Re: Sunrise Residential Project Description

We are proposing forty-four (44) single-family residences on 11.54 acres at 3804 Sunrise Boulevard in Fort Pierce, FL. Currently the property is zoned R-3 with a future land use of RM. The site was recently annexed into the City of Ft. Pierce and has an existing Zoning of RS-3 and an existing Future Land Use of RM. The site is bordered by single family RS-3 zoning on the south and west. To the north is a cemetery and the east is a Florida Department of Transportation building, both with industrial zoning. We are proposing a rezoning of Planned Development (PD) with 3.81 units per acre. Below is a table comparing the requested changes from the R-3 zoning

Zoning Requirement	**R-3**	**PD**
Min. Lot Size	7,200 SF	4,920 SF
Min. Lot Width	65’	60’
Min. Lot Depth	100’	70’ (82’ proposed)
Min. Front Yard Depth	25’	15’,20’ for garage
Min. Side Yard Depth	15’	5’
Min. Rear Yard Depth	15’	15’
Max Lot Coverage	35%	40%
Max Building Height	35’	45’
Density	6 units per acre	3.81 units per acre

We are also requesting a reduction of the minimum right-of-way width for the interior roadway from 60’ to 50’. This is common in other municipalities and a proposed section can be found in the civil plans

The site will consist of one ungated entrance in the northwest corner of the site off of Sunrise Boulevard. The 44 residences will be connected by one looped road with an interior sidewalk.

Drainage will be conveyed through interconnected inlets and pipes to three (3) separate dry ponds. The dry ponds will be planted with a variety of wax myrtles and sand cordgrass instead of typically bahia sod. This will add to the aesthetics of the project as well as nutrient removal from the stormwater.

A 10’ landscape buffer will be provided along the perimeter of the site. The south property line contains a 60’ drainage easement. Vegetation in that area will remain untouched but a landscape buffer will occur on the south portion of the easement.

The project will contain a looped water main and a private lift station for the utilities. Dry utilities will be provided in the 10’ utility easement shown on the front of the lots

A bus stop will be provided onsite and a Routed Bus Plan has been included in the civil drawings. An open space area between lot 35 and lot 50 will be utilized for an amenity center. Future plans will be provided for the City's review.

No phasing is proposed for this project as all infrastructure will be built in one phase. It is possible building permits will be pulled in phases but not until after all infrastructure is complete.

There are no previously approved site plans for this site

The main Public Benefit of the project is the deceased density. Currently the project allows for 6 units per acre which would allow for sixty-nine(69) single family residents. This decreases the number of traffic trips on the existing roads. The decrease in lots size and setbacks allows for a shared amenity lot that all the residents can enjoy.

Should you have any questions or require additional information, please feel free to contact this office at your earliest convenience.

STANDARD SEPARATION STATEMENT FOR WATER / SEWER CONFLICTS

1. SANITARY SEWER, FORCE MAINS, AND STORM SEWERS SHOULD CROSS UNDER WATER MAINS WHENEVER POSSIBLE. SANITARY SEWERS, FORCE MAINS AND STORM SEWERS CROSSING UNDER WATER MAINS SHALL BE LAID TO PROVIDE A MINIMUM VERTICAL DISTANCE OF 6 INCHES, PREFERABLY 12 INCHES BETWEEN THE INVERT OF THE UPPER PIPE AND THE CROWN OF THE LOWER PIPE WHEN ABOVE, AND AT LEAST 12 INCHES OF SEPARATION WHEN THE WATER MAIN IS BELOW.

WHERE SANITARY SEWER, FORCE MAINS, STORM SEWERS MUST CROSS A WATER MAIN WITH LESS THAN 6 INCHES VERTICAL SEPARATION, BOTH THE SEWER AND WATER MAIN SHALL BE CONSTRUCTED OF DUCTILE IRON PIPE (DIP) CENTERED ON THE CROSSING. (DIP IS NOT REQUIRED FOR STORM SEWERS.) SUFFICIENT LENGTHS OF DIP MUST BE USED TO PROVIDE A MINIMUM SEPARATION OF 10 FEET BETWEEN TWO JOINTS. ALL JOINTS ON THE WATER MAIN WITHIN 20 FEET OF THE CROSSING MUST BE MECHANICALLY RESTRAINED.

ALL CROSSINGS SHALL BE ARRANGED SO THAT THE SEWER PIPE JOINTS AND WATER MAIN PIPE JOINTS ARE EQUIDISTANT FROM THE POINT OF CROSSING (PIPES CENTERED ON THE CROSSING). AT SUCH CROSSINGS PIPES SHALL BE ARRANGED SO THAT ALL WATER MAIN JOINTS ARE AT LEAST THREE FEET FROM ALL JOINTS IN VACUUM-TYPE SANITARY SEWERS, STORM SEWERS, STORMWATER FORCE MAINS, OR PIPELINES CONVEYING RECLAIMED WATER REGULATED UNDER PART III OF CHAPTER 62-610, F.A.C., AND AT LEAST SIX FEET FROM ALL JOINTS IN GRAVITY OR PRESSURE TYPE SANITARY SEWERS, WASTEWATER FORCE MAINS, OR PIPELINES CONVEYING RECLAIMED WATER NOT REGULATED UNDER PART III OF CHAPTER 62-610, F.A.C.

WHERE A NEW PIPE CONFLICTS WITH AN EXISTING PIPE WITH LESS THAN 6 INCHES VERTICAL CLEARANCE, THE NEW PIPE SHALL BE CONSTRUCTED OF DIP (EXCEPT STORM SEWERS) AND NEW PIPES SHALL BE ARRANGED TO MEET THE CROSSING REQUIREMENTS ABOVE.

2. A MINIMUM 3-FOOT HORIZONTAL SEPARATION SHALL BE MAINTAINED BETWEEN ANY TYPE OF STORM SEWER AND WATER MAIN IN PARALLEL INSTALLATIONS WHENEVER POSSIBLE.

A MINIMUM 3-FOOT, AND PREFERABLE 10-FOOT HORIZONTAL SEPARATION SHALL BE MAINTAINED BETWEEN VACUUM TYPE SANITARY SEWER AND WATER MAIN IN PARALLEL INSTALLATIONS WHENEVER POSSIBLE.

A MINIMUM 10-FOOT HORIZONTAL SEPARATION SHALL BE MAINTAINED BETWEEN "ONSITE SEWAGE TREATMENT AND DISPOSAL SYSTEM" AND WATER MAIN IN PARALLEL INSTALLATIONS WHENEVER POSSIBLE.

A MINIMUM 6-FOOT, AND PREFERABLE 10-FOOT HORIZONTAL SEPARATION SHALL BE MAINTAINED BETWEEN GRAVITY OR PRESSURE TYPE SANITARY SEWER, WASTEWATER FORCE MAIN, OR PIPELINE CONVEYING RECLAIMED WATER AND WATER MAIN IN PARALLEL INSTALLATIONS WHENEVER POSSIBLE. THE MINIMUM HORIZONTAL SEPARATION DISTANCE BETWEEN WATER MAINS AND GRAVITY-TYPE SANITARY SEWERS SHALL BE REDUCED TO 3 FOOT WHERE THE BOTTOM OF THE WATER MAIN IS LAID AT LEAST SIX INCHES ABOVE THE TOP OF THE SEWER

IN CASES WHERE IT IS NOT POSSIBLE TO MAINTAIN A 10-FOOT HORIZONTAL SEPARATION, THE WATER MAIN MUST BE LAID IN A SEPARATE TRENCH OR ON A UNDISTURBED EARTH SHELF LOCATED ON ONE SIDE OF THE SEWER OR FORCE MAIN AT SUCH AN ELEVATION THAT THE BOTTOM OF THE WATER MAIN IS AT LEAST 6 INCHES ABOVE THE TOP OF THE SEWER.

WHERE IT IS NOT POSSIBLE TO MAINTAIN A VERTICAL DISTANCE OF 6 INCHES IN PARALLEL INSTALLATIONS, THE WATER MAIN SHALL BE CONSTRUCTED OF DIP AND THE SEWER OR THE FORCE MAIN SHALL BE CONSTRUCTED OF DIP (EXCEPT STORM SEWER) WITH A MINIMUM VERTICAL DISTANCE OF 6 INCHES. THE WATER MAIN SHOULD ALWAYS BE ABOVE THE SEWER. JOINTS ON THE WATER MAIN SHALL BE LOCATED AS FAR APART AS POSSIBLE FROM JOINTS ON THE SEWER OR FORCE MAIN (STAGGERED JOINTS).

3. ALL DIP SHALL BE PRESSURE CLASS 250 MIN.. ADEQUATE PROTECTIVE MEASURES AGAINST CORROSION SHALL BE USED AS DETERMINED BY THE DESIGN ENGINEER.

SEQUENCE OF CONSTRUCTION

UPON IMPLEMENTATION AND INSTALLATION OF THE FOLLOWING AREAS: TRAILER, PARKING, LAYDOWN, PORTA-POTTY, WHEEL WASH, CONCRETE WASHOUT, FUEL AND MATERIAL STORAGE CONTAINERS, SOLID WASTE CONTAINERS, ETC., IMMEDIATELY DENOTE THEM ON THE SITE MAPS AND NOTE ANY CHANGES IN LOCATION AS THEY OCCUR THROUGHOUT THE CONSTRUCTION PROCESS.

