onsite is a 11,000 gallons liquid helium transportable dewar/tank plus numerous smaller dewars from 5-25 gallons each. There are also 10 compressed helium tube trailers at 180,000 cubic feet each with only one or two full at the same time. There is 13,000 gallon liquid nitrogen tank stored outside for filling of tanker trucks. There are also numerous empty cylinders (propane, oxygen etc) stored outside. The Hazardous Materials Business Plan (HMBP) was last submitted to the California Environmental Reporting System on April 1, 2015. Please update the Business Activities form to show "NO" for "Is your facility a Hazardous Waste Generator?" All violations noted in this HMBP inspection report are to be corrected within 30 days and proof of those corrections submitted to this office in the same time frame. CERTIFICATION OF RETURN TO [Truncated]; Note: data in [EVAL Notes] field for some records is truncated from the source.

Eval Source: CERS
Eval Notes:

Alameda County Dept. of Environmental Health (ACDEH) inspector arrived on-site at Matheson Tri-Gas, Inc. 6925 Central Ave Newark, CA 94560 to conduct an inspection of Hazardous Materials Business Plan (HMBP). ACDEH met with Helium Plant Operator/Supervisor Erich Friedrich, and Plant Manager Adam Awkal who provided consent for and assisted ACDEH with the inspection. Facility has three employees and is base for two drivers. Facility stores bulk liquid helium and transfills the liquid helium to dewars for customer orders. Multiple empty dewars stored in the warehouse ranging in size from 60 to 500 liters. There is a helium gas recovery system that captures helium vapor gas then transferred to tube trailers stored onsite. A small lab in the facility tests for purification. HMBP is readily available to all employees. In review of the facility's business plan there are changes required in the business activities and business owner/operator pages reported in the [Truncated]; Note: data in [EVAL Notes] field for some records is truncated

from the source.

Evaluations

Eval Date: 07/15/2021
Violations Found: No
Eval General Type: Compliance Evaluation Inspection
Eval Type: Routine done by local agency
Eval Division: Alameda County Environmental Health
Eval Program: HMRRP
Eval Source: CERS
Eval Notes:

ACDEH inspectors arrived on site at Mission Linen & Uniform Service, 6590 Central Ave Newark, to complete an inspection of the Hazardous Materials Business Plan and Hazardous Waste Generator program. Facility representative Don Bock assisted with the inspection. Mission Linen & Uniform Service is a large-scale industrial uniform retail service and commercial laundry cleaning company. Uniform cleaning services apply to a broad spectrum of commercial businesses including restaurant and hospitality as well as medical PPE. All hazardous materials used in the cleaning process are self-contained in a closed loop system and collected through water treatment. The facility process operates under a single large industrial warehouse room, while most hazardous material cleaning liquids are consolidated into three main rooms: Boiler Room: This room is where water from the city is treated with Decon to soften water and boil steam prior to wa... [TRUNCATED: Refer to full Inspection Report]; Note: data in [EVAL Notes] field for some records is truncated from the source.

Eval Source: CERS
Eval Notes:

GENERATE NOV LTR/ADDING VIOLATION IN EC; Note: data in [EVAL Notes] field for some records is truncated from the source.

Eval Date: 07/15/2021
Violations Found: Yes
Eval General Type: Compliance Evaluation Inspection
Eval Type: Routine done by local agency
Eval Division: Alameda County Environmental Health
Eval Program: HW
Eval Source: CERS
Eval Notes:

The facility's main waste stream is concentrated in the water treatment room, in which filters capture most hazardous chemicals before water is dumped in the sanitary sewer. The filter cakes have a history of hazardous waste disposal for the last 3 years. Testing results from 3/3/2020 indicated hazardous waste determination was made. Facility also services a fleet of around 70 vehicles. The fleet maintenance room stores 2x55 gallon drums of used oil and a 55 gallon drum for used oil filters.; Note: data in [EVAL Notes] field for some records is truncated from the source.

RB Case No: 01S0654
Local Case No: 0717
Begin Date: 8/16/2006
Lead Agency: SAN FRANCISCO BAY RWQCB (REGION 2)
Local Agency: ALAMEDA COUNTY WATER DISTRICT
CUF Case: NO
CalEnvScreen Score:
EPA Region: 9
Qty Rlsd Gallons:
Potential COC: Dichloroethane (DCA), Dichloroethene (DCE), Freon
How Discovered: Groundwater Monitoring, Site Assessment/Site Investigation, Subsurface Monitoring
Stop Method: Repair Product Piping
Stop Description:
Case Worker: UUU
Military DoD Site: No
Leak Reported Dt: 2006-03-02 00:00:00
No Further Action Dt:
Potential Media of Concern: Other Groundwater (uses other than drinking water)
How Discovered Description:
Calwater Watershed Name: Santa Clara - Fremont Bayside (205.20)
DWR GW Subbasin Name: Santa Clara Valley - Niles Cone (2-009.01)
Disadvantaged Community:
Coordinate Source: Google Geocode
Discharge Cause: Unknown
Discharge Source: Piping
Facility Project Sub Type:
Calenviroscreen 3 Score: 66-70%
Calenviroscreen 4 Score: 60-65%
File Location: All Files are on GeoTracker or in the Local Agency Database
Site History:

The property is approximately 5 acres and currently developed with a gas cylinder processing facility. The facility consists of a number of buildings and canopied areas that house the cylinder cleaning and processing operations, storage, and offices.

Violation Program: CA **Violation Division:** Alameda County Environmental Health
Citation: 22 CCR 45 67450.3(c)(9)(F) - California Code of Regulations, Title 22, Chapter 45, Section(s) 67450.3(c)(9)(F)
Violation Notes:

Owner/Operator failed to obtain assessment or reassessment every five (5) years or the remaining service life of the hazardous waste treatment tank system, as stated in the engineer's assessment, whichever is less. A hazardous waste tank reassessment has not been conducted for the wastewater pretreatment [Tanks T-504 and 505]: The October 29, 2009 engineers report calls for a tank re-inspection in June 2011. Miller Engineering completed a tank assessment report for Tank T-504 and 505, dated October 9, 2013. This 2013 report called for re-inspection and certification by October 2018.

Obtain assessment or reassessment of the hazardous waste treatment tank system pursuant to 22 CCR 66265.192, completed by a professional engineer. Obtain a written hazardous waste tank system reassessment for the [Tanks T-504 and 505] tank system in accordance with 22 CCR 15 66265.192 and submit a copy to the CUPA. The re-certification was due by October 2018.

Violation Description:

Failure of generator to obtain assessment or reassessment every five (5) years or the remaining service life of the tank system, as stated in the engineer's assessment, whichever is less. This assessment applies to onground or aboveground tank systems containing only non-RCRA hazardous wastes generated onsite, and tank systems authorized under Permit-by-Rule, Conditional Authorization, and Conditional Exemption or for a small quantity generator onground or aboveground tank systems containing RCRA hazardous wastes generated onsite.

