In some applications it is useful to protect the feed through connection with a separate fuse. Fuse terminal blocks are made up of one terminal block bottom section with a fuse insertion carrier. The fuses vary from pivoting fuse levers and pluggable fuse holders to screwable closures and flat plug-in fuses.

AGC

1/4" x 1-1/4" Fast-acting glass tube fuses

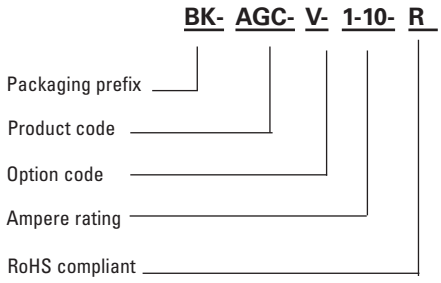
RoHS

Product features

- Fast-acting
- Optional axial leads available
- 1/4" x 1-1/4" (6.3 mm x 32 mm) physical size
- Glass tube, nickel-plated brass end cap construction
- UL Listed product meets standard 248-14

Applications

Primary circuit protection



- Power supplies
- Battery chargers
- Monitors
- Consumer electronics
- Test equipment

Agency information

- UL Listed card: File E19180, Guide JDYX (AGC 1/10 A - 10 A)
- UL Recognition card: File E19180, Guide JDYX2 (AGC 11 A - 40 A)
- CSA Component acceptance card (Class No. 1422-30)
- CSA Certification acceptance card (Class No. 1422–01)

Ordering code

The ordering code is the part number replacing the "/" with a "-" plus adding the packaging prefix and option code.

Packaging prefix

- Blank (5 ferrule/cartridge parts in a 5 inch tin, 4 axial lead parts in a 5 inch tin)
- BK- (100 parts packed into a cardboard carton with flaps folded)

Option code

- -B- (Board washable - Hermetically sealed to withstand aqueous cleaning)
- -V- (Axial leads - copper tinned wire with nickel-plated brass end caps)

Product image

To feed through power, signal, and data is the classical requirement in electrical engineering and panel building. The insulating material, the connection system and the design of the terminal blocks are the differentiating features. A feed-through terminal block is suitable for joining and/or connecting one or more conductors. They could have one or more connection levels that are on the same potential or insulated against one another.

AC Outlet

DIN-Rail Mountable Receptacles

DIN-rail receptacles, 5A, 15A and 20A power outlets, provide a convenient power source for portable computers or test devices for in-the-panel troubleshooting. They mount on standard 35mm DIN-rail. The terminations accept slotted or Phillips screwdrivers. The mounting foot includes a latching lock - slide it open, mount the module on the DIN-rail and slide the lock closed.

- Easily snaps onto 35mm DIN-rail
- Panel mountable, model dependent
- 5A, 15A or 20A versions
- Easy to wire
- Available with ground fault current interrupt (GFCI) or standard outlets
- Optional power-on indication with GFCI*
- NEMA rated enclosure with UL94 VO flammability rating
- UL508A, cULus, and cURus and CSA* approved
- Latching mounting foot makes installation and removal from DIN-rail easy

*Applies to part number 6720005430

Dead Front Fuse Holders

LPSC Series POWR-SAFE Fuse Holders

600 V

Description

The POWR-SAFE LPSC series dead front fuse holders feature touch-safe protection for personnel when installing and removing fuses. These fuse holders are intended to house Class CC fuses. They are available in 1-, 2-, 3-, and 4-pole configurations and are offered in indicating and non-indicating options. The LPSC series is DIN rail mountable and easily installed and removed with no additional fuse pullers or tools. They are UL Listed for branch circuit protection. The indicating fuse holders show blown fuse indication above 80 V.

Features & Benefits

FEATURES	BENEFITS
Meets dead front requirements	Maximum safety for personnel
35 mm DIN rail mountable	Easy installation in various settings
Compact design	Ultimate flexibility, space-saving
Easy removal	No fuse pullers or additional tools required
Ventilated design	Cooler operation

Applications

- For use with Class CC fuses

Class CC Fuses
KLDR Series

600 V ac • 300 V dc • Time-Delay • 1/10–30 A

Description

KLDR Series time-delay fuses are designed to protect control transformers, solenoids, and similar inductive components with high-magnetizing currents during the first half-cycle. These small-sized fuses provide excellent protection of motor branch circuits containing IEC or NEMA-rated motor controllers or contactors. The KLDR Series fuses closely match most control power transformer characteristics, which permits them to be sized in accordance with the latest revisions of UL 508 (Industrial Control) and UL 845 (Motor Control Centers).

Features & Benefits

FEATURES	BENEFITS
Current-limiting	Reduces damage caused by heating and magnetic effects of short-circuit currents
Short-circuit protection	Improves safety with faster response times to fault currents
Rejection capability	Prevents use of fuses with lower interrupting ratings or voltage when used with corresponding fuse holders
Time-delay	Allows for a temporary current surge for a short period of time without blowing

Applications

- Transformer and solenoid protection

Specifications

Voltage Rating	Ac: 600 V Dc: 300 V
Amperage Range	1/10 – 30 A
Interrupting Ratings	Ac: 200,000 A rms symmetrical Dc: 20,000 A self-certified
Material	Body: Melamine Caps: Nickel-plated Bronze
Fuse Weight	.019 lb (8.62g)
Applicable Standards	UL 248-4, Class CC
Environmental	RoHS Compliant
Country of Origin	Mexico

DRAFT

Type T and Type TF

Type T transformers are designed with low impedance windings for excellent voltage regulation and can accommodate the high inrush current associated with contactors, starters, solenoids, and relays. Type T transformers are manufactured using the most advanced insulating materials and are the best choice if size and cost are of concern.

Type TF transformers include factory-installed primary and secondary fuse blocks. Type TF transformers consist of two primary fuse blocks and one secondary fuse block. The primary includes rejection-style clips to increase the AIC ratings for the fuses. Since the fuse blocks are mounted on the top of the transformer, Type TF transformers are interchangeable with Type T transformers except for their increased height.

Selection Guide

1. Determine the inrush and sealed VA of each coil in the control circuit and the VA of all other components.
2. Total the **sealed** VA of all operating coils and the VA of all other loads. (This determines the minimum VA size required for the circuit.)
3. Total the **inrush** VA of all coils that are starting at the same time and all loads and coils that are running.
4. Locate a value in the VA column of Table 14.23 Regulation Chart for Type T, page 14-14, shown below, that is **equal to** or **greater than** the value calculated in step 2.
5. In the VA row selected in step 4, find the inrush value under the appropriate voltage regulation column of Table 14.23 Regulation Chart for Type T, page 14-14, shown below. If this value is **greater than** the calculated value from step 3, this is the correct transformer VA rating.

   If the inrush value on the selected VA row is **not greater than** the calculated value from step 3, use the next higher transformer VA rating, that is, the rating on the next row.

If your supply voltage is stable and fluctuates less than 5%, Schneider Electric recommends you use the 90% secondary voltage column. If your supply voltage is not stable and fluctuates more than 10% we recommend you use the 95% secondary voltage column. We recommend that you never use the 85% secondary voltage column since magnetic devices lose life expectancy if they are continuously started at 85% of rated voltage.

Table 14.23: Regulation Chart for Type T

VA	Inrush VA @ 20% power factor			Inrush VA @ 40% power factor

Field Installed Fuse Blocks—Design for Line to Line Primary Voltages and Line to Neutral Secondary Voltages

Table 14.31: Accessories

Catalog No.	Voltage Codes			Description	Order Qty
Fuse Kit					
—	D1, D2, D3, D4, D5, D13, D14,D15, D23, D31, D33, D37	D20, D32	D19, D50	—	—
9070FB3A	T25–T200	T25–T150	—	3-pole fuse block for primary and secondary fusing, accommodates 1-1/2 x 13/32 in. midget fuse (2 rejection and 1 non-rejection)	1
9070FB3B	T250–T3000	T250–T2000	T25–T2000		1
9070FB2A	T25–T200	T25–T150	—	2-pole fuse block for primary fusing, accommodates 1-1/2 x 13/32 in. midget fuse (2 rejection)	1
9070FB2B	T250–T3000	T250–T2000	T25–T2000		1
9070SF25A	T25–T200	T25–T150	—	Secondary fuse clips accommodates 1-1/4 x 1/4 in. fuse	10
9070SF25B	T250–T3000	T250–T2000	T25–T2000		10
9070SF41A	T25–T200	T25–T150	—	Secondary fuse clips accommodates 1-1/2 x 13/32 in. fuse	10
9070SF41B	T250–T3000	T250–T2000	T25–T2000		10
9070FB1A	T25–T200	T25–T150	—	Secondary fuse block accommodates 1-1/4 x 1/4 in. fuse	1
9070FB1B	T250–T3000	T250–T2000	T25–T2000		1
9070FP1	—	—	—	Fuse puller for TF and FB kits	10

[2] TF designed for line to line primary and line to neutral secondary. If secondary connected in series, fuse block should be disconnected.

Table 44 - Fuse Puller—For ease in installing fuses and finger protection, used with fuse blocks with 1-1/2 in. x 13/32 in. fuses

Class	Type	VA Accessory Key			Description
		I	II	III	
9070	FP-1	ALL	ALL	ALL	Fuse puller kit complies with IP00 per EN-60529, 3 pullers per kit.

NOTE: Final IP rating is determined by the enclosure where the transformer is used.

DRAFT

14. Kits must be ordered separately. Also supplied in bulk packages of 100 individual covers. Add “B” to Type number if ordering bulk (available only on FSC-1B and FSC-2B).

Supplemental Fuses
FLM Series

Item 15e

250 V ac • 10x38 (Midget) • Time-Delay • 1/10–30 A

Description

The FLM series 250 V fuses are designed to protect control circuit transformers, solenoids, and other circuits with high in-rush currents. They are also excellent for supplemental protection of small motors. The time-delay design can carry an overload several times the normal load for a short period of time without blowing. The FLM fuses are non-indicating and may be used with an indicating fuse block to identify a blown fuse.

Features & Benefits

FEATURES	BENEFITS
10x38 mm size	Common dimensions used in a variety of applications
Time-delay	Allows for temporary current surge for a short period of time without blowing
Paper body	Cost effective materials provide a lower cost alternative for supplemental circuit protection
POWR-GARD® technology	Ensures quality backup overcurrent protection

Applications

- Control circuit transformers
- Solenoids
- Circuits with high in-rush currents
- Small motors

UL489 / CSA C22.2 No 5 / IEC/EN 60947-2 / GB14048-2
Miniature Circuit Breakers

Multi9 C60BP and C60BPR Miniature Circuit Breakers

C60BP and C60BPR are multi-standard miniature circuit breakers and branch circuit protection as defined by UL489. They combine the following functions:

- circuit protection against short-circuit curves
- circuit protection against overload currents
- tripping and fault indication by the addition of auxiliary accessories

9421 Type L
Circuit Breaker Operating Mechanism

Type L Circuit Breaker Mechanisms

Type L door-mounted, variable depth operating mechanisms feature heavy duty, all metal construction with trip indication. All mechanisms can be padlocked in the Off position when the enclosure door is open. Further, the handle assemblies can be locked Off with up to three padlocks, which also locks the enclosure when the door is closed. (The 3 in. handle accepts one padlock.) Complete kits are rated for NEMA 1, 3R, and 12 enclosures. They include a handle assembly, operating mechanism, and shaft assembly.

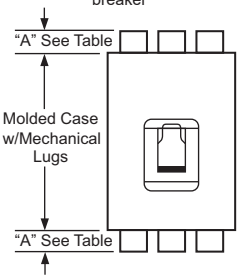
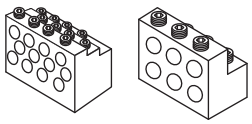
Description	B-Frame	H- and J-Frame	D- and L-Frame	D- and L-Frame
1 Auxiliary Switch 1a 1b	LV26950	S29450	S29450	S29450
2 Auxiliary Switch 2a 2b	—	2 x S29450	2 x S29450	2 x S29450
3 Auxiliary Switch 3a 3b	—	—	3 x S29450	3 x S29450



NOTE: The location of the accessory in the circuit breaker determines its function.



[1] Mounting depth measured in inches from circuit breaker mounting surface (control panel) to outside of enclosure door.
[2] These circuit breaker operating mechanisms must use the 9421LHP•• or LCP•• handles only.
[3] Type LW1 and LW4 include an 8 in. handle (9421LHP8) rather than a 6 in. handle.
[4] For a red handle and yellow bezel, add suffix RY to catalog number, e.g., 9421LH6RY.
[5] 3 in. handles are not recommended for use with these circuit breakers.

Crimp lugs or PDC connectors extension "A" past end of circuit breaker

Power Distribution Connectors

Power distribution connectors (PDCs) can be used for multiple load wire connections on one circuit breaker in place of standard distribution block to save space and time.

The connectors are attached to circuit breaker terminals equipped with separately provided terminal nut connectors.*[29]*

Applications:

- For use on load end of circuit breaker only
- For use in UL 508 Industrial Control applications
- For use in UL 1995/CSA C22.2 No. 236 heating and cooling equipment
- For copper wire only

DRAFT

[29] Refer to Table xxxxxx: Terminal Shields and Phase Barriers
[30] Not for use with I-Line™ circuit breakers.
[31] Special Purpose—Not for General Use. Use on ON end of the circuit breaker only when ON end is used as Load end. Use on OFF end of the circuit breaker only when OFF end is used as Load end.
[32] Kit includes long terminal shield and cover, which adds 1.65 inches to standard lug with short terminal shield.

SDSA1175

SDSA 3-Phase

SDSA1175 and SDSA 3-Phase Surge Protective Devices

Surgelogic™ SDSA1175 surge protective devices are designed and listed for indoor or outdoor installation and surge suppression for single-phase three-wire 120/240 Vac or two-wire 120 Vac 60 Hz electrical services. This product is ideal for panel builders as well as manufacturers and integrators of instrumentation cabinets for industrial and commercial applications for single-phase power systems. Two SDSA1175 surge protection devices can be installed to provide suppression for 208Y/120 Vac three-phase four-wire services.

Surgelogic™ SDSA 3-Phase surge protective devices are designed and listed for indoor or outdoor installation and surge suppression for three-phase electrical services up to 600 Vac. The SDSA 3-Phase series is used extensively in service entrance panels to provide an efficient and economical means of surge suppression and also ideal for point of use applications for that added level of protection.

US and Canadian UL® Listed as Type 1 SPD to the UL 1449 standard. Complies with requirements of NEC® Article 285, CSA 233.1-87, and CSA C22.2 No. 8-M1986 as appropriate.

- LED indicates operational status
- Short circuit current rating 25 kA (SDSA1175), 200 kA (SDSA 3-Phase)
- Suitable for indoor and outdoor applications (NEMA Type 4X rated)
- Convenient back-nipple mounting
- Optional mounting bracket QOSAMK (for SDSA1175/SDSA1175T)

Application Information

Voltage Rating-Class B and C–600 V

Blocks are rated based on NEC Table 310-16 using 167 °F (75 °C) wire

Aluminum blocks are tin-plated high conductive aluminum. Copper blocks are tin-plated high conductive copper.

Housing material:

- Miniature Blocks are made from high impact thermoplastic rated at 257 °F (125 °C) max. and –40 °F (–40 °C) min.
- Full Size Blocks are made from general purpose phenolic rated at 302 °F (150 °C) max. and –40 °F (-40 °C) min.

All blocks have a flammability rating of UL 94V-0.

For the short-circuit current ratings and dimensions, see catalog **9080CT9603**.

[1] Lugs suitable for use with 75 °C (167 °F) conductors.
[2] Aluminum blocks will accept either aluminum or copper conductors.
[3] Copper blocks will accept copper conductors only.
[4] These covers must be ordered in multiples of 5. Each cover comes with two self-tapping screws.
[5] Will not work on a 9080LBA362106 block.

Push-To-Test Pilot Light

Remote Test Pilot Light

NOTE: To select and order Contact Blocks, Light Modules, Knobs, and Accessories, see Type KA Contact Blocks, page 19-90 through Hermetically Sealed Power Reed Contact Blocks, page 19-92.

NOTE: For use in hazardous locations—See Square D Offering According to Class, Division, and Group, page 19-92. Contact blocks and legend plate not included unless otherwise noted.

DRAFT

[105] When ordering, add prefix 9001 to the catalog number.
[106] ▲ Add the voltage assembly code as chosen from Standard and Shallow Depth Light Modules, page 19-91.**EXAMPLE: SKT•••R31 with 208 Vac red LED voltage = SKT37LRR31.**
[107] ■ Add the color code as chosen from the color cap table below.**EXAMPLE: SKP1 with a blue fresnel cap = SKP1L31.**
[108] The cap must be the same color as the LED light module chosen, e.g., for a green LED, use a green color cap.
[109] On neon light modules, use clear color caps only.
[110] Use only full voltage or resistor voltage assembly codes on remote test pilot lights. Do not choose LED, neon or transformer codes. For AC use only.
[111] Use only full voltage or resistor voltage assembly codes on remote test pilot lights. Do not choose LED (exception — these LED codes are allowed: 38LG, 38LL, 38LR, 38LW, 38LY), neon or transformer codes. For AC use only.
[112] Add the color code as chosen from the color cap table below.**EXAMPLE: SKP1 with a blue fresnel cap = SKP1L31.**

CE marked

[121] For use with all operators except KX and remote test pilot.
[122] For use in hazardous locations—See Square D Offering According to Class, Division, and Group, page 19-92.
[123] With LED light modules, use either a clear color cap or a cap the same color as the LED.
[124] With neon type light modules, use a **clear** color cap only.
[125] When ordering, add prefix 9001 to the catalog number.
[126] Not for use on KX operators.
[127] Reduces the depth of illuminated push buttons with contact blocks by over 33%.

NOTE: To select and order Contact Blocks, Light Modules, Knobs, and Accessories, see Type KA Contact Blocks, page 19-62 through Hermetically Sealed Power Reed Contact Blocks, page 19-64.

[57] When ordering, add prefix 9001 to the catalog number.
[58] These operators can be ordered complete with contact blocks. For maximum block usage, see "H" Codes, page 19-65. Add the chosen "H" number to the end of the operator.
[59] On neon light modules, use clear knobs only.
[60] ▲ See Table 19.147 Color Codes, page 19-56 and insert the color code in the Type number. **Example: SKR9( ) with a yellow knob = SKR9Y**
[61] To obtain a red knob with "Push Emergency Stop" printed on the red knob—substitute "R05" in place of "R"
[62] ♦ Add the voltage assembly code as chosen from Standard and Shallow Depth Light Modules, page 19-63. **Example: SKR8P♦ with 277 V 50–60 Hz = SKR8P8**
[63] For positions, refer to Table 19.148 Positions for 9001SKR8RH1 or H13, page 19-56 and Table 19.149 Positions for 9001SKR8H25, page 19-56.
[64] The knob must be the same color as the LED light module chosen, for example, for a green LED, use a green knob.
[65] These colors are not available on illuminated push-pull operators.

DRAFT

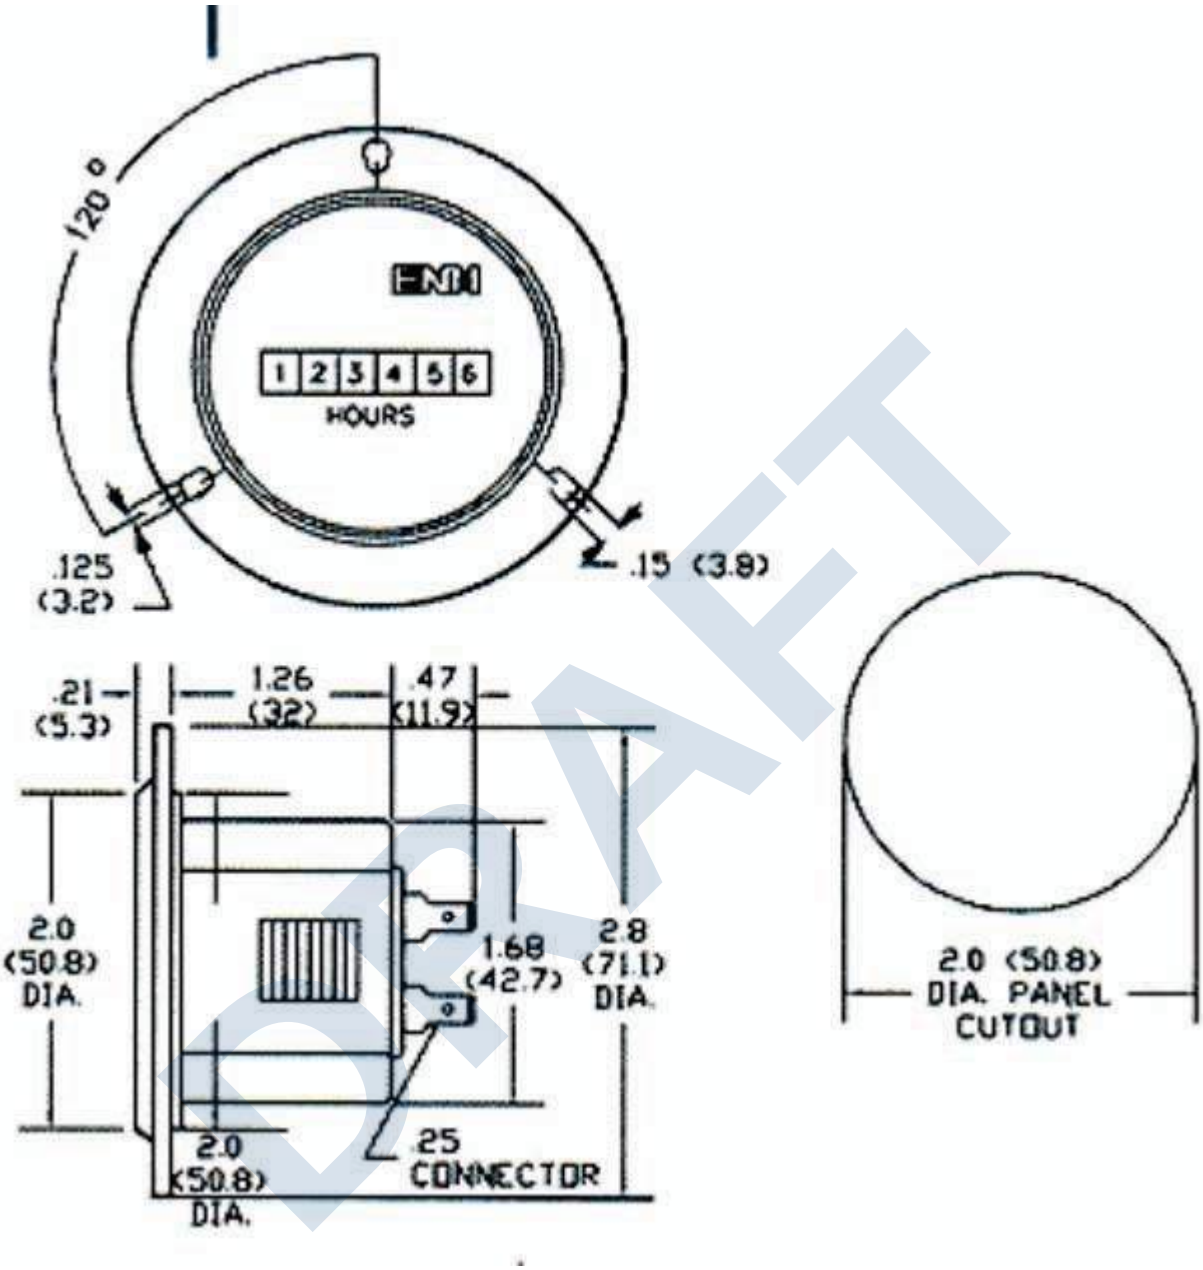
Item 32

Item # T50B212 with NEMA 4x12 Gasket

with NEMA 4x12 Gasket

ENM's series T50 AC hour meter in a large 3-hole flange. Includes NEMA 4X. 12 rated panel gasket for water and corrosion resistant panel mounting (see accessories). A quartz crystal time base insures accurate time keeping. This model is also frequency insensitive.