PHASE 1:

1. CONSTRUCT STABILIZED CONSTRUCTION ENTRANCE (1) AND INSTALL SILT FENCE.
2. DEMOLISH EXISTING STRUCTURES, IF APPLICABLE
3. CONSTRUCT AND STABILIZE SEDIMENT BASIN AND DRAINAGE SWALES WITH APPROPRIATE OUTFALL STRUCTURES (CLEAR ONLY THOSE AREAS NECESSARY TO INSTALL CONTROL DEVICES LISTED ABOVE)
4. INSTALL INLET PROTECTION AT EXISTING INLET(S).
5. INSTALL AND STABILIZE ANY NECESSARY HYDRAULIC CONTROL STRUCTURES (DIKES, CHECK DAMS, OUTLET TRAPS, RISER PIPE DISCHARGE POINT, ETC.)
6. PREPARE CLEARING AND GRUBBING OF THE SITE, IF APPLICABLE.

PHASE 2:

7. PERFORM MASS GRADING. ROUGH GRADE TO ESTABLISH PROPOSED DRAINAGE PATTERNS.
8. START CONSTRUCTION OF THE BUILDING PAD AND STRUCTURES.
9. TEMPORARILY SEED WITH PURE LIVE SEED, THROUGHOUT CONSTRUCTION, DISTURBED AREAS THAT WILL BE INACTIVE FOR 7 DAYS OR MORE OR AS REQUIRED BY GENERIC PERMIT.
10. INSTALL UTILITIES, UNDERDRAINS, STORM SEWERS, AND CURBS.
11. INSTALL INLET PROTECTION AT ALL STORM DRAIN INLETS AS EACH INLET IS INSTALLED. PERMANENTLY STABILIZE AREAS TO BE VEGETATED AS THEY ARE BROUGHT TO FINAL GRADE.
12. PREPARE SITE FOR PAVING AND PAVE SITE.
13. CONTACT CIVIL ENGINEER ONCE THE SITE APPEARS TO BE FULLY STABILIZED.
14. REMOVE ALL TEMPORARY EROSION AND SEDIMENT CONTROL DEVICES AFTER INSPECTION AND APPROVAL OF THE ENGINEER AND STABILIZE ANY AREA DISTURBED BY THE REMOVAL OF BMPS.
15. CONTINUE DAILY INSPECTION REPORTS UNTIL THE FINAL DAILY INSPECTION IS SIGNED OFF BY THE CONSTRUCTION MANAGER THAT THE SITE IS FULLY STABILIZED AND THE PERMIT MAY BE TERMINATED.

MAINTENANCE

ALL MEASURES STATED ON THIS SITE MAP, AND IN THE STORM WATER POLLUTION PREVENTION PLAN, SHALL BE MAINTAINED IN FULLY FUNCTIONAL CONDITION UNTIL NO LONGER REQUIRED FOR A COMPLETED PHASE OF WORK OR FINAL STABILIZATION OF THE SITE. ALL EROSION AND SEDIMENTATION CONTROL MEASURES SHALL BE CHECKED BY A QUALIFIED PERSON IN ACCORDANCE WITH THE CONTRACT DOCUMENTS OR THE APPLICABLE PERMIT, WHICHEVER IS MORE STRINGENT, AND REPAIRED IN ACCORDANCE WITH THE FOLLOWING:

1. INLET PROTECTION DEVICES AND BARRIERS SHALL BE REPAIRED OR REPLACED IF THEY SHOW SIGNS OF UNDERMINING OR DETERIORATION.
2. ALL SEEDED AREAS SHALL BE CHECKED REGULARLY TO SEE THAT A GOOD STAND IS MAINTAINED. AREAS SHOULD BE FERTILIZED, WATERED, AND RESEEDED AS NEEDED.
3. SILT FENCES SHALL BE REPAIRED TO THEIR ORIGINAL CONDITIONS IF DAMAGED. SEDIMENT SHALL BE REMOVED FROM THE SILT FENCES WHEN IT REACHES ONE-HALF THE HEIGHT OF THE SILT FENCE.
4. THE CONSTRUCTION EXITS SHALL BE MAINTAINED IN A CONDITION WHICH WILL PREVENT TRACKING OR FLOW OF MUD ONTO PUBLIC RIGHTS-OF-WAY. THIS MAY REQUIRE PERIODIC TOP DRESSING OF THE CONSTRUCTION EXITS AS CONDITIONS DEMAND.
5. THE TEMPORARY PARKING AND STORAGE AREA SHALL BE KEPT IN GOOD CONDITION (SUITABLE FOR PARKING AND STORAGE). THIS MAY REQUIRE PERIODIC TOP DRESSING OF THE TEMPORARY PARKING AREA AS CONDITIONS DEMAND.
6. OUTLET STRUCTURES IN THE SEDIMENTATION BASINS SHALL BE MAINTAINED IN OPERATIONAL CONDITIONS AT ALL TIMES. SEDIMENT SHALL BE REMOVED FROM SEDIMENT BASINS OR TRAPS WHEN THE DESIGN CAPACITY HAS BEEN REDUCED BY 50%.

HALT ALL ACTIVITIES AND CONTACT THE CONSULTANT TO PERFORM INSPECTION AND CERTIFICATION OF BMPS. GENERAL CONTRACTOR SHALL SCHEDULE AND CONDUCT STORM WATER PRE-CONSTRUCTION MEETING WITH CONSULTANT AND ALL GROUND-DISTURBING CONTRACTORS BEFORE PROCEEDING WITH CONSTRUCTION.

CONTRACTOR TO BE RESPONSIBLE FOR OBTAINING ALL DEWATERING PERMITS NECESSARY FOR CONSTRUCTION

THE PRESENCE OF GROUNDWATER SHOULD BE ANTICIPATED ON THIS PROJECT. CONTRACTOR'S BID SHALL INCLUDE CONSIDERATION FOR ADDRESSING THIS ISSUE.

SITE PREPARATION SHOULD BE IN ACCORDANCE WITH GEOTECHNICAL INVESTIGATION

INTRODUCTION

An upland habitat survey for gopher tortoise (*Gopherus polyphemus*) was conducted on the approximately 11.34-acre property located on 3804 Sunrise Blvd, Fort Pierce, Florida (see Figure 1). The survey included review of 100% of potential gopher tortoise habitat within the subject property.

The objectives of the survey were to document gopher tortoise burrows within the construction footprint of the property to confirm presence/absence, document the status and location of gopher tortoise burrows, and approximate the number of tortoises that would need relocation. The results of the survey determine the subsequent actions required to develop the subject property.

This Survey Report provides a summary of the survey activities conducted, including methods used and areas surveyed. Survey activities were executed according to the burrow survey methodology from the Florida Fish and Wildlife Conservation Commission (FWC) Gopher Tortoise Permitting Guidelines, April 2008, Revised April 2023, Appendix 4 Methods for Burrow Surveys on Development (Donor) and Recipient Sites, 100% Burrow Survey Protocol. Survey activities were conducted on January 25 and the morning January 26, 2024. The information contained herein is based on the findings from the field survey.

SITE LOCATION AND DESCRIPTION

The ±11.34-acre property is located in White City, a census-designated place (CDP) in Saint Lucie County within Section 33, Township 35 South and Range 40 East. The subject property is along the east side of Sunrise Blvd. The Saint Lucie County Property Appraiser lists the Property Parcel ID as 2433-123-0001-000-1. The Future Land Use designation is residential.

The vegetative component of the subject property is predominantly exotic vegetation, shrub brushland, cabbage palms and scattered hardwoods. An isolated waterbody is present within the north west corner and a water filled ditch runs along the southern boundary of the subject property. The Florida Cooperative Land Cover (CLC) System developed by the Florida Fish and Wildlife Conservation Commission (FWC) classifies the land cover as 1821 – Low Structure Density and 18332 – Fallow Orchards. The predominant land cover classification is Fallow Orchards (1832). Figure 2 provides the CLC map for the subject property.

The vegetative community was characterized in the field as a degraded mixed upland community consisting of shallow ridge and furrows with a sparse canopy and dense shrub stratum. The ridge and furrow landform is a result of the historic orchard land use. The canopy stratum consists primarily of cabbage palm (*Sabal palmetto*), and laurel oak (*Quercus laurifolia*). The shrub stratum consisted of dense ceaserweed (*Urena lobata*), Jack-in-the-bush (*Chromolaena odorata*), Brazillian pepper (*Schinus terebinthifolia*), and shoebutton ardisia (*Ardisia elliptica*). Ground cover stratum was generally limited due to the dense canopy, shrub and vine cover. Limited areas with herbaceous vegetative cover were observed providing suitable forage for gopher tortoises.