Violations

Violation Date: 09/22/2017 ***Violation Source:*** CERS
Violation Program: HMRRP ***Violation Division:*** Alameda County Environmental Health
Citation: HSC 6.95 25508.1(a)-(f) - California Health and Safety Code, Chapter 6.95, Section(s) 25508.1(a)-(f)
Violation Notes:

Returned to compliance on 11/15/2017. OBSERVATION: The facility has not submitted the Hazardous Materials Inventory Chemical Description page for 6,750lbs of Sulfur Dioxide, 880 lbs of Methyl Fluoride, and 2000 gallons of 30% Hydrochloric Acid to the CUPA. Tank 506 3% Hypochlorate (Bleach) needs to be labeled empty to remain out of the Hazardous Materials Inventory. HMBP shall be updated within 30 days of change in chemical inventory, change of address, ownership, or business name. CORRECTIVE ACTION: Complete and submit the Hazardous Materials Inventory Chemical Description page for all materials listed above electronically in the California Environmental Reporting System (CERS). Also label Tank 506 as empty if it no longer contains 3% Hypochlorate, otherwise, it will need to be submitted in the Hazardous Materials Inventory Chemical Description page. Provide photo documentation of labeling.

Violation Description:

Failure to electronically update business plan within 30 days of any one of the following events:
A 100 percent or more increase in the quantity of a previously disclosed material.
Any handling of a previously undisclosed hazardous materials at or above reportable quantities.
A change of business address, business ownership, or business name.
A substantial change in the handler's operations that requires modification to any portion of the business plan.

Violation Notes:

Returned to compliance on 10/22/2013.

Violation Description:

Failure to properly label hazardous waste accumulation containers with the following requirements: "Hazardous Waste", name and address of the generator, physical and chemical characteristics of the Hazardous Waste, and starting accumulation date.

Violations

Violation Date: 06/21/2022 ***Violation Source:*** CERS
Violation Program: CA ***Violation Division:*** Alameda County Environmental Health
Citation: HSC 6.5 25200.3(g) - California Health and Safety Code, Chapter 6.5, Section(s) 25200.3(g)
Violation Notes:

Returned to compliance on 09/29/2023. The hazardous waste treatment unit was not closed properly. ACDEH CUPA was notified of the tiered permit intent to close in November 2021. There has been no further communication or work plan transmitted to ACDEH CUPA regarding the closure activities, closure date, decontamination, proper disposition of the treatment system, and other pertinent information as required by Conditional Authorization and hazardous waste tank closures. Based on the September 2017 CUPA inspection, the inspector noted the facility no longer treats hazardous waste onsite. CERS was updated 11/15/2017 to reflect "NO" for Does your facility treat hazardous waste on-site? Ensure that compliance with the requirements have been met to properly close the HW treatment unit and/or notify the CUPA that the HW treatment unit has been properly closed and/or decontaminated.

Violation Description:

Failure of the generator to remove or decontaminate all containment system components and structures or equipment contaminated with hazardous waste and soils and provide written notification of all closure activities at the closure of the treatment unit.

Violations

Violation Date: 09/22/2017 ***Violation Source:*** CERS

Citation: 22 CCR 15 66265.197 - California Code of Regulations, Title 22, Chapter 15, Section(s) 66265.197
Violation Notes:

Returned to compliance on 09/29/2023. The waste water pretreatment tank system (consisting in part, tanks 504 and 505) has not been properly closed. Tanks 504 and 505 are part of the conditionally authorized tiered permit process used to treat spent caustic scrubber solution. MTG has notified ACDEH CUPA of the intent to close the tiered permit on Nov. 9, 2021. However, ACDEH CUPA's Feb 14, 2022 Email "Matheson Tri-Gas Tiered Permit Closure Letter - Deposit Account" has gone unanswered. MGT has been apprised that until the tiered permit is formally closed, it remains active. Submit photos/documentation and a work plan to the CUPA demonstrating the tank system for the tiered permit process used to treat spent caustic scrubber solution has been closed in accordance with the requirements of 22 CCR 15 66265.197.

Violation Description:

Failure of owner or operator to properly close a hazardous waste tank system ensuring the minimization of further maintenance and that the required requirements have been met.

Violations

Violation Notes:

Returned to compliance on 10/17/2013.

Violation Description:

Failure to prepare written operating procedures that provide clear instructions or steps for safely conducting activities associated with each covered process consistent with the safety information for that process and address the following:
1. Initial startup;
2. Normal operations;
3. Temporary operations;
4. Emergency shutdown and operations;
5. Normal shutdown;
6. Startup following a normal or emergency shutdown or a major change that requires a hazard review;
7. Consequences of deviations and steps required to correct or avoid deviations;
8. Equipment inspections.

Citation: 22 CCR 15 66265.192(h) - California Code of Regulations, Title 22, Chapter 15, Section(s) 66265.192(h)
Violation Notes:

A hazardous waste tank reassessment has not been conducted for the [Tanks T-504 and 505] tank system within 5 years of the previous tank system assessment or within the remaining service life of the tank system as stated in the engineer's report, whichever is less. The October 29, 2009 engineers report calls for a tank re-inspection in June 2011. Miller Engineering completed a tank assessment report for Tank T-504 and 505, dated October 9, 2013. This 2013 report called for re-inspection and certification by October 2018. Obtain a written hazardous waste tank system reassessment for the [Tanks T-504 and 505] tank system in accordance with 22 CCR 15 66265.192 and submit a copy to the CUPA. The re-certification was due by October 2018.

Violation Description:

Failure of generator to obtain assessment or reassessment every five (5) years or the remaining service life of the tank system, as stated in the engineer's assessment, whichever is less. This assessment applies to onground or aboveground tank systems containing only non-RCRA hazardous wastes generated onsite, or for a small quantity generator onground or aboveground tank systems containing RCRA hazardous wastes generated onsite.

Eval Notes:

Onsite to conduct the Tiered Permitting Conditionally Authorized inspection at Matheson Tri-Gas - 6775 Central Ave., Newark, CA. Met with Hub Operations Manager, Geoffrey Downing and Production & Maintenance Manager, Juan Mora. The facility is authorized to treat 15,000 gallons of waste water per month from their operation. Based on the quantity, the facility is also a Large Quantity Generator (LQG). As a LQG, the facility is required to dispose of/treat their hazardous waste every 90 days, prepare and submit a biennial report and a source reduction report (SB14) due every 5 years. Alameda County Environmental Health (ACDEH) has an active permit for the treatment system. Mr. Juan Mora said that the facility has cut back production and changed their operations so that treatment of hazardous waste no longer occurs. The facility currently treats rainwater only from the chemical pad area to around pH 7. The past two years' treatment records verified pH range of waste [Truncated]; Note: data in [EVAL Notes] field for some records is truncated from the source.

