SECTION 1 - Project Description

Project Description

The proposed project known as "Rancho La Habra" consists of 150.8 acres, and proposes the construction of 277 single family homes, 145 multi-family units, a 2.7-acre commercial site (An additional 49 multi-family units may be constructed as an option to the proposed commercial site), approximately 38.9 acres of open space, paved streets, un-paved trails and access roads, and general improvements related to a residential development. The site is part of the 'La Habra Hills Specific Plan'. The proposed project site is located within the San Gabriel sub-watershed portion of the Santa Ana River Basin, in the City of La Habra, County of Orange, California. The project site is bounded by Beach Boulevard to the west, La Habra Hills Drive to the north, Idaho Street to the east, Tracts 15030 and 15031 to the south and Hillsboro Drive to the south (see included vicinity map).

The limits of this study were expanded to include all offsite areas with potential to generate run-on as well as taking into consideration the existing storm drain system that flows through the site from the developments to the south. The study area breakdown is as follows:

- On-site proposed development area = 115.47 acres
- On-site undeveloped area = 35.46 acres
- Offsite area tributary to drainage area 'C' = 47.00 acres

Total study area = 197.93 acres

- Tract 15030 Line 'I' Peak effluent 25 year Q equals 254.1 cfs
- Tract 15030 Line 'M' Peak effluent 25 year Q equals 48.6 cfs

Pre-Development Conditions

Historically the site was vacant consisting of natural rolling hills. In 1999, the site was graded and a golf course was constructed. Currently, the site remains a fully functioning golf course with irrigated fairways, sand traps and water features. The existing topography of the site divides the project into seven distinct drainage areas, 'A', 'B', 'C', 'D', 'E', 'F' and 'G' with Coyote Creek flowing from northeast to southwest behind the existing commercial/industrial and residential properties located west of Beach Boulevard. During storms, surface run-off drains towards a series of area drains that outlet into the various water features along the golf course. The water features are connected to the public storm drain system, and ultimately outlet into Coyote Creek, which is located approximately 400 feet to the west of the site. Water is then conveyed along the natural drainage course of San Gabriel sub-watershed towards the Pacific Ocean.

Additionally, along the southerly project boundary, two residential tracts (tract 15030 and tract 15031) were developed and the off-site storm drain system was integrated into the golf course design. A portion of the runoff from both of these tracts co-mingles with the water features along the fairways. The water features were intended to act as retarding basins, ultimately mitigating the increase in storm water run-off associated with the development of both the residential tracts and golf course. Maintenance was the responsibility of the golf course.

Currently, the 48-inch diameter portion of Line 'A' of Tract 15030 as it crosses Beach Boulevard, is undersized and incapable of carrying the additional flows from Lines 'M' and 'N' of Tract 15030. The layout of Line 'A' yields a maximum capacity of 101.6 cfs as it crosses Beach Blvd. However, the velocity head of the 17% slope pipe immediately upstream, increases the capacity to 254 cfs. The addition of Line 'M' and 'N' over load the system and create a substantial hydraulic jump, back water the system and ultimately cause flooding within the golf course (please refer to the Analysis of Area 'C' for design proposal and analysis).

Post-Development Conditions

As required by the Santa Ana Regional Water Quality Control Board, and the MS4 Permit (Municipal Separate Storm Sewer System), the proposed grading of this site has been designed to be consistent with the existing drainage patterns (MS4 Permit, Section XII.A.1). The topography of the site divides the project into seven distinct drainage management areas (DMA), 'A', 'B', 'C', 'D', 'E', 'F' and 'G' (see DMA map included in 'Section 5'). DMA 'A' consists of the eastern quarter of the site and generally drains northeasterly into a proposed water quality and detention basin. DMA 'B' consists of the western half of the eastern half of the site and generally drains northerly into a proposed water quality and detention basin. DMA 'C' consists of the western half of the site and generally drains northerly into a proposed water quality and detention basin. DMA 'D' consists of the southern center portion of the site that will remain open space and generally drains northerly towards and into an existing water feature that will remain and directly connect to a realigned storm drain system. DMA 'E' consists of La Habra Hills Drive, and generally drains northerly towards and into existing catch basins which will remain. DMA 'F' consists of the existing clubhouse along La Habra Hills Drive, which drains towards the existing water feature within DMA 'D'. DMA 'G' consists of the slopes along the north easterly boundary of the site and drain off-site in the existing and proposed conditions. There are no improvements proposed in association with DMA 'G' and was therefore not analyzed. The development of this project will decrease the perviousness of the site through the addition of pavement, sidewalks, houses and other impervious structures. Reduction in pervious area reduces the ability for rain water to be captured and infiltrated. Accordingly, increased imperviousness will increase the total storm water run-off volumes and increase the peak flow rates. The proposed on-site water quality and detention basins are being designed to meet water quality requirements and mitigate for any increase in run-off volume and flow rates associated with the development, flow rates will be reduced to be equal to or less than the existing flow rates.