DRAFT

Specifications

Series	T50
Display	6-Digit
Voltage	115 V AC
Reset	None
Size	1.68W x 1.68H x 1.26D Inch
Face Dia - Flange	2.8 Inch
Face Dia - Cutout	2 Inch
Weight	2 oz.
Mounting Style	3-Hole Panel
Power	Less than 0.4 W

Item T50B212, with NEMA 4x12 Gasket

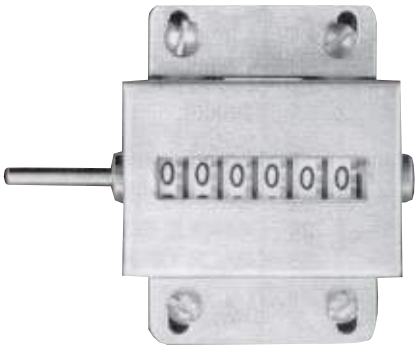
Dimensional Drawing

DRAFT

Standard Mounting Types

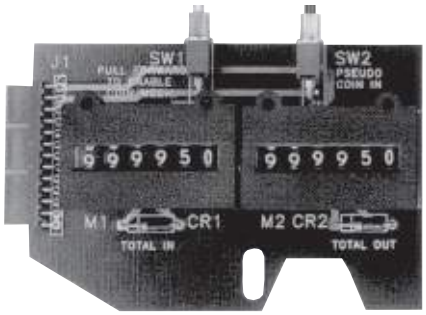
[illegible]L

Panel Mounting is obtained by cutting a circular or rectangular cut-out in the desired panel and the instrument is inserted with the flange resting on the top of the panel. The instrument is held in place by compressing a plastic or steel spring clip from behind the panel. This type of mounting is very popular because it requires no additional fasteners. Models are also considered panel mounted when they are inserted into a panel cut-out and mounted from the front using a two or more hole flange and fastened with screws from the front of the panel (pictured to the right).



[illegible] [illegible] [illegible]L

Back of panel mounting is usually achieved by cutting an opening in a thin panel large enough to read the display. Two or more holes are drilled in the panel and screws are inserted from the front to secure the instrument against the back of the panel wall.



[illegible]

Base mounting is usually a free standing mount and connections are made with a two or more hole flange at the bottom of the unit. This is a standard mount for most mechanical counters and is sometimes used for hour meters when a panel is not available.

[illegible]

PC board mounting is common for using counters in add-on PCB modules to electronic machinery. This type of mounting eliminates the need for any wires and multiple counters can be assembled as one unit. The counters are attached by soldering the protruding pins into the PCB and two or more fasteners are also screwed into the bottom of the unit for additional support onto the PC board.

[illegible]

Rear mounting is similar to PCB mounting except there are no pins for soldering, only two or more holes on the bottom for threaded or self-tapping screws. This is an optional type of mounting used mainly when a suitable panel is not available.

Monitoring Relays
1-Phase True RMS AC Over or Under Current
Type DIB01 100A

CARLO GAVAZZI

- **TRMS AC over or under current monitoring relay**
- **Current measuring through built-in current transformer**
- **Selection of measuring range by DIP-switches**
- **Measuring ranges from 2 A to 100 A AC**
- **Adjustable current on relative scale**
- **Adjustable hysteresis on relative scale**
- **Adjustable delay function (0.1 to 30 s)**
- **Programmable latching or inhibit at set level**
- **Output: 8 A SPDT relay N.D. or N.E. selectable**
- **For mounting on DIN-rail in accordance with DIN/EN 50 022**
- **22.5 mm Euronorm housing**
- **LED indication for relay, alarm and power supply ON**
- **Galvanically separated power supply**

Product Description

DIB01 is a precise TRMS AC over or under current (selectable by DIP-switch) monitoring relay.
Owing to the built-in latch function, the ON-position of the relay output can be maintained. Inhibit function can be used to avoid relay operation when not desired (maintenance, transitions).
The LED's indicate the state of the alarm and the output relay. Through the built-in current transformer it is possible to monitor loads up to 100 A AC.

Emissions	According to EN 60255-26 According to EN 61000-6-3

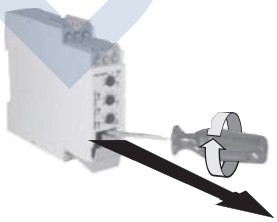
Mode of Operation

DIB01 monitors AC over or under current through an internal current transformer.

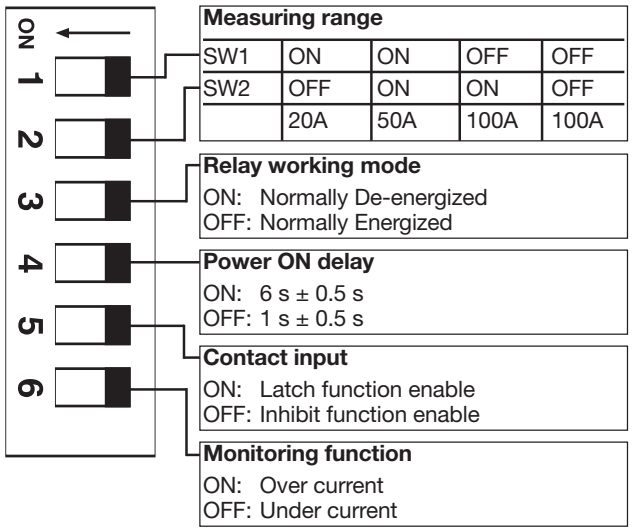
Example 1
(connection between terminals A1, Y1 - latching function enabled - Relay ND)
The relay operates and latches in operating position when the measured value exceeds (or drops below) the set level for more than the set delay time. Provided that the current has dropped below (or has exceeded) the set point (see hysteresis setting), the relay releases when the interconnection between terminals A1, Y1 is interrupted or the power supply is interrupted as well. The red LED flashes until the delay time has expired.

Example 2
(no connection between terminals A1, Y1 - latch function disabled - Relay ND)
The relay operates when the measured value exceeds (or drops below) the set level for more than the set delay time. It releases when the current drops below (or exceeds) the set level (see hysteresis setting) or when power supply is interrupted.

Note
When the inhibit contact is opened, if the input signal is already in alarm position, the delay time needs to elapse before relay activation.



Function/Range/Level and Time Delay Setting



Adjust the input range setting DIP switches 1 and 2 as shown below.
Select the desired function setting DIP switches 3 to 6 as shown below.
To access the DIP switches open the grey plastic cover as shown below.
Selection of level and time delay:

Upper knob:
Setting of hysteresis on relative scale: 0 to 30% on set value.

Centre knob:
Current level setting on relative scale: 10 to 110% on full scale.

Lower knob:
Setting of delay on alarm time on absolute scale (0.1 to 30 s).

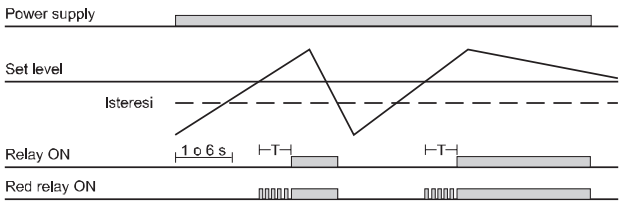
Measuring range

SW1	ON	ON	OFF	OFF
SW2	OFF	ON	ON	OFF
	20A	50A	100A	100A

Relay working mode
ON: Normally De-energized
OFF: Normally Energized

Power ON delay
ON: 6 s ± 0.5 s
OFF: 1 s ± 0.5 s

Contact input
ON: Latch function enable
OFF: Inhibit function enable



Monitoring function
ON: Over current
OFF: Under current

Item 34

REPORT

7L Series
LED Panel Light

Design by MINELLI | FOSSATI

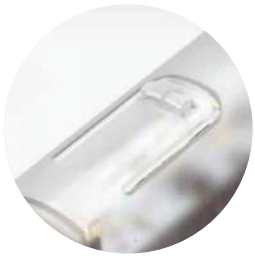
Connector
Type 07L.11
included in
the packaging

LED light for electrical panels - with magnetic mount

- **"Two in One" mount - direct magnetic mount or through a screw-mounted metallic bracket**
- **Brightness levels: 600 or 1200 lumens**
- **Versions with: 1 - direct switching**
  2 - motion detector
  3 - ON/OFF switch
- Power supply - Multi-voltage: (12…48)V AC/DC and (110…240)V AC/DC
- Available with push-in terminals or plug-in terminals

Approvals

DRAFT



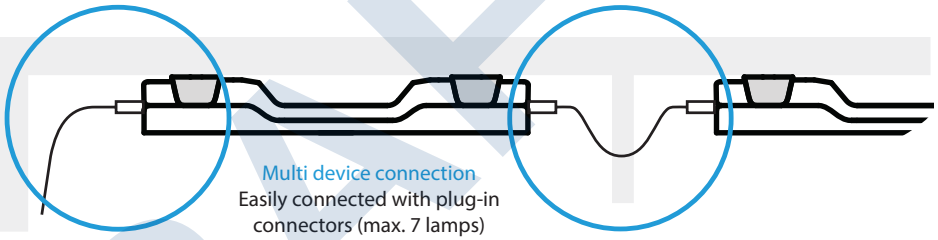
Type 7L.43 (600 lumens)
Type 7L.46 (1200 lumens)

- Direct magnetic mount or through a screw-mounted metallic bracket
- Power supply: (12…48)V AC/DC and (110…240)V AC/DC
- Nominal power consumption: 6 W (600 lm), 9 W (1200 lm)
- Radiation angle: 120°
- Colour temperature: 5,000 K
- Protection category: IP20

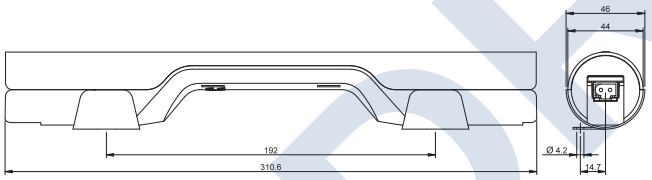
Direct switching

Switching via ON/OFF soft latch switch

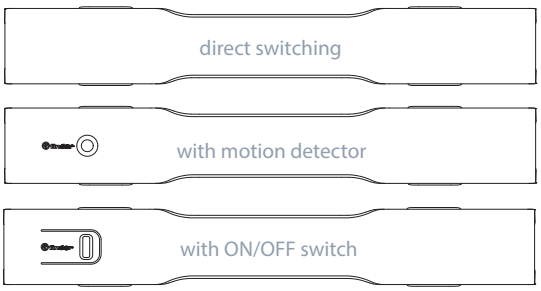
Switching via motion detector



Magnetic mount directly to metallic panel



Magnetic mount via screw-mounted metallic bracket



Quick and simple wiring system via **push-in connectors** for the connection to a single unit, or via **plug-in connectors** for the connection to a single or multiple units.

Multi device connection
Easily connected with plug-in connectors (max. 7 lamps)

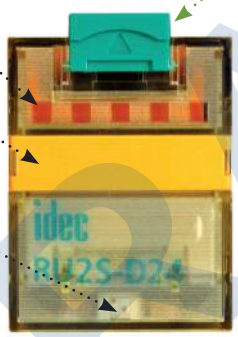
RU Series Universal Relays

Key features:

- Full featured universal miniature relays
- Designed with environment taken into consideration
- Two terminal styles: plug-in and PCB mount
- Non-polarized LED indicator
- No internal wires, lead-free construction
- Cadmium-free contacts
- Mechanical flag indicator
- Manual latching lever with color coding for AC or DC coil
- Snap-on yellow marking plate; optional marking plates are available in four other colors
- Maximum contact ratings: 10A (RU2), 6A (RU4), 3A (RU42)
- UL Recognized, CSA Certified, EN Compliant



EN61810-1

With Latching or Momentary Lever

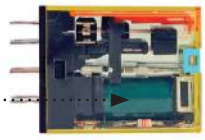
Mechanical Indicator*
The contact position can be confirmed through the five small windows.

Marking Plate
Standard yellow marking plate is easily replaced with optional marking plates in four colors for easy identification of relays.

LED Indicator*
Non-polarized green LED indicator is standard provision for plug-in terminal, latching lever types

Latching and Momentary Lever
Using the lever, operation can be checked without energizing the coil. The lever is color coded for AC and DC coils.

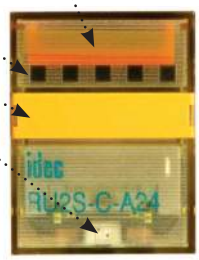
	Latching	Momentary
AC coil:	Orange	Red
DC coil:	Green	Blue



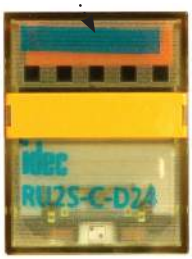
In Normal Operation

Note: Turn off the power to the relay coil when using the latching lever. After checking the operation, return the latching lever in the normal position.

Standard (without lever)



AC/DC Color Marking
For identification of AC or DC coils.
AC coil: Yellow
DC coil: Blue

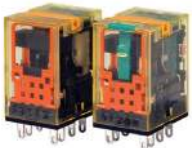


Mechanical Indicator*

Marking Plate

LED Indicator*
Non-polarized green LED indicator is standard provision for plug-in terminal types.

AC Coil



DC Coil

Coil Voltage	Tape Color
24V AC	White
100 to 110V AC	Clear
110 to 120V AC	Blue
200 to 220V AC	Black
220 to 240V AC	Red
24V DC	Green
6V DC	Voltage marking on yellow tape
12V DC	
48V DC	
110V DC	

*Not available on PCB type.

6mm and 14mm Slim Interface Relay

RV8 Series 6mm Width

Electromechanical Screw Terminal

Solid State Spring Clamp Terminal

PRODUCT DESCRIPTION

IDEC 6mm and 14mm interface relays provide a compact solution for general purpose relay requirements. Available in electromechanical and solid state models, the RV8 series Interface relays are ideal for PLC and electronic systems, industrial automation, panel builders, assembly machine applications and other applications that require a high switching capability in a compact space. The RV8 series interface relays can be used as interfaces between the controller and the actuator to switch small and medium size loads.

KEY FEATURES

- Class I, Division 2 and Class I, Zone 2 Hazardous Location options (electromechanical relays only)
- Solid State relay versions available (6mm only)
- Only 70mm in height from DIN rail
- Gold-plated contacts (electrical mechanical relays only)
- Pre-assembled relay and DIN mount socket
- Universal screw terminals (flat and phillips) or spring clamp terminals
- Universal AC/DC socket with built-in surge suppression and green LED
- 6A-16A contact rating (electromechanical relays only)
- Lever for easy locking and removal of relay
- Operating temperature of -40°C ~ +70°C (-20°C ~ +60°C for SSR)
- RoHS compliant

6mm and 14mm Slim Interface Relay

RV8 Series 14mm Width

Top View with Marking Plate

14mm wide

Electromechanical Screw Terminal

Electromechanical Spring Clamp Terminal

PRODUCT DESCRIPTION

14mm interface relays are ideal for panels with limited room, these low-profile relays provide up to a 40% reduction in DIN rail space when compared with standard plug-in relays. RV8 relays are good for higher load switching applications, panels with high I/O content and commercial HVAC panels. UL listed when paired with a corresponding socket.

LF SERIES CLASS T FUSE BLOCKS

300 V • 600 V

Description

The Littelfuse Class T fuse blocks offer many advantages such as space saving design, universal mounting holes, snap-to-release DIN rail mounts and available covers.

Features/Benefits

- Space-saving design
- Universal mounting holes for easy replacement
- One hand release from DIN rail for 30–60 A fuses
- Reinforced fuse clips are standard
- Covers available for most amperages to enhance safety

Specifications

Voltage Ratings	300 V/600 V
Ampere Ratings	0 – 600 A
Leakage Current	<0.6 mA at 600 V
Withstand Rating	200 kA RMS SYM
Flammability Rating	UL94 V-0
Approvals	UL Listed (File: E14721) CSA Certified (File: LR7316)
Environmental	RoHS Compliant, Lead (Pb) Free

Recommended Fuses

300 V JLLN
600 V JLLS

Class T Fuses
JLLS Series

600 V ac • Fast-Acting • 1–1200 A

Description

The JLLS series fast-acting fuses are the most compact fuses available in ratings above 30 amperes — less than one-third the size of comparable Class R fuses. The JLLS fuses are used for short-circuit protection of drives and surge-sensitive components. When rated in accordance with the NEC, these fuses provide fast-acting overload and short-circuit protection for non-inductive circuits and equipment. Main switches containing JLLS fuses can be used to provide compact protection for meter stacks. It should be noted that molded case circuit breaker load centers and panelboards have increased interrupting ratings when "series rated" with Littelfuse Class T fuses. JLLS fuses are available in non-plated and silver plated terminations.

Features & Benefits

FEATURES	BENEFITS
200,000 AIR	Safety feature providing reliable interruption of all overcurrents up to 200,000 A
Current-limiting	Reduces damage caused by heating and magnetic effects of short-circuit currents; extends the equipment's lifecycle
Fast-acting	Provides fast short-circuit response for equipment requiring fast overload protection
POWR-GARD® technology	Ensures quality overcurrent protection
Compact size	More efficient use of available space – typical three-pole Class T fuse blocks require less than 50% of the panel area required for Class R fuse blocks
Functional protection	When used as input or output fuses for surge-sensitive components, they can prevent opening of expensive semiconductor fuses that protect individual components

Applications

- Variable speed drives
- Power conversion devices (inverters, rectifiers, UPS)
- Power supplies and power distribution units
- Compact main switches
- Individual electric services and meters

Nominal ratings	
I_N	Rated current available continuously without overloadability at 40 °C.
P_N	Typical motor power in no-overload use.
Maximum output current	
I_{max}	Maximum output current. Available for 2 seconds at start, then as long as allowed by drive temperature.
Light-overload use	
I_{Ld}	Continuous current allowing 110% I_{Ld} for 1 minute every 10 minutes at 40 °C.
P_{Ld}	Typical motor power in light-overload use.
Heavy-duty use	
I_{Hd}	Continuous current allowing 150% I_{Hd} for 1 minute every 10 minutes at 40 °C. * Continuous current allowing 130% I_{Hd} for 1 minute every 10 minutes at 40 °C. ** Continuous current allowing 125% I_{Hd} for 1 minute every 10 minutes at 40 °C.
P_{Hd}	Typical motor power in heavy-duty use.

The ratings apply for the frames R1 to R9 up to +40 °C in enclosure class 21.
For derating at higher altitudes, temperatures, switching frequencies or enclosure classes, see the HW manuals, document codes: 3AXD50000018826 and 3AXD50000015497.

DRAFT

Control panel options

—
01 Assistant control panel is included as standard.
—
02 Optional Bluetooth panel. USB connection as standard.
—
03 By using the CDPI-01 panel adapter, the assistant control panel is able to manage up to 32 drives.

Assistant control panel
Set up the drive using the assistant control panel delivered as standard with all ACS580 drives. There is no need to know any drive parameters, as the control panel helps to set up the essential settings quickly and get the drive into action.

- Drive setup with the primary settings menu including embedded assistants
- Process monitoring with one glance at the control panel's editable home view showing you the status of the drive and process
- Drive maintenance with the help function providing context-sensitive guidance and troubleshooting instructions
- Drive diagnostics under the diagnostics menu informing the user of the root cause.

Bluetooth panel
The optional Bluetooth panel enables connection with the Drivetune mobile app. The app is available for free on the Google Play and the Apple App store.