Eval Notes:

Routine triennial hazardous waste generator (HWG) inspection. Matheson Tri-Gas cleans, tests, fills, certifies, stores, and ships various gas cylinders and bottles at the plant. Signatures not collected due to COVID protocols. Matheson Tri-Gas is referred to as "MTG" in this report. Matheson is a RCRA and CA non-RCRA large quantity generator. During a look-back since the last HWG inspection in September 2017, the facility generated more than the LQG threshold of 1,000 kgs/month. RCRA: During Feb to May 2019 (10.8 tons, average of 3.6 tons/month). April 2021 disposed of 9.2 tons (average of 0.83 tons/month from May 2020 to April 2021. It is unclear the time period this waste was generated versus disposed (e.g. steady-state vs. episodic). CA non-RCRA: During Feb to May 2018 (12.2 tons, average of 3.4 tons/month). May 2019 disposed of 10.8 tons of waste code 122. Last disposal of waste code 122 was in 2003. It i... Eval Notes:

Onsite on 9/22/2017 to begin the RCRA Large Quantity Generator inspection at Matheson Tri-Gas - 6775 Central Ave., Newark, CA. Met with Hub Operations Manager, Geoffrey Downing and Production & Maintenance Manager, Juan Mora. Historically, the facility is a RCRA large quantity generator, but in 2013, operations have scaled back and hazardous waste is generated at a smaller quantity according to Juan Mora. ACDEH did not observe hazardous waste manifests every 90 days for 2015, therefore hazardous waste was not removed within the required 90 day time. During today's inspection on 9/22/17, observations of the operations and hazardous waste storage areas shows significant drop in hazardous waste generated. Less than 1000 kg of hazardous waste is generated per month. ACDEH returned on 10/5/2017 to complete the Hazardous Waste Generator inspection.; Note: data in [EVAL Notes] field for some records is truncated from the source.

Eval Notes:

Routine tiered permit conditionally authorized (TP-CA) inspection. Matheson Tri-Gas is referred to as "MTG" in this report. ACDEH CUPA was notified of Matheson Tri-Gas intent to close the TP-CA on November 2021 from James Murphree; no further communication has been received by CUPA. ACDEH CUPA transmitted an Email dated Feb. 2022 requesting a deposit-refund for the review of a workplan to formally close the TP-CA; no response has been received. TP-CA is considered operational, subject to permitting requirements, and inspections, until the TP-CA is formally closed (documented clean/decontaminated, tanks properly closed/disposed of). Per a November 2017 Matheson communication and ACDEH CUPA 2017 inspection: The tank system used for scrubber acid-base neutralization, tanks T-504 and T-505, is being used to store rain water. Apparently no active hazardous waste treatment is on-going. Description of the hazardous waste treatme... Generator Code Description: Large Quantity Generator
Source Type: Notification

Hazardous Waste Handler Details

Sequence No: 1
Receive Date: 19900406
Handler Name: MATHESON GAS PRODUCTS
Federal Waste Generator Code: 1
Generator Code Description: Large Quantity Generator
Source Type: Annual/Biennial Report

Hazardous Waste Handler Details

Sequence No: 2
Receive Date: 19920225
Handler Name: MATHESON GAS PRODUCTS
Federal Waste Generator Code: 1
Generator Code Description: Large Quantity Generator
Source Type: Annual/Biennial Report

Hazardous Waste Handler Details

Sequence No: 3
Receive Date: 20020304

Handler Name: MATHESON TRI-GAS INC.
Federal Waste Generator Code: 1
Generator Code Description: Large Quantity Generator
Source Type: Annual/Biennial Report

Waste Code Details

Hazardous Waste Code: 122
Waste Code Description: Alkaline solution without metals (pH > 12.5)

Hazardous Waste Code: 181
Waste Code Description: Other inorganic solid waste

Hazardous Waste Code: 212
Waste Code Description: Oxygenated solvents (acetone, butanol, ethyl acetate, etc.)

Hazardous Waste Code: 221
Waste Code Description: Waste oil and mixed oil

Hazardous Waste Code: 271
Waste Code Description: Organic monomer waste (includes unreacted resins)

Hazardous Waste Code: 343
Waste Code Description: Unspecified organic liquid mixture

Hazardous Waste Code: 352
Waste Code Description: Other organic solids

Hazardous Waste Code: 551
Waste Code Description: Laboratory waste chemicals

Hazardous Waste Code: 611
Waste Code Description: Contaminated soil from site clean-ups

Hazardous Waste Code: 741
Waste Code Description: Liquids with halogenated organic compounds > 1000 mg/l

Hazardous Waste Code: 751
Waste Code Description: Solids or sludge with halogenated organic comp. > 1000 mg/kg

Hazardous Waste Code: 791
Waste Code Description: Liquids with pH < 2

Hazardous Waste Code: D001
Waste Code Description: IGNITABLE WASTE

Hazardous Waste Code: D002
Waste Code Description: CORROSIVE WASTE

Hazardous Waste Code: D022
Waste Code Description: CHLOROFORM

Hazardous Waste Handler Details

Violation Description:

Failure of the Existing Hazardous Waste Tank P.E. assessment to contain the following:
1) Tank configuration (i.e., horizontal, vertical), and gross capacity (in gallons);
2) Design standard(s), if available, according to which the tank and ancillary equipment were constructed and all of the following information:
A) Material of construction;
B) Material thickness and the method used to determine the thickness;
C) Description of tank system piping (material, diameter);
D) Description of any internal and external pumps; and
E) Sketch or drawing of tank including dimensions.
3) Documented age of the tank system, if available, otherwise, an estimate of the age based on owner or operator knowledge;
4) Description and evaluation of the adequacy of any leak detection equipment;
5) Description and evaluation of any corrosion protection equipment;
6) Description and evaluation of any spill prevention or overfill equipment;
7) Hazardous characteristics of the waste(s) that have been or will be handled;
8) Description of any structural damage or inadequate construction or installation such as cracks, punctures, or damaged fittings. All discrepancies shall be documented in the assessment and remedied before the tank system is certified for use.
9) Results of a leak test, internal inspection, or other tank system integrity examination including the type of integrity examination performed (i.e., ultrasonic, internal examination, volumetric tank test, pipeline pressure test). Tank system integrity or leak test requirements must be in compliance with all local requirements. Prior to conducting a tank system integrity test or leak test, contact local agency staff for local requirements.
10) Estimated remaining service life of the tank system based on findings of subsections 1) through 9).