Redevelopment poses a series of unique hydrologic challenges, the foremost being how to accommodate additional run-off without increasing the 'Q' or over loading the downstream storm drain system. These concerns will be addressed by designing the proposed water quality basins to mitigate any increase in run-off volume as well as restricting the effluent 'Q' to be equal to or less than the existing 'Q'. Existing peak 'Q's' were determined from the as-built storm drain improvement plans for tracts 15030, 15031, 8339, 9590, 9591 and La Habra Hills Drive Improvement Plans, provided by the City of La Habra, and are as follows:

Area A – Tract 9590 maximum pipe capacity equals 47.12 cfs

Area C, Line 'M' – Tract 15030 Peak effluent 25 year Q equals 48.6 cfs

Additionally, the existing storm drain system that conveys storm run-off from tracts 15030 and 15031 will have to be realigned and incorporated into the proposed project design. The realignment will provide dedicated storm drain facilities to allow the off-site run-on to flow through the proposed development without co-mingling with the on-site run-off. The realignment of Line 'A' will maintain a 16.82% slope east of Beach Blvd. to maintain the existing velocity head and capacity of Line 'A'.

Analysis

We have analyzed the proposed project site based on the pre and post development conditions for the 2-year, 5-year, 25-year and 100-year storm events. Orange County Flood Division rational methods and unit hydrograph methodologies were utilized to determine existing and proposed development storm volumes. Any anticipated increase in storm volume or peak Q's associated with the proposed development will have to be retained on site and routed to reduce the peak flow rates to be equal to or less than the existing conditions. The results of this analysis are summarized in the following tables. (There are no improvements proposed in association with DMA 'G' and was therefore not analyzed.)

UNIT HYDROGRAPH – STORM VOLUME (ac.ft.)				
	2 YEAR 24 HOUR	5 YEAR 24 HOUR	25 YEAR 24 HOUR	100 YEAR 24 HOUR

DMA 'A' - Basin 'A'

Drainage Management Area 'A' consists of 27.4 acres which are tributary to Basin 'A' and produce a peak flow of 69.8 cfs during the 100-year storm and a peak flow of 54.3 cfs during the 25-year storm. The existing 30-inch diameter RCP storm drain pipe (constructed per City of La Habra, Tract 9590 off-site storm drain plans) has a maximum capacity of 47.12 cfs. The outlet structure for Basin 'A' will be designed to reduce the peak flows to a maximum of 47.12 cfs, thus mitigating for any increase. Additionally, water quality will be addressed by installing a 'modular wetlands' system (or approved equivalent) on the outlet pipe, that will be sized to treat the entire BMP volume. Installation of the BMP device will be in such a way as to not restrict or prevent larger storm volumes from safely passing through the basin while still addressing water quality requirements. BMP sizing calculations are provided in the project specific WQMP.

BASIN 'A' - UNIT HYDROGRAPH - PEAK FLOW RATE (cfs)								
	2 YEAR		5 YEAR		25 YEAR		100 YEAR	
	EX.	PR.	EX.	PR.	EX.	PR.	EX.	PR.
3 HOUR	13.3	27.0	32.1	35.0	52.5	54.3	69.8	69.8
6 HOUR								
12 HOUR								
24 HOUR								

The proposed development will increase the volume of storm water run-off, the largest increase is during the 5 year 24 hour storm event, where the anticipated run-off is increased by 1.8 acre feet from the existing condition. This increase is being mitigated by the proposed water quality / detention basin located on the north easterly most portion of the site. The preliminary basin sizing, which is shown on the Vesting Tentative Tract Map, will accommodate the combined water quality volume and mitigated volume requirements. Retention of the mitigated volume will also allow time to reduce the developed peak Q down to be equal to or less than the pipe capacity design Q of 47.12 cfs.

BASIN 'A' - UNIT HYDROGRAPH - STORM VOLUME (Ac. Ft.)

24 HOUR	0.8	2.2	1.8	3.6	5.8	7.1	11.0	11.0

DMA 'B' - Basin 'B'

Drainage Management Area 'B' consists of 19.7 acres which are tributary to underground storage basin 'B' and produce a peak flow of 58.2 cfs during the 100-year storm and a peak flow of 45.2 cfs during the 25-year storm. Every storm that was modeled, resulted in negligible or no increase in the peak storm flow rate. Any increase will be mitigated by the proposed underground storage vault. The vault will be sized to store anticipated storm volume increase and release it at a rater equal to or less than the existing peak flow rates.