Some of the Drivetune features are: commissioning, troubleshooting, monitoring and controlling the drive. Drivetune also has full parameter access.

— 01 — 02 — 03

—
Control panel options
Assistant control panel ACS-AP-S is included as standard in the delivery. ACS-AP-S (+J400) can be replaced by +J options below.

Option code	Description	Type designation
+J400	Assistant control panel (+J400 option automatically included)	ACS-AP-S
+J425	Industrial Assistant control panel*	ACS-AP-I
+J429	Control panel with Bluetooth interface*	ACS-AP-W
+J424	Blank control panel cover (no control panel delivered)	CDUM-01
3AXD50000004419	Panel bus adapter	CDPI-01
3AUA0000108878	Control panel mounting platform (flush mounted, requires also panel bus adapter on the drive)	DPMP-01
3AXD50000010763	Door mounting kit for the panel, surface mounted (for one drive, contains both DPMP-02 and CDPI-01)	DPMP-EXT

* Also compatible with ACS880 drives

DRAFT

Additional options

04 Cold configuration adapter CCA-01
—
05 Remote monitoring tool NETA-21
—
06 Drive composer PC tool

Safe configuration for unpowered drives
The CCA-01 cold configuration adapter provides a serial communication interface for unpowered ACS580 drives. With the adapter, safety isolation of both serial communication and control board power supply is possible. The power supply is taken from a PC USB port.

Remote monitoring access worldwide
The NETA-21 remote monitoring tool gives easy access to the drive via the Internet or local Ethernet network. NETA-21 comes with a built-in web server. Compatible with standard web browsers, it ensures easy access to a web-based user interface. Through the web interface, the user can configure drive parameters, and monitor drive log data, load levels, runtime, energy consumption, I/O data and bearing temperatures of the motor connected to the drive.

PC tools
The Drive composer PC tool offers fast and harmonized setup, commissioning and monitoring for all-compatible drives. The free version of the tool provides start-up and maintenance capabilities and gathers all drive information, such as parameter loggers, faults, backups and lists, into a support diagnostics file. Drive composer pro provides additional features such as custom parameter windows, graphical control diagrams of the drive's configuration, and improved monitoring and diagnostics.

Connectivity options

— 07 ACS580 is compatible with many fieldbus protocols
— 08 Input/output extension modules

Fieldbus adapter modules
The ACS580 general purpose drives are compatible with a wide range of fieldbus protocols. The drive comes with Modbus RTU fieldbus interface as standard. Fieldbus communication reduces wiring costs when compared to traditional hard-wired input/output connections.

—
07

Option code	Fieldbus protocol	Adapter

Input/output extension modules
Standard input and output can be extended by using optional analog and digital input/output extension modules. The modules are easily installed in the extension slots located on the drive.

DRAFT

EMC – electromagnetic compatibility

Every ACS580 drive is equipped with a built-in filter to reduce high-frequency emissions. EMC product standard (EN 61800-3) category C2 is fulfilled in wall-mounted drives.

EMC standards
The EMC product standard (EN 61800-3) covers the specific EMC requirements stated for drives (tested with motor and motor cable) within the EU. EMC standards such as EN 55011 or EN 61000-6-3/4 are applicable to industrial and domestic equipment and systems, including the components inside the drive. Drive units complying with the requirements of EN 61800-3 are compliant with comparable categories in EN 55011 and EN 61000-6-3/4 but not necessarily vice versa. EN 55011 and EN 61000-6-3/4 do not specify cable length or require a motor to be connected as a load. The emission limits are comparable to EMC standards according to the table below.

Domestic environments versus public low voltage networks
The first environment includes domestic premises. It also includes establishments directly connected without an intermediate transformer to a low voltage power supply network that supplies buildings used for domestic purposes. The second environment includes all establishments directly connected to public low voltage power supply networks.

Comparison of EMC standards

EMC according to EN 61800-3 product standard	EN 61800-3 product standard	EN 55011. product family standard for industrial, scientific and medical (ISM) equipment	EN 61000-6-4, generic emission standard for industrial environments	EN 61000-6-3, generic emission standard for residential, commercial and light-industrial environment
1st environment, unrestricted distribution	Category C1	Group 1. Class B	Not applicable	Applicable
1st environment, restricted distribution	Category C2	Group 1. Class A	Applicable	Not applicable
2nd environment, unrestricted distribution	Category C3	Group 2. Class A	Not applicable	Not applicable
2nd environment, restricted distribution	Category C4	Not applicable	Not applicable	Not applicable

EMC compliance and maximum cable length of ACS580-01/07 units*

Type	Voltage	Frame sizes	1st environment, restricted distribution, C2, grounded network (TN)	2nd environment, unrestricted distribution, C3, grounded network (TN)	2nd environment, unrestricted distribution, C3, ungrounded network (IT)
ACS580-01	380 - 480 V	R1 - R5	Standard device, cable length 100 m	Standard device, cable length 100 m	-
ACS580-01	**380 - 480 V**	**R6 - R9**	**Standard device, cable length 150 m**	**Standard device, cable lenght 150 m**	**-**

* Motor cable operational functionality up to 300 m. See ACS580 hardware manuals 3AXD50000018826, 3AXD50000015497, 3AXD50000045815 and 3AXD50000032622 for frame specific information.

DRAFT

Cooling and fuses

Cooling
ACS580 drives are fitted with variable-speed cooling air fans. The cooling air must be free from corrosive materials and not exceed the maximum ambient temperature of 40°C for frames R1 to R9 (50°C with derating). The speed-controlled fans cool the drive only when needed, which reduces overall noise level and energy consumption.

Fuse connections
Standard fuses can be used with ABB general purpose drives. For input fuses, see the table below.

Wall-mounted drives, ACS580-01

Cooling air flow and recommended input protection fuses for 380 to 415 V units

‡ Coming soon
* Heat dissapation value is a reference for cabinet thermal design
** The maximum noise level is at full fan speed. When the drive is not operating at full load and at maximum ambient temperature the noise level is lower.
***ABB does not require Bussmann brand fuses. Fuses which meet the appropriate UL class type, current rating, and are rated at 600V, 200 kA may be used.

DRAFT

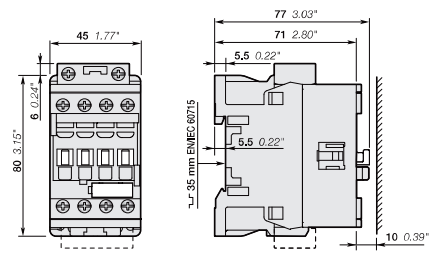
Item 39a

AF09 ... AF38 3-pole contactors

4 to 18.5 kW

AC / DC operated

AF09-30-10



AF26-30-00

AF09 ... AF38 contactors are mainly used for controlling 3-phase motors and power circuits up to 690 V AC and 220 V DC. These contactors are of the block type design with 3 main poles.

- control circuit: AC or DC operated with electronic coil interface accepting a wide control voltage range (e.g. 100...250 V AC and DC), only 4 control voltage ranges covering 24...500 V 50/60 Hz and 20...500 V DC
  - can manage large control voltage variations
  - reduced panel energy consumption
  - very distinct closing and opening.
- built-in surge suppression
- add-on auxiliary contact blocks for front or side mounting and a wide range of accessories.

CA4-10 Auxiliary Contact Block

DRAFT

General Information

Extended Product Type	CA4-10
Product ID	1SBN010110R1010
EAN	3471523130005
Catalog Description	CA4-10 Auxiliary Contact Block
Long Description	CA4-10 is a 1-pole front mounted auxiliary contact block equipped with screw terminals and can be fitted on AF(C)09(Z)(B)...96 contactors and NF(C)(Z)(B) contactor relays. CA4-10 is available with 1 N.O. instantaneous contacts for standard industrial environments.

Connection sets for reversing contactors with screw terminals

The BER connection sets are used to connect the main poles of two 3-pole contactors with screw terminals mounted side by side.
The BER connection sets are made up of 1 upstream and 1 downstream connections.
BER connection sets are insulated and made of solid copper bars.

For 3-pole contactors	Type	Order code	Pkg qty	Weight (1 pce) kg

BER16-4KF

Connection sets for reversing contactors with Push-in Spring terminals

The BER..-4KF connection sets are used to connect the main poles of two 3-pole AF09(Z)B..K ... AF38(Z)B..K contactors mounted side by side.
The connection sets are made up of:

- 1 upstream and 1 downstream connections
- Insulated, solid copper bars
- Black fork pieces for a quick dismounting of reversing contactors.

Three-phase busbars ensure a quick and safe connection and are therefore a cost effective solution. A variety of different three-phase busbars up to 100 A are in the assortment. Between 2 and 4 manual motor starters with none, one or two lateral auxiliary contacts can be connected. Different three-phase feeder terminals are available according to the application.

Phase connecting links and phase power infeed blocks are also available for single-phase applications.

Description

MMS and MS132-T can be equipped with auxiliary contacts for lateral/front mounting, signaling contacts for lateral mounting, undervoltage releases and shunt trips. Two different signaling contacts are available. The accessories can be fitted wiring free and without tools. A variety of combinations is possible as required for the application. The auxiliary contacts change position with the main contacts. The signaling contact SK signals tripping regardless if it was caused by short-circuit or overload. The signaling contact CK signals tripping in case it was caused by short-circuit. Undervoltage releases are used for remote tripping of the manual motor starters especially for emergency stop circuits. Shunt trips release the MMS used for remote tripping. These main accessories are suitable throughout the MS116/MS132/MS165-range.

Data sheet

Manual motor starter MS132

Manual motor starters are electrome-chanical protection devices for the main circuit. They are used mainly to switch motors manually ON/OFF and protect them fuse less against short-circuit, overload and phase failures.
Fuse less protection with a manual motor starter saves costs, space and ensures a quick reaction under short-circuit condition, by switching off the motor within milliseconds. Fuse less starter combinations are setup together with contactors.

DRAFT

Description

- Overload protection – trip class 10
- Phase loss sensitivity
- Disconnect function
- Temperature compensation from -25 … +60 °C
- Adjustable current setting for overload protection
- Suitable for three- and single-phase application
- Trip-free mechanism
- Trip indication
- Clear switch position indication ON/OFF/TRIP
- Lockable handle

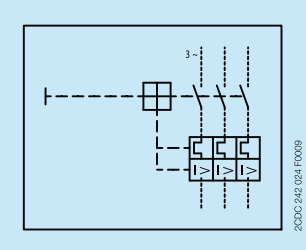
Application

The manual motor starters protect the load and the installation against short-circuit and overload. They are three pole protection devices with thermal tripping elements for overload protection and electro-magnetic tripping elements for short-circuit protection. Furthermore, they provide a disconnect function for safely isolation of the installation and the supply and can be used for the manual switching of loads.



The manual motor starters have a setting scale in Amperes, which allows the direct adjusting of the device without any additional calculation. In compliance with international and national standards, the setting current is the rated current of the motor and not the tripping current (no tripping at 1.05 x I, tripping at 1.2 x I; I = setting current).

Power and productivity for a better world™

CompactLogix Controllers

The CompactLogix system is designed to provide a Logix solution for differently sized applications. Most CompactLogix controllers are ideal for small and mid-size applications. These applications are machine-level control applications. The CompactLogix 5480 controllers, however, are more ideal for use in mid to large-size applications.

The CompactLogix platform brings together the benefits of a common programming environment, common networks, and common control engine in a small footprint with high performance. Combined with 1769 Compact I/O or Compact 5000 I/O modules, the CompactLogix platform supports simple to more complex motion, with unprecedented power and scalability. A CompactLogix platform is ideal for systems that require standalone and system-connected control over EtherNet/IP, ControlNet, or DeviceNet networks.

A simple system can consist of a standalone controller with one bank of I/O modules and DeviceNet communication. In a more complex system, add other networks, motion control, and safety control. As part of the Integrated Architecture® system, the CompactLogix controllers use the same programming software, network protocol, and information capabilities as all Logix 5000™ controllers. This system provides a common development environment for all control disciplines.

For detailed specifications, see the following publications:

- CompactLogix 5380, Compact GuardLogix 5380, and CompactLogix 5480 Controllers Specifications Technical Data, publication 5069-TD002
- CompactLogix Controllers Specifications Technical Data, publication 1769-TD005

(2) Compact GuardLogix 5380 controllers support Dual-IP mode and DLR/Linear mode. Mode use is user-configurable.

(3) CompactLogix 5480 controller supports Dual-IP mode and DLR/Linear mode on ports A1 and A2. Mode is user-configurable.

DRAFT

CompactLogix 5380 Controllers

The CompactLogix 5380 controllers are the first Logix controllers to offer configurable EtherNet/IP modes, that is, Dual-IP mode or Linear/DLR mode. With CompactLogix 5380 controller firmware revision 29.011 or later, you can configure the embedded Ethernet ports to connect to separate networks, an enterprise-level EtherNet/IP network, and a device-level network. When the controller operates in Dual-IP mode, each port requires its own network configuration.

The CompactLogix 5380 controllers deliver scalable control that is ideal for applications from small standalone equipment to high-performance indexing tables, process skids, case packers and erectors, and packaging. The CompactLogix 5380 controllers also provide a truly integrated motion solution.

In a CompactLogix 5380 controller system, Compact 5000 I/O modules are installed to the right of the controller as local I/O modules. As many as 31 modules can be installed in the system. The CompactLogix 5380 controllers come with:

- Dual embedded Ethernet ports for use in star, linear, and DLR EtherNet/IP network topologies
- USB port for firmware updates and programming
- Support for Dual-IP mode
- 5069-ECR end cap

Energy Depletion characteristics for the 5069-L310ER-NSE controller.

The residual stored energy of the 5069-L310ER-NSE controller depletes to 20 µJ or less in 2 minutes. The 5069-L310ER-NSE controller does not maintain the real-time clock on power cycle.

Programming software support	Based on catalog number: • Version 28 or later - 5069-L320ER, 5069-L340ERM only • Version 29 or later - 5069-L306ER, 5069-L306ERM, 5069-L310ER, 5069-L310ER-NSE, 5069-L310ERM, 5069-L320ERM, 5069-L320ERMK, 5069-L330ER, 5069-L330ERM, 5069-L330ERMK, 5069-L340ER • Version 30 or later - 5069-L350ERM, 5069-L350ERMK, 5069-L380ERM, 5069-L3100ERM							

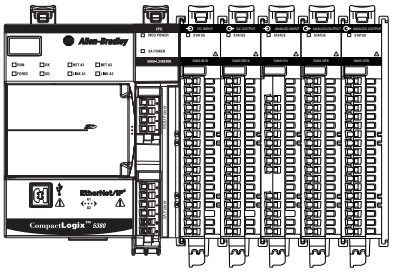
(1) The maximum number of nodes that are listed represents when the controller is used with the Logix Designer application, version 31 or later. Some controllers can be used with earlier Logix Designer application versions. The maximum number of nodes that a controller supports can be fewer in Logix Designer application, versions 30 or earlier.

(2) When you use a 5069-L330ER, 5069-L330ERM, or 5069-L330ERMK controller with the Logix Designer application, version 29.00.00, the application limits the number of local I/O modules in the project to 16. For more information, see the Rockwell Automation Knowledgebase article #942580, '5380 CompactLogix controllers limited to 16 local 5069 modules in V29 of Studio 5000® software.'The document is available at http://www.rockwellautomation.com/knowledgebase.
With the Logix Designer application, version 30.00.00 or later, the controller supports as many as 31 local I/O modules.

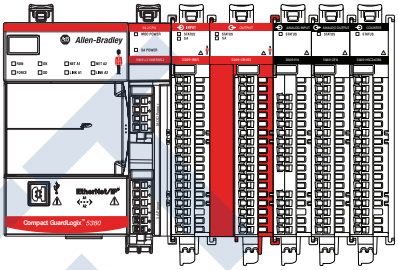
Example CompactLogix 5380 System on an EtherNet/IP Network

DRAFT

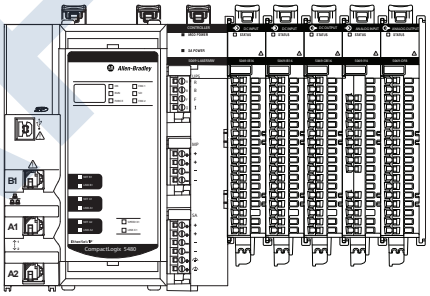
Compact 5000 I/O Modules



You can install Compact 5000 I/O modules as local I/O modules in a CompactLogix 5380, Compact GuardLogix 5380, or CompactLogix 5480 control system.



The Compact 5000 I/O architecture provides a wide range of input and output modules to span many applications, from high-speed digital to process control. The architecture uses Producer/Consumer technology that allows input information and output status to be shared among multiple Logix 5000 controllers.



The Compact 5000 I/O modules are installed to the right of a CompactLogix 5380, Compact GuardLogix 5380, or CompactLogix 5480 controller and require removable terminal blocks (RTBs) to connect field-side wiring. The RTBs that are used with CompactLogix 5380 or Compact GuardLogix 5380 controllers are sold separately. The RTBs that are used with the CompactLogix 5480 controller ship with the controller.

You can use Compact 5000 I/O safety modules with Compact GuardLogix 5380 controllers only. You cannot use them with CompactLogix 5380 controllers.

The modules draw system-side power, which is known as Module (MOD) power, and field-side power, which is known as Sensor Actuator (SA) power from the system backplane as needed. The modules then pass the remaining power to the next module in the system.

DRAFT

The following apply when you use Compact 5000 I/O modules:

- You cannot use Compact 5000 I/O modules with the other CompactLogix controllers.
- Some restrictions that apply when you use Compact 5000 I/O modules with Compact GuardLogix 5380 controllers. For more information, see the CompactLogix 5380 and Compact GuardLogix Controllers User Manual, publication 5069-UM001 and the Compact 5000 I/O Digital Modules User Manual, publication 5000-UM004.

Compact 5000 I/O DC Digital Modules

Cat. No.	Inputs/Outputs	Voltage Category	MOD Current, Max	SA Power Current, Max
5069-IB16, 5069-IB16K	16 inputs, sink	24V DC	75 mA	200 mA
5069-IB16F				
5069-IB6F-3W	6 inputs, sink			150 mA per channel 900 mA module
5069-OB16, 5069-OB16K	16 outputs, source			Local Actuator (LA) Power Current(1) 0.5 A per channel 8 A module
5069-OB16F				
5069-OB8	8 outputs (2 groups of 4)			LA Power Current(1) 2 A per channel 8 A per group 16 A per module

(1) The module does not draw current from the SA power bus that is internal to the system. Local Actuator (LA+ and LA-) connections are used to supply field-side power to the module.

Compact 5000 I/O AC Digital Modules

5069-FPD	Compact 5000 I/O field potential distributor	–	10 mA (DC power) 25 mA (AC power)

(1) SA power current is drawn only when the embedded output channels are used.

For more information on how to use local Compact 5000 I/O modules, see the following:

- Compact 5000 I/O Digital and Safety Modules in Logix 5000 Control Systems User Manual, publication 5000-UM004
- Compact 5000 I/O Analog Modules in Logix 5000 Control Systems User Manual, publication 5000-UM005
- Compact 5000 I/O High-speed Counter Modules in Logix 5000 Control Systems User Manual, publication 5000-UM006

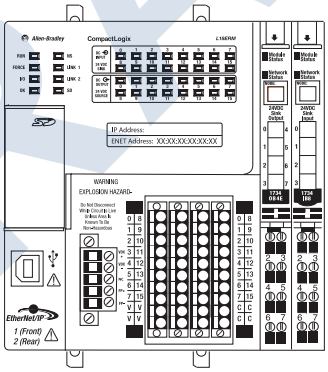
Compact 5000 I/O End Caps

The right-most Compact 5000 I/O module in a CompactLogix 5380 or CompactLogix 5480 control system requires an end cap. The end cap catalog number is 5069-ECR. An end cap ships with the CompactLogix 5380, CompactLogix 5480 controllers, and Compact 5000 I/O EtherNet/IP adapters. You do not need to order one separately. However, you can order replacement 5069-ECR end caps.

DRAFT

Removable Terminal Blocks

You can order removable terminal blocks (RTBs) with the CompactLogix 5380 and Compact GuardLogix 5380 controllers and 5069-FPD field potential distributor modules separately. The RTBs are used to connect wiring to the controllers. The following table describes the RTBs.



Cat. Nos.	Device Supported	Description
5069-RTB14CJC-SCREW	Compact 5000 I/O module	14-pin screw type terminal block with embedded CJC thermistors
5069-RTB14CJC-SPRING		14-pin spring type terminal block with embedded CJC thermistors
5069-RTB18-SCREW		18-pin screw type terminal block
5069-RTB18-SPRING		18-pin spring type terminal block
5069-RTB6-SCREW	5069-FPD module	6-pin screw type terminal block
5069-RTB6-SPRING		6-pin spring type terminal block
5069-RTB64-SCREW	CompactLogix 5380 and Compact GuardLogix 5380 controllers 5069-AEN2TR EtherNet/IP adapter	4 and 6-pin screw type terminal block
5069-RTB64-SPRING		4 and 6-pin spring type terminal block
5069-RTB5-SCREW	5069-AENTR EtherNet/IP adapter	5-pin screw type terminal block
5069-RTB5-SPRING		5-pin spring type terminal block

The CompactLogix 5480 controller uses RTBs for power supply connections. The

1734 POINT I/O Modules

Additional 1734 POINT I/O modules can be installed on a CompactLogix 5370 L1 controller. The POINT I/O family is ideal for applications where flexibility and low cost of ownership are key for successful control system design and operation.

An RTB provides the wiring and terminations for field-side connections, and system power for the backplane.