Violation Description:

Failure to provide employees within the first six months after the date of their employment, or assignment to the facility, or to work unsupervised, or to a new position at a facility with hazardous waste training to ensure employees are competent in the following areas: hazardous waste management procedures (including contingency plan implementation) relevant to the positions in which they are employed, emergency response and emergency equipment, and procedures for using, inspecting, repairing, and replacing facility emergency and monitoring equipment. In addition, the owner/operator shall ensure facility personnel take part in an annual review of the initial training and training records training records on current personnel shall be kept until closure of the facility. Training records on former employees shall be kept for at least three years from the date the employee last worked at the facility. The records shall include the following: the job title for each position at the facility related to hazardous waste management, and the name of the employee filling each job; a written job description for each position, duties of facility personnel assigned to each position, and a written description of the type and amount of both introductory and continuing training that will be given to each person filling a position.

Violation Notes:

Returned to compliance on 04/09/2015.

Violation Description:

Failure of the generator to adequately complete, and maintain for review, the following requirements of the source reduction report (SB-14):
1) The name and location of the site;
2) Telephone number;
3) Identification Number;
4) The SIC Code5;
5) Length of time the company has been in business at the present site;
6) Major products manufactured or services provided and, if necessary to convey an understanding of the business, their general applications or examples of their applications or end use;
7) Number of employees;
8) A general description of site Operations/Maintenance with corresponding block diagrams focusing on quantity and type of hazardous wastes, raw materials, and final products produced at the site;
9) Identification of all routinely generated hazardous waste streams that annually weigh 600 kg or more and that result from ongoing processes or Operations/Maintenance and exceed 5 percent of the total yearly weight of hazardous waste generated, for extremely hazardous waste, that annually weigh 0.6 kg or more and exceed 5 percent of the total yearly weight of extremely hazardous waste generated at the site;
10) For each hazardous waste stream identified the report shall include all of the following information:
A) An estimate of the quantity of hazardous waste generated,
B) An evaluation of source reduction approaches available and are potentially viable. The evaluation shall consider at least all of the following source reduction approaches:
i) Input change.
ii) Operational improvement.
iii) Production process change.
iv) Product reformulation.
v) Administration/ Documentation steps taken to reduce hazardous waste generation including but not limited to: (A) Inventory control; (B) Employee award programs; (C) Employee training; (D) In-house policies; (E) Corporate or management commitment; and (F) Other programs or measures,
11) Consideration of the following factors for each measure evaluated in accordance with subsection (10) of this section (where a specific factor does

not apply identify as N/A): (1) Expected change in the amount of hazardous waste generated; (2) Technical feasibility; (3) Economic evaluation: (A) Capital cost, operating cost, waste management cost; (B) Return on investment (ROI), breakdown point, avoided cost, pretax payback period, or any other economic comparison method; (4) Effects on product quality; (5) Employee health and safety implications; (6) Permits, variances, compliance schedules or applicable state local and federal agencies; (7) Releases and discharges,
12) Any pertinent information, such as waste stream constituents and concentration of constituents, needed to evaluate and implement source reduction measures;
13) A specification of the technically feasible and economically practicable source reduction measures for each hazardous waste stream and the plan shall fully document any statement explaining the generator's rationale for rejecting any available source reduction approach;
14) A timetable for making progress towards implementation of the selected source reduction measures;
15) A list of each measure considered but not selected for a detailed evaluation as a potentially viable source reduction measure. For each measure rejected, explain the generator's rationale. This list shall be supplemented for waste streams where no measures were identified with a narrative demonstrating the good faith efforts undertaken to identify measures.
16) A timetable for making reasonable and measurable progress towards implementation of the selected source reduction measures specified in subsection (13) of this section. It shall also include an implementation schedule for completing the evaluation of potentially viable source reduction measures and it shall prioritize processes and wastes for future research, development and source reduction analysis;
17) P.E. Certification; and
18) A summary progress report that briefly summarizes the results of implementing the sou; Note: data in [Violation Description] field for some records is truncated from the source.

Citation: 22 CCR 15 66265.192(h) - California Code of Regulations, Title 22, Chapter 15, Section(s) 66265.192(h)
Violation Notes:

Returned to compliance on 04/09/2015.

Violation Description:

Failure to obtain and maintain a written assessment reviewed and certified by an independent, qualified, professional engineer stating the new hazardous waste tank system has sufficient structural integrity, is acceptable for the transferring, storing and treating of hazardous waste, and that the tanks and containment system including the foundation, structural support, seams, connections, and pressure controls (if applicable) are suitably designed and that the tank system has sufficient structural strength, compatibility with the waste(s) to be transferred, stored or treated, and corrosion protection so that it will not collapse, rupture, or fail. This assessment shall be obtained prior to placing the tank system in service, and shall be kept on file at the facility. The tank assessment shall be good for five years. This assessment shall also include, at a minimum, the following information:
(1) Design standard(s) according to which the tank(s) and ancillary equipment are or will be constructed;
(2) Hazardous characteristics of the waste(s) to be handled;
(3) For new tank systems or components in which the external shell of a metal tank or any external metal component of the tank system is or will be in contact with the soil or with water, a determination by a corrosion expert of:
(A) Factors affecting the potential for corrosion, including but not limited to:
1. Soil moisture content;
2. Soil pH;
3. Soil sulfides level;
4. Soil resistivity;
5. Structure to soil potential;
6. Influence of nearby underground metal structures (e.g., piping);
7. Stray electric current; and
8. Existing corrosion-protection measures (e.g., coating, cathodic protection), and
(B) The type and degree of external corrosion protection that are needed to ensure the integrity of the tank system during the use of the tank system or component, consisting of one or more of the following:
1. Corrosion-resistant materials of construction such as special alloys or fiberglass-reinforced plastic;
2. Corrosion-resistant coating (such as epoxy or fiberglass) with cathodic protection (e.g., impressed current or sacrificial anodes); and

3. Electrical isolation devices such as insulating joints and flanges;
(4) For underground tank system components that are likely to be affected by vehicular traffic, a determination of design or operational measures that will protect the tank system against potential damage; and
(5) Design considerations to ensure that:
(A) Tank foundations will maintain the load of a full tank;
(B) Tank systems will be anchored to prevent flotation or dislodgement where the tank system is placed in a saturated zone, or is located within a seismic fault zone;
(C) Tank systems will withstand the effects of frost heave; and
(D) The installation of a corrosion protection system that is field fabricated shall be supervised by an independent corrosion expert to ensure proper installation.

Violation Notes:

Returned to compliance on 04/09/2015.