BASIN 'B' - UNIT HYDROGRAPH - PEAK FLOW RATE (cfs)

6 HOUR								
12 HOUR								
24 HOUR								

The proposed development will increase the volume of storm water run-off, the largest increase is during the 5 year 24 hour storm event, where the anticipated run-off is increased by 1.4 acre feet from the existing condition. This increase is being mitigated by the proposed 1.4 ac-ft underground storage vault located on the northerly most portion of the site, adjacent to La Habra Hills Drive. The preliminary vault sizing, which is shown on the Vesting Tentative Tract Map, will accommodate the combined water quality volume and mitigated volume requirements.

24 HOUR	0.6	1.8	1.5	2.9	4.5	5.4	8.1	8.0

DMA 'C' - Basin 'C'

Drainage Management Area 'C' consists of 121.0 acres that are tributary to Basin 'C', including 47.0 tributary off-site acres. The entire drainage management area produces a peak flow of 360.1 cfs during the 100-year storm and a peak flow of 271.0 cfs during the 25-year storm. Every storm that was modeled experienced an increased peak flow rate in the developed condition as compared to the existing condition. The largest increase was experienced during the 100 year storm, which saw an increased peak storm run-off of 32.6 cfs. This increase is being mitigated by the proposed water quality / detention basin located on the westerly most portion of the site, adjacent to Beach Boulevard. (See Basin C routing analysis on the following page)

BASIN 'C' - UNIT HYDROGRAPH - PEAK FLOW RATE (cfs)								
	2 YEAR		5 YEAR		25 YEAR		100 YEAR	
	EX.	PR.	EX.	PR.	EX.	PR.	EX.	PR.

6 HOUR								
12 HOUR								
24 HOUR								

The proposed development will increase the volume of storm water run-off, the largest increase is during the 5 year 24 hour storm event, where the anticipated run-off is increased by 4.6 acre feet from the existing condition. This increase is being mitigated by the proposed water quality / detention basin located on the westerly most portion of the site. The preliminary basin sizing, which is shown on the Vesting Tentative Tract Map, will accommodate the combined water quality volume and mitigated volume requirements.

BASIN 'C' - UNIT HYDROGRAPH - STORM VOLUME (Ac. Ft.)								
	2 YEAR		5 YEAR		25 YEAR		100 YEAR	
	EX.	PR.	EX.	PR.	EX.	PR.	EX.	PR.
3 HOUR	3.0	4.3	6.2	7.8	13.2	14.4	21.5	21.5
6 HOUR	3.1	5.1	6.8	9.3	17.2	18.8	29.5	29.5
12 HOUR	3.3	6.0	7.5	10.8	21.2	23.3	38.1	37.9
24 HOUR	3.5	7.1	8.3	12.9	26.4	29.1	49.1	48.9

Basin 'C' has a storage capacity of 18.94 acre feet with a depth of 8.9 feet plus 1.1 feet of freeboard. The storage capacity includes the use of an underground 1.84 ac-ft concrete vault. The largest volume being mitigated is 5.7 acre feet which is approximately one-third of the basin's capacity. The balance of the basins storage capacity will be utilized to mitigate the increased peak run-off velocities.

Basin 'C' Routing

BASIN 'C' - UNIT HYDROGRAPH – ROUTED – PEAK (cfs)								
	2 YEAR		5 YEAR		25 YEAR		100 YEAR	
	ROUTED FLOW	EX. PEAK DECREASE	ROUTED FLOW	EX. PEAK DECREASE	ROUTED FLOW	EX. PEAK DECREASE	ROUTED FLOW	EX. PEAK DECREASE
3 HOUR	5.3	**-81.2**	15.3	**-125.1**	40.7	**-198.9**	56.2	**-271.3**
6 HOUR	5.1	**-81.4**	18.8	**-121.6**	46.5	**-193.1**	69.2	**-258.3**
12 HOUR	6.5	**-80.0**	21.8	**-118.6**	49.5	**-190.1**	77.4	**-250.1**
24 HOUR	6.9	**-79.6**	24.1	**-116.3**	50.8	**-188.8**	79.7	**-247.8**

In all of the modeled storm events the peak flow rate was drastically reduced to below the pre-developed condition. The 100 year 3-hour storm experienced the largest decreased peak flow rate, a reduction of 271.3 cfs from 360.1 cfs to 56.2 cfs.

