## SOLE SOURCE FOR SECURE IDENTIFICATION DOCUMENTS

The design and creation of secure identification documents incorporates multi-discipline technologies. These technologies, when fused together, create an effective barrier that is highly resistant to replication, duplication, and imitation. It takes specialized expertise, materials, and equipment to produce an ID which has tightly coupled the personal data, photographic image and security features with sufficient quality to pass a well-designed verification process. Access to these components is restricted to certified government agencies with audit controls in place. The ID document incorporates multiple overt and covert technologies that unalterably link both fixed and variable data to the document itself. Using patented technologies, The Police and Sheriffs Press, Inc.(PASP) is able to link a full color digital photograph to a demetalized optical variable device (OVD) incorporating an unalterable unique serialization of each document. This unique personalized (OVD) is further enhanced by using another patented technology called HOLOVIEW®. This security feature allows for the viewing of the personalized OVD with its unique serialization on the reverse side of the document using an ambient light source. There are no other companies in the world that have this technology.

While the above patented technologies offer enough justification for sole source procurement, PASP also incorporate other proven security elements in unique ways into the document core structure. The embedment of multiple UV (black light) structures, nano text laser imaging, metal detection capabilities, numerous embedded OVD's round out the document security. The document security issuance system is user friendly ensuring uptime reliability. The unique personalized holographic HOLOVIEW® panel is immune to counterfeiting and replication and can be 100% verified without any equipment.

The training of all police personnel to the 100% validation level can be obtained within two minutes of instruction. This means that after a brief training period, an officer will be able to identify an original document from a counterfeit document 100% of the time. The HOLOVIEW® ID can be validated as an original document by a trained officer within a few seconds. The document can even be validated at night using a flashlight or any light source. Document security features without the ability to be validated in the field are valueless to an officer trying to determine if he is viewing an official document or a counterfeit. The HOLOVIEW® ID was created for the Law Enforcement community who requires secure documentation and ease of validation.

The Police and Sheriffs Press, Inc. is committed to producing the highest level of security documents and offering service that exceeds your expectations.

"Protecting the most valuable I.D. in the world....Yours!"