1734 AC Digital Modules

Cat. No.	Inputs/Outputs	Voltage Category	Wiring Base	POINTBus™ Current @ 5V DC
1734-IA2	2 inputs, nonisolated, sink	120V AC	1734-TB, 1734-TBS, 1734-TOP, 1734-TOPS	75 mA
1734-IA4	4 inputs, nonisolated, sink			
1734-IM2	2 inputs, nonisolated, sink	220V AC		
1734-IM4	4 inputs, nonisolated, sink			
1734-OA2	2 outputs, nonisolated, source	120/220V AC		
1734-OA4	4 outputs, nonisolated, source

Summary of Changes

Topic	Pages
Updated the Certifications table.	3
Added the Firmware line (for Series D terminals) to the Technical Specifications tables.	4...6

The PanelView™ Plus 7 Standard terminals are operator interface devices. They monitor and control devices that are attached to ControlLogix® 5570 and CompactLogix™ 5370 controllers on an EtherNet/IP™ network. Animated graphic and text displays provide operators a view into the operating state of a machine or process. Operators interact with the control system by using touch screen input.

The PanelView Plus 7 Standard terminals include these features:

- Terminal functionality permits connection to 1 controller, up to 100 screens, and up to 500 alarms.
- FactoryTalk® View Machine Edition software provides a familiar environment for creating HMI applications.
- Windows CE operating system with desktop access for configuration and third-party applications.
- Ethernet communication that supports linear and star network topology.
- PDF viewer to access PDF files that are stored on the terminal.
- More screen options including 4-in., 6-in., 7-in., 9-in., 10-in., 12-in., and 15-in. terminals.
- Widescreen on three sizes, 4-in., 9-in., and 12-in. terminals.
- Greater screen resolution.
- Terminals are available with an Allen-Bradley brand marking, or with no marking for customers who want to put their own brand label on the terminal.
- Certifications including Class I, Div. 2; Class II, Div. 2; Class III; and ATEX, IECEx, and INMETRO Zones 2 and 22.

Product Dimensions

The table provides product dimensions. The 5.7-in. and 10.4-in. touch-screen terminals are shown for illustrative purposes. All other terminal sizes look similar. For information on proper mounting clamp installation, refer to the PanelView Plus 7 Standard Terminals User Manual, publication 2711P-UM007.

Figure 1 - PanelView Plus 7 Standard Terminals, Front View

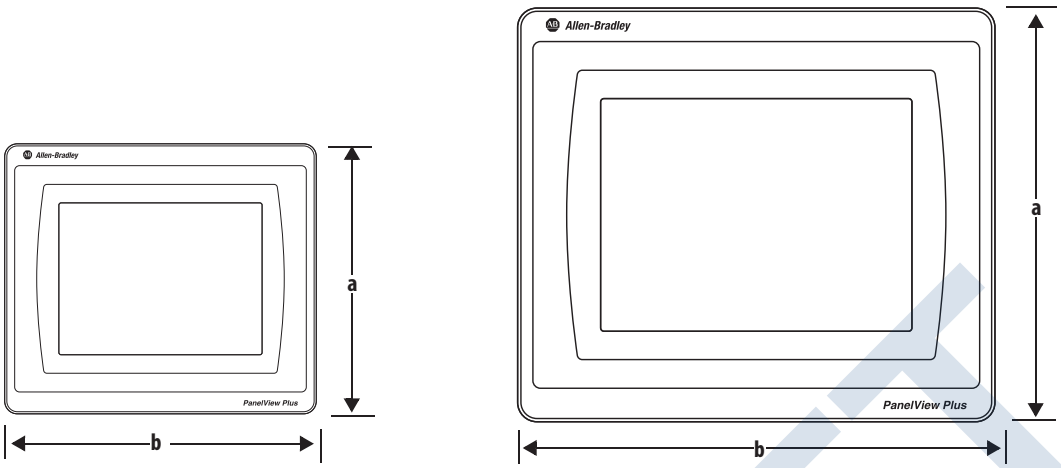

Figure 2 - PanelView Plus 7 Standard Terminals with Single Ethernet Port, Bottom View

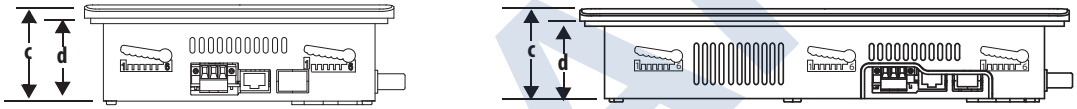

Figure 3 - PanelView Plus 7 Standard Terminals with Dual Ethernet Ports, Bottom View

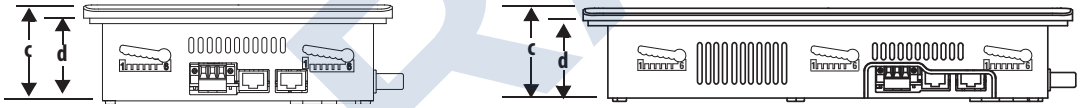

Table 6 - PanelView Plus 7 Standard Terminals Dimensions

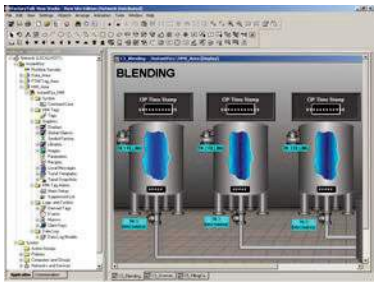

Terminal Size	Input Type	Height (a) mm (in.)	Width (b) mm (in.)	Overall Depth (c) mm (in.)	Mounted Depth (d) mm (in.)
4.3 in.	Touch	110 (4.33)	135 (5.31)	56.5 (2.22)	50.14 (1.97)
5.7 in.	Touch	152 (5.98)	176 (6.93)	56.5 (2.22)	50.14 (1.97)
6.5 in.	Touch	170 (6.69)	212 (8.35)	56.5 (2.22)	50.14 (1.97)
9 in.	Touch	190 (7.48)	280 (11.02)	56.5 (2.22)	50.14 (1.97)
10.4 in.	Touch	252 (9.92)	297 (11.69)	56.5 (2.22)	50.14 (1.97)
12.1 in.	Touch	246 (9.69)	340 (13.39)	56.5 (2.22)	50.14 (1.97)
15 in.	Touch	318 (12.52)	381 (15.00)	56.5 (2.22)	50.14 (1.97)

When mounted in a panel, the front of the bezel extends less than 6.36 mm (0.25 in.) from the front of the panel.

DRAFT

HMI Software

All PanelView Plus 7 terminals are configured with FactoryTalk View Studio software and have an integrated runtime system called FactoryTalk View Machine Edition Station.

Machine Edition Station runs projects developed with FactoryTalk View Studio software and is included on all PanelView Plus 7 terminals.

Two versions of FactoryTalk View Studio software support application development for PanelView Plus 7 terminals.

Cat. No.[1]	Description
9701-VWSTMENE	FactoryTalk View Studio for Machine Edition software - Configuration software for developing and testing machine level human machine interface (HMI) applications. Includes RSLinx® Enterprise and KEPServer Enterprise software.
9701-VWSTENE	FactoryTalk View Studio software - Configuration software for developing and testing machine level and supervisory level human machine interface (HMI) applications.

(1) Order localized versions of the software by replacing EN in the catalog number with DE for German, FR for French, JP for Japanese, or ZH for Chinese.

You can import PanelView Standard/PanelBuilder™ 32 and PanelView *e* applications into FactoryTalk View Studio software as Machine Edition applications by using the Machine Edition Import Wizard. The Import Wizard steps you through a few options such as scaling to a new screen resolution size, and then converts objects, text, tags, and communication configurations to ones that are available in Machine Edition.

FactoryTalk ViewPoint software, an add-on to FactoryTalk View Studio software, allows plant managers, production supervisors, system integrators, and other key stakeholders to view and control real-time plant floor operations remotely from a web browser. FactoryTalk ViewPoint enabled displays are fully scalable and animated in the browser. The remote user can also view displays that are not the active display of the terminal.

Each PanelView Plus 7 terminal contains one license supporting a single client connection to the terminal. No additional software is required.

For a complete list of available HMI software, visit http://www.rockwellautomation.com/rockwellsoftware.

Important User Information

Read this document and the documents listed in the additional resources section about installation, configuration, and operation of this equipment before you install, configure, operate, or maintain this product. Users are required to familiarize themselves with installation and wiring instructions in addition to requirements of all applicable codes, laws, and standards.

Activities including installation, adjustments, putting into service, use, assembly, disassembly, and maintenance are required to be carried out by suitably trained personnel in accordance with applicable code of practice.

If this equipment is used in a manner not specified by the manufacturer, the protection provided by the equipment may be impaired.

In no event will Rockwell Automation, Inc. be responsible or liable for indirect or consequential damages resulting from the use or application of this equipment.

The examples and diagrams in this manual are included solely for illustrative purposes. Because of the many variables and requirements associated with any particular installation, Rockwell Automation, Inc. cannot assume responsibility or liability for actual use based on the examples and diagrams.

No patent liability is assumed by Rockwell Automation, Inc. with respect to use of information, circuits, equipment, or software described in this manual.

Reproduction of the contents of this manual, in whole or in part, without written permission of Rockwell Automation, Inc., is prohibited

Throughout this manual, when necessary, we use notes to make you aware of safety considerations.

	**WARNING:** Identifies information about practices or circumstances that can cause an explosion in a hazardous environment, which may lead to personal injury or death, property damage, or economic loss.
	**ATTENTION:** Identifies information about practices or circumstances that can lead to personal injury or death, property damage, or economic loss. Attentions help you identify a hazard, avoid a hazard, and recognize the consequence.
IMPORTANT	Identifies information that is critical for successful application and understanding of the product.

Labels may also be on or inside the equipment to provide specific precautions.

	**SHOCK HAZARD:** Labels may be on or inside the equipment, for example, a drive or motor, to alert people that dangerous voltage may be present.
	**BURN HAZARD:** Labels may be on or inside the equipment, for example, a drive or motor, to alert people that surfaces may reach dangerous temperatures.
	**ARC FLASH HAZARD:** Labels may be on or inside the equipment, for example, a motor control center, to alert people to potential Arc Flash. Arc Flash will cause severe injury or death. Wear proper Personal Protective Equipment (PPE). Follow ALL Regulatory requirements for safe work practices and for Personal Protective Equipment (PPE).

DRAFT

Broadcast Storm Protection

A broadcast storm occurs when a network is overwhelmed by continuous multicast or broadcast traffic typically caused by loops in the network. A severe broadcast storm can block all other network traffic. Stratix® 2000 switches provide protection against broadcast storms. When the broadcast storm protection feature is enabled, the switch drops incoming broadcast traffic if the traffic exceeds a certain threshold.

Stratix 2000 switches use two methods to determine the threshold for incoming broadcast traffic, depending on the switch catalog number:

- Packet-based threshold—The switch counts the number of broadcast packets received within a time cycle. Once the number of broadcast packets reaches the maximum number of packets in the time cycle, the port drops any excess broadcast packets. For threshold values based on packet number, see Table 1.
- Rate-based threshold—The switch tracks the bandwidth of each port based on a maximum bit rate. Once a port reaches the maximum bit rate, the port drops any excess broadcast packets. For threshold values based on rate, see Table 2.

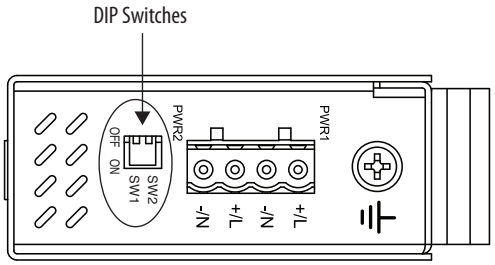
Table 1 - Packet-based Thresholds

Cat. No.	Broadcast Storm Threshold (Packets per Second)
1783-US5T	20 pps for 10 Mbps per port; 200 pps for 100 Mbps per port
1783-US4T1F	20 pps for 10 Mbps per port; 200 pps for 100 Mbps per port
1783-US4T1H	20 pps for 10 Mbps per port; 200 pps for 100 Mbps per port
1783-US8T	20 pps for 10 Mbps per port; 200 pps for 100 Mbps per port
1783-US6T2F	20 pps for 10 Mbps per port; 200 pps for 100 Mbps per port
1783-US6T2H	20 pps for 10 Mbps per port; 200 pps for 100 Mbps per port
1783-US7T1F	20 pps for 10 Mbps per port; 200 pps for 100 Mbps per port
1783-US7T1H	20 pps for 10 Mbps per port; 200 pps for 100 Mbps per port
1783-US6T2TG2F	128 pps for 10/100/1000 Mbps
1783-US6T2TG2H	128 pps for 10/100/1000 Mbps
1783-US8TG2GX	128 pps for 10/100/1000 Mbps

Table 2 - Rate-based Thresholds

Cat. No.	Broadcast Storm Threshold
1783-US16T	10 Mbps per port
1783-US16T2S	10 Mbps per port
1783-US5TG	25 Mbps per port

You can enable or disable broadcast storm protection by using DIP switch SW1 on the top panel of the switch:



- To enable the feature, set SW1 to the On position and restart the switch.
- To disable the feature, set SW1 to the Off position. By default, the feature is disabled.

DRAFT

DIP Switches

There are two DIP switches on the top panel of the switches. Each switch has On and Off states.

IMPORTANT To activate DIP switch settings, you must restart the switch.

32695-M

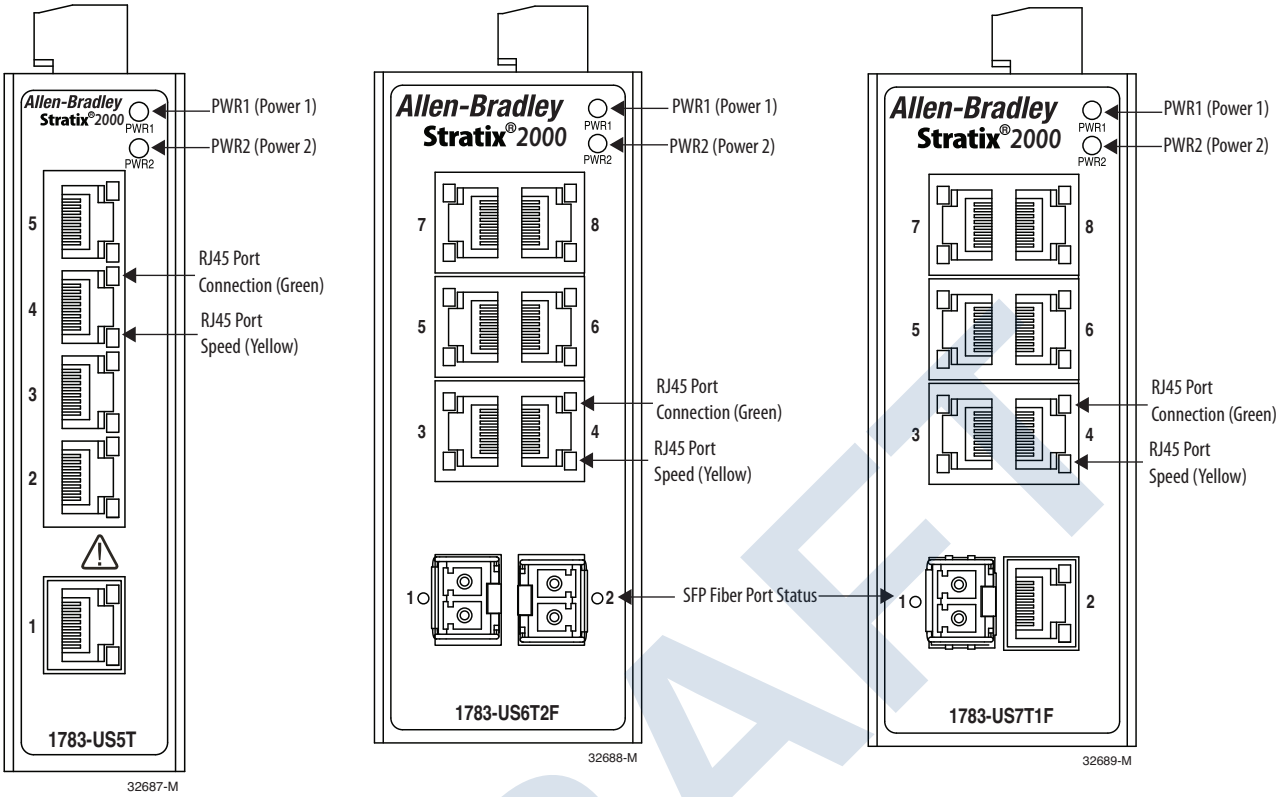
The function of the DIP switches varies by catalog number.

Cat. No.	DIP Switch	Status	Description	Default
1783-US5T, 1783-US4T1F, 1783-US4T1H, 1783-US8T, 1783-US6T2F, 1783-US6T2H, 1783-US7T1F, 1783-US7T1H, 1783-US16T, 1783-US16T2S	SW1	On	Enables broadcast storm protection.	Off
		Off	Disables broadcast storm protection.	
	SW2	Reserved		Off
1783-US6T2TG2F 1783-US6T2TG2H	SW1	On	Enables broadcast storm protection.	Off
		Off	Disables broadcast storm protection.	
	SW2	On	Sets the SFP fiber port speed to 100 Mbps (100Base-FX). SW2 must remain in the On position.	On
		Off	Reserved	
1783-US5TG 1783-US8TG2GX	SW1	On	Enables broadcast storm protection.	Off
		Off	Disables broadcast storm protection.	
	SW2	On	Transmits jumbo frames up to 10 KB on the 1783-US5TG switch and up to 9.6 KB on the 1783-US8TG2GX switch.	Off
		Off	Drops jumbo frames.	

Status Indicators

The status indicators on the switches indicate the following:

- Status of each power supply
- Status of port speed
- Status of network connection or activity



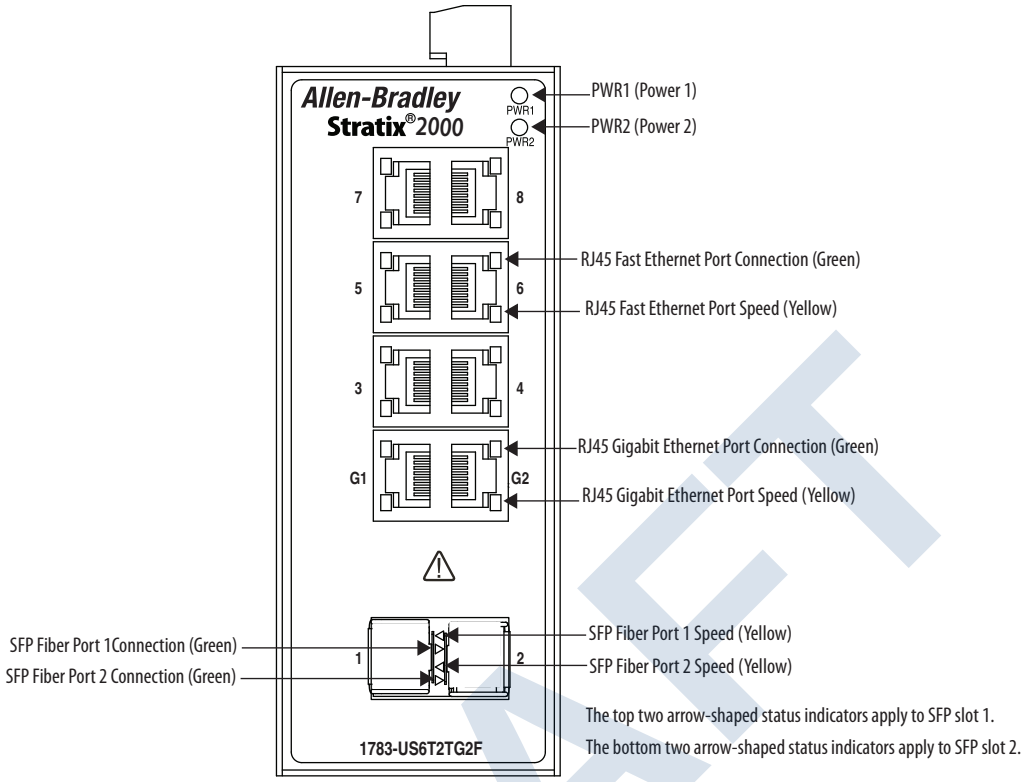
The function of the status indicators varies by catalog number:

- 5- and 8-port Fast Ethernet Switches on page 5
- 10-port Fast Ethernet Switches on page 6
- 16- and 18-port Fast Ethernet Switches on page 7
- 5- and 10-port Gigabit Ethernet Switches on page 8

DRAFT

5- and 8-port Fast Ethernet Switches

These illustrations show the status indicators on the 1783-US5T, 1783-US6T2F, and 1783-US7T1F switches. The status indicators on the 1783-US4T1F, 1783-US4T1H, 1783-US8T, 1783-US6T2H, 1783-US7T1H switches function the same as these switches.