Run-off during the existing condition was directed towards a manmade lake, within the golf course fairway, which acted as a detention basin, reducing the peak 25 year 24 hour storm flow rate within the effluent pipe (Line 'M' – Tract 15030 Storm Drain Improvements) to 48.6 cfs. Line 'M' – Tract 15030, is a dedicated storm drain pipe serving as the outlet for the afore mentioned lake within the golf course. The proposed development will mimic the existing condition by restricting the outlet flowrates to a maximum of 49 cfs for all storms except the 100 year storms where the maximum flow rate will be 79.7 cfs. The proposed detention basin has 18.94 ac-ft of storage capacity and can route all of the storm events that we analyzed through the basin without utilizing the emergency spillway.

The existing 48-inch storm drain pipe crossing Beach Boulevard (Tract 15030 Line 'A') is undersized and cannot accommodate the existing design Q as shown on the improvement plans for Tract 15030. The proposed development will remove the connection of Line 'M' and Line 'N' from Line 'A', reducing the volume of water flowing through Line 'A' to 254 cfs which the existing system can accommodate. Lines 'M' and 'N' will be rerouted through the proposed basin where it will comingle with the onsite flows and subsequently routed. The peak effluent flow routed through Basin 'C' will be 79.7 cfs, and will be directed through a new parallel pipe crossing Beach Boulevard and reconnect Line 'A' west of Beach Boulevard. The proposed new point of connection to Line 'A' will be at the junction structure where Line 'A' transitions from a 48-inch pipe to a 60-inch pipe. All downstream facilities from the new point of connection have adequate capacity and can accommodate the addition of 79.7 cfs. Furthermore, all downstream facilities are engineered, hardened and or stabilized and not subject to hydraulic conditions of concern.

Area 'D'

Drainage Management Area 'D' consists of 20.5 acres and is generally being left un-developed, with the exception of some minor remedial grading. The existing water feature along the northerly boundary of area 'D' will act as a detention facility and mitigate the anticipated run-off from this area. Area 'D' is slightly shrinking in size as a portion of the area is being added to areas 'A' and 'E'. Due to this realignment of a minor portion of this drainage area, a negligible increase in volume (less than 0.1 ac-ft) and velocity (0.9 cfs) was experienced. Area 'D' produced a peak flow of 59.4 cfs during the 100-year storm and a peak flow of 44.2 cfs during the 25-year storm. The existing lakes outlet structure reduces the peak flow rate down to 19.3 cfs. The proposed realignment of the lake and storm drain system will mimic the existing conditions and reduce the proposed flow rate down to 19.3 cfs, thus mitigating any increased flow rate.

AREA 'D' - UNIT HYDROGRAPH - PEAK FLOW RATE (cfs)								
	2 YEAR		5 YEAR		25 YEAR		100 YEAR	
	EX.	PR.	EX.	PR.	EX.	PR.	EX.	PR.
3 HOUR	16.0	16.3	26.1	26.5	43.3	44.2	58.7	59.4
6 HOUR								
12 HOUR								
24 HOUR								

The proposed development will have a minimal effect on the volume of storm water run-off from this area. The largest increase experienced across all storms was less than 0.1 ac-ft, and will be mitigated for within the existing pond. The preliminary basin sizing, which is shown on the Vesting Tentative Tract Map, will accommodate the mitigated volume requirements.

AREA 'D' - UNIT HYDROGRAPH - STORM VOLUME (Ac. Ft.)								
	2 YEAR		5 YEAR		25 YEAR		100 YEAR

24 HOUR	0.7	0.8	1.7	1.7	4.9	5.0	8.7	8.7

Area 'E'

Drainage Management Area 'E' comprises of realigning La Habra Hills Drive and the club house parking lot. The proposed condition is substantially similar to the existing condition, with negligible differences in imperviousness. Area E comprises of 5.8 acres, tributary to two existing catch basins along La Habra Hills Drive. These 5.8 acres produce a peak flow of 24.0 cfs during the 100-year storm and a peak flow of 18.5 cfs during the 25-year storm. Every storm that was modeled experienced an increased peak flow rate in the developed condition as compared to the existing condition. The largest increase was experienced during the 100 year storm, which saw an increased peak storm run-off of 3.7 cfs. The existing 42-inch storm drain has a capacity of 171 cfs with a 25-year design flow rate of 147 cfs. The addition on 3.7 cfs is a minor increase is considered negligible, therefore no mitigation measures are required.

AREA 'E' - UNIT HYDROGRAPH - PEAK FLOW RATE (cfs)

24 HOUR	0.8	0.8	1.3	1.2	2.0	2.0	2.6	2.6

Area 'F'

Drainage Management Area 'F' consists of 1.7 acres and produce a peak flow of 7.1 cfs during the 100-year storm and a peak flow of 5.5 cfs during the 25-year storm. Every storm modeled showed no increase in peak storm flow rates.