Violation Description:

Failure of the LQG and/or TP generator, on all new and existing hazardous waste tank systems and ancillary equipment, to meet the following secondary containment requirements:
1) Designed, installed, and operated to prevent any migration of wastes or accumulated liquid out of the system to the soil, ground water, or surface water at any time during the use of the tank system; and
2) Capable of detecting and collecting releases and accumulated liquids until the collected material is removed.
3) Constructed of or lined with materials that are compatible with the waste(s) to be placed in the tank system and shall have sufficient strength and thickness to prevent failure due to pressure gradients (including static head and external hydrological forces), physical contact with the waste to which they are exposed, climatic conditions, the stress of installation, and the stress of daily operation (including stresses from nearby vehicular traffic);
4) Placed on a foundation or base capable of providing support to the secondary containment system and resistance to pressure gradients above and below the system and capable of preventing failure due to settlement, compression, or uplift;
5) Provided with a leak detection system that is designed and operated so that it will detect the failure of either the primary and secondary containment structure or any release of hazardous waste or accumulated liquid in the secondary containment system within 24 hours, or at the earliest practicable time if the existing detection technology or site conditions will not allow detection of a release within 24 hours;
6) Sloped or otherwise designed or operated to drain and remove liquids resulting from leaks, spills, or precipitation. Spilled or leaked waste and accumulated precipitation shall be removed from the secondary containment system within 24 hours, or in as timely a manner as is possible to prevent harm to human health or the environment, if removal of the released waste or accumulated precipitation cannot be accomplished within 24 hours.
7) Secondary containment for tanks shall include one or more of the following devices:
a) A liner (external to the tank); b) a vault; c) a double-walled tank; or d) an equivalent device as approved by the Department.
8) The secondary containment systems shall satisfy the following requirements:
a) External liner systems shall be designed or operated to contain 100 percent of the capacity of the largest tank within its boundary; or
b) Designed or operated to prevent run-on and infiltration of precipitation into the secondary containment system unless the collection system has sufficient excess capacity to contain run-on and infiltration. Such additional capacity shall be sufficient to contain run-on and infiltration of precipitation from a 25-year, 24-hour rainfall event;
c) Free of cracks or gaps; and
d) Designed and installed to completely surround the tank and to cover all surrounding earth likely to come into contact with the waste if released from the tank(s) (i.e., capable of preventing lateral as well as vertical migration of the waste).
9) Vault systems shall be:
a) Designed or operated to contain 100 percent of the capacity of the largest tank within its boundary;
b) Designed or operated to prevent run-on and infiltration of precipitation into the secondary containment system unless the collection system has sufficient excess capacity to contain run-on and infiltration. Such additional capacity shall be sufficient to contain run-on and infiltration of precipitation from a 25-year, 24-hour rainfall event;
c) Constructed with chemical-resistant water stops in place at all joints (if any);
d) Provided with an impermeable interior coating or lining that is compatible with the waste being transferred, stored or treated and that will prevent migration of waste into the concrete;
e) Provided with a means to protect against the formation of and ignition of vapors within the vault, if the w; Note: data in [Violation Description] field for some records is truncated from the source.

Eval Program: HWLQG
Eval Source: CERS
Eval Notes:

Onsite to conduct the Hazardous Waste Generator inspection at Britech Electropolishing Inc., - 6821 Central Ave. Suite A, Newark, CA. Met with owner, Lavanya Narne and Consultant, Lafayette Foland. Generator is a RCRA Large Quantity Generator, whose waste stream is Chromium/Copper solids and neutralized/filtered water is discharged under Union Sanitary Discharge Permit (expires 6/30/2019) OBSERVATION: Facility's entire electropolishing process is contained in secondary containment, but employees are walking in the secondary containment space rather than on raised walkable grates. ACDEH recommends providing raised grated walkways for employees so they do not step into the secondary containment and risk dragging out any spilled material. OBSERVATION: Observed that the Hazardous Waste Treatment Tanks do not have seismic analysis in the tank assessmnt. Facility is

located in a liquefaction zone. The tank assessment mentions that all other tanks are bolted to the floor, [Truncated]; Note: data in [EVAL Notes] field for some records is truncated from the source.

Eval Notes:

Routine trienial tiered permit (TP) inspection. Met with Lavanya Narne, owner. Britech operates a Permit by Rule hazardous waste treatment process. The process precipitates metallic ions (chrome, nickel, silver) via flocculation and does pH neutralization prior to discharge to Union Sanitary District under POTW permit. There are four holding tanks and one filter press in the TP process. Caustic soda and magnisium are used for the pH neutralization and flocculation.; Note: data in [EVAL Notes] field for some records is truncated from the source.

Eval Notes:

Onsite to conduct the Tiered Permitting Permit by Rule inspection at Britech Electropolishing Inc., - 6821 Central Ave. Suite A, Newark, CA. Met with owner, Lavanya Narne and Consultant, Lafayette Foland. Generator is a RCRA Large Quantity Generator, whose waste stream is Chromium/Copper solids and neutralized/filtered water is discharged under Union Sanitary Discharge Permit (expires 6/30/2019). Observed that the closure cost estimate needs to be revised to reflect soil sampling costs (~$1500), 2018 cost increases, and increased agency permit fees to $2000. For the 2018 Closure Cost estimate submitted by March1, 2018, include the items mentioned above. OBSERVATION: Observed that the Nitric Acid tank is not seismically secured and the tank assessment mentions that all other treatment tanks are bolted to the floor, but seismic verification is not present. During the upcoming Tank

Assessment, have the PE do a seismic analysis on all treatment tanks. ACDEH has to [Truncated]; Note: data in [EVAL Notes] field for some records is truncated from the source.

Violation Program: HMRRP **Violation Division:** Alameda County Environmental Health
Citation: HSC 6.95 25508(a)(3) - California Health and Safety Code, Chapter 6.95, Section(s) 25508(a)(3)
Violation Notes:

Returned to compliance on 09/19/2022. Per Devin Corcoran, the emergency contact information on the Business Owner/Operator Identification page in the California Environmental Reporting System (CERS) needs to be updated. Update the emergency contact information on the Business Owner/Operator Identification page in CERS no later than 7/29/2022.

Violation Description:

Failure to report program data electronically.

Violations

Violation Date: 06/29/2022 **Violation Source:** CERS
Violation Program: HW **Violation Division:** Alameda County Environmental Health
Citation: 22 CCR 11 66261.7 - California Code of Regulations, Title 22, Chapter 11, Section(s) 66261.7
Violation Notes:

Returned to compliance on 08/29/2022. The facility failed to label their 55-gallon drums that previously held a hazardous material/waste. This is a

repeated violation that is being elevated to a Class II violation. Label all 55-gallon drums that previously held a hazardous material/waste with the following information no later than 7/29/2022: • The word "Empty" • The date the container was been emptied Submit a picture of this to Alameda County CUPA to close the violation.