The Natural Resources Conservation Service (NRCS) Web Soil Survey lists five soil types within the subject property. Table 1 provides a summary of the soil types present within the subject property. Figure 3 provides the NRCS Web Soil Survey graphically for the subject property. A brief description of each soils type follows.

Ankona and Farmton sands is poorly drained soil found in flatwoods on marine terraces. The seasonal high-water table is at a depth of 6 to 18 inches. The gopher tortoise burrowing suitability is rated as "less suited". Less Suited rating states that these soils have characteristics that may limit establishment, maintenance, or use of the site by gopher tortoise. Colonization and population densities may be below average or restricted in the area due to the limiting factors even though all of the other species habitat requirements are met (USDA, 2024).

Arents are Somewhat poorly drained sandy soils found on rises in marine terraces. Depth to water is 18 to 36 inches. This soils type is listed as not rated in the Web Soil Survey gopher tortoise burrowing suitability.

Susanna and Wauchula sands are poorly drained soil found in flatwoods on marine terraces. The seasonal high-water table is at a depth of 6 to 18 inches. The gopher tortoise burrowing suitability is rated as "unsuitable". These soils have characteristics that may limit establishment, maintenance, or use of the site by gopher tortoise. Areas of included soils with better drainage may provide suitable soil properties in some locations (USDA, 2024).

Tantile and Pomona sands are poorly drained soil found in flatwoods on marine terraces. The seasonal high-water table is at a depth of 6 to 18 inches. The gopher tortoise burrowing suitability is rated as "unsuitable" (USDA, 2024).

Winder loamy sand is poorly drained soil found in flats on marine terraces. The seasonal high-water table is at a depth of 12 to 18 inches. The gopher tortoise burrowing suitability is rated as "less suited" (USDA, 2024).

METHODS

The survey activities were completed by an FWC gopher tortoise agent and performed in accordance with those specified in Appendix 4 of the FWC Guidelines. Equipment utilized during the survey included a camera, Trimble DGPS unit, and a handheld datalogger running Solo Field mapping software.

The pedestrian survey was conducted by walking pre-determined transects in an approximate east-west orientation at 50-foot spacing across 100 percent of the subject property (see Figure 4). Apparent burrow activity status (active, inactive, or abandoned), size (juvenile <5 in.; subadult 5-8 in.; adult >8 in.), GPS coordinates, and photographs were recorded for each burrow encountered along each transect. Burrows that were not clearly made by a tortoise were not recorded.

RESULTS/DISCUSSION

The 100 % pedestrian survey of the project area resulted in no potentially occupied burrows. Multiple burrows from other burrowing fauna (i.e., armadillo *[Dasypus novemcinctus*]) were noted during the survey. Figure 4 provides the survey design graphically.

An apparent high-water table and dense vegetative cover provides poor quality gopher tortoise habitat throughout the majority of the subject property. Ponding, saturated soils, and organic soils were observed throughout the property. Optimal forage species (i.e., asgrasses and forbes) were generally absent due to the dense canopy and shrub, and cover. Additionally, approximately 50 percent of the soil types on the property are classified as "unsuitable" while the other 50 percent are listed as "less suited".

In Florida, gopher tortoises are categorized as Threatened on the Endangered Species List and are therefore protected by state law, Chapter 68A - 27.003, FL Administrative Code. An FWC relocation permit is required prior to any disturbance to a burrow or handling of a tortoise. Please note that ground disturbances within 25 feet in any direction from the burrow is prohibited until a relocation permit has been obtained and the tortoise has been relocated to either and offsite recipient site or a suitable onsite relocation area. The findings of this survey are valid for a period of ninety days. A resurvey must be completed prior to construction activities that will occur beyond the ninety-day period.

Date: 6/7/2024

1. Purpose

The purpose of this report is to provide St Lucie County, the NSLRWCD, and the SFWMD with calculations and documentation which demonstrates that the proposed surface water management system meets the criteria of the master stormwater management system.

2. Background

The subkect parcel consists of some 11.54 acres; the development will include the entirety of the property area. Additional work outside the immediate parcel boundary may include improvements to the Sunrise Boulevard right-of-way, as determined by the county per planning approval.

The site is currently undeveloped; the majority of the site is native forest, consistent with the FLUCCS "Mixed Upland Forest" designation. No wetland areas have been observed on the parcel. According the USGS, the parcel is comprised of 40% "Susanna" sands, 20% "WInder loamy" sands, 20% "Ankona" sands, and 20% others; this mixture of group A/D, B/D, and C/D soils averages to B/D hydrologic group soil. Existing elevations ranging from about 14 NAVD along the north property line to 9.0 NAVD along the south; the existing grades appear to direct stormwater runoff from the north to the south. The southern portion of the property consists of a drainage easement with an east-west ditch that collects runoff. Ultimately, runoff resolves itself to the county right-of-way, where it crosses Sunrise Blvd. and enters the county stormwater management and preservation area know as Platt's Creek. Platt's Creek has a direct connection to the North St Lucie River and the NSLRWCD.

The property is bordered on the south by private residences, on the east by an FDOT storage yard (and cell tower), on the west by Surrise Boulevard, and to the north by the White City Cemetery. Stormwater runoff from offsite is controlled from entering the subject parcel. The parcel is is a FEMA "X" Flood Zone.

3. Proposed System

The proposed Surface-Water Management System (SMS) for the project includes a series of interconnected dry retention ponds capable of providing the necessary water quality treatment and nutrient abatement as required by the state and the district. These will also provide the necessary attenuation required to comply with NSLRWCD's outfall limitations. Outfall shall be controlled by a single drop structure with discharge to the existing ditch along the south of the property, where it will be conveyed to the county right-of-way, and into the Platts's Creek Conservatory.

The SMS has been designed such that the peak stage for the 10-year/24-hour event shall not cause flooding within the proposed vehicular use areas, that the peak stage for the 25-year/3-day event shall not exceed the perimeter berm for the project, and the 100-year/3-day event with Zero discharge shall not stage above the proposed Finish Floor Elevation (14.00 NAVD).

Pre-development Discharge

We have included a PRE Development routing model to determine the rate at which runoff leaves the parcel. All events are listed in the ICPR report, compared to the POST Development outfall rates. For all events, the PRE Development rate exceeds the POST Development rate.

There may be additional restrictions on outfall rate, in accordance with NSLRWCD limited discharge requirements. At the time of this report, we are in coordination with County and District officials to determine our legal positive outfall and decide the criteria the project must conform to.

Tailwater Justification

As noted above, we are currently coordinating with County and District officials to determine the legal positive outfall for the site, and decide which authority dictates mandates on that outfall. For the purposes of the preliminary report, we have used the existing ditch to the south of the property, as runoff from the parcel has been in the past. We do not have any information at present as to a time-stage relationship within the ditch. Again, we are currently coordinating...

Post-Development Stage & Discharge

(See Output From ICPR Software)

Event	Rainfall (in.)	Max Stage (FT-NAVD)	PRE Q (cfs)	POST Q (cfs)
25yr-3 day (Berm)	10.00	10.86 < 11.00 Berm	26.21	16.63
10yr-1 day (Roads)	6.00	10.15 < 11.00 Inlet (Min. Pavement)	16.71	7.94
10yr-3 day (Discharge)	8.50	NA	22.52	16.14
100yr-3 day (FFE)	12.23	12.83 < 14.00 FFE (zero discharge)	35.35	0.00

Conclusion

As demonstrated in this drainage report, all the proposed improvements meet the development criteria for St. Lucie County, the NSLRWCD, and the SFWMD for stormwater management and flood protection. All minimum elevations are met for the proposed site improvements, and the discharge rates POST Development are less than PRE Development rates. Please refer to the included ICPR Report for complete details.

Furthermore, we have demonstrated adequate pollution abatement through the use of the dry retention systems. Per the BMPTRAINS Report, the proposed development will generate less-than-or-equal-to nitrogen and phosphorus discharge relative to Pre Development conditions. Please refer to the included BMPTRAINS Report for complete details.

Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (https://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2_053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

How Soil Surveys Are Made

Soil surveys are made to provide information about the soils and miscellaneous areas in a specific area. They include a description of the soils and miscellaneous areas and their location on the landscape and tables that show soil properties and limitations affecting various uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They observed and described many soil profiles. A soil profile is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed or from the surface down to bedrock. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

Currently, soils are mapped according to the boundaries of major land resource areas (MLRAs). MLRAs are geographically associated land resource units that share common characteristics related to physiography, geology, climate, water resources, soils, biological resources, and land uses (USDA, 2006). Soil survey areas typically consist of parts of one or more MLRA.

The soils and miscellaneous areas in a survey area occur in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept, or model, of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil

scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

The objective of soil mapping is not to delineate pure map unit components; the objective is to separate the landscape into landforms or landform segments that have similar use and management requirements. Each map unit is defined by a unique combination of soil components and/or miscellaneous areas in predictable proportions. Some components may be highly contrasting to the other components of the map unit. The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The delineation of such landforms and landform segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, onsite investigation is needed to define and locate the soils and miscellaneous areas.