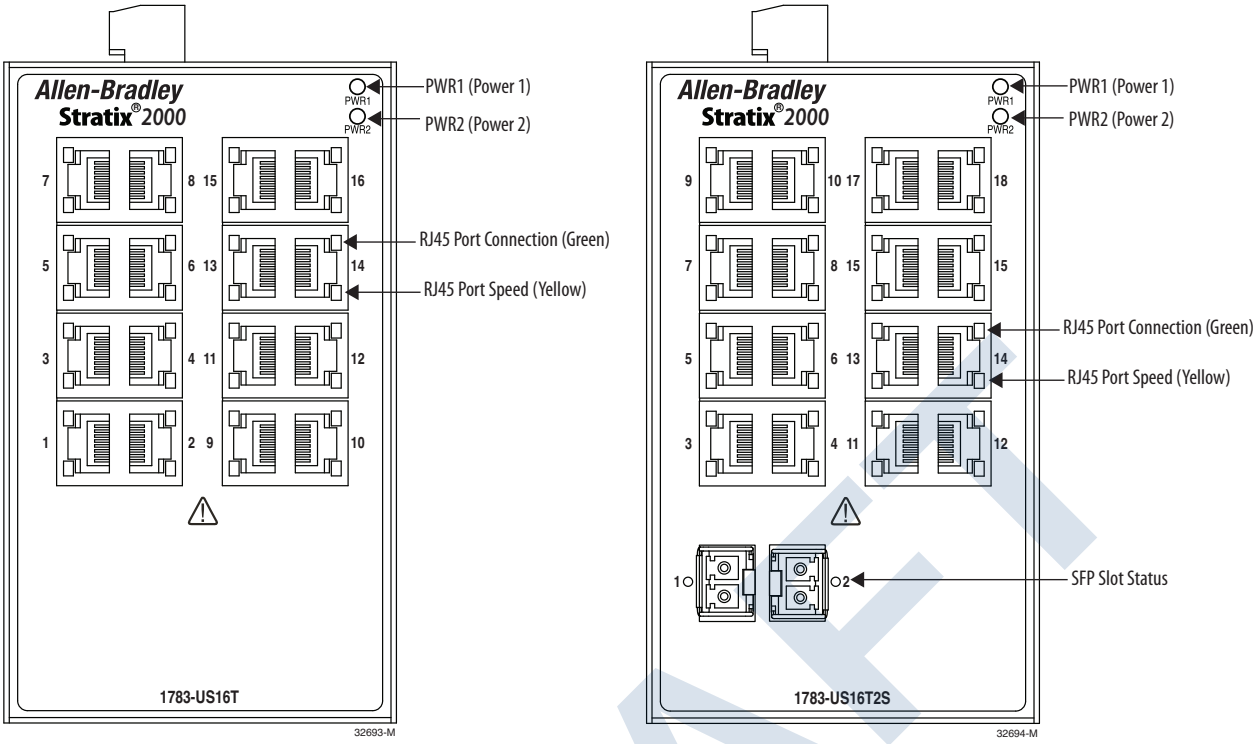
Indicator	Status	Description
PWR1	On	PWR1 is connected and operates normally.
	Off	PWR1is not connected or operates abnormally.
PWR2	On	PWR2 is connected and operates normally.
	Off	PWR2 is not connected or operates abnormally.
RJ45 port connection (green)	On	The port has an operating network connection.
	Blinking(1)	There is network activity on the port.
	Off	The port has no network connection.
RJ45 port speed (yellow)	On	The port is operating at 100 Mbps (100Base-TX).
	Off	The port is operating at 10 Mbps, or the port has no network connection.
SFP fiber port status (green)	On	The port has an operating network connection.
	Blinking(1)	There is network activity on the port.
	Off	The port has no network connection.

(1) For blink rate, see page 9.

DRAFT

10-port Fast Ethernet Switches

This illustration shows the status indicators on the 1783-US6T2TG2F and 1783-US6T2TG2H switches.

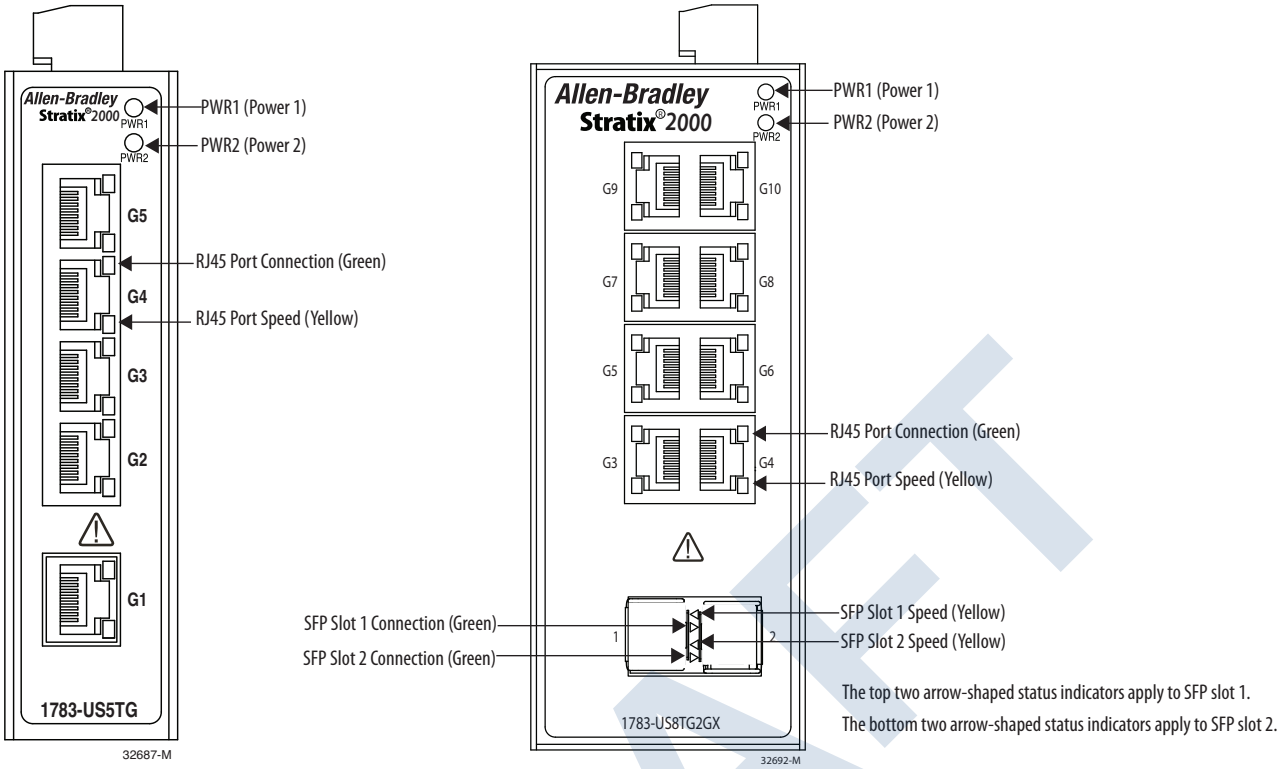


Indicator	Status	Description
PWR1	On	PWR1 is connected and operates normally.
	Off	PWR1is not connected or operates abnormally.
PWR2	On	PWR2 is connected and operates normally.
	Off	PWR2 is not connected or operates abnormally.
RJ45 Fast Ethernet port connection (green)	On	The port has an operating network connection.
	Blinking	There is network activity on the port.
	Off	The port has no network connection. For the blink rate, see page 9.
RJ45 Fast Ethernet port speed (yellow)	On	The port is operating at 100 Mbps (100Base-TX).
	Off	The port is operating at 10 Mbps, or the port has no network connection.
RJ45 Gigabit Ethernet port connection (green)	On	The port has an operating network connection.
	Blinking	There is network activity on the port. For the blink rate, see page 9.
	Off	The port has no network connection.
RJ45 Gigabit Ethernet port speed (yellow)	On	The port is operating at 1000 Mbps (1000Base-TX).
	Off	The port is operating at 10/100 Mbps (10/100Base-T(X)), or the port has no network connection.
SFP fiber port connection	On	The port has an operating network connection.
	Blinking	There is network activity on the port. For the blink rate, see page 9.
	Off	The port has no network connection.
SFP fiber port speed (yellow)	On	The port is operating at 1000 Mbps (1000Base-X).
	Off	The port is operating at 100 Mbps (100Base-FX), or the port has no network connection. **IMPORTANT:** By default, the switch operates at 100 Mbps and the SFP fiber port speed indicator is Off.

DRAFT

16- and 18-port Fast Ethernet Switches

These illustrations show the status indicators on the 1783-US16T and 1783-US16T2S switches.



Indicator	Status	Description
PWR1	On	PWR1 is connected and operates normally.
	Off	PWR1is not connected or operates abnormally.
PWR2	On	PWR2 is connected and operates normally.
	Off	PWR2 is not connected or operates abnormally.
RJ45 port connection (green)	On	The port has an operating network connection.
	Blinking(2)	There is network activity on the port.
	Off	The port has no network connection.
RJ45 port speed (yellow)	On	The port is operating at 100 Mbps (100Base-TX).
	Off	The port is operating at 10 Mbps, or the port has no network connection.
SFP slot status(1)	On	The port has an operating network connection.
	Blinking(2)	There is network activity on the port.
	Off	The port has no network connection.

(1) Available only on 1783-US16T2S switches.
(2) For blink rate, see page 9.

DRAFT

5- and 10-port Gigabit Ethernet Switches

These illustrations show the status indicators on the 1783-US5TG and 1783-US8TG2GX switches.

Indicator	Status	Description
PWR1	On	PWR1 is connected and operates normally.
	Off	PWR1is not connected or operates abnormally.
PWR2	On	PWR2 is connected and operates normally.
	Off	PWR2 is not connected or operates abnormally.
RJ45 port connection (green)	On	The port has an operating network connection.
	Blinking	There is network activity on the port.
	Off	The port has no network connection.
RJ45 port speed (yellow)	On	The port is operating at 1000 Mbps (1000Base-TX).
	Off	The port is operating at 10/100 Mbps (10/100Base-TX), or the port has no network connection.
SFP slot speed (yellow)(1)	On	The port is operating at 1000 Mbps (1000Base-X).
	Off	The port is operating at 100 Mbps (100Base-FX), or the port has no network connection.
SFP slot connection (green)(1)	On	The port has an operating network connection.
	Blinking	There is network activity on the port.
	Off	The port has no network connection.

(1) Available only on 1783-US8TG2GX switches.

DRAFT

Status Indicator Blink Rate

A port status indicator blinks to indicate network activity on the port. The rate at which a status indicator blinks varies by catalog number.

Cat. No.	Rate
1783-US5T	105 ms
1783-US5TG	84 ms

PULS

DIMENSION CP-Series

CP5.241, CP5.241-C1, CP5.241-S1, CP5.241-S2, CP5.242

24V, 5A, 120W, SINGLE PHASE INPUT

POWER SUPPLY

- AC 100-240V Wide-range Input
- Width only 32mm
- Efficiency up to 94.3%
- Excellent Partial Load Efficiency
- 20% Output Power Reserves
- Easy Fuse Breaking – 3 times nominal current for 12ms
- Safe Hiccup^{PLUS} Overload Mode
- Active Power Factor Correction (PFC)
- Minimal Inrush Current Surge
- Full Power Between -25°C and +60°C
- DC-OK Relay Contact
- 3 Year Warranty

PRODUCT DESCRIPTION

The Dimension CP-Series are cost optimized power supplies without compromising quality, reliability and performance. The CP-Series is part of the DIMENSION power supply family.

The CP5.241 power supplies come with three connection terminal options: screw, spring-clamp or push-in terminals, which are optimized for automated wiring.

The CP5.241-C1 is equipped with conformal coated pc-boards preferred for the use in harsh environments and the CP5.242 features an enhanced DC input voltage range.

The most outstanding features of these units are the small size, the high efficiency, the electronic inrush current limitation, active PFC and the wide operational temperature range. The devices have a power reserve of 20% included, which may even be used continuously at temperatures up to +45°C. Additionally, they can deliver 3 times the nominal output current for 12ms which helps to trip fuses on faulty output branches.

High immunity to transients and power surges as well as low electromagnetic emission, a DC-OK signal contact for remote monitoring, and a large international approval package for a variety of applications makes this unit suitable for nearly every situation.

SHORT-FORM DATA

Output voltage	DC 24V	Nominal
Adjustment range	24 - 28V	Factory setting 24.1V
Output current	6.0 - 5.1A	Below +45°C ambient
	5.0 – 4.3A	At +60°C ambient
	3.8 – 3.2A	At +70°C ambient
	Derate linearly between +45°C and +70°C	
Input voltage AC	AC 100-240V	-15%/+10%
Mains frequency	50-60Hz	±6%
Input current AC	1.09 / 0.6A	At 120 / 230Vac
Power factor	0.98 / 0.91	At 120 / 230Vac
Input voltage DC	DC 110-150V ±20%	For CP5.241 (-xx)
	DC 110-300V ±20%	For CP5.242
Input current DC	1.21 / 0.43A	At 110 / 300Vdc
AC Inrush current	4 / 4A	At 120 / 230Vac
Efficiency	93.6 / 94.3%	At 120 / 230Vac
Losses	8.2 / 7.3W	At 120 / 230Vac
Hold-up time	35 / 35ms	At 120 / 230Vac
Temperature range	-25°C to +70°C	
Size (WxHxD)	32x124x102mm	Without DIN-rail
Weight	440g / 0.97lb

TERMINOLOGY AND ABREVIATIONS

PE and ⏚ symbol	PE is the abbreviation for **P**rotective **E**arth and has the same meaning as the symbol ⏚.
Earth, Ground	This document uses the term "earth" which is the same as the U.S. term "ground".
T.b.d.	To be defined, value or description will follow later.
AC 230V	A figure displayed with the AC or DC before the value represents a nominal voltage with standard tolerances (usually ±15%) included. E.g.: DC 12V describes a 12V battery disregarding whether it is full (13.7V) or flat (10V)
230Vac	A figure with the unit (Vac) at the end is a momentary figure without any additional tolerances included.
50Hz vs. 60Hz	As long as not otherwise stated, AC 230V parameters are valid at 50Hz mains frequency.
may	A key word indicating flexibility of choice with no implied preference.
shall	A key word indicating a mandatory requirement.
should	A key word indicating flexibility of choice with a strongly preferred implementation.

1. INTENDED USE

This device is designed for installation in an enclosure and is intended for commercial use, such as in industrial control, process control, monitoring and measurement equipment or the like.

Do not use this device in equipment where malfunction may cause severe personal injury or threaten human life.

If this device is used in a manner outside of its specification, the protection provided by the device may be impaired.

2. INSTALLATION INSTRUCTIONS

⚠ Risk of electrical shock, fire, personal injury or death.

- Turn power off before working on the device. Protect against inadvertent re-powering.
- Do not modify or repair the unit.
- Do not open the unit as high voltages are present inside.
- Use caution to prevent any foreign objects from entering the housing.
- Do not use in wet locations or in areas where moisture or condensation can be expected.
- Do not touch during power-on, and immediately after power-off. Hot surfaces may cause burns.

Obey the following installation instructions:

This device may only be installed and put into operation by qualified personnel.

This device does not contain serviceable parts. The tripping of an internal fuse is caused by an internal defect.

If damage or malfunction should occur during installation or operation, immediately turn power off and send unit to the factory for inspection.

Install the device in an enclosure providing protection against electrical, mechanical and fire hazards.

Install the device onto a DIN-rail according to EN 60715 with the input terminals on the bottom of the device. Other mounting orientations require a reduction in output current.

Make sure that the wiring is correct by following all local and national codes. Use appropriate copper cables that are designed for a minimum operating temperature of 60°C for ambient temperatures up to +45°C, 75°C for ambient temperatures up to +60°C and 90°C for ambient temperatures up to +70°C. Ensure that all strands of a stranded wire enter the terminal connection. Use ferrules for wires on the input terminals. Unused screw terminals should be securely tightened.

The device is designed for pollution degree 2 areas in controlled environments. No condensation or frost is allowed.

The enclosure of the device provides a degree of protection of IP20.

The isolation of the device is designed to withstand impulse voltages of overvoltage category III according to IEC 60664-1.

The device is designed as “Class of Protection I” equipment according to IEC 61140. Do not use without a proper PE (Protective Earth) connection.

The device is suitable to be supplied from TN, TT or IT mains networks. The continuous voltage between the input terminal and the PE potential must not exceed 300Vac.

The input can also be powered from batteries or similar DC sources. The continuous voltage between the supply voltage and the PE/ground potential must not exceed 360Vdc.

A disconnecting means shall be provided for the input of the device.

The device is designed for convection cooling and does not require an external fan. Do not obstruct airflow and do not cover ventilation grid!

The device is designed for altitudes up to 5000m (16400ft). Above 2000m (6560ft) a reduction in output current and over voltage category is required.

DRAFT

Keep the following minimum installation clearances: 40mm on top, 20mm on the bottom, 5mm left and right side. Increase the 5mm to 15mm in case the adjacent device is a heat source. When the device is permanently loaded with less than 50%, the 5mm can be reduced to zero.

The device is designed, tested and approved for branch circuits up to 32A (IEC) and 30A (UL) without additional protection device. If an external fuse is utilized, do not use circuit breakers smaller than 6A B- or C-Characteristic to avoid a nuisance tripping of the circuit breaker.

The maximum surrounding air temperature is +70°C (+158°F). The operational temperature is the same as the ambient or surrounding air temperature and is defined 2cm below the device.

The device is designed to operate in areas between 5% and 95% relative humidity.

DRAFT

3. AC-INPUT

The device is suitable to be supplied from TN, TT or IT mains networks with AC voltage. For suitable DC supply voltages see chapter 4.

AC input	Nom.	AC 100-240V	
AC input range	Min.	85-264Vac	Continuous operation
	Min.	264-300Vac	Occasionally for maximal 500ms
Allowed voltage L or N to earth	Max.	300Vac	Continuous, according to IEC 60664-1
Input frequency	Nom.	50–60Hz	±6%
Turn-on voltage	Typ.	80Vac	Steady-state value, see Fig. 3-1
Shut-down voltage	Typ.	74Vac	Steady-state value, see Fig. 3-1
External input protection	See recommendations in chapter 2.		

		AC 100V	AC 120V	AC 230V	
Input current	Typ.	1.30A	1.09A	0.60A	At 24V, 5A, see Fig. 3-3
Power factor	Typ.	0.99	0.98	0.91	At 24V, 5A, see Fig. 3-4
Crest factor	Typ.	1.7	1.8	2.2	At 24V, 5A, The crest factor is the mathematical ratio of the peak value to RMS value of the input current waveform.
Start-up delay	Typ.	420ms	380ms	385ms	See Fig. 3-2
Rise time	Typ.	80ms	80ms	80ms	At 24V, 5A const. current load, 0mF load capacitance, see Fig. 3-2
	Typ.	100ms	100ms	110ms	At 24V, 5A const. current load, 5mF load capacitance,, see Fig. 3-2
Turn-on overshoot	Max.	200mV	200mV	200mV	See Fig. 3-2

Fig. 3-1 **Input voltage range**

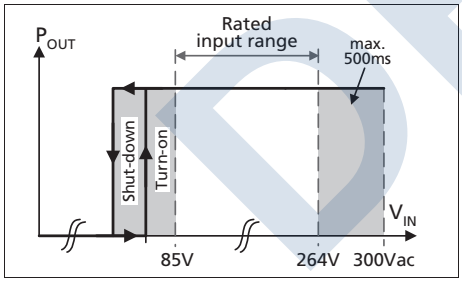

Fig. 3-2 **Turn-on behavior, definitions**

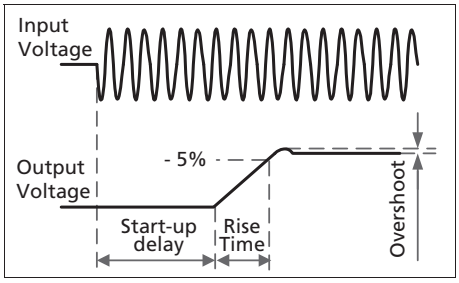

Fig. 3-3 **Input current vs. output current at 24V output voltage**

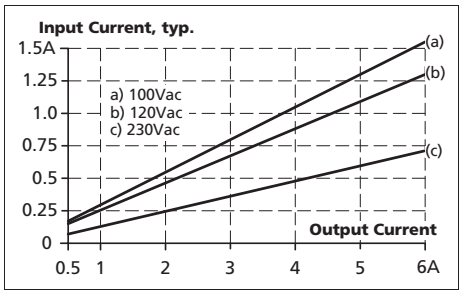

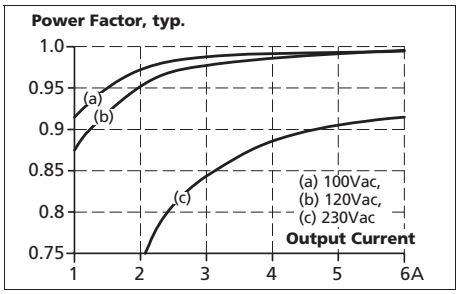

Fig. 3-4 **Power factor vs. output current at 24V output voltage**

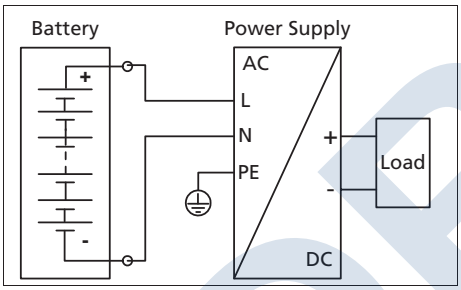
DRAFT



4. DC-INPUT

The device is suitable to be supplied from a DC input voltage. Use a battery or a similar DC source. A supply from the intermediate DC-bus of a frequency converter is not recommended and can cause a malfunction or damage the unit.

Connect +pole to L, –pole to N and the PE terminal to an earth wire or to the machine ground.