Violation Description:

Failure to manage empty containers greater than 5 gallons in capacity that previously held a hazardous material/waste in accordance with 22 CCR 11 66261.7 including but not limited to the following:

(e)(2)By reclaiming its scrap value onsite or shipping the container or inner liner to a person who reclaims its scrap value; or

(3) By reconditioning or re manufacturing the container or inner liner onsite for subsequent reuse, or shipping the container or inner liner to a person who reconditions or re-manufactures the container or inner liner; or

(4) By shipping the container or inner liner to a supplier or to another intermediate collection location for accumulation prior to managing the container or inner liner pursuant to subsections (e)(2) or (e)(3) of 22 CCR 11 66261.7; or

(i) By shipping the container or inner liner back to the supplier for the purpose of being refilled.

(f) A container or an inner liner removed from a container larger than five gallons in capacity which is managed pursuant to subsection (e) of 22 CCR 11 66261.7 shall be marked with the date it has been emptied and shall be managed within one year of being emptied.

Violation Notes:

Returned to compliance on 08/29/2022. The facility failed to label their 55-gallon drum of used oil filters with the accumulation start date. Label the drum of used oil filters with the following information no later than 7/29/2022: • The words "Drained used oil filters" • The accumulation start date Submit a picture of this to Alameda County CUPA to close the violation.

Violation Description:

Failure to properly manage used oil and/or fuel filters in accordance with the requirements.

Violations

Violation Date: 06/29/2022 ***Violation Source:*** CERS
Violation Program: HMRRP ***Violation Division:*** Alameda County Environmental Health
Citation: HSC 6.95 25507 - California Health and Safety Code, Chapter 6.95, Section(s) 25507
Violation Notes:

Returned to compliance on 09/19/2022. The facility failed to implement the following aspects of its Hazardous Materials Business Plan: 1. Unattended waste oil and waste antifreeze spill were observed in the secondary containment and on top of the drums. 2. Incompatible gases were stored together in the shop - oxygen and acetylene cylinders were stored with each other in the same cage and the oxygen cylinders were stored within 6 feet of the propane cylinders. This violation was also cited on 6/23/2015. Clean up all waste oil/antifreeze spills and segregate the incompatible gases no later than

7/29/2022 (incompatible gases should be stored at least 15 feet apart). Submit pictures of this to Alameda County CUPA to close the violation.

Violation Description:

Failure to adequately establish and implement a business plan when storing/handling a hazardous material at or above reportable quantities.

Violations

Violation Date: 06/29/2022 ***Violation Source:*** CERS

Violation Notes:

Returned to compliance on 12/02/2022. The Emergency Response and Contingency Plan in CERS does not include the contact information for the Primary/Secondary Emergency Coordinators. Update the Emergency Response and Contingency Plan in CERS to include the missing information no later than 7/29/2022.

Violation Description:

Failure to establish and electronically submit an adequate emergency response plan and procedures for a release or threatened release of a hazardous material.

Violations

Violation Date: 04/24/2019 ***Violation Source:*** CERS
Violation Program: HW ***Violation Division:*** Alameda County Environmental Health
Citation: 49 CFR 1 172 - U.S. Code of Federal Regulations, Title 49, Chapter 1, Section(s) 172
Violation Notes:

Returned to compliance on 05/04/2023. Universal Waste Handler (UWH) failed to properly package, label, mark, placard, or prepare and retain shipping papers for all universal waste being shipped to another universal waste handler, destination facility, or foreign facility. Facility shall transmit to ACDEH CUPA the next fluorescent tube disposal manifest. Submit documentation to the CUPA demonstrating that all universal waste noted above have been properly packaged, labeled, marked, placarded, or prepared and retain shipping papers.

Violation Description:

Failure of the universal waste handler to transfer universal waste to another universal waste handler, or appropriate destination facility. Failure to package, label, mark and placard shipments and prepare shipping papers for any universal waste that meets the hazardous materials definition in accordance with DOT 49 CFR parts 171-180.

Citation: 40 CFR 1 262.34(d)(5)(iii) - U.S. Code of Federal Regulations, Title 40, Chapter 1, Section(s) 262.34(d)(5)(iii)
Violation Notes:

Returned to compliance on 08/29/2022. Empty container management and storage shall be added to the list of training items. Observed several empty, unlabeled poly containers and one 5 gallon bucket of oily water outside north of mechanic's shop. Submit documentation to the CUPA demonstrating that employees have been properly trained on container management.

Violation Description:

Failure to ensure that all employees are thoroughly familiar with proper waste handling and emergency procedures, relevant to their responsibilities during normal facility operations and emergencies.

Violations Found: Yes
Eval General Type: Compliance Evaluation Inspection
Eval Type: Routine done by local agency
Eval Division: Alameda County Environmental Health
Eval Program: HW
Eval Source: CERS
Eval Notes:

Alameda County CUPA inspector Luke Voropaeff was onsite to conduct a routine Hazardous Waste Generator inspection. Consent to inspect was provided by the vice president, Devin Corcoran. D&D Equipment/Fine Line generates less than 1000 kg of hazardous waste each month. Observed hazardous waste streams included waste oil, waste antifreeze, drained used oil filters, and universal waste. They do not qualify as a Conditionally Exempt Small Quantity Universal Waste Generator because they do not manage/dispose of their unusable aerosol as universal waste. An Aerosol Can Waste Management handout and Universal Waste Fact Sheet will be provided to the facility with a copy of this report. The inspection report was not written onsite due to Alameda County CUPA's social distancing policy during the COVID-19 pandemic. It was emailed to devincorcoran@earthlink.net and tita.flsd@yahoo.com on 7/8/2022.; Note: data in [EVAL Notes] field for some records is truncated from the source.

Violations

Violation Date: 06/06/2018 **Violation Source:** CERS
Violation Program: HWLQG **Violation Division:** Alameda County Environmental Health
Citation: 22 CCR 12 66262.34(f) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.34(f)
Violation Notes:

Returned to compliance on 07/05/2018. OBSERVATIONS: 1. Facility generally manages most hazardous waste as satellite accumulation areas. The labels that are currently being used are missing the following: name and address of the generator, the composition and physical state of the waste and the hazardous properties of the waste. 2. One mobile used oil cart in the Maintenance Area is missing a hazardous waste label. CORRECTIVE ACTIONS: 1. Relabel all drums of hazardous waste that have satellite accumulation labels with the correct information. Submit a photo of several drums labeled with the new labels. 2. Label the mobile used oil cart with a completed hazardous waste label. Submit a photo of this correction.

Violation Description:

Failure to properly label hazardous waste accumulation containers with the following requirements: "Hazardous Waste", name and address of the generator, physical and chemical characteristics of the Hazardous Waste, and starting accumulation date.