AREA 'F' - UNIT HYDROGRAPH - PEAK FLOW RATE (cfs)

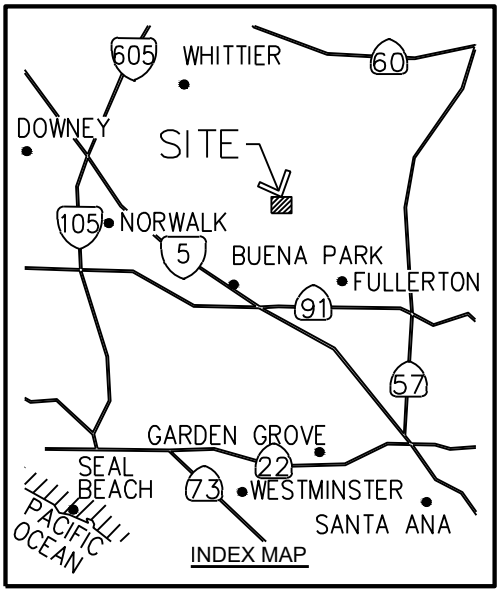
24 HOUR	0.2	0.2	0.4	0.4	0.6	0.6	0.8	0.8

Conclusion

The development of this project does not propose a significant change over the existing conditions as illustrated in the previous tables. Peak flow rates however, did increase as would be expected with the addition of impervious area. This increase in flow rate and any increase in run-off volume will be mitigated by proposed water quality basins 'A', 'B' and 'C'. Areas 'D' and 'E' propose a negligible increase in run-off and peak Q. The existing 42-inch storm drain line that services areas D and E has additional capacity available, and can accommodate the addition of 3.7 cfs. The downstream receiving waters is an engineered and maintained channel that is not susceptible to hydraulic conditions of concern (HCOC). The minimal anticipated increase in peak Q and storm volume is considered negligible, and therefore, no mitigation measures are required. The proposed increase in run-off for Area 'F' will be mitigated on site through the implementation of LID and BMPs as proposed in the WQMP. Area 'G' drains off-site during the existing and proposed conditions, no improvements are proposed and no mitigation is required.



Based upon the results of this report, it is concluded that drainage facilities discussed above will adequately protect the site area from flood damage associated with the 100-year storm event. The proposed facilities, with ultimate development and adequate maintenance, will convey flows safely through the site area in accordance with Orange County requirements.

A Storm Drain Hydraulic Analysis will be prepared in a separate report during the final design. At that time all flows will be routed through the basins and the outlet structures will be sized. Additionally, the preliminary sizing of the outlet structures and basins as shown on the Vesting Tentative Tract Map will be updated based on the final design calculations.

ORANGE COUNTY
HYDROLOGY MANUAL

MEAN PRECIPITATION INTENSITIES FOR NONMOUNTAINOUS AREAS

Figure B-3

B.4. UNIT HYDROGRAPH METHOD DESIGN STORM

The Orange County desgin storm shall be used for all unit hydrograph method calculations (Figures B-5a, b, c).

The point precipitation depths in Table B.2 shall be used for the single-day design storm.

For watersheds with detention basins, a multi-day storm shall be used as shown in Sections B.5 and B.6.

Due to the variations in point precipitation values between mountainous and nonmountainous areas, area averaging of rainfall is required when catchments include areas both above and below the 2,000-foot elevation.

TABLE B.2.

ORANGE COUNTY POINT PRECIPITATION DATA (inches)

	DURATION					
T-YR.	5M	30M	1H	3H	6H	24H
100	0.52(.78)	1.09(1.34)	1.45(1.94)	2.43(3.96)	3.36(6.19)	5.63(11.27)

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL: http://websoilsurvey.nrcs.usda.gov
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Orange County and Part of Riverside County, California
Survey Area Data: Version 8, Sep 19, 2014

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Jul 1, 2014—Jul 9, 2014

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydrologic Soil Group

Hydrologic Soil Group— Summary by Map Unit — Orange County and Part of Riverside County, California (CA678)				
Map unit symbol	**Map unit name**	**Rating**	**Acres in AOI**	**Percent of AOI**
102	Alo clay, 30 to 50 percent slopes	D	18.8	12.8%
109	Anaheim clay loam, 30 to 50 percent slopes	C	80.3	54.8%
207	Sorrento loam, 2 to 9 percent slopes	B	0.5	0.3%
208	Sorrento clay loam, 0 to 2 percent slopes	C	38.4	26.2%
220	Xerorthents loamy, cut and fill areas, 15 to 30 percent slopes		8.6	5.8%
Totals for Area of Interest			**146.6**	**100.0%**