DC input	Nom.	DC 110-150V	±20% For CP5.241, CP5.241-C1, CP5.241-S1, CP5.241-S2
	Nom.	DC 110-300V	±20% For CP5.242
DC input range	Min.	88-180Vdc	Continuous operation For CP5.241, CP5.241-C1, CP5.241-S1, CP5.241-S2
		88-360Vdc	Continuous operation for CP5.242
DC input current	Typ.	1.21A	At 110Vdc, at 24V, 5A
	Typ.	0.43A	At 300Vdc, at 24V, 5A
Allowed Voltage (+) or (-) input to Earth	Max.	360Vdc	Continuous according to IEC 60664-1
Turn-on voltage	Typ.	74Vdc	Steady state value
Shut-down voltage	Typ.	67Vdc	Steady state value

Fig. 4-1 **Wiring for DC Input**

DRAFT

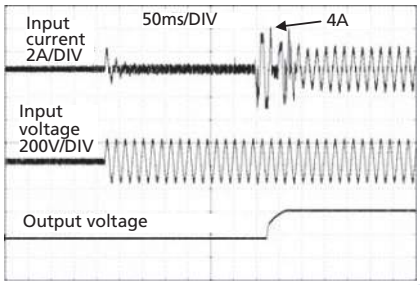
5. INPUT INRUSH CURRENT

An active inrush limitation circuit (NTCs, which are bypassed by a relay contact) limits the input inrush current after turn-on of the input voltage.

The charging current into EMI suppression capacitors is disregarded in the first microseconds after switch-on.

		AC 100V	AC 120V	AC 230V	
Inrush current	Max.	$8A_{peak}$	$7A_{peak}$	$7A_{peak}$	At 40°C, cold start
	Typ.	$5A_{peak}$	$4A_{peak}$	$4A_{peak}$	At 25°C, cold start
	Typ.	$5A_{peak}$	$5A_{peak}$	$6A_{peak}$	At 40°C, cold start
Inrush energy	Max.	$0.4A^2s$	$0.5A^2s$	$1A^2s$	At 40°C, cold start

Fig. 5-1 **Typical turn-on behaviour at nominal load, 120Vac input and 25°C ambient**



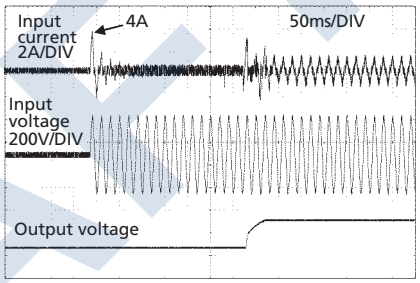


Fig. 5-2 **Typical turn-on behaviour at nominal load, 230Vac input and 25°C ambient**

DRAFT

6. OUTPUT

The output provides a SELV/PELV rated voltage, which is galvanically isolated from the input voltage.

The output is designed to supply any kind of loads, including capacitive and inductive loads. If extreme large capacitors, such as EDLCs (electric double layer capacitors or "UltraCaps") with a capacitance > 0.3F are connected to the output, the unit might charge the capacitor in an intermittent mode.

The output is electronically protected against overload, no-load and short-circuits. In case of a protection event, audible noise may occur.

Output voltage	Nom.	24V	
Adjustment range	Min.	24-28V	Guaranteed value
	Max.	30.0V	This is the maximum output voltage which can occur at the clockwise end position of the potentiometer due to tolerances. It is not a guaranteed value which can be achieved.
Factory settings	Typ.	24.1V	±0.2%, at full load and cold unit
Line regulation	Max.	10mV	Between 85 and 300Vac
Load regulation	Max.	50mV	Between 0A and 6A, static value, see Fig. 6-1
Ripple and noise voltage	Max.	50mVpp	Load >0.2A, Bandwidth 20Hz to 20MHz, 50Ohm
	Max.	200mVpp	Load <0.2A, Bandwidth 20Hz to 20MHz, 50Ohm
Output current	Nom.	6A[1)]	At 24V and an ambient temperatures below 45°C
	Nom.	5A	At 24V and 60°C ambient temperature
	Nom.	3.8A	At 24V and 70°C ambient temperature
	Nom.	5.1A[1)]	At 28V and an ambient temperatures below 45°C
	Nom.	4.3A	At 28V and 60°C ambient temperature
	Nom.	3.2A	At 28V and 70°C ambient temperature
		Derate linearely between +45°C and +70°	
Fuse breaking current	Typ.	15A	Up to 12ms once every five seconds, see Fig. 6-2. The fuse braking current is an enhanced transient current which helps to trip fuses on faulty output branches. The output voltage stays above 20V.
Overload behaviour		Continuous current	For output voltage above 13Vdc, see Fig. 6-1
		Intermittent current[2)]	For output voltage below 13Vdc, see Fig. 6-1
Overload/ short-circuit current	Max.	7.2A	Continuous current, see Fig. 6-1
	Typ.	9A	Intermitted current peak value for typ. 1s Load impedance 50mOhm, see Fig. 6-3 Discharge current of output capacitors is not included.
	Max.	3.5A	Intermitted current average value (R.M.S.) Load impedance 50mOhm, see Fig. 6-3
Output capacitance	Typ.	1 800µF	Included inside the power supply
Back-feeding loads	Max.	35V	The unit is resistant and does not show malfunctioning when a load feeds back voltage to the power supply. It does not matter whether the power supply is on or off. The absorbing energy can be calculated according to the built-in large sized output capacitor.

1) This current is also available for temperatures up to +70°C with a duty cycle of 10% and/ or not longer than 1 minute every 10 minutes.

2) At heavy overloads (when output voltage falls below 13V), the power supply delivers continuous output current for 1s. After this, the output is switched off for approx. 9s before a new start attempt is automatically performed. This cycle is repeated as long as the overload exists. If the overload has been cleared, the device will operate normally. See Fig. 6-3.

DRAFT

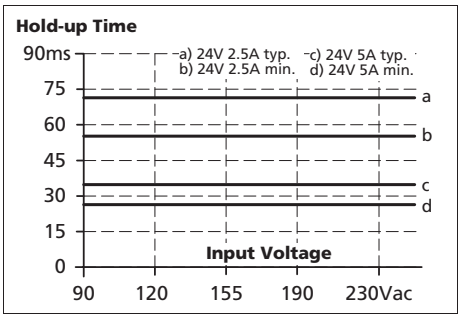
7. HOLD-UP TIME

The hold-up time is the time during which a power supply's output voltage remains within specification following the loss of input power. The hold-up time is output load dependent. At no load, the hold-up time can be up to several seconds. The green DC-ok lamp is also on during this time.

		AC 100V	AC 120V	AC 230V	
Hold-up Time	Typ.	70ms	70ms	70ms	At 24V, 2.5A, see Fig. 7-1
	Min.	55ms	55ms	55ms	At 24V, 2.5A, see Fig. 7-1
	Typ.	35ms	35ms	35ms	At 24V, 5A, see Fig. 7-1
	Min.	27ms	27ms	27ms	At 24V, 5A, see Fig. 7-1

Fig. 7-1 **Hold-up time vs. input voltage**



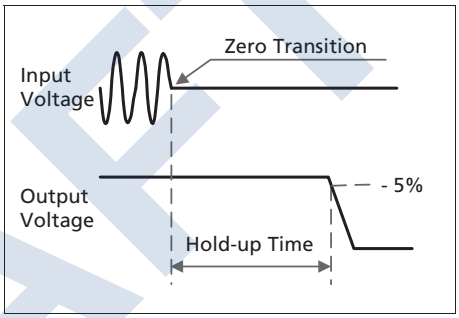


Fig. 7-2 **Shut-down behavior, definitions**

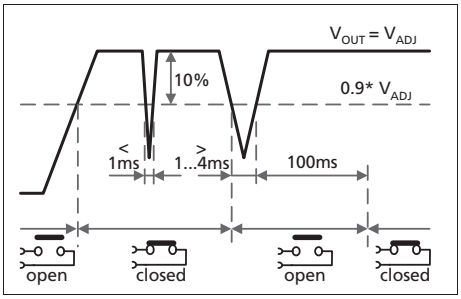

8. DC-OK RELAY CONTACT

This feature monitors the output voltage on the output terminals of a running power supply.

Contact closes	As soon as the output voltage reaches typ. 90% of the adjusted output voltage level.
Contact opens	As soon as the output voltage dips more than 10% below the adjusted output voltage. Short dips will be extended to a signal length of 100ms. Dips shorter than 1ms will be ignored.
Switching hysteresis	Typically 0.7V
Contact ratings	Maximal 60Vdc 0.3A, 30Vdc 1A, 30Vac 0.5A, resistive load Minimal permissible load: 1mA at 5Vdc
Isolation voltage	See dielectric strength table in section 18.

Fig. 8-1 **DC-ok relay contact behavior**

DRAFT

9. EFFICIENCY AND POWER LOSSES

		AC 100V	AC 120V	AC 230V	
Efficiency	Typ.	92.9%	93.6%	94.3%	At 24V, 5A
	Typ.	92.7%	93.5%	94.5%	At 24V, 6A (Power Boost)
Average efficiency*)	Typ.	91.3%	91.7%	92.0%	25% at 1.25A, 25% at 2.5A, 25% at 3.75A. 25% at 5A
Power losses	Typ.	1.3W	1.3W	1.4W	At 24V, 0A
	Typ.	4.6W	4.4W	4.1W	At 24V, 2.5A
	Typ.	9.2W	8.2W	7.3W	At 24V, 5A
	Typ.	11.3W	9.8W	8.4W	At 24V, 6A (Power Boost)

*) The average efficiency is an assumption for a typical application where the power supply is loaded with 25% of the nominal load for 25% of the time, 50% of the nominal load for another 25% of the time, 75% of the nominal load for another 25% of the time and with 100% of the nominal load for the rest of the time.

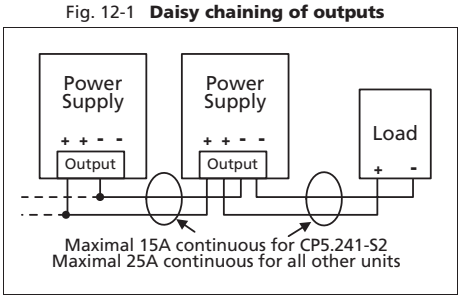
Screwdriver	3.0mm slotted to open the spring	3.0mm slotted to open the spring	3mm slotted to open the spring

Daisy chaining:

Daisy chaining (jumping from one power supply output to the next) is allowed as long as the average output current through one terminal pin does not exceed 25A or 15A for the CP5.241-S2. If the current is higher, use a separate distribution terminal block as shown in Fig. 12-2.

Fig. 12-1 **Daisy chaining of outputs**



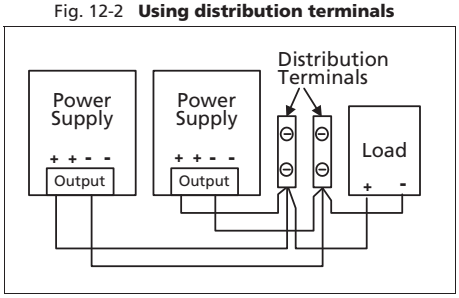


Fig. 12-2 **Using distribution terminals**

DRAFT

13. LIFETIME EXPECTANCY

The Lifetime expectancy shown in the table indicates the minimum operating hours (service life) and is determined by the lifetime expectancy of the built-in electrolytic capacitors. Lifetime expectancy is specified in operational hours and is calculated according to the capacitor's manufacturer specification. The manufacturer of the electrolytic capacitors only guarantees a maximum life of up to 15 years (131 400h). Any number exceeding this value is a calculated theoretical lifetime which can be used to compare devices.

	AC 100V	AC 120V	AC 230V	
Lifetime expectancy	265 000h	270 000h	274 000h	At 24V, 2.5A and 40°C
	748 000h	764 000h	775 000h	At 24V, 2.5A and 25°C
	128 000h	143 000h	166 000h	At 24V, 5A and 40°C
	363 000h	405 000h	469 000h	At 24V, 5A and 25°C
	81 000h	96 000h	119 000h	At 24V, 6A and 40°C
	228 000h	271 000h	336 000h	At 24V, 6A and 25°C

14. MTBF

MTBF stands for **M**ean **T**ime **B**etween **F**ailure, which is calculated according to statistical device failures, and indicates reliability of a device. It is the statistical representation of the likelihood of a unit to fail and does not necessarily represent the life of a product.

The MTBF figure is a statistical representation of the likelihood of a device to fail. A MTBF figure of e.g. 1 000 000h means that statistically one unit will fail every 100 hours if 10 000 units are installed in the field. However, it can not be determined if the failed unit has been running for 50 000h or only for 100h.

For these types of units the MTTF (**M**ean **T**ime **T**o **F**ailure) value is the same value as the MTBF value.

	AC 100V	AC 120V	AC 230V	
MTBF SN 29500, IEC 61709	800 000h	807 000h	867 000h	At 24V, 5A and 40°C
	1 402 000h	1 414 000h	1 510 000h	At 24V, 5A and 25°C
MTBF MIL HDBK 217F	339 000h	343 000h	368 000h	At 24V, 5A and 40°C; Ground Benign GB40
	490 000h	496 000h	529 000h	At 24V, 5A and 25°C; Ground Benign GB25

	109 000h	111 000h	119 000h	At 24V, 5A and 25°C; Ground Fixed GF25

DRAFT

15. EMC

The EMC behavior of the device is designed for applications in industrial environment as well as in residential, commercial and light industry environments.

The device is investigated according to EN 61000-6-1, EN 61000-6-2, EN 61000-6-3 and EN 61000-6-4.

EMC Immunity

Electrostatic discharge	EN 61000-4-2	Contact discharge Air discharge	8kV 15kV	Criterion A Criterion A
Electromagnetic RF field	EN 61000-4-3	80MHz-2.7GHz	20V/m	Criterion A
Fast transients (Burst)	EN 61000-4-4	Input lines Output lines DC-OK signal (coupling clamp)	4kV 2kV 2kV	Criterion A Criterion A Criterion A
Surge voltage on input	EN 61000-4-5	L → N L → PE, N → PE	2kV 4kV	Criterion A Criterion A
Surge voltage on output	EN 61000-4-5	+ → - + / - → PE	1kV 2kV	Criterion A Criterion A
Surge voltage on DC-OK	EN 61000-4-5	DC-OK signal → PE	1kV	Criterion A
Conducted disturbance	EN 61000-4-6	0.15-80MHz	20V	Criterion A
Mains voltage dips	EN 61000-4-11	0% of 100Vac 40% of 100Vac 70% of 100Vac 0% of 200Vac 40% of 200Vac 40% of 200Vac 70% of 200Vac	0Vac, 20ms 40Vac, 200ms 70Vac, 500ms 0Vac, 20ms 80Vac, 200ms, <4A 80Vac, 200ms, >4A 140Vac, 500ms	Criterion A Criterion C Criterion A Criterion A Criterion A Criterion C Criterion A
Voltage interruptions	EN 61000-4-11	0% of 200Vac (=0V)	5000ms	Criterion C
Powerful transients	VDE 0160	Over entire load range	750V, 0.3ms	Criterion A

Performance criterions:
A: The device shows normal operation behavior within the defined limits.
C: Temporary loss of function is possible. The device may shut-down and restarts by itself. No damage or hazards for the device will occur.

EMC Emission

Conducted emission input lines	EN 55011, EN 55022, FCC Part 15, CISPR 11, CISPR 22	Class B
Conducted emission output lines	IEC/CISPR 16-1-2, IEC/CISPR 16-2-1	Limits for local DC power networks fulfilled
Radiated emission	EN 55011, EN 55022	Class B
Harmonic input current (PFC)	EN 61000-3-2	Fulfilled for Class A equipment
Voltage fluctuations, flicker	EN 61000-3-3	Fulfilled, tested with constant current loads, non pulsing

This device complies with FCC Part 15 rules.
Operation is subjected to following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Switching Frequencies

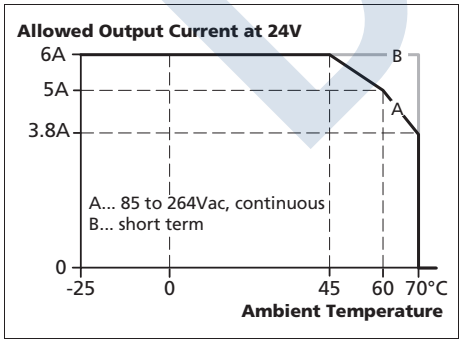
PFC converter	30kHz to 140kHz	Input voltage and output load dependent
Main converter	60kHz to 140kHz	Output load dependent
Auxiliary converter	30kHz to 60kHz	Output load dependent

DRAFT

16. ENVIRONMENT

Operational temperature	-25°C to +70°C (-13°F to 158°F)	Operational temperature is the same as the ambient or surrounding temperature and is defined as the air temperature 2cm below the unit.
Storage temperature	-40°C to +85°C (-40°F to 185°F)	For storage and transportation
Output de-rating	1.6W/°C 3W/°C 0.33A/1000m or 5°C/1000m	Between +45°C and +60°C (113°F to 140°F) Between +60°C and +70°C (140°F to 158°F) For altitudes >2000m (6560ft), see Fig. 16-2
	The de-rating is not hardware controlled. The user has to take this into consideration to stay below the de-rated current limits in order not to overload the unit.	
Humidity	5 to 95% r.h.	According to IEC 60068-2-30
Atmospheric pressure	110-54kPa	See Fig. 16-2 for details
Altitude	Up to 5000m (16 400ft)	See Fig. 16-2 for details
Over-voltage category	III	According to IEC 60664-1 for altitudes up to 2000m
	II	According to IEC 60664-1, for altitudes above 2000m
Degree of pollution	2	According to IEC 62477-1, not conductive
Vibration sinusoidal	2-17.8Hz: ±1.6mm; 17.8-500Hz: 2g 2 hours / axis	According to IEC 60068-2-6
Shock	30g 6ms, 20g 11ms 3 bumps per direction, 18 bumps in total	According to IEC 60068-2-27
	Shock and vibration is tested in combination with DIN-Rails according to EN 60715 with a height of 15mm and a thickness of 1.3mm and standard orientation.	
LABS compatibility	As a rule, only non-silicon precipitating materials are used. The unit conforms to the LABS criteria and is suitable for use in paint shops.	
Corrosive gases	Tested according to ISA-71.04-1985, Severity Level G3 and IEC 60068-2-60 Test Ke Method 4 for a service life of minimum 10years in these environments.	
Audible noise	Some audible noise may be emitted from the power supply during no load, overload or short circuit.	

Fig. 16-1 **Output current vs. ambient temp.**



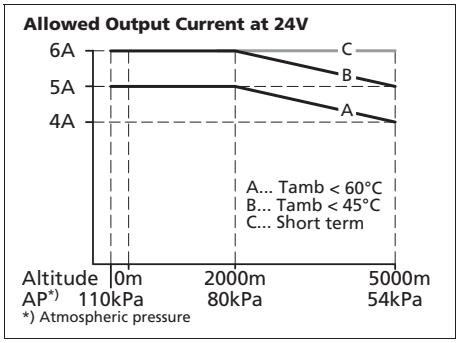


Fig. 16-2 **Output current vs. altitude**

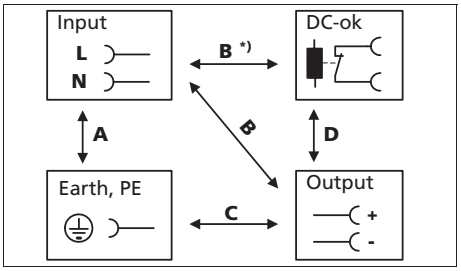
DRAFT

17. SAFETY AND PROTECTION FEATURES

Isolation resistance	Min.	500MOhm	At delivered condition between input and output, measured with 500Vdc
	Min.	500MOhm	At delivered condition between input and PE, measured with 500Vdc
	Min.	500MOhm	At delivered condition between output and PE, measured with 500Vdc
	Min.	500MOhm	At delivered condition between output and DC-OK contacts, measured with 500Vdc
PE resistance	Max.	0.1Ohm	Resistance between PE terminal and the housing in the area of the DIN-rail mounting bracket.
Output over-voltage protection	Typ.	30.5Vdc	
	Max.	32.0Vdc	
		In case of an internal defect, a redundant circuit limits the maximum output voltage. The output shuts down and performs three restart attempts. If the failure continues, the output shuts down. Cycle input power to reset.	
Class of protection		I	According to IEC 61140 A PE (Protective Earth) connection is required
Degree of protection		IP 20	According to EN/IEC 60529
Over-temperature protection		Included	Output shut-down with automatic restart. Temperature sensors are installed on critical components inside the unit and turn the unit off in safety critical situations, which can happen e.g. when ambient temperature is too high, ventilation is obstructed or the de-rating requirements are not followed. There is no correlation between the operating temperature and turn-off temperature since this is dependent on input voltage, load and installation methods.
Input transient protection		MOV (Metal Oxide Varistor)	For protection values see chapter 15 (EMC).
Internal input fuse		Included	Not user replaceable slow-blow high-braking capacity fuse
Touch current (leakage current)	Typ.	0.10mA / 0.27mA	At 100Vac, 50Hz, TN-,TT-mains / IT-mains
	Typ.	0.13mA / 0.38mA	At 120Vac, 60Hz, TN-,TT-mains / IT-mains
	Typ.	0.20mA / 0.60mA	At 230Vac, 50Hz, TN-,TT-mains / IT-mains
	Max.	0.13mA / 0.35mA	At 110Vac, 50Hz, TN-,TT-mains / IT-mains
	Max.	0.17mA / 0.51mA	At 132Vac, 60Hz, TN-,TT-mains / IT-mains
	Max.	0.27mA / 0.81mA	At 264Vac, 50Hz, TN-,TT-mains / IT-mains

DRAFT

18. DIELECTRIC STRENGTH



The output voltage is floating and has no ohmic connection to the ground.

The output is insulated to the input by a double or reinforced insulation.

Type and routine tests are conducted by the manufacturer. Field tests may be conducted in the field using the appropriate test equipment which applies the voltage with a slow ramp (2s up and 2s down). Connect all input-terminals together as well as all output poles before conducting the test. When testing, set the cut-off current settings to the value in the table below.

We recommend that either the + pole or the – pole shall be connected to the protective earth system. This helps to avoid situations in which a load starts unexpectedly or can not be switched off when unnoticed earth faults occur.