Soil scientists make many field observations in the process of producing a soil map. The frequency of observation is dependent upon several factors, including scale of mapping, intensity of mapping, design of map units, complexity of the landscape, and experience of the soil scientist. Observations are made to test and refine the soil-landscape model and predictions and to verify the classification of the soils at specific locations. Once the soil-landscape model is refined, a significantly smaller number of measurements of individual soil properties are made and recorded. These measurements may include field measurements, such as those for color, depth to bedrock, and texture, and laboratory measurements, such as those for content of sand, silt, clay, salt, and other components. Properties of each soil typically vary from one point to another across the landscape.

Observations for map unit components are aggregated to develop ranges of characteristics for the components. The aggregated values are presented. Direct measurements do not exist for every property presented for every map unit component. Values for some properties are estimated from combinations of other properties.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and

identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

Soil Map

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or

landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

Re: Sunrise Residential PD Benefits

The main Public Benefit of the project is the deceased density. Currently the project allows for 6 units per acre which would allow for sixty-nine(69) single family residents. This decreases the number of traffic trips on the existing roads. The decrease in lots size and setbacks allows for a shared amenity lot that all the residents can enjoy.

Re: Sunrise Residential Project Description

We are proposing forty-four (44) single-family residences on 11.54 acres at 3804 Sunrise Boulevard in Fort Pierce, FL. Currently the property is zoned R-3 with a future land use of RM. The site was recently annexed into the City of Ft. Pierce and has an existing Zoning of RS-3 and an existing Future Land Use of RM. The site is bordered by single family RS-3 zoning on the south and west. To the north is a cemetery and the east is a Florida Department of Transportation building, both with industrial zoning. We are proposing a rezoning of Planned Development (PD) with 3.81 units per acre. Below is a table comparing the requested changes from the R-3 zoning

Zoning Requirement	**R-3**	**PD**
Min. Lot Size	7,200 SF	4,920 SF
Min. Lot Width	65’	60’
Min. Lot Depth	100’	70’ (82’ proposed)
Min. Front Yard Depth	25’	15’,20’ for garage
Min. Side Yard Depth	15’	5’
Min. Rear Yard Depth	15’	15’
Max Lot Coverage	35%	40%
Max Building Height	35’	45’
Density	6 units per acre	3.81 units per acre

We are also requesting a reduction of the minimum right-of-way width for the interior roadway from 60’ to 50’. This is common in other municipalities and a proposed section can be found in the civil plans

The site will consist of one ungated entrance in the northwest corner of the site off of Sunrise Boulevard. The 44 residences will be connected by one looped road with an interior sidewalk.

Drainage will be conveyed through interconnected inlets and pipes to three (3) separate dry ponds. The dry ponds will be planted with a variety of wax myrtles and sand cordgrass instead of typically bahia sod. This will add to the aesthetics of the project as well as nutrient removal from the stormwater.

A 10’ landscape buffer will be provided along the perimeter of the site. The south property line contains a 60’ drainage easement. Vegetation in that area will remain untouched but a landscape buffer will occur on the south portion of the easement.

The project will contain a looped water main and a private lift station for the utilities. Dry utilities will be provided in the 10’ utility easement shown on the front of the lots

A bus stop will be provided onsite and a Routed Bus Plan has been included in the civil drawings. An open space area between lot 35 and lot 50 will be utilized for an amenity center. Future plans will be provided for the City's review.

No phasing is proposed for this project as all infrastructure will be built in one phase. It is possible building permits will be pulled in phases but not until after all infrastructure is complete.

There are no previously approved site plans for this site

The main Public Benefit of the project is the deceased density. Currently the project allows for 6 units per acre which would allow for sixty-nine(69) single family residents. This decreases the number of traffic trips on the existing roads. The decrease in lots size and setbacks allows for a shared amenity lot that all the residents can enjoy.

Sunrise Lakes

STORMWATER MAINTENANCE PLAN

AND SEDIMENTATION AND EROSION CONTROL PLAN

I. Project Description

The project consists of fifty (50) single family lots and an amenity center,. The project is served by a stormwater management system that provides stormwater attenuation and water quality pretreatment in accordance with City of Fort Pierce requirements.

The system contains the following features:

Storm Sewer

Stormwater Inlets

Dry Detention Ponds

II. Sedimentation and Erosion Control Measures

A silt fence shall be constructed around the perimeter of the construction areas before construction commences, as shown on the plans. Refer to the Florida Sediment and Erosion Control Manual, latest edition for requirements. Sedimentation and erosion control measures shall be monitored continuously and maintained as necessary.

During periods of dry weather and windy conditions, wind erosion can be a problem in areas that have not been stabilized. When these conditions occur, the soil shall be wetted down as necessary.

III. Pre-construction Meeting and Construction Monitoring Requirements

A pre-construction meeting will be held between the contractor, County inspector and KMA Engineering & Surveying representatives prior to release of the plans. Construction monitoring requirements will be reviewed at the meeting and are specified on the Paving and Drainage Plan (Construction Field Observations)

IV. Release into Service

Prior to release into service, the stormwater system shall be certified by the engineer-of-record, including the submittal of as-built drawings. The following items, at a minimum, will be required:

1. Remove any debris and vegetation in the storm sewer system.
2. After clean-up and stabilization of grassed area, all sedimentation and erosion control temporary measures, such as filter cloth at inlet grates, silt fences, turbidity barriers, hay bales, etc., shall be removed.
3. Removal of all nuisance exotic vegetation.
4. Permanent stabilization of all lake banks, swales, etc.

V. Operation & Maintenance

Sunrise Lakes Homeowners Assocaition shall be responsible for the implementation of the Stormwater Maintenance Plan including all catch basins, pipes, and retention pond areas. Maintenance shall occur on a regular basis, monthly or quarterly, and after any severe rainfall events, and shall consist of the following:

1. All silt, debris, and vegetation shall be removed from all catch basins and pipes.

2. Any deterioration to the structures shall be repaired promptly.
3. No chemicals, oils, greases, or similar wastes shall come in to contact with the stormwater management system. This could result in clogging of the soil in the retention pond areas.
4. No grass clippings shall be disposed of in the system. This will cause clogging of the system and will create ideal conditions for breeding mosquitoes.
5. Inspect the discharge pipes at least once per year to ensure the system is functioning properly.
6. Silt in culverts and inlets shall be removed at least every six months and no less than once a year in order to prevent clogging of the storm pipe and inlets.
7. All nuisance exotic vegetation shall be removed on a monthly basis. All re-growth shall be removed effectively.
8. No fertilizer is to be applied to the grass within the retention area.
9. Lake banks shall be inspected for erosion or shoals at least every six months and no less than one year. Should erosion or shoals appear, they shall be corrected immediately to prevent further issues with the system.
10. Operation and maintenance of all operable control structures.

PLANNED DEVELOPMENT (PD) ZONING DEVELOPMENT AGREEMENT

THIS PLANNED DEVELOPMENT (PD) ZONING DEVELOPMENT AGREEMENT (this "**Agreement**") is made and entered into this ___day of _____, 2024, (the "**Effective Date**") by and between DT VENTURES 1 LLC, a Florida limited liability company (the "**Applicant**"), and the CITY OF FORT PIERCE, a political subdivision of the State of Florida (the "**City**").

WITNESSETH:

WHEREAS, Applicant is the owner and developer of certain real property in the city limits of Fort Pierce, Florida, more particularly described in the legal description attached hereto and incorporated herein as **Exhibit "A"** (the "**Property"**); and

WHEREAS, Applicant intends to develop a Planned Development ("**PD**") to be known as "Sunrise Lakes" consisting of 11.54 acres with 50 single family dwelling units ("**DU**s") (the "**Project**"); and

WHEREAS, Section 125-212 of the Code of Ordinances of the City requires that the Applicant enter into this Agreement with the City as a condition of approval of the Project.

NOW, THEREFORE, the parties do hereby agree as follows:

1. Duration of Agreement. This Agreement shall be effective, shall run with the land and shall be binding on all parties and all persons claiming under it for an initial term of five (5) years from the Effective Date hereof (the "**Expiration Date**"). The Expiration Date may be extended for a period of five (5) years after approval by the Board of City Commissioners (the "**Board**") at a public hearing, unless an instrument has been recorded agreeing to release, amend or modify this Agreement in whole, or in part, as provided below. The foregoing notwithstanding, if the expiration date of any development approvals associated with this Agreement or with the Property are ever extended to a date that is later than the Expiration Date, the Expiration Date shall automatically extend to that later date. A proposed timeline of development is specified on **Exhibit "B"**, attached hereto and by this reference incorporated herein (the "**Development Timeline**").

2. Phasing Requirements. The Development shall be constructed in one Phase.

3. <u>Development Requirements for the Project.</u> The Project shall conform to the following requirements:

A. Lot and Building Dimensions:

i. **Min. Lot Size -** 4,920 square feet
ii. **Min. Lot Width –** 60 feet
iii. **Min. Lot Depth -** 70 feet
iv. **Min. Front Yard Depth –** 15 feet for main structure,20 feet for garage
v. **Min. Side Yard Depth -** 5 feet
vi. **Min. Rear Yard Depth -** 15 feet
vii. **Max Lot Coverage -** 40%
viii. **Max Building Height -** 45 feet
ix. **Density –** 4.33 units per acre
x. **Minimum right-of-way width for the interior roadway** – 50 feet

B. Entrances. The site will consist of one ungated entrance in the northwest corner of the site providing ingress from and egress to Sunrise Boulevard. The DUs will be connected by one looped road with an interior sidewalk.