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

**** CONFLUENCE OF MAIN STREAMS ****
------------------------------------------------------------------------
The following data inside Main Stream is listed:
In Main Stream number: 3
Stream flow area =      5.740(Ac.)
Runoff from this stream =     15.892(CFS)
Time of concentration =   10.55 min.
Rainfall intensity =     3.162(In/Hr)
Area averaged loss rate (Fm) =    0.1250(In/Hr)
Area averaged Pervious ratio (Ap) = 0.5000
Summary of stream data:

Stream  Area  Flow rate      TC     Fm       Rainfall Intensity
 No.    (Ac.)   (CFS)       (min) (In/Hr)     (In/Hr)

1     14.43    30.932     17.38    0.157      2.383
2      6.44    14.883     14.01    0.125      2.693
3      5.74    15.892     10.55    0.125      3.162
Qmax(1) =
          1.000 *    1.000 *    30.932) +
          0.879 *    1.000 *    14.883) +
          0.743 *    1.000 *    15.892) + =      55.832
Qmax(2) =
          1.139 *    0.806 *    30.932) +
          1.000 *    1.000 *    14.883) +
          0.846 *    1.000 *    15.892) + =      56.710
Qmax(3) =
          1.350 *    0.607 *    30.932) +
          1.183 *    0.753 *    14.883) +
          1.000 *    1.000 *    15.892) + =      54.476

Total of 3 main streams to confluence:
Flow rates before confluence point:
      31.932      15.883      16.892
Maximum flow rates at confluence using above data:
       55.832       56.710       54.476
Area of streams before confluence:
       14.430        6.440        5.740
Effective area values after confluence:
       26.610       23.805       19.342

Results of confluence:
Total flow rate =     56.710(CFS)
Time of concentration =    14.005 min.
```

```
Effective stream area after confluence  =     23.805(Ac.)
Study area average Pervious fraction(Ap) =  0.568

**** SUBAREA FLOW ADDITION ****
________________________________________________________________________
UNDEVELOPED (average cover) subarea
Decimal fraction soil group A = 0.000
Decimal fraction soil group B = 0.000
Decimal fraction soil group C = 1.000
Decimal fraction soil group D = 0.000
SCS curve number for soil(AMC 2)  = 79.00
Pervious ratio(Ap) = 1.0000  Max loss rate(Fp)=     0.250(In/Hr)
Max Catchment Loss (Fm) =     0.250(In/Hr)
The area added to the existing stream with this TC
does not add flow per Para 6b, Page D-15 of the OCHM,
therefore the upstream flow rate of Q =     56.710(CFS) is being used
Time of concentration =    14.01 min.
Rainfall intensity =      2.693(In/Hr) for a    25.0 year storm
Effective runoff coefficient used for area,(total area with modified
rational method)(Q=KCIA) is C = 0.851
Subarea runoff =      0.000(CFS) for    0.790(Ac.)
Total runoff =     56.710(CFS)       Total area =       24.59(Ac.)
Area averaged Fm value =    0.146(In/Hr)
End of computations, total study area =           27.40 (Ac.)
The following figures may
be used for a unit hydrograph study of the same area.
Note: These figures do not consider reduced effective area
effects caused by confluences in the rational equation.

Area averaged pervious area fraction(Ap) = 0.581
Area averaged SCS curve number (AMC 2) =  70.6

Area-averaged catchment yield fraction, Y =  0.030
Area-averaged low loss fraction, Yb =  0.970
++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
User entry of time of concentration  =   0.634 (hours)
Watershed area =      27.39(Ac.)
Catchment Lag time =   0.507 hours
Unit interval =   5.000 minutes
Unit interval percentage of lag time = 16.4301
Hydrograph baseflow =     0.00(CFS)
Average maximum watershed loss rate(Fm) =  0.250(In/Hr)
Average low loss rate fraction (Yb) = 0.970 (decimal)
FOOTHILL S-Graph Selected
Computed peak 5-minute rainfall =  0.190(In)
Computed peak 30-minute rainfall =  0.400(In)
Specified peak 1-hour rainfall =  0.530(In)
Computed peak 3-hour rainfall =  0.890(In)
Specified peak 6-hour rainfall =  1.220(In)
Specified peak 24-hour rainfall =  2.050(In)

Rainfall depth area reduction factors:
Using a total area of      27.39(Ac.) (Ref: fig. E-4)

5-minute factor = 0.999     Adjusted rainfall =  0.190(In)
30-minute factor = 0.999    Adjusted rainfall =  0.399(In)
```