Fig. 18-1 **Dielectric strength**

		A	B	C	D
Type test	60s	2500Vac	3000Vac	1000Vac	500Vac
Routine test	5s	2500Vac	2500Vac	500Vac	500Vac
Field test	5s	2000Vac	2000Vac	500Vac	500Vac
Field test cut-off current settings		> 10mA	> 10mA	> 20mA	> 1mA

B*)
When testing input to DC-OK ensure that the maximal voltage between DC-OK and the output is not exceeded (column D). We recommend connecting DC-OK pins and the output pins together when performing the test.

DRAFT

Edco DRS Series

DIN Rail Protection

The Edco DRS Series is a din rail mountable, single pair surge suppression module implementing three-stage hybrid technology. This module addresses over-voltage transients with gas tubes and silicon avalanche components. In addition, sneak currents are mitigated with resetable fuses (PTCs). The PTCs increase resistance several orders of magnitude when over-currents exceed safe levels. A normal state resumes when over-currents are removed. The ability to self-restore in this manner significantly increases suppressor performance and survivability.

The Edco DRS Series mounts onto a standard 35mm industrial din rail. There are three "Field Side" and three "Electronics Side" screw terminals. One is reserved for a shield. Three electrically tied ground terminals are provided for grounding the Edco DRS Series unit to Building-Approved Ground. Shield is isolated from ground. For a 2-terminal version without a shield, order the Edco DRS-xxx-2.

UL® 497B

General Technical Specifications

Part Number	Max Peak Signal Voltage	Nominal Breakdown Voltage	Max Current Ip 10x1000?s (Occurrences)	Peak Current 8x20?s	Typ Cap (pf)	Max Continuous Current	Nominal Series Resistance

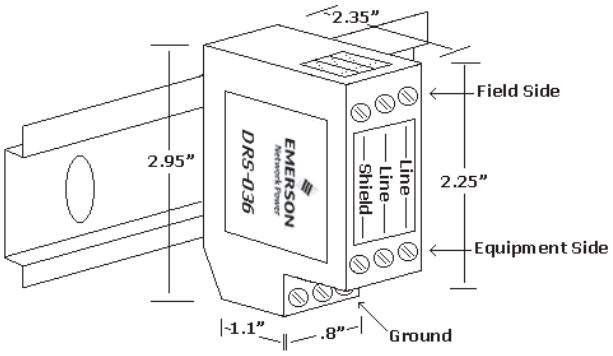
*DRS-130 RMS	170	200	>10	8KA	1500	5A	None

* *WARNING!! Edco DRS-130 RMS is for Discrete Signal Use Only. Do not use Edco DRS-130 RMS on 120 VAC Power Lines. This unit is a Non-Hybrid, MOV design, rated above 5A operational current and can withstand greater than eight occurrences of a 10kA 8x20µs waveform, and greater than 1000 occurrences of a 200A 10x1000µs waveform.*



Features

- Low-voltage data surge protection
- Three-stage hybrid protection
- Sneak/fault current protection with resettable fuses (PTCs)
- Low profile packaging
- Easy installation
- Fits standard 35mm din rail
- Fast response time <1 nanosecond
- UL 497B Listed
- 5 year warranty

EMERSON
Network Power

Installation

3-Terminal Device

2-Terminal Device

Maximum Wire Size = 12 AWG

Installation Instructions

Read and Understand These Instructions:

These protectors are intended for indoor use on communication loop circuits which have been isolated from the Public Switch Telephone Network.

The communication loop circuits shall not be exposed to accidental contact with the electric light or power conductors. The protectors shall be installed per the applicable requirements of the National Electric Code, ANSI/NFPA 70.

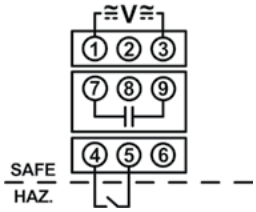
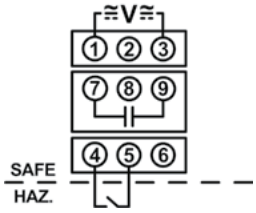
The ISE Series of Intrinsically Safe Relays provide a safe and reliable method to control a single load (motor starters, relays, etc.) with a single input device (switches, sensors, etc.) located in a hazardous area. These products are approved for use in Class I Groups A, B, C, D, Class II Groups E, F, G, and Class III Hazardous Locations (Zones 0 & 1 in Canada). The ISE Series relay must be mounted in a safe area, following Macromatic Control Drawing Number ISD2A01, as shown in Instruction Sheet 901-0000-329.

The ISE Series relays utilize a compact 17.5mm wide enclosure that can be both mounted on 35mm DIN rail or panel-mounted with two screws. Hazardous terminals are on the bottom of the unit for easy access in the enclosure to incoming wiring from the hazardous area and are clearly marked.

Standard Operation





Each ISE Series relay consists of an intrinsically safe input and a corresponding electromechanical relay output. There is one bi-color LED for status indication. With input voltage applied, the LED will be ON (Green) to indicate power is applied.

When the input device from the hazardous area is *closed*, the output relay is energized and the LED is ON (Orange). When the input device *opens*, the output relay will de-energize and the LED will be ON (Green).

Inverted Operation (V-suffix)

Each ISE Series relay consists of an intrinsically safe input and a corresponding electromechanical relay output. There is one bi-color LED for status indication. With input voltage applied, the LED will be ON (GREEN) to indicate power is applied.

When the input device from the hazardous area is *open*, the output relay is energized and the LED is ON (ORANGE). When the input device *closes*, the output relay will be de-energized and the LED will be ON (GREEN).

INPUT VOLTAGE	NUMBER OF CHANNELS	CATALOG NUMBER	WIRING
102-132V AC (50/60Hz) & 10-125V DC	1	ISEUR1	 **DIAGRAM 811**
102-132V AC (50/60Hz) & 10-125V DC	1	ISEUR1V	 **DIAGRAM 811**

DRAFT

1-CHANNEL INTRINSICALLY SAFE RELAYS

ISE Series

Application Data

Input Voltage: 102-132V AC (50/60Hz.) & 10-125V DC

Load (Burden): 2VA Maximum

Input Switch Open Circuit Voltage: 10V DC

Output Contacts:
SPST-NO (Form A) 3A Resistive @ 125V AC @ 60ºC & 30V DC Resistive, Pilot Duty Rating D300

SPST-NO (Form A) 5A Resistive @ 125V AC @ 40ºC & 30V DC Resistive, Pilot Duty Rating D300

Life: Electrical: 50,000 Closures @ Full Load AC
Mechanical: 5 Million Closures @ No Load

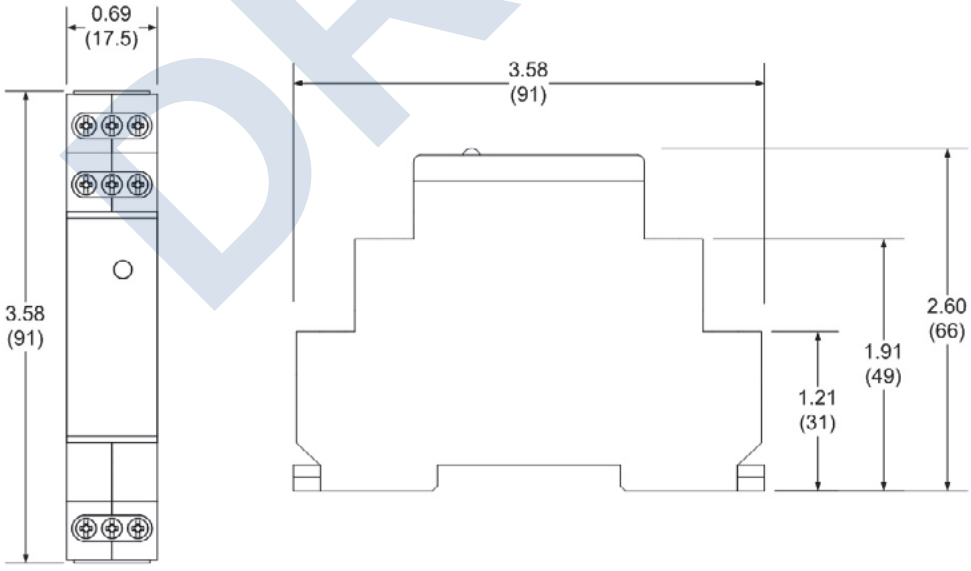
Response Times: < 50ms

Temperature:
Operating: -28º to + 60º C (-18º F to +140º F)
Storage: -55º to +85º C (-67º to 185º F)

LED Indication:
Standard Operation, ON (Green) - Input voltage; ON (Orange) - Input closed and relay energized;
Inverse Operation (V-suffix), ON (Green) - Input voltage; ON (Orange) - Input open and relay energized

Insulation Voltage:
1500 V AC between coil & contacts
750 V AC between open contacts
1500 V AC between hazardous and safe circuits

Wire Sizes:
One #14-24 AWG Conductor or
Two #16 or 18 AWG Conductors



Mounting: Mounts on 35mm DIN-rail or panel-mounted with two #8 screws when DIN-rail clips are fully extended from under the enclosure.

Control Drawing: See Instruction Sheet 901-0000-329, which includes Control Drawing ISD1A04.

INSTALLATION

GracePorts® are intended to be mounted in or on an enclosure product. Installation should be performed by a qualified technician and adhere to applicable regulatory codes. These devices are for mounting on the flat surface of enclosures having the same type environmental ratings.

All installations:

1) Cut panel opening and mount GracePort® assembly to enclosure with gasket.
2) Connect low voltage interface wiring according to documentation provided with unit.

On units configured for optional AC power:

1) Connect outlet device as per code. *Note: It is the responsibility of the installer to ensure adequate separation of high and low voltage circuits in the end-use product.*
2) Ensure that the metal housing is reliably grounded using grounding means provided.

Explosion-Proof Control Stations
"CXI" Series

"When a smaller enclosure is needed for industrial controls, our CXI Series cannot be beat."

Features:

All enclosures are available in NEMA 4X with neoprene gasket for water tight applications.

All enclosures are suitable for surface or panel mounting.

Cast from light - weight corrosion resistant aluminum

Attractive wheelabrate finish

Durable cast mounting feet and easily accessible grounding screw.

Expanded internal space for splicing or terminal blocks.

Available to use with Mini Pilot Device Series (1" center to center)

Ordering Instructions:

All "CXI" enclosures are machined with operator (3/4" NPSM in cover) and standard conduit holes as specified in chart. (Consult factory for custom specifications).

To order NEMA-4 gasket, add suffix "N4" to part number (CXI 333-X1-N4). For Panel Mount Applications (3/4" NPSM in base instead of cover), use prefix "CXP" instead of "CXI" (CXP 333-X1).

To order Junction Box type enclosures, order "AXI" Series Enclosures.

Spacing constraints may apply when using some operator types (Mushroom Head P.B., Illum. P.B., Push to Test P.L., etc.); C/F

Consult factory for terminal installation or custom layouts.

See "order form page" on additional information to customize this enclosure.

Applications:

Locations such as Waste Water Treatment Plant (WWTP), Processing Facilities (Oil, Gas, etc.), Refineries, & Chemical Plants explosion

CXI series can be used for Control Stations, Manual Motor Starters, or Pendant Stations

Try our spacious CXI 484 when Group B is required

Materials:

Enclosures: Copper-free Aluminum (less than 0.25% copper content)

Cover Bolts: Cad-Plated or Stainless Steel (please specify)

Mounting Pan (Opt.): Aluminum*;

Galvanized Steel or Phenolic Materials available upon request.

*Note: Aluminum Mounting Pan will be provided if mounting pan is requested, unless otherwise noted.

Compliances:

N.E.C. - Class. I, Div. 1 & 2 Groups B*, C & D

Class. II, Div. 1 & 2 Groups E, F & G

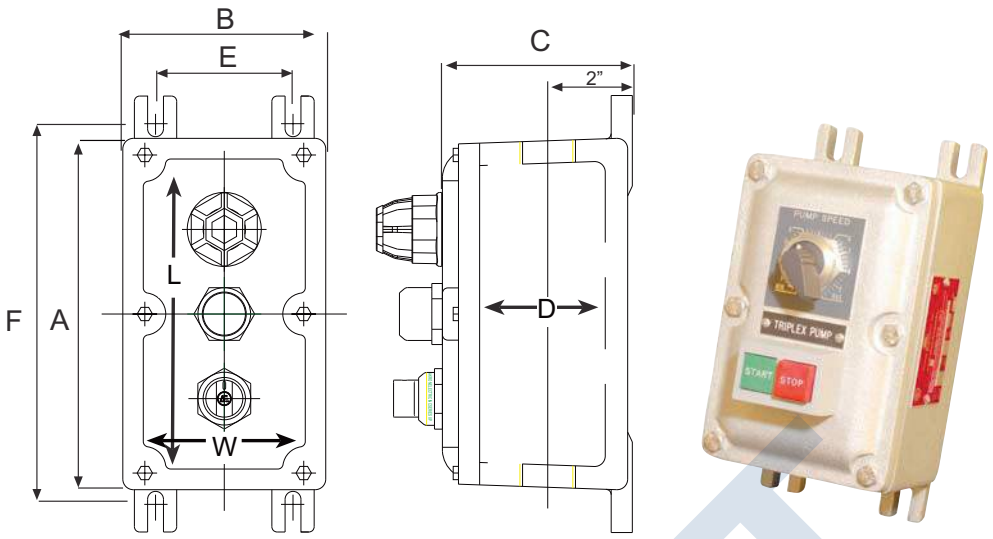
Class. III

NEMA 7 & 9 (Optional 3, 4X)

* - CXI 484 Only

Certificate Number 03.059.1

ISO 9001 With Design



Approvals:

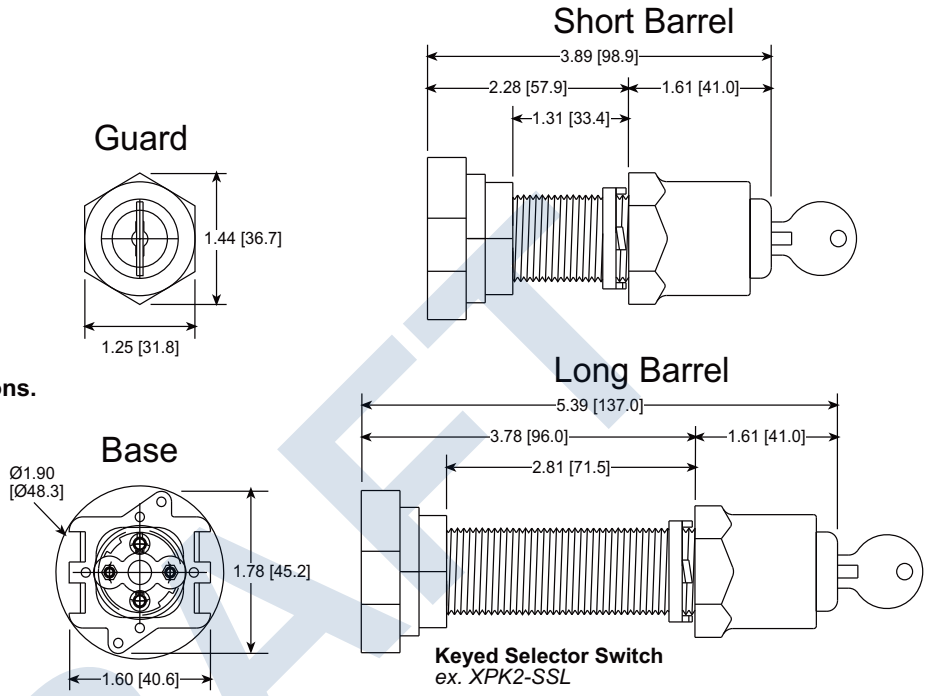
CLASS III,
NEMA TYPE 4, 4X, 7 & 9

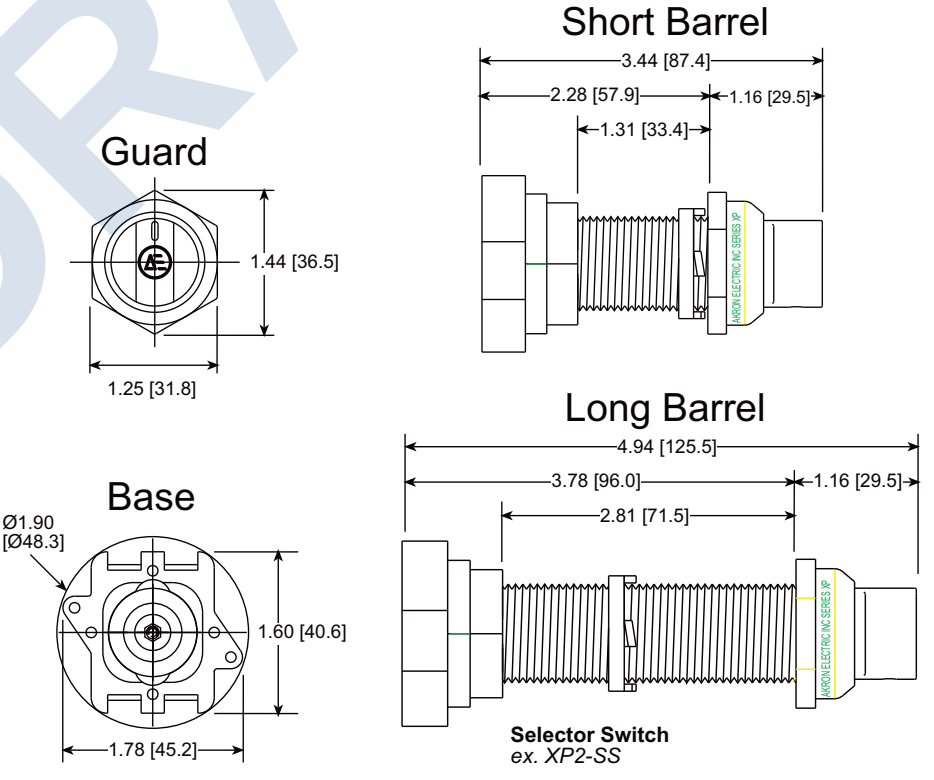
UL 698 Industrial Control Equipment in Hazardous (Classified) Locations.

UL 1203 Explosion-Proof and Dust-Ignition-Proof Electrical Equipment for Use in Hazardous (Classified) Locations.

CSA C22.2 No. 30-LR86146 Explosion-Proof Enclosures for use in Class I Hazardous locations.



FILE NO. E203605
FILE NO. E181300
FILE NO. E139669



LR86146

(Optional)

FEATURES

- Operator bodies are black anodized & teflon impregnated.
- Operating Shafts are stainless steel.
- 3/4-14 NPSM threaded body size
- **Long Series:** Accommodates up to 2-1/2" thick enclosure wall thickness.
- **Short Series:** Accommodates up to 1" thick enclosure wall thickness.
- Explosion-Proof Operators are suitable for panel or surface mount applications.
- See Contact Block Information sheet for mounting and rating information.
- Selector Switches available in 2 or 3 positions (For Keyed - specify key removal position)
- Three unique key configurations available - Specify AE1, AE2, or AE3

CONTINUOUS HINGE, TYPE 4X

INDUSTRY STANDARDS

Mounting brackets required to meet UL/CSA external mounting requirements.

UL 508A Listed; Type 4, 4X, 12, 13; File No. E61997 cUL Listed per CSA C22.2 No 94; Type 4, 4X, 12, 13; File No. E61997 Enclosure flammability evaluated per UL 508A Window flammability evaluated per UL 508A

NEMA/EEMAC Type 4, 4X, 12, 13
IEC 60529, IP66

APPLICATION

The efficient design and simple construction of these enclosures make them durable in corrosive environments, yet aesthetically pleasing. Corner latches provide unobstructed access. The continuous hinge provides a secure seal, and double latching creates added security.

SPECIFICATIONS

- Compression-molded fiberglass has outstanding chemical- and temperature-resistance qualities and exhibits excellent weatherability and physical properties
- Fiberglass is easily punched, drilled, filed or sawed
- Gasket assures watertight and dust-tight seal
- Polyester mounting brackets and stainless steel attachment screws are provided with each enclosure
- Scratch-resistant polycarbonate windows are permanently bonded in place
- Molded-in-place threaded brass inserts and plated steel screws are provided for mounting optional panels and terminal block kits
- Removable hinged cover attached to body with Type 316 stainless steel hinge pin
- Screw-cover enclosures are secured with two captivated Type 316 stainless steel slotted cover screws
- Enclosures with quick-release latches have corrosion-resistant polyester latches located in corners that provide unobstructed access to enclosure
- Hinge pin and bail are corrosion-resistant Type 316 stainless steel
- Padlock provisions included in each latch
- Material is halogen free

FINISH

Standard fiberglass material finish is light-gray inside and out. Optional steel panels are painted white. Optional stainless steel, aluminum, conductive and composite panels are unpainted.

ACCESSORIES

See also Accessories.
H2OMIT Vent Drains, Type 4X
HOL-SEALERS, Non-Metallic Hole Seals
Panels for Junction Boxes
Threaded Panel Extenders
Quick-Release Latch Kit
Swing-Out Panel Kit

MODIFICATION AND CUSTOMIZATION

Hoffman excels at modifying and customizing products to your specifications. Contact your local Hoffman sales office or distributor for complete information.

Overview

SITRANS LT500 is a versatile, single and multi-vessel level monitor/controller for virtually any application in a wide range of industries.