C. Drainage. Stormwater drainage will be conveyed through interconnected inlets and pipes to three (3) separate dry ponds. The dry ponds will be planted with a variety of wax myrtles and sand cordgrass instead of typical bahia sod, to add to the aesthetics of the Project as well as provide for nutrient removal from the stormwater.

D. Landscaping. Applicant shall provide a 10-foot landscape buffer along the perimeter of the site, with a 10-foot landscape buffer along the southern property line along a 60-foot drainage easement.

E. Utilities. The Project will contain a looped water main and a private lift station to serve the Project's wastewater needs. Dry utility lines and infrastructure will be provided in the 10-foot utility easement shown on the front of each lot.

F. Public Transit Stop and Amenity Center. A bus stop will be provided onsite, and a Routed Bus Plan has been included in the civil drawings. An open space area between lot 35 and lot 50 will be utilized for an amenity center. Future plans will be provided for the City's review.

G. Public Benefit. The Project represents a decreased density from the maximum density permitted by the underlying Future Land Use Designation (Low-density residential (RL)), which permits 6.5 DUs per acre, or seventy-five (75) DUs total. The Project, at 50 DUs, represents a significantly lower number of traffic trips on the existing public roads than does the permitted density.

4. **Public Facilities that will Service the Development.**

A. **Fort Pierce Water and Sewer Authority (FPUA)-** Water and Sewer provider, with water and sewer available to provide for the Project.

B. **St. Lucie County Road Infrastructure-** Sunrise Boulevard provides access to the site.

C. **North St. Lucie River Water Control District (NSLRWCD)**- Existing canal on south end of property provides sufficient drainage outfall to accommodate the Project.

D. **St. Lucie County School District**- White City Elementary School, Forest Grove Middle School, and Fort Pierce Central High School are available to serve the Project.

5. **Reservation or Dedication of Land for Public Purposes.** The south property line contains a 60-foot drainage easement, which shall continue to serve its public drainage-related function through construction and after the development of the Project.

6. **Description of Local Development Permits Required for the Development**. The Development shall require the following approvals:

A. City of Ft. Pierce Building Permit
B. Fort Pierce Utility Authority Permit
C. South Florida Water Management District (SFWMD) Environmental Resource Permit
D. North St. Lucie Water Control District Connection Permit
E. Florida Department of Environmental Protection Water Main Extension Permit
F. Florida Department of Environmental Protection Domestic Wastewater Collection/Transmission System Permit

7. **Project Compliance.** By entering into this Agreement, the Board finds that the Project is consistent with the City's comprehensive plan and land development code. Any failure of this Agreement to address a particular permit, condition, term, or restriction shall not relieve the Applicant of the necessity of complying with the law governing said permitting requirements, conditions, terms, or restrictions. Attached hereto as **Exhibit "C"** is a list of any conditions, terms, restrictions, or other requirements determined by the Board for the public health, safety, or welfare of its citizens.

8. **Destruction.** In the event that all or a portion of the Development should be destroyed by a storm, fire, or other common disaster, Applicant, its grantees, successors or assigns shall have the right to rebuild and/or repair so long as there is strict compliance with the approved master site plan, final site plan(s), subdivision plat(s), and development orders.

9. **Modification, Amendment, and Release.** This Agreement may not be modified, amended, or released, except by written instrument signed by the Board and the Applicant, provided that such modification, amendment, or release has been approved by the Board after public hearing. Notwithstanding anything contained hereinto the contrary, Applicant, its successors in interest and the Board may amend or terminate this Agreement without securing the consent of other property owners

whose property is affected by this Agreement, unless such amendment or termination directly and materially modifies the allowable uses or entitlements of such owners' property.

10. **Governing Law**. This Agreement and the construction and enforcement thereof shall be interpreted under the laws of the State of Florida. The parties hereto agree without reservation of any rights under federal or state law, that in any litigation arising under this Agreement, the parties hereto waive the right to trial before a jury and all such litigation shall be litigated only in a non-jury hearing in the State Courts of Florida, St. Lucie County.

11. **Successors and Assigns.** This Agreement shall be deemed to be a covenant running with the land and shall be binding upon the heirs, legal representatives, successors and assigns of the Applicant and any person, firm, corporation or entity who or which may become the successor in interest to the Property. No subsequent transfer of the Property or any assignment of interest therein shall relieve or discharge the Applicant from any term, condition, obligation or duties set out in this Agreement.

12. **Notice**. Any notice, request, demand, consent, approval, or other communication required or permitted by this Agreement shall be given or made in writing and shall be served as elected by the party giving the notice by any of the following methods: (i) hand delivery to the other party; (ii) delivery by commercial overnight courier service; (iii) mailed by registered or certified mail (postage prepaid), return receipt requested; (iv) mailed by regular U.S. mail; or (v) sent by electronic mail (Email). GENERAL POLICY

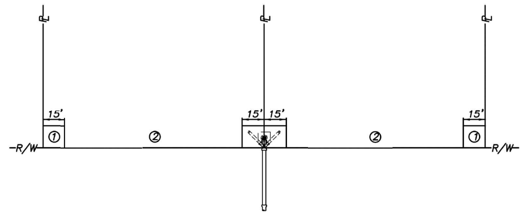
WHERE COST JUSTIFIED AND OPERATIONALLY FEASIBLE, IT IS THE GENERAL POLICY OF THE F.P.U.A. TO PROVIDE WATER, ELECTRIC, SEWER AND GAS SERVICE FROM THE STREET SIDE OF A PIECE OF PROPERTY. DEPENDING ON FACTORS SUCH AS LOCATION OF EXISTING SUPPLY SOURCE FACILITIES, REAR OR SIDE LOT LINE SUPPLY MAY BE AUTHORIZED, BUT ONLY WITH PRIOR APPROVAL FROM THE F.P.U.A.



NOTES:

1. THE PREFERRED POINT OF CONNECTION TO THE F.P.U.A. SEWER LATERAL, AREA ①, SHALL BE LOCATED IN THE CORNER OF THE PROPERTY SELECTED BY THE F.P.U.A. AS THE BEST LOCATION FOR THE LATERAL. EVERY EFFORT WILL BE MADE TO SELECT THE CORNER WHERE TWO LATERALS CAN BE CONNECTED IN A "Y" CONFIGURATION AS SHOWN.
2. IF PHYSICAL BARRIERS OR OTHER OBSTACLES PREVENT THE CONNECTION OF THE BUILDING SERVICE LINE TO THE F.P.U.A. SEWER LATERAL, WITHIN AREA ①, THE F.P.U.A. ENGINEERING DEPARTMENT MAY AUTHORIZE THE CONNECTION ALONG THE PORTION OF THE R/W LINE MARKED AREA ②.
3. HORIZONTAL SEPARATION OF WATER AND WASTEWATER SERVICES SHOULD BE A MINIMUM OF SIX FEET AND PREFERABLY 10 FEET.
4. THE WASTEWATER LATERAL SHALL BE LOCATED WITHIN RIGHT-OF-WAY AND TERMINATE AT THE PROPERTY LINE.
5. THE F.P.U.A. SHALL BE RESPONSIBLE FOR THE MAINTENANCE AND REPAIR OF THE WASTEWATER LATERAL WITHIN THE EASEMENT OR RIGHT-OF-WAY, UP TO THE POINT OF CONNECTION.

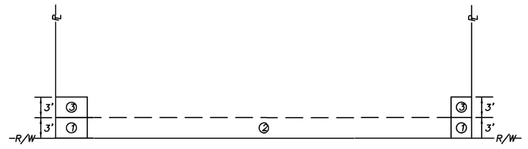
WHERE COST JUSTIFIED AND OPERATIONALLY FEASIBLE, IT IS THE GENERAL POLICY OF THE F.P.U.A. TO PROVIDE WATER, ELECTRIC, SEWER AND GAS SERVICE FROM THE STREET SIDE OF A PIECE OF PROPERTY. DEPENDING ON FACTORS SUCH AS LOCATION OF EXISTING SUPPLY SOURCE FACILITIES, REAR OR SIDE LOT LINE SUPPLY MAY BE AUTHORIZED, BUT ONLY WITH PRIOR APPROVAL FROM THE F.P.U.A.



NOTES:

1. THE PREFERRED POINT OF CONNECTION TO THE F.P.U.A. WATER METER, AREA ① SHALL BE LOCATED IN THE CORNER OF THE PROPERTY SELECTED BY THE F.P.U.A. AS THE BEST LOCATION FOR THE WATER METER. EVERY EFFORT WILL BE MADE TO SELECT THE CORNER WHERE TWO WATER SERVICES AND METERS CAN BE CONNECTED.