```
1-hour factor = 0.999       Adjusted rainfall =  0.529(In)
3-hour factor = 1.000       Adjusted rainfall =  0.890(In)
6-hour factor = 1.000       Adjusted rainfall =  1.220(In)
24-hour factor = 1.000 Adjusted rainfall =  2.050(In)
```

**** CONFLUENCE OF MINOR STREAMS ****
____________________________________________________________________________
Along Main Stream number: 1 in normal stream number 2
Stream flow area =     11.770(Ac.)
Runoff from this stream =      9.741(CFS)
Time of concentration =   16.29 min.
Rainfall intensity =     1.149(In/Hr)
Area averaged loss rate (Fm) =    0.2298(In/Hr)
Area averaged Pervious ratio (Ap) = 1.0000
Summary of stream data:

Stream  Area  Flow rate      TC     Fm       Rainfall Intensity
 No.    (Ac.)   (CFS)       (min) (In/Hr)     (In/Hr)

1      7.83     7.089     13.95    0.250      1.256
2     11.77     9.741     16.29    0.230      1.149
Qmax(1) =
          1.000 *    1.000 *     7.089) +
          1.116 *    0.857 *     9.741) + =      16.403
Qmax(2) =
          0.894 *    1.000 *     7.089) +
          1.000 *    1.000 *     9.741) + =      16.078

Total of 2 streams to confluence:
Flow rates before confluence point:
       7.089       9.741
Maximum flow rates at confluence using above data:
       16.403       16.078
Area of streams before confluence:
        7.830       11.770
Effective area values after confluence:
       17.914       19.600
Results of confluence:
Total flow rate =     16.403(CFS)
Time of concentration =    13.953 min.
Effective stream area after confluence =     17.914(Ac.)
Study area average Pervious fraction(Ap) =  1.000
Study area average soil loss rate(Fm) =    0.238(In/Hr)
Study area total (this main stream) =      19.60(Ac.)
End of computations, total study area =           19.60 (Ac.)
The following figures may
be used for a unit hydrograph study of the same area.
Note: These figures do not consider reduced effective area
effects caused by confluences in the rational equation.

Area averaged pervious area fraction(Ap) = 1.000
Area averaged SCS curve number (AMC 2) =  80.2

**** CONFLUENCE OF MINOR STREAMS ****
____________________________________________________________________________
Along Main Stream number: 1 in normal stream number 2
Stream flow area =     11.770(Ac.)
Runoff from this stream =     15.304(CFS)
Time of concentration =   15.70 min.
Rainfall intensity =     1.675(In/Hr)
Area averaged loss rate (Fm) =    0.2298(In/Hr)
Area averaged Pervious ratio (Ap) = 1.0000
Summary of stream data:

Stream  Area  Flow rate      TC     Fm       Rainfall Intensity
 No.    (Ac.)   (CFS)       (min) (In/Hr)     (In/Hr)

1      7.83    11.150     13.38    0.250      1.832
2     11.77    15.304     15.70    0.230      1.675
Qmax(1) =
          1.000 *    1.000 *    11.150) +
          1.109 *    0.852 *    15.304) + =      25.613
Qmax(2) =
          0.900 *    1.000 *    11.150) +
          1.000 *    1.000 *    15.304) + =      25.343

Total of 2 streams to confluence:
Flow rates before confluence point:
      11.150      15.304
Maximum flow rates at confluence using above data:
       25.613       25.343
Area of streams before confluence:
        7.830       11.770
Effective area values after confluence:
       17.859       19.600
Results of confluence:
Total flow rate =     25.613(CFS)
Time of concentration =    13.377 min.
Effective stream area after confluence =     17.859(Ac.)
Study area average Pervious fraction(Ap) =  1.000
Study area average soil loss rate(Fm) =    0.238(In/Hr)
Study area total (this main stream) =      19.60(Ac.)
End of computations, total study area =           19.60 (Ac.)
The following figures may
be used for a unit hydrograph study of the same area.
Note: These figures do not consider reduced effective area
effects caused by confluences in the rational equation.

Area averaged pervious area fraction(Ap) = 1.000
Area averaged SCS curve number (AMC 2) =  80.2

________________________________________________________________________
Along Main Stream number: 1 in normal stream number 2
Stream flow area =     11.770(Ac.)
Runoff from this stream =     32.725(CFS)
Time of concentration =   14.83 min.
Rainfall intensity =     3.319(In/Hr)
Area averaged loss rate (Fm) =    0.2298(In/Hr)
Area averaged Pervious ratio (Ap) = 1.0000
Summary of stream data:

Stream  Area  Flow rate      TC     Fm       Rainfall Intensity
 No.    (Ac.)   (CFS)       (min) (In/Hr)     (In/Hr)