Citation: HSC 6.95 25508.1(a)-(f) - California Health and Safety Code, Chapter 6.95, Section(s) 25508.1(a)-(f)
Violation Notes:

Returned to compliance on 01/11/2022. The facility failed to update it's business plan (in CERS) within 30 days of adding/handling the following hazardous materials: 1. Acetylene – 2,452 cubic feet (multiple cylinders) – Compressed Gas Storage (storeroom) 2. Argon/carbon dioxide – 1,419 cubic feet (multiple cylinders) – Compressed Gas Storage (storeroom) 3. Argon/carbon dioxide/helium – 718 cubic feet (multiple cylinders) – Compressed Gas Storage (storeroom) 4. WD-40 – 55 gallons (one drum) – Storeroom 5. Argon/carbon dioxide – 218 cubic feet (two 109-cubic foot cylinders) – Maintenance Shop 6. Argon/carbon dioxide – 381 cubic feet (one cylinder) – Behind the Maintenance Shop (outside) 7. Used oil – 110 gallons (two 55-gallon drums) – Behind the Maintenance Shop (outside) 8. Diesel Exhaust Fluid (DEF) – 37.5 gallons (fifteen 2.5-gallon containers) – Solar Heavy Equipment Repair Shop (adjacent) 9. Used oil – 110 gallons (two 55-gallon drums) – Solar Heavy Equipment Repair... [TRUNCATED: Refer to full Inspection Report]

Violation Description:

Failure to electronically update business plan within 30 days of any one of the following events:
A 100 percent or more increase in the quantity of a previously disclosed material.
Any handling of a previously undisclosed hazardous materials at or above reportable quantities.
A change of business address, business ownership, or business name.
A substantial change in the handler's operations that requires modification to any portion of the business plan.

Citation: HSC 6.67 25270.4.5(a) - California Health and Safety Code, Chapter 6.67, Section(s) 25270.4.5(a)
Violation Notes:

Returned to compliance on 07/31/2018. OBSERVATION: In the SPPC Plan and Monthly tank inspection logs, it is not clear what secondary containment structure was being inspected. The old gasoline tank was single walled steel contained in a concrete bermed area; the new gasoline tank is constructed as double walled steel/concrete with integral secondary containment and interstitial space. CORRECTIVE ACTION: Training shall emphasize and clarify what structure comprises secondary containment for any and all tanks that are subject to sized secondry containment (e.g. gasoline tank with intergal secondary containment vs. concrete wall). Transmit the updated SPPC Plan portion discussing secondary containment along with updated training noting secondary containment.

Violation Description:

Failure to provide the following training to all oil-handling personnel:

1. Operation and maintenance of equipment to prevent discharges.

2. Discharge procedure protocols.

3. Applicable pollution control laws, rules, and regulations.

4. General facility operations.

5. Contents of the SPCC Plan.

Violations

Violation Date: 10/23/2014 ***Violation Source:*** CERS
Violation Program: HW ***Violation Division:*** Alameda County Environmental Health
Citation: 22 CCR 15 66265.196 - California Code of Regulations, Title 22, Chapter 15, Section(s) 66265.196
Violation Notes:

Returned to compliance on 04/08/2015.

Violation Description:

Failure to properly respond to a spill/leak with the following requirements:
a) General emergency procedures as required in section 66265.56.
b) Cessation of use; prevention of flow or addition of wastes into the tank system or secondary containment system and inspect the system to determine the cause of the release.
c) Removal of waste from tank system or secondary containment system.
1) If the release was from the tank system, the owner or operator shall, within 24 hours after detection of the leak or, if the owner or operator demonstrates that that is not possible, at the earliest practicable time remove as much of the waste as is necessary to prevent further release of hazardous waste to the environment and to allow inspection and repair of the tank system to be performed.
2) If the release was to a secondary containment system, all released materials shall be removed within 24 hours or in as timely a manner as is possible to prevent harm to human health and the environment.
d) The owner or operator shall immediately conduct a visual inspection of the release and, based upon that inspection:
1) Prevent further migration of the leak or spill to soils or surface water; and
2) Remove, and properly dispose of, any visible contamination of the soil or surface water.
e) Notifications, reports.
1) Any release to the environment, except as provided in subsection e)2) of this section, shall be reported within 24 hours of detection.
2) A leak or spill of hazardous waste is exempted from the requirements of subsection (e) of this section, but is not exempted from the requirements of section 66265.56, if it is:
A) Less than or equal to a quantity of one (1) pound, and

B) Immediately contained and cleaned-up.
3) Within 30 days of detection of a release to the environment, a report containing the following information shall be submitted:
A) Likely route of migration of the release;
B) Characteristics of the surrounding soil (soil composition, geology, hydrogeology, climate);
C) Results of any monitoring or sampling conducted in connection with the release, (if available). If sampling or monitoring data relating to the release are not available within 30 days, these data shall be submitted as soon as they become available;
D) Proximity to downgradient drinking water, surface water, and population areas; and
E) Description of response actions taken or planned.
f) Provision of secondary containment, repair, or closure.
1) Unless the owner or operator satisfies the requirements of subsections f)2) through 4) of this section, the tank system shall be closed in accordance with section 66265.197.
2) If the cause of the release was a spill that has not damaged the integrity of the system, the owner/operator may return the system to service as soon as the released waste is removed and repairs, if necessary, are made.
3) If the cause of the release was a leak from the primary tank system into the secondary containment system, the system shall be repaired prior to returning the tank system to service.
4) If the source of the release was a leak to the environment from a component of a tank system without secondary containment, the owner/operator shall provide the component of the system from which the leak occurred with secondary containment that satisfies the requirements of section 66265.193 before it can be returned to service, unless the source of the leak is an aboveground portion of a tank system. If the source is an aboveground component that can be inspected visually, the component shall be repaired and may be returned to service without secondary containment as long as the requirements of subsection g) of this section are satisfied. If a component is replaced to comply with the requirements of this subsection, that component shall satisfy the requirements for new tank systems or components in sections 66265.192 and 66265.193. Additionally, if a leak has occurred in any portion of a tank system component that is not; Note: data in [Violation Description] field for some records is truncated from the source.

Violations

Violation Date: 06/06/2018 ***Violation Source:*** CERS
Violation Program: HWLQG ***Violation Division:*** Alameda County Environmental Health
Citation: 22 CCR 15 66265.31 - California Code of Regulations, Title 22, Chapter 15, Section(s) 66265.31
Violation Notes:

Returned to compliance on 07/05/2018. OBSERVATIONS: Several secondary containment pallets that stored hazardous waste had liquid in them and one fire extinguisher next to the 10,000 gallon diesel AST needed to be recharged. CORRECTIVE ACTIONS: Clean out all secondary containment pallets and ensure they are kept clean and dry. The fire extinguisher was replaced during this inspection.