2. IF PHYSICAL BARRIERS OR OTHER OBSTACLES PREVENT THE CONNECTION OF THE BUILDING SERVICE LINE TO THE F.P.U.A. WATER SERVICE, WITHIN AREA ① , THE F.P.U.A. ENGINEERING DEPARTMENT MAY AUTHORIZE THE CONNECTION ALONG THE PORTION OF THE R/W LINE MARKED AREA ② , OR ALONG THE PROPERTY LINES MARKED AREA ③.

3. HORIZONTAL SEPARATION OF WATER AND WASTEWATER SERVICES SHOULD BE A MINIMUM OF 6 FEET AND PREFERABLY 10 FEET.

4. ALL METERS SHALL BE INSTALLED IN AN UNRESTRICTED AREA FOLLOWING EASE OF ACCESS AND PROVIDING ADEQUATE PROTECTION.

5. THE F.P.U.A. SHALL BE RESPONSIBLE FOR THE MAINTENANCE AND REPAIR OF THE WATER LATERAL WITHIN THE EASEMENT OR RIGHT–OF–WAY, UP TO THE POINT OF CONNECTION.

STANDARD SEPARATION STATEMENT FOR WATER / SEWER CONFLICTS

1. SANITARY SEWER, FORCE MAINS, AND STORM SEWERS SHOULD CROSS UNDER WATER MAINS WHENEVER POSSIBLE. SANITARY SEWERS, FORCE MAINS AND STORM SEWERS CROSSING UNDER WATER MAINS SHALL BE LAID TO PROVIDE A MINIMUM VERTICAL DISTANCE OF 6 INCHES, PREFERABLY 12 INCHES BETWEEN THE INVERT OF THE UPPER PIPE AND THE CROWN OF THE LOWER PIPE WHEN ABOVE, AND AT LEAST 12 INCHES OF SEPARATION WHEN THE WATER MAIN IS BELOW.

WHERE SANITARY SEWER, FORCE MAINS, STORM SEWERS MUST CROSS A WATER MAIN WITH LESS THAN 6 INCHES VERTICAL SEPARATION, BOTH THE SEWER AND WATER MAIN SHALL BE CONSTRUCTED OF DUCTILE IRON PIPE (DIP) CENTERED ON THE CROSSING. (DIP IS NOT REQUIRED FOR STORM SEWERS.) SUFFICIENT LENGTHS OF DIP MUST BE USED TO PROVIDE A MINIMUM SEPARATION OF 10 FEET BETWEEN TWO JOINTS. ALL JOINTS ON THE WATER MAIN WITHIN 20 FEET OF THE CROSSING MUST BE MECHANICALLY RESTRAINED.

ALL CROSSINGS SHALL BE ARRANGED SO THAT THE SEWER PIPE JOINTS AND WATER MAIN PIPE JOINTS ARE EQUIDISTANT FROM THE POINT OF CROSSING (PIPES CENTERED ON THE CROSSING). AT SUCH CROSSINGS PIPES SHALL BE ARRANGED SO THAT ALL WATER MAIN JOINTS ARE AT LEAST THREE FEET FROM ALL JOINTS IN VACUUM-TYPE SANITARY SEWERS, STORM SEWERS, STORMWATER FORCE MAINS, OR PIPELINES CONVEYING RECLAIMED WATER REGULATED UNDER PART III OF CHAPTER 62-610, F.A.C., AND AT LEAST SIX FEET FROM ALL JOINTS IN GRAVITY OR PRESSURE TYPE SANITARY SEWERS, WASTEWATER FORCE MAINS, OR PIPELINES CONVEYING RECLAIMED WATER NOT REGULATED UNDER PART III OF CHAPTER 62-610, F.A.C.

WHERE A NEW PIPE CONFLICTS WITH AN EXISTING PIPE WITH LESS THAN 6 INCHES VERTICAL CLEARANCE, THE NEW PIPE SHALL BE CONSTRUCTED OF DIP (EXCEPT STORM SEWERS) AND NEW PIPES SHALL BE ARRANGED TO MEET THE CROSSING REQUIREMENTS ABOVE.

2. A MINIMUM 3-FOOT HORIZONTAL SEPARATION SHALL BE MAINTAINED BETWEEN ANY TYPE OF STORM SEWER AND WATER MAIN IN PARALLEL INSTALLATIONS WHENEVER POSSIBLE.

A MINIMUM 3-FOOT, AND PREFERABLE 10-FOOT HORIZONTAL SEPARATION SHALL BE MAINTAINED BETWEEN VACUUM TYPE SANITARY SEWER AND WATER MAIN IN PARALLEL INSTALLATIONS WHENEVER POSSIBLE.

A MINIMUM 10-FOOT HORIZONTAL SEPARATION SHALL BE MAINTAINED BETWEEN "ONSITE SEWAGE TREATMENT AND DISPOSAL SYSTEM" AND WATER MAIN IN PARALLEL INSTALLATIONS WHENEVER POSSIBLE.

A MINIMUM 6-FOOT, AND PREFERABLE 10-FOOT HORIZONTAL SEPARATION SHALL BE MAINTAINED BETWEEN GRAVITY OR PRESSURE TYPE SANITARY SEWER, WASTEWATER FORCE MAIN, OR PIPELINE CONVEYING RECLAIMED WATER AND WATER MAIN IN PARALLEL INSTALLATIONS WHENEVER POSSIBLE. THE MINIMUM HORIZONTAL SEPARATION DISTANCE BETWEEN WATER MAINS AND GRAVITY-TYPE SANITARY SEWERS SHALL BE REDUCED TO 3 FOOT WHERE THE BOTTOM OF THE WATER MAIN IS LAID AT LEAST SIX INCHES ABOVE THE TOP OF THE SEWER

IN CASES WHERE IT IS NOT POSSIBLE TO MAINTAIN A 10-FOOT HORIZONTAL SEPARATION, THE WATER MAIN MUST BE LAID IN A SEPARATE TRENCH OR ON A UNDISTURBED EARTH SHELF LOCATED ON ONE SIDE OF THE SEWER OR FORCE MAIN AT SUCH AN ELEVATION THAT THE BOTTOM OF THE WATER MAIN IS AT LEAST 6 INCHES ABOVE THE TOP OF THE SEWER.

WHERE IT IS NOT POSSIBLE TO MAINTAIN A VERTICAL DISTANCE OF 6 INCHES IN PARALLEL INSTALLATIONS, THE WATER MAIN SHALL BE CONSTRUCTED OF DIP AND THE SEWER OR THE FORCE MAIN SHALL BE CONSTRUCTED OF DIP (EXCEPT STORM SEWER) WITH A MINIMUM VERTICAL DISTANCE OF 6 INCHES. THE WATER MAIN SHOULD ALWAYS BE ABOVE THE SEWER. JOINTS ON THE WATER MAIN SHALL BE LOCATED AS FAR APART AS POSSIBLE FROM JOINTS ON THE SEWER OR FORCE MAIN (STAGGERED JOINTS).

3. ALL DIP SHALL BE PRESSURE CLASS 250 MIN.. ADEQUATE PROTECTIVE MEASURES AGAINST CORROSION SHALL BE USED AS DETERMINED BY THE DESIGN ENGINEER.

SEQUENCE OF CONSTRUCTION

UPON IMPLEMENTATION AND INSTALLATION OF THE FOLLOWING AREAS: TRAILER, PARKING, LAYDOWN, PORTA-POTTY, WHEEL WASH, CONCRETE WASHOUT, FUEL AND MATERIAL STORAGE CONTAINERS, SOLID WASTE CONTAINERS, ETC., IMMEDIATELY DENOTE THEM ON THE SITE MAPS AND NOTE ANY CHANGES IN LOCATION AS THEY OCCUR THROUGHOUT THE CONSTRUCTION PROCESS.

PHASE 1:

1. CONSTRUCT STABILIZED CONSTRUCTION ENTRANCE (1) AND INSTALL SILT FENCE.
2. DEMOLISH EXISTING STRUCTURES, IF APPLICABLE
3. CONSTRUCT AND STABILIZE SEDIMENT BASIN AND DRAINAGE SWALES WITH APPROPRIATE OUTFALL STRUCTURES (CLEAR ONLY THOSE AREAS NECESSARY TO INSTALL CONTROL DEVICES LISTED ABOVE)
4. INSTALL INLET PROTECTION AT EXISTING INLET(S).
5. INSTALL AND STABILIZE ANY NECESSARY HYDRAULIC CONTROL STRUCTURES (DIKES, CHECK DAMS, OUTLET TRAPS, RISER PIPE DISCHARGE POINT, ETC.)
6. PREPARE CLEARING AND GRUBBING OF THE SITE, IF APPLICABLE.