1      7.83    24.018     12.51    0.250      3.658
2     11.77    32.725     14.83    0.230      3.319
Qmax(1) =
          1.000 *    1.000 *    24.018) +
          1.110 *    0.844 *    32.725) + =      54.664
Qmax(2) =
          0.900 *    1.000 *    24.018) +
          1.000 *    1.000 *    32.725) + =      54.353

Total of 2 streams to confluence:
Flow rates before confluence point:
      24.018      32.725
Maximum flow rates at confluence using above data:
       54.664       54.353
Area of streams before confluence:
        7.830       11.770
Effective area values after confluence:
       17.762       19.600
Results of confluence:
Total flow rate =     54.664(CFS)
Time of concentration =    12.510 min.
Effective stream area after confluence =     17.762(Ac.)
Study area average Pervious fraction(Ap) =  1.000
Study area average soil loss rate(Fm) =    0.238(In/Hr)
Study area total (this main stream) =      19.60(Ac.)
End of computations, total study area =           19.60 (Ac.)
The following figures may
be used for a unit hydrograph study of the same area.
Note: These figures do not consider reduced effective area
effects caused by confluences in the rational equation.

Area averaged pervious area fraction(Ap) = 1.000
Area averaged SCS curve number (AMC 2) =  80.2

**** CONFLUENCE OF MAIN STREAMS ****
________________________________________________________________________
The following data inside Main Stream is listed:
In Main Stream number: 3
Stream flow area =     46.950(Ac.)
Runoff from this stream =     38.492(CFS)
Time of concentration =   17.88 min.
Rainfall intensity =     1.089(In/Hr)
Area averaged loss rate (Fm) =    0.2296(In/Hr)
Area averaged Pervious ratio (Ap) = 0.9184
Summary of stream data:

Stream  Area  Flow rate      TC     Fm       Rainfall Intensity
 No.    (Ac.)   (CFS)       (min) (In/Hr)     (In/Hr)

1     48.84    23.054     32.30    0.251      0.776
2     25.23    17.441     20.12    0.250      1.018
3     46.95    38.492     17.88    0.230      1.089
```

```
Qmax(1) =
          1.000 *    1.000 *    23.054) +
          0.685 *    1.000 *    17.441) +
          0.635 *    1.000 *    38.492) + =      59.452
Qmax(2) =
          1.462 *    0.623 *    23.054) +
          1.000 *    1.000 *    17.441) +
          0.917 *    1.000 *    38.492) + =      73.737
Qmax(3) =
          1.598 *    0.554 *    23.054) +
          1.093 *    0.889 *    17.441) +
          1.000 *    1.000 *    38.492) + =      75.826

Total of 3 main streams to confluence:
Flow rates before confluence point:
      24.054      18.441      39.492
Maximum flow rates at confluence using above data:
       59.452       73.737       75.826
Area of streams before confluence:
       48.840       25.230       46.950
Effective area values after confluence:
      121.020      102.602       96.418

Results of confluence:
Total flow rate =     75.826(CFS)
Time of concentration =    17.881 min.
Effective stream area after confluence  =     96.418(Ac.)
Study area average Pervious fraction(Ap) =  0.968
Study area average soil loss rate(Fm) =    0.243(In/Hr)
Study area total =     121.02(Ac.)
End of computations, total study area =          121.02 (Ac.)
The following figures may
be used for a unit hydrograph study of the same area.
Note: These figures do not consider reduced effective area
effects caused by confluences in the rational equation.

Area averaged pervious area fraction(Ap) = 0.968
Area averaged SCS curve number (AMC 2) =  78.3

**** INITIAL AREA EVALUATION ****
__________________________________________________________________________
UNDEVELOPED (average cover) subarea
Decimal fraction soil group A = 0.000
Decimal fraction soil group B = 0.000
Decimal fraction soil group C = 1.000
Decimal fraction soil group D = 0.000
SCS curve number for soil(AMC 2)  = 79.00
Pervious ratio(Ap) = 1.0000  Max loss rate(Fp)=     0.250(In/Hr)
Max Catchment Loss (Fm) =     0.250(In/Hr)
Initial subarea data:
Initial area flow distance =   298.000(Ft.)
Top (of initial area) elevation =   383.000(Ft.)
Bottom (of initial area) elevation =   324.000(Ft.)
Difference in elevation =    59.000(Ft.)
Slope =    0.19799  s(%)=      19.80
TC = k(0.706)*[(length^3)/(elevation change)]^0.2
Initial area time of concentration =    9.532 min.
Rainfall intensity =      2.217(In/Hr) for a     5.0 year storm
Effective runoff coefficient used for area (Q=KCIA) is C = 0.798
Subarea runoff =      1.965(CFS)
Total initial stream area =        1.110(Ac.)