Violation Description:

Failure to maintain and operate the facility to minimize the possibility of a fire, explosion, or any unplanned sudden or non-sudden release of hazardous waste or hazardous waste constituents to air, soil, or surface water which could threaten human health or the environment.

Violations

Failure to complete and maintain at the facility the Substantial Harm Criteria certification form when owner or operator determines that the facility could not be reasonably expected to cause substantial harm to the environment.

Violations

Violation Date: 11/18/2021 ***Violation Source:*** CERS
Violation Program: HWLQG ***Violation Division:*** Alameda County Environmental Health
Citation: 22 CCR 15 66265.16 - California Code of Regulations, Title 22, Chapter 15, Section(s) 66265.16
Violation Notes:

Returned to compliance on 11/18/2021. The 2020 training for hazardous waste generator was not available for review due to personnel changes and the Pandemic. The 2019 and 2021 training documentation and training matrix were available. Corrected onsite since 2021 documentation was provided. Ensure that hazardous waste training is performed and documented each year.

Violation Description:

Failure to provide employees with hazardous waste training program of class room instructions or on-the-job training within the first six months after the date of their employment or assignment to a facility, or to a new position at a facility and annually thereafter. Training records on current personnel shall be kept until closure of the facility and for former employees the record shall be kept for at least three years from the date the employee last worked at the facility. The records shall include the following: the job title for each position at the facility related to hazardous waste management, and the name of the employee filling each job; a written job description for each position, duties of facility personnel assigned to each position, and a written description of the type and amount of both introductory and continuing training that will be given to each person filling a position.

Violation Program: HWLQG ***Violation Division:*** Alameda County Environmental Health
Citation: 22 CCR 15 66265.52 - California Code of Regulations, Title 22, Chapter 15, Section(s) 66265.52
Violation Notes:

Returned to compliance on 06/29/2018. OBSERVATIONS: The April 2017 Emergency Action Plan needs to be revised to include an updated list of Emergency Contacts on page 5. CORRECTIVE ACTIONS: Update the plan with the correct contact people. Resubmit it to CERS.

Violation Description:

Failure to include all of the following in the Contingency Plan: description of actions personnel will take in response to a release or emergency, arrangements with local authorities, list of emergency coordinators including name, addresses & phone numbers, list of emergency equipment and their physical description, location and capabilities, evacuation plan, and OES phone number. (If the owner or operator has already prepared a Spill Prevention, Control, and Countermeasures (SPCC) Plan or some other emergency or contingency plan, the owner or operator need only amend that plan to incorporate hazardous waste management provisions.)

Violation Program: HWLQG ***Violation Division:*** Alameda County Environmental Health
Citation: HSC 6.5 25250.22 - California Health and Safety Code, Chapter 6.5, Section(s) 25250.22
Violation Notes:

Returned to compliance on 01/11/2022. Used oil and/or fuel filters were observed with open lids and satellite accumulation label on the drum, also paper and metal filters were in the same container. Paper filters are hazardous waste and metal filters are recyclable and should be placed in separate drums. Maintain all drums closed unless actively adding or removing waste, separate paper and metal filters and label paper filters as hazardous waste and metal filters with used oil filters. Submit photo documentation to ACDEH by January 12, 2022 (Approximately 30 days from ACDEH's paperwork review).

Violation Description:

Failure to properly manage used oil and/or fuel filters in accordance with the requirements.

Citation: HSC 6.67 25270.4.5(a) - California Health and Safety Code, Chapter 6.67, Section(s) 25270.4.5(a)
Violation Notes:

Returned to compliance on 07/31/2018. OBSERVATION: In the SPCC Plan Section 3.3 refers to "diked structures". No petroleum containing tanks/containers appeared to be contained in diked structures as the secondary containment. All tanks/containers secondary containment are integral double walled or contained within a building. CORRECTIVE ACTION: In the SPCC Plan, explain what is this diked structure, where is it located, and what tanks are being contained with the diked structure. Transmit the updated Section 3.3 to ACDEH Inspector within 30 days.

Violation Description:

Failure to adequately discuss in the SPCC Plan facility drainage or drainage controls such as secondary containment around containers and other structures, equipment, and procedures for the control of a discharge.

Violations

Violation Date: 10/23/2014 ***Violation Source:*** CERS
Violation Program: HW ***Violation Division:*** Alameda County Environmental Health
Citation: 22 CCR 15 66265.16 - California Code of Regulations, Title 22, Chapter 15, Section(s) 66265.16
Violation Notes:

Returned to compliance on 04/08/2015.

Violation Description:

Failure to provide employees within the first six months after the date of their employment, or assignment to the facility, or to work unsupervised, or to a new position at a facility with hazardous waste training to ensure employees are competent in the following areas: hazardous waste management procedures (including contingency plan implementation) relevant to the positions in which they are employed, emergency response and emergency equipment, and procedures for using, inspecting, repairing, and replacing facility emergency and monitoring equipment. In addition, the owner/operator shall ensure facility personnel take part in an annual review of the initial training and training records training records on current personnel shall be kept until closure of the facility. Training records on former employees shall be kept for at least three years from the date the employee last worked at the facility. The records shall include the following: the job title for each position at the facility related to hazardous waste management, and the name of the employee filling each job; a written job description for each position, duties of facility personnel assigned to each position, and a written description of the type and amount of both introductory and continuing training that will be given to each person filling a position.

Violation Notes:

Returned to compliance on 04/08/2015.

Violation Description:

Failure to complete and electronically submit hazardous material inventory information for all reportable hazardous materials on site at or above reportable quantities.

Violations

Violation Date: 06/26/2018 ***Violation Source:*** CERS
Violation Program: APSA ***Violation Division:*** Alameda County Environmental Health
Citation: HSC 6.67 25270.4.5(a) - California Health and Safety Code, Chapter 6.67, Section(s) 25270.4.5(a)
Violation Notes:

Returned to compliance on 07/31/2018. OBSERVATION: In the SPPC Plan and Monthly tank inspection logs, it is not clear what secondary containment structure was being inspected. The old gasoline tank was single walled steel contained in a concrete bermed area; the new gasoline tank is constructed as double walled steel/concrete with integral secondary containment and interstitial space. CORRECTIVE ACTION: Clarify what structure comprises secondary containment for any and all tanks that are subject to sized secondry containment (e.g. gasoline tank with intergal secondary containment vs. concrete wall). Transmit the updated SPPC Plan portion discussing secondary containment.

Violation Description:

Failure to comply with one or more of the following requirements:
1. Have record of inspections and integrity tests signed by the appropriate supervisor or inspector.
2. Keep written procedures and records of inspections and integrity tests for at least three years.
3. Keep comparison records.