PHASE 2:

7. PERFORM MASS GRADING. ROUGH GRADE TO ESTABLISH PROPOSED DRAINAGE PATTERNS.
8. START CONSTRUCTION OF THE BUILDING PAD AND STRUCTURES.
9. TEMPORARILY SEED WITH PURE LIVE SEED, THROUGHOUT CONSTRUCTION, DISTURBED AREAS THAT WILL BE INACTIVE FOR 7 DAYS OR MORE OR AS REQUIRED BY GENERIC PERMIT.
10. INSTALL UTILITIES, UNDERDRAINS, STORM SEWERS, AND CURBS.
11. INSTALL INLET PROTECTION AT ALL STORM DRAIN INLETS AS EACH INLET IS INSTALLED. PERMANENTLY STABILIZE AREAS TO BE VEGETATED AS THEY ARE BROUGHT TO FINAL GRADE.
12. PREPARE SITE FOR PAVING AND PAVE SITE.
13. CONTACT CIVIL ENGINEER ONCE THE SITE APPEARS TO BE FULLY STABILIZED.
14. REMOVE ALL TEMPORARY EROSION AND SEDIMENT CONTROL DEVICES AFTER INSPECTION AND APPROVAL OF THE ENGINEER AND STABILIZE ANY AREA DISTURBED BY THE REMOVAL OF BMPS.
15. CONTINUE DAILY INSPECTION REPORTS UNTIL THE FINAL DAILY INSPECTION IS SIGNED OFF BY THE CONSTRUCTION MANAGER THAT THE SITE IS FULLY STABILIZED AND THE PERMIT MAY BE TERMINATED.

ALL MEASURES STATED ON THIS SITE MAP, AND IN THE STORM WATER POLLUTION PREVENTION PLAN, SHALL BE MAINTAINED IN FULLY FUNCTIONAL CONDITION UNTIL NO LONGER REQUIRED FOR A COMPLETED PHASE OF WORK OR FINAL STABILIZATION OF THE SITE. ALL EROSION AND SEDIMENTATION CONTROL MEASURES SHALL BE CHECKED BY A QUALIFIED PERSON IN ACCORDANCE WITH THE CONTRACT DOCUMENTS OR THE APPLICABLE PERMIT, WHICHEVER IS MORE STRINGENT, AND REPAIRED IN ACCORDANCE WITH THE FOLLOWING:

1. INLET PROTECTION DEVICES AND BARRIERS SHALL BE REPAIRED OR REPLACED IF THEY SHOW SIGNS OF UNDERMINING OR DETERIORATION.
2. ALL SEEDED AREAS SHALL BE CHECKED REGULARLY TO SEE THAT A GOOD STAND IS MAINTAINED. AREAS SHOULD BE FERTILIZED, WATERED, AND RESEEDED AS NEEDED.
3. SILT FENCES SHALL BE REPAIRED TO THEIR ORIGINAL CONDITIONS IF DAMAGED. SEDIMENT SHALL BE REMOVED FROM THE SILT FENCES WHEN IT REACHES ONE-HALF THE HEIGHT OF THE SILT FENCE.
4. THE CONSTRUCTION EXITS SHALL BE MAINTAINED IN A CONDITION WHICH WILL PREVENT TRACKING OR FLOW OF MUD ONTO PUBLIC RIGHTS-OF-WAY. THIS MAY REQUIRE PERIODIC TOP DRESSING OF THE CONSTRUCTION EXITS AS CONDITIONS DEMAND.
5. THE TEMPORARY PARKING AND STORAGE AREA SHALL BE KEPT IN GOOD CONDITION (SUITABLE FOR PARKING AND STORAGE). THIS MAY REQUIRE PERIODIC TOP DRESSING OF THE TEMPORARY PARKING AREA AS CONDITIONS DEMAND.
6. OUTLET STRUCTURES IN THE SEDIMENTATION BASINS SHALL BE MAINTAINED IN OPERATIONAL CONDITIONS AT ALL TIMES. SEDIMENT SHALL BE REMOVED FROM SEDIMENT BASINS OR TRAPS WHEN THE DESIGN CAPACITY HAS BEEN REDUCED BY 50%.

HALT ALL ACTIVITIES AND CONTACT THE CONSULTANT TO PERFORM INSPECTION AND CERTIFICATION OF BMPS. GENERAL CONTRACTOR SHALL SCHEDULE AND CONDUCT STORM WATER PRE-CONSTRUCTION MEETING WITH CONSULTANT AND ALL GROUND-DISTURBING CONTRACTORS BEFORE PROCEEDING WITH CONSTRUCTION.

LIST OF FIGURES

INTRODUCTION

An upland habitat survey for gopher tortoise (*Gopherus polyphemus*) was conducted on the approximately 11.34-acre property located on 3804 Sunrise Blvd, Fort Pierce, Florida (see Figure 1). The survey included review of 100% of potential gopher tortoise habitat within the subject property.

The objectives of the survey were to document gopher tortoise burrows within the construction footprint of the property to confirm presence/absence, document the status and location of gopher tortoise burrows, and approximate the number of tortoises that would need relocation. The results of the survey determine the subsequent actions required to develop the subject property.

This Survey Report provides a summary of the survey activities conducted, including methods used and areas surveyed. Survey activities were executed according to the burrow survey methodology from the Florida Fish and Wildlife Conservation Commission (FWC) Gopher Tortoise Permitting Guidelines, April 2008, Revised April 2023, Appendix 4 Methods for Burrow Surveys on Development (Donor) and Recipient Sites, 100% Burrow Survey Protocol. Survey activities were conducted on January 25 and the morning January 26, 2024. The information contained herein is based on the findings from the field survey.

SITE LOCATION AND DESCRIPTION

The ±11.34-acre property is located in White City, a census-designated place (CDP) in Saint Lucie County within Section 33, Township 35 South and Range 40 East. The subject property is along the east side of Sunrise Blvd. The Saint Lucie County Property Appraiser lists the Property Parcel ID as 2433-123-0001-000-1. The Future Land Use designation is residential.

The vegetative component of the subject property is predominantly exotic vegetation, shrub brushland, cabbage palms and scattered hardwoods. An isolated waterbody is present within the north west corner and a water filled ditch runs along the southern boundary of the subject property. The Florida Cooperative Land Cover (CLC) System developed by the Florida Fish and Wildlife Conservation Commission (FWC) classifies the land cover as 1821 – Low Structure Density and 18332 – Fallow Orchards. The predominant land cover classification is Fallow Orchards (1832). Figure 2 provides the CLC map for the subject property.

The vegetative community was characterized in the field as a degraded mixed upland community consisting of shallow ridge and furrows with a sparse canopy and dense shrub stratum. The ridge and furrow landform is a result of the historic orchard land use. The canopy stratum consists primarily of cabbage palm (*Sabal palmetto*), and laurel oak (*Quercus laurifolia*). The shrub stratum consisted of dense ceaserweed (*Urena lobata*), Jack-in-the-bush (*Chromolaena odorata*), Brazillian pepper (*Schinus terebinthifolia*), and shoebutton ardisia (*Ardisia elliptica*). Ground cover stratum was generally limited due to the dense canopy, shrub and vine cover. Limited areas with herbaceous vegetative cover were observed providing suitable forage for gopher tortoises.

The Natural Resources Conservation Service (NRCS) Web Soil Survey lists five soil types within the subject property. Table 1 provides a summary of the soil types present within the subject property. Figure 3 provides the NRCS Web Soil Survey graphically for the subject property. A brief description of each soils type follows.

Ankona and Farmton sands is poorly drained soil found in flatwoods on marine terraces. The seasonal high-water table is at a depth of 6 to 18 inches. The gopher tortoise burrowing suitability is rated as "less suited". Less Suited rating states that these soils have characteristics that may limit establishment, maintenance, or use of the site by gopher tortoise. Colonization and population densities may be below average or restricted in the area due to the limiting factors even though all of the other species habitat requirements are met (USDA, 2024).

Arents are Somewhat poorly drained sandy soils found on rises in marine terraces. Depth to water is 18 to 36 inches. This soils type is listed as not rated in the Web Soil Survey gopher tortoise burrowing suitability.

Susanna and Wauchula sands are poorly drained soil found in flatwoods on marine terraces. The seasonal high-water table is at a depth of 6 to 18 inches. The gopher tortoise burrowing suitability is rated as "unsuitable". These soils have characteristics that may limit establishment, maintenance, or use of the site by gopher tortoise. Areas of included soils with better drainage may provide suitable soil properties in some locations (USDA, 2024).

Tantile and Pomona sands are poorly drained soil found in flatwoods on marine terraces. The seasonal high-water table is at a depth of 6 to 18 inches. The gopher tortoise burrowing suitability is rated as "unsuitable" (USDA, 2024).

Winder loamy sand is poorly drained soil found in flats on marine terraces. The seasonal high-water table is at a depth of 12 to 18 inches. The gopher tortoise burrowing suitability is rated as "less suited" (USDA, 2024).

METHODS

The survey activities were completed by an FWC gopher tortoise agent and performed in accordance with those specified in Appendix 4 of the FWC Guidelines. Equipment utilized during the survey included a camera, Trimble DGPS unit, and a handheld datalogger running Solo Field mapping software.

The pedestrian survey was conducted by walking pre-determined transects in an approximate east-west orientation at 50-foot spacing across 100 percent of the subject property (see Figure 4). Apparent burrow activity status (active, inactive, or abandoned), size (juvenile <5 in.; subadult 5-8 in.; adult >8 in.), GPS coordinates, and photographs were recorded for each burrow encountered along each transect. Burrows that were not clearly made by a tortoise were not recorded.

RESULTS/DISCUSSION

The 100 % pedestrian survey of the project area resulted in no potentially occupied burrows. Multiple burrows from other burrowing fauna (i.e., armadillo *[Dasypus novemcinctus*]) were noted during the survey. Figure 4 provides the survey design graphically.

An apparent high-water table and dense vegetative cover provides poor quality gopher tortoise habitat throughout the majority of the subject property. Ponding, saturated soils, and organic soils were observed throughout the property. Optimal forage species (i.e., asgrasses and forbes) were generally absent due to the dense canopy and shrub, and cover. Additionally, approximately 50 percent of the soil types on the property are classified as "unsuitable" while the other 50 percent are listed as "less suited".

In Florida, gopher tortoises are categorized as Threatened on the Endangered Species List and are therefore protected by state law, Chapter 68A - 27.003, FL Administrative Code. An FWC relocation permit is required prior to any disturbance to a burrow or handling of a tortoise. Please note that ground disturbances within 25 feet in any direction from the burrow is prohibited until a relocation permit has been obtained and the tortoise has been relocated to either and offsite recipient site or a suitable onsite relocation area. The findings of this survey are valid for a period of ninety days. A resurvey must be completed prior to construction activities that will occur beyond the ninety-day period.

INTRODUCTION

O'Rourke Engineering & Planning was retained to prepare a traffic analysis for the proposed development consisting of 50 Single Family dwelling units located on Sunrise Boulevard in St. Lucie County, Florida. The purpose of this report is to determine the project's impact on the surrounding roadway system.

In order to make the determination that the project complies with County Concurrency Guidelines, the following analytical steps were taken:

- summary of the project
- summary of existing lane geometries
- summary of the existing traffic volumes
- assessment of project traffic
- determination of impact area
- summary of buildout cumulative traffic volumes
- summary of levels of service with the project traffic added

Each of these steps is outlined herein.

PROJECT DESCRIPTION

The proposed development located on Sunrise Boulevard in St. Lucie County, Florida, will consist of 50 Single Family dwelling units. The site is currently vacant. The project will have access to Sunrise Boulevard via one full access driveway. The project has an anticipated buildout year of 2027. The project location is shown in **Figure 1**. The number of lanes is also shown in **Figure 1**.

PROJECT TRAFFIC

To estimate future traffic generated by the development, the ITE Trip Generation, 11th Edition trip rates for Single Family Detached (Land Use Code 210) was applied to estimate the trips generated by the proposed development. These calculations are shown in **Tables 1a, 1b, and 1c**.

As shown, the project will generate 533 new daily trips. There will be 40 AM peak hour trips with 10 entering the project and 30 trips exiting the project. The project will generate 52 new PM peak hour trips. There will be 33 trips entering the project and 19 trips exiting the project in the PM peak hour.

EXISTING CONDITIONS

The study area is defined as the roadways upon which the project has an impact of 1% of the level of service capacity within the radius of development influence of 1 mile. Once the project traffic was assigned, the study area was refined based on the impact percentages.

The study area roadways were defined in terms of existing lane geometrics and existing traffic volumes.

Existing Lane Geometrics and Traffic Control

The study area was reviewed to determine the existing number and type of lanes, and the traffic control along the roadway. Each roadway is described below.

- Sunrise Boulevard is a two-lane undivided major collector roadway with a general north/south alignment.
- Bell Avenue is a two-lane undivided major collector with an east/west alignment.
- Midway Road is a four-lane divided principal arterial with an east/west alignment.
- 25th Street is a four-lane divided principal arterial with a north/south alignment.
- Oleander Avenue is a two-lane minor arterial with a north/south alignment.

Existing Traffic Volumes/ Service Volume

Link volume data was obtained from the St. Lucie County TPO. The count data along with the number of lanes and the associated peak hour/peak direction service volumes will be summarized in the upcoming sections of the report. The service volumes were developed based on the St. Lucie County 2023 Traffic Counts and Level of Service Report. Traffic volumes for the intersection of Sunrise Boulevard and Bell Avenue were counted on April 2, 2024, during the AM and PM peak periods.

Appendix B includes the St. Lucie County 2023 Traffic Counts and Level of Service Report.

PROJECT DISTRIBUTION/ ASSIGNMENT/IMPACT

The project traffic was distributed by general geographic direction and then assigned to the roadway network.

Distribution/ Assignment – This general distribution led to an assignment of trips based on the anticipated ultimate destinations and the roadway paths used to reach those destinations. The project assignment for the proposed development is shown in **Figure 2.**

Impact – Tables 2a and 2b summarize the project impact as a percent of service volume capacity. Significant is defined as 1% or more within the radius of development impact. As shown in **Tables 2a and 2b**, the project is significant on Sunrise Boulevard, Bell Avenue, and Oleander Avenue.

LINK ANALYSIS

The links where the project traffic is significant were analyzed further to ensure they will meet concurrency. A 5-year area wide growth rate was calculated using the FDOT Historical Traffic Count volumes. The calculated growth rate resulted in a rate of 1.16%. Existing traffic volumes were taken from the TPO Level of Service report and grown using the higher of 2.5% per year or 1% plus committed projects. "Other approved" unbuilt projects include Dade & Sunrise, American Silicon, Oleander Oaks, and Napa Auto. Project traffic was then added to create total traffic. **Tables 3a and 3b** summarize the results of the link analysis. As shown, the link of Oleander Avenue from Bell Avenue to Farmer's Market Road is currently operating below the adopted level of service. Based on FS 163.318 the project is not responsible for deficient links. All other significant links will remain at an acceptable level of service at project buildout.

Details of the growth rate calculation and background projects are included in **Appendix C.**

INTERSECTION ANALYSIS

The intersection of Bell Avenue and Sunrise Boulevard is a four-way stop, with flashing beacons. There is a single approach on all lanes except the northbound flared right turn lane. The analysis does not reflect the lane since the through and left queues could block access during the peak hour. The intersection was counted during the AM and PM peak hours on April 2, 2024. A seasonal factor of 1.01 was applied to the traffic counts. The growth rate of 2.5% was applied for 3 years, and the background projects consisting of Dade & Sunrise, Oleander Oaks, American Silicone, and Napa Auto were then added. Finally, project traffic was added to determine the 2027 total traffic.

The intersection was analyzed using HCS for unsignalized intersections. As shown in **Table 4**, the Sunrise Boulevard & Bell Avenue intersection will operate at a LOS B in the AM and PM peak hours with the existing lane configuration for Existing and Total Traffic 2027 conditions.

Appendix D includes the intersection analysis and data.

DRIVEWAY ANALYSIS

There will be one project driveway located on Sunrise Boulevard. The driveway on Sunrise Boulevard will be a full access driveway. **Figure 3** illustrates the project traffic at the driveway. The FDOT multi-modal guidebook was used to determine the need for right and left turn lanes at the project driveways. Sunrise Boulevard has a posted speed limit of 35 MPH. The PM peak hour has the highest turning volumes. The Project Driveway has approximately 6% southbound left turns and an approaching volume of 263 vehicles and an opposing volume of 279 vehicles in the peak hour. Therefore, a southbound left-turn lane is not warranted at the Project Driveway. The Project Driveway has a northbound right-turn volume of 17 vehicles in the peak hour and an approach volume of 279 vehicles. Therefore, a northbound right-turn lane is not warranted at the Project Driveway.

The project driveway was analyzed using HCS for unsignalized intersections. As shown in Table 4, the Project Driveway will operate at a LOS B in the AM and PM peak hours at project buildout.

Appendix E includes the driveway analysis and data.

CONCLUSION

With 40 net new AM peak hour trips and 52 net new PM peak hour trips, all links and intersections are projected to operate at acceptable levels of service with the existing roadway network, with the exception of Oleander Avenue from Bell Avenue to Farmer's Market Road, which is currently operating below the adopted level of service. As this is an existing deficiency, the project is not responsible for improvements to this roadway. Therefore, the project meets the requirements for concurrency.

2.2 TRIP DISTRIBUTION AND TRIP ASSIGNMENT

Projected traffic demand of project trips on study roadways was derived with use of the adopted regional travel demand model. Land use data for the project was entered into a new traffic analysis zone (TAZ) within the Greater Treasure Coast Regional Planning Model (GTCRPM) set and situated within the existing roadway network to appropriately represent project access. The model was used to assign trips for all trip purposes between allocated origin and destination pairs using project buildout year model data. Trip distribution for the project was extracted from the completed model assignment and reviewed for logic. The resulting model plots showing percent of daily project distribution are provided in **Appendix C.**

Daily model project distribution was referenced to manually assign project distribution at the study area intersections and driveways in general accordance with model output. **Figure 1** shows the intersection movement project distribution surrounding Oleander Oaks used in this TIS.

Project trip distribution percentages were used to assign anticipated project trips to the study area roadways and intersections. **Figure 2** shows the anticipated AM and PM peak hour project volumes at the study area intersections.