Benefits

- Easy to use HMI display with local four-button programming, menu-driven parameters, and Wizard support for key applications.
- English, German, French, Spanish, Chinese, Italian, Portuguese, Japanese, Danish, Dutch, Swedish, Finnish, Polish, Russian, and Korean texts on the HMI.
- Removable terminal blocks for ease of wiring.
- Digital input for back-up level override from point level device.
- Communication options for HART, Modbus RTU, PROFIBUS PA, PROFIBUS DP, and PROFINET.
- Single or dual point level monitoring.
- Advanced process intelligence echo processing for reliable accurate measurement in difficult applications.
- Auto False-Echo Suppression for fixed obstruction avoidance.
- IQ Guard for health monitoring, NE107 diagnostics, saved echo profiles, event logging, data logging, parameter change logging, hundreds of diagnostics, self check validation, and programming configuration backup/report
- Up to 6 independent programmable relays for pump control, alarms, or remote totalization.
- Level, volume, and flow measurements in open channels, differential control, extended pump control, and alarm functions.
- Wall, panel, and remote panel mounting options.
- Remote configuration via EDD with SIMATIC PDM and SITRANS DTM via USB.
- MCERTS certified for open channel flow.

Application

SITRANS LT500 mA HART version can be used with SITRANS LR110, LR120, Probe LU240 or any level device generating a mA signal. The ultrasonic version can connect any EchoMax or legacy transducer. SITRANS LT500 offers true dual point monitoring and digital communications. SITRANS LT500 is low maintenance and economical. With its advanced control functions, it can operate pumps during lower cost time periods and manage pump rosters for efficiency.

SITRANS LT500 will monitor open channel flow and features advanced relay alarming and pump control functions as well as volume conversion.

- Key Applications: wet wells, flumes/weirs, bar screen control, hoppers, chemical storage, liquid storage, crusher bins, dry solids storage

Design

SITRANS LT500 is available in wall, panel, or remote panel mounting options.

Technical specifications

SITRANS LT500 mA HART version	
Mode of operation	Level, space, distance, volume, flow, head, difference, average, totalization
Sensor input, mA HART version	
Number of inputs	1 or 2
PV measurement	Advanced process intelligence
Terminal voltage	Max. 26 V, Min. 18 V (0 ... 22.6 mA)
Wiring	2 conductor, twisted, shielded, 0.5 ... 0.75 mm² (22 ... 18 AWG)
Max. cable length	500 m (1 640.42 ft)
Sensor input communication	• 4 ... 20 mA • HART protocol, for supported sensors: SITRANS LR110, LR120, SITRANS Probe LU240
4 ... 20 mA sensor input	
• Resolution	0.025 % of full scale
• Accuracy	0.1 % of full scale
HART sensor input	Resolution, range, and accuracy are dependent on connected sensor
Digital input	
Quantity	2
Switching threshold, low	0 ... 0.5 V DC
Switching threshold, high	10 ... 50 V DC
Input current	Max. 3 mA
Bias voltage	24 V
Analog output	
Quantity	1 or 2
Range	0 ... 20 mA or 4 ... 20 mA isolated
• Max. load	750 Ω
• Resolution	0.1 % of range
Accuracy	±20 µA
Startup current	3.6 mA
Fail-safe	Programmable as high, low, last reliable, set value, or hold per NAMUR NE43
Wiring	2 conductor, twisted, shielded, 0.5 ... 0.75 mm² (22 ... 18 AWG)
Relay output	
Quantity	Up to 6, 4 form A and 2 form C
Rating	5 A at 250 V AC, 5 A at 30 V DC, non-inductive
Durability	50 000 operations min. per relay (5 A at 30 V DC, resistive load)
Fail-safe	Programmable as energized, de-energized, or hold
Wiring	Copper conductors per local requirements to meet 250 V 5 A contact rating
Rated operating conditions	
Installation conditions	
• Location	Indoor/outdoor
• Installation category	II
• Pollution degree	4
Ambient conditions	
• Ambient temperature	-20 ... +50 °C (-4 ... +122 °F)
• Storage temperature	-20 ... +50 °C (-4 ... +122 °F)
• Humidity	Maximum relative humidity 80 % for temperatures up to 31 °C decreasing linearly to 50 % relative humidity at 40 °C
• Altitude	2 000 m (6 565 ft) maximum
• Vibration resistence	
- Vibration broad-band random, according to IEC 60068-2-64	• 10 ... 200 Hz, 0.0104 g²/Hz • 200 ... 500 Hz, 0.005 g²/Hz

Technical specifications (continued)

SITRANS LT500 mA HART version	
- Vibration non-stationary including shock, according to IEC 60068-2-27	• Peak Acceleration: 25 g • Duration: 6 ms • Number of impacts per direction: 1 000 • Impact directions: 6
• Bump/shock resistence	25 g
EMC performance	IEC/EN 61326-1, EN 55011 (Class A)
Design	
Weight	
• Wall mount	1.22 kg (2.68 lb)
• Panel mount	1.35 kg (2.97 lb)
• Remote panel mount	1.73 kg (3.80 lb)
Enclosure	
• Material	Polycarbonate
• Degree of protection	
• Wall mount	IP65/Type 4X
• Panel mount	IP54/Type 3
• Remote panel mount	IP65/Type 3 (front panel), IP20 (enclosure)
UV exposure	F1 rating per UL746C
Display and control	
• LCD display	60 x 40 mm (2.36 x 1.57 inch) LCD, 240 x 160 pixels resolution
• Menu navigation	4 push button keys
Update time	1 second or less
Memory	Program and parameters stored in non-volatile Flash memory
Real time clock memory retention without power	48 hours
CPU speed	96 MHz
Memory card	8 GB Industrial micro SD
Power supply	
AC version	100 ... 230 V AC, ±15 %, 50/60 Hz, 36 VA (17 W)
DC version	12 ... 30 V DC (20 W)
Certificates and approvals	• CE, UKCA, RCM, EAC, FM, $_{C}CSA_{US}$, $_{C}UL_{US}$ • $_{C}CSA_{US}$ Class I, Div. 2, Group A, B, C and D; Class II, Div 2, Group F & G; Class III • MCERTS
Communication	
Service interface	USB 2.0 mini A cable
Optional Fieldbus	• HART 7, with Active/Passive 4 ... 20 mA • Modbus RTU • PROFIBUS PA per profile 4.01 • PROFIBUS DP • PROFINET
Remote configuration via service interface	• EDD via SIMATIC PDM • SITRANS DTM via PACTware

SITRANS LT500 Ultrasonic version	
Mode of operation	Level, space, distance, volume, flow, head, difference, average, totalization
Sensor input, ultrasonic version	
Number of inputs	1 or 2
PV measurements	Advanced process intelligence
Measuring range	0.3 ... 60 m (1 ... 196 ft), transducer dependent
Transducer frequency	10 ... 52 kHz

Technical specifications (continued)

SITRANS LT500 Ultrasonic version	
Ultrasonic transducer	Compatible transducers: all EchoMax and ST-H series transducers, legacy coaxial cable connections via converter
Accuracy	
• Error in measurement	• Standard operation: ±1 mm (0.04 inch) plus 0.17 % of measured distance • High accuracy OCM: ±1 mm (0.04 inch), within 3 m (9.84 ft) range
• Resolution	• Standard operation: 0.1 % of range or 2 mm (0.08 inch), whichever is greater • High accuracy OCM: 0.6 mm (0.02 inch), within 3 m (9.84 ft) range
• Temperature compensation	• -40 ... +150 °C (-40 ... +300 °F) • Integral temperature sensor in t-ransducer • External TS-3 temperature sensor (optional) • Programmable fixed temperature values
Wiring	Transducer: 2 copper conductors, twisted, with foil shield/drain wire, 300 V 0.5 ... 0.75 mm² (22 ... 18 AWG)
• Max. cable length	365 m (1 200 ft)
Analog input	
• Resolution	0.025 % of full scale
• Accuracy	0.1 % of full scale
• Polling rate	>1 Hz
• Maximum cable length	500 m (1640.42 ft)
Digital input

Item 65

Overview

EchoMax XPS transducers use ultrasonic technology to measure level in a wide range of liquids and solids.

Benefits

- Integral temperature compensation
- Low ringing effect reduces blanking distance
- Optional foam facing for dusty applications
- Self-cleaning and low-maintenance
- Chemically resistant
- Hermetically sealed

Application

XPS transducers can be fully immersed, are resistant to steam and corrosive chemicals, and can be installed without flanges.

The XPS series offers versions for various measuring ranges up to 30 m (100 ft) and up to a max. temperature of 95 °C (203 °F).

During operation, the EchoMax transducers emit acoustic pulses in a narrow beam. The level monitor measures the propagation time between pulse emission and its reflection (echo) to calculate the distance.

* For SITRANS LUT400, MultiRanger 100/200, HydroRanger 200

Mounting
Make particularly sure that the radiating face of the transducer is protected from damage. Mount the transducer so that it is above the maximum material level by at least the blanking value. On liquid applications, the transducer must be mounted so that the axis of transmission is perpendicular to the liquid surface. On solids applications, an Easy Aimer should be used to facilitate aiming the transducer. Consider the optional temperature sensor when mounting the transducer.

Interconnection
Do not route cable openly or near high voltage or current runs, contactors and SCR control drives. For optimum isolation against electrical noise, run cable separately in a grounded metal conduit. Seal all thread connections to prevent ingress of moisture.

XPS ultrasonic transducer connections

SIEMENS

Datasheet for

Pointek CLS200 RF Capacitance point level switch, rod design. Detects level and interface in liquids, solids, slurries, and foam. Adjustable, 5.5 m (18.04 ft), insertion, adaptable sensitivity, with the ability to tune out build-up on probe.

Ordering data: **7ML56300AB000GA0**

General

Manufacturer	Siemens
Supplier	Siemens
Product designation	Point level measurement - Capacitance switch
Brand name	Pointek CLS200
Type designation	Pointek CLS200 RF Capacitance point level switch, rod design. Detects level and interface in liquids, solids, slurries, and foam. Adjustable, 5.5 m (18.04 ft), insertion, adaptable sensitivity, with the ability to tune out build-up on probe.
Article number	7ML56300AB000GA0
Net weight	0,5 kg
Slogan	Precise and versatile - Inverse frequency shift capacitance level switch for liquids and solids

Mode of operation and application

Measuring principle	capacitive

Input

Measurand	Level
Unit of the measurand	pF

Output

Digital output

Number	2

Relay output

Number	1
Type	Single Pole Double Throw (SPDT)
Switching capacity voltage, AC (maximum)	250 V
Switching capacity current, AC (maximum)	8 A
Switching capacity voltage, DC (maximum)	30 V
Switching capacity current, DC (maximum)	5 A
Switching capacity real power (maximum)	150 W
Switching capacity apparent power (maximum)	2.000 VA
Time constant for smoothing	
Time constant for smoothing (minimum)	1 s
Time constant for smoothing (maximum)	60 s
Number of outputs	1
Switching capacity voltage, AC (maximum)	30 V
Switching capacity voltage, DC (maximum)	30 V
Switching capacity current, AC (maximum)	82 mA
Switching capacity current, DC (maximum)	82 mA

Operating conditions

Medium temperature	
Medium temperature (minimum)	-40 °C

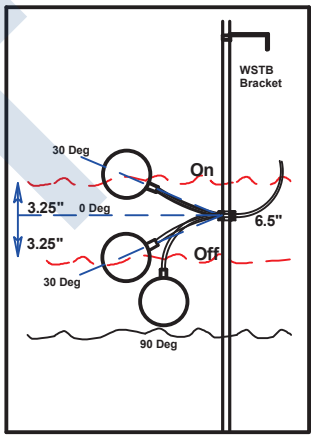
GENERAL DESCRIPTION

The Roto-Float SSTNM is a non-mercury, direct acting float switch. Each float contains a single pole, single throw reed switch which changes state at +30 from horizontal and -30 from horizontal. The float housing is 5" in diameter, made of 316 stainless steel and Teflon coated for preventing grease and debris from collecting on the float. Extra-hard usage electrical cable is used to electrically connect the switch back to the control panel. The cable and switch are epoxy encapsulated in the float housing potting tube, forming a watertight, impact resistant unit. The Roto-Float SSTNM **Type P** is equipped with a stainless steel bracket for attachment to a 1" pipe, (by others). The **Type W** mounting style is equipped with a stainless steel bracket and clip assembly that secures the float to a WRW wire rope kit. The **Type S** suspended has an external lead weight attached to the cable and is suspended fro above on the floats own cable.

Applications

The Roto-Float SSTNM was designed primarily for controlling pumps in wastewater applications for turning pumps on and off in emptying or filling situations; signal alarm levels, and other application where liquid levels need to be automatically monitored. Its use may be suitable in other liquids, as well.

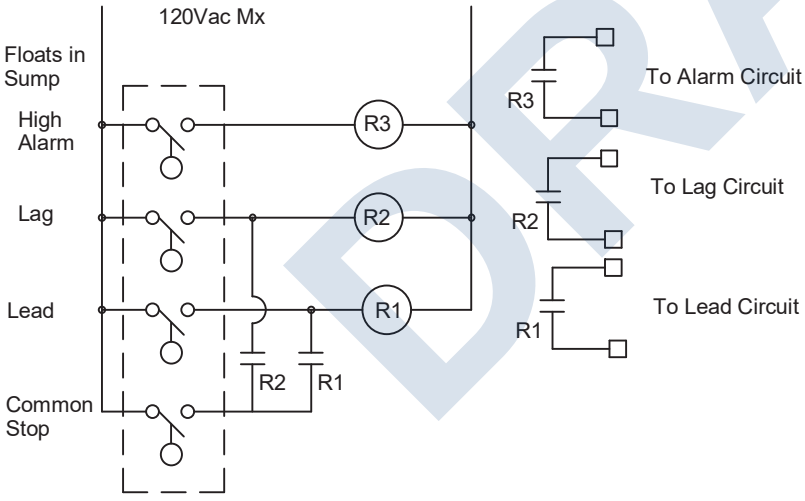
Specification Information



Electrical Rating: 1A @ 120Vac; reed switch
Temp. Limit: 110F
Circuit Configuration: NO, *normally open
NC, *normally closed
This switch is compatible with intrinsically safe circuits. The switch neither stores nor generates an electrical charge.

Mounting Styles:
Type P- Pipe mounted for 1" pipe
Type W- Wire rope mounted, (use w. WRW Kit)
Type S- Suspended, external weight on cable

Mounting Style	Cable Length	*Switch Configuration	*Model No.	Wgt
Type P	20	NO	P20NO-SSTNM	3.4
Type P	30	NO	P30NO-SSTNM	4.3
Type P	40	NO	P40NO-SSTNM	5.2
Type W	20	NO	W20NO-SSTNM	3.2
Type W	30	NO	W30NO-SSTNM	4.1
Type W	40	NO	W40NO-SSTNM	5.0
Type S	20	NO	S20NO-SSTNM	7.2
Type S	30	NO	S30NO-SSTNM	8.1
Type S	40	NO	S40NO-SSTNM	9.0
Type S	100	NC	S100NC-SSTNM	



*Normal is defined as state of switch with no liquid present.

*Change 'NO' to 'NC' for normally closed floats. Longer lengths are available.

Normally Open Type P SSTNM
Switch Status vs. Liquid Level

Nominal Duplex Circuit (Reference Only!)

Submitted_____

Approved_____

Important Information:

The green wire should always be properly grounded, per NEC. Use this product in accordance with the NEC, local codes, and the authority having jurisdiction. Roto-Float SSTNM is suitable for use with intrinsically safe circuits.

Do not use Roto-Float SSTNM in gasoline or other volatiles and combustibles. Check with the factory for exotic applications.

GREAT WHITE CENTER FLOW SCREEN
INSTALLATION PROCEDURE

Important! The Hydro-Dyne Engineering equipment installation layout drawings (as built) in the Operations & Maintenance Manual must be reviewed and comprehended prior to the development of the installation plan. Hydro-Dyne recommends applying a food grade anti-seize compound on all hardware to be installed by contractor to facilitate removal and replacement as needed. White Knight NSF H1 (or equal) is the recommended anti-seize compound.

Important! The Hydro-Dyne Engineering equipment may use components not manufactured by Hydro-Dyne Engineering. It is imperative that the installation personnel read and follow all installation instructions for each component supplied, including those not manufactured by Hydro-Dyne Engineering. Reference the Operations & Maintenance Manual Guide, which explains various sections regarding equipment installation details. For additional information regarding installation of the equipment, please contact Hydro-Dyne Engineering customer service at 813-818-0777.

1.0 Safety Precautions:

1.1 **DANGER:** This equipment should be installed, adjusted and serviced by qualified electrical and mechanical personnel. The personnel must be familiar with the construction and operation of this equipment and the hazards involved. Fatal injury could occur if this precaution is not observed.

A. Be sure to always wear safety glasses, gloves and hard hats as required.

B. Be sure the power input disconnect is in the correct position. Power either on or off depending on the work to be performed.

C. Have a backup technician who is always in sight and ready to assist in the case of an emergency.

D. Be sure the motor frame is connected to earth ground.

2.0 Installation of Screen:

2.1 **Important!** Use the lifting eyes on the head for setting the unit upright. The lifting eyes are designed for vertical lifts only. Additional “pull eyes” may be furnished mid-level screen to help keep screen vertical.

2.2 Care should be taken to protect lubrication fittings, automatic grease dispensers (if supplied) and drive during lifting and installation.

2.3 If supplied with stainless steel channel filler plates and not installed onto screen, secure each channel filler plate assembly to appropriate screen side. Adjust supporting flat bar to within one half of the true slot opening being used. Ensure to stay parallel to screen over entire screen length.

A. Depending on application, it may be best to install the filler plates after the installation of the screen into the channel. Contractor to determine.

DRAFT

Note: Please align effluent deflector in the up position. This will allow the deflector to rest against the rear cover. See the correct installation position in the image below.

2.4 Each screen must be installed as located on the detailed Hydro-Dyne installation layout drawings. Lower each screen assembly into channel using the pad eyes welded to the top of the head section, making sure the unit drops vertically. Additional "pull eyes" may be furnished mid-level screen to help keep screen vertical.

A. Verify outlet fit to position.
B. Bolt to invert first, based on outlet.
C. Then bolt the rest of the screen.
D. Grout as needed for leveling.

2.5 If supplied with external compactor(s) and sluice, loosely assemble entire sluice, then loosely assemble sluice to external compactor(s). Then loosely assemble sluice to screen for proper fit prior to anchoring equipment or support stands. Reference compactor installation procedure.

A. If supplied with sluice support stand(s), loosely secure stand(s) onto the screen with supplied hardware. Then anchor stand(s) onto top of channel. Grout as needed for leveling. Ensure stand(s) are flush to mounting surface. Anchor equipment securely to top of channel then secure to screen.

2.6 If supplied with integral compactor(s), each integral compactor must be installed as located on the detailed Hydro-Dyne layout drawings relative to the screen discharge chute. Each compactor collection hopper must be fastened to the screen discharge chute. Reference compactor installation procedure.

2.7 Anchor screen securely.

A. Mark anchor locations, move screen out of way, drill and install anchors, lift screen down over anchors and secure.

DRAFT

B. Be certain to drill to embed depth as shown on drawings or per manufacturer's specifications were applicable.

C. If anchors have not been specified per HDE Installation layout drawings, use ¾ inch dia. torque setting anchors for screen base and ½ inch dia. torque setting anchors for filler plates and braces.

2.8 If supplied with braces, securely anchor each brace to the top of the channel walls as indicated on the installation layout drawings.

2.9 Install channel filler plates to screen (if not previously installed). Securely anchor each filler plate to the channel side walls as indicated on installation layout drawings. If channel filler plates are supplied with neoprene channel seals, no channel wall anchors are needed.

2.10 Before each screen is placed into service, each Shaft Seal internal clamp must be adjusted per manufacturer's requirements to eliminate leakage. Each shaft seal is located on both the shaft drive end and shaft driven end. The motor will need to be jogged until the screw head of the adjustable clamp can be accessed through the adjustment port. Finger tighten the clamp about a ¼ turn. See maintenance section for details.

2.11 Before each screen is placed into service, each Shaft Seal located on both the shaft drive end and shaft driven end must be greased. Pump grease through each grease fitting, until full as needed. If supplied with an auto grease dispenser, ensure each grease dispenser container is full as needed. "Lubriplate-FGL" food grade grease (or equivalent) is the recommended lubricant for all shaft seals.

2.12 Before each screen is placed into service, each 4-Bolt Flange Bearing located on both the shaft drive end and shaft driven end must be greased. Use only one pump of grease through each grease fitting. If supplied with an auto grease dispenser, ensure each grease dispenser container is full. "Lubriplate-FGL" food grade grease (or equivalent) is the recommended lubricant for all flange bearings.

3.0 Accessory Components:

3.1 **Important!** Hydro-Dyne Engineering does not provide installation of any accessories or piping, unless noted per the Manufacturer's Scope of Work. As each application differs, Hydro-Dyne Engineering does not typically supply any piping, mounting brackets or flange accessories unless noted per the Manufacturer's Scope of Work. Reference installation drawings and accessory section for details.

A. If wash water is required, upon installing any plumbing to any wash water header inlet, a union coupling (or true union valve) is necessary to facilitate appropriate adjustment as needed.

B. Hydro-Dyne Engineering recommends the use of a true union ball valve installed in-line with each wash water header inlet (if supplied). This will facilitate the maintenance of each wash water header and nozzles without having to shut off the water supply at the main and will enable the ability to conserve water by controlling the amount of water being used.

DRAFT

3.2 If supplied, install all wash water accessories such as sediment filters, strainers, solenoid valves, ball valves, check valves, needle valves, flow meters, pressure gauges and pumps. Reference accessory section for details.

3.3 If supplied, install all level sensing accessories, such as transducers, sensors and float switches. Reference controls section for details.

3.4 If supplied, install all freeze protection, thermal or speed control accessories, such as motion sensors, thermostats and heat tracing. Reference accessory section and controls section for installation details.

A. **Important!** If supplied with an ambient thermostat or heat trace thermostat, the device setting must be verified to be set at a minimum 40 degrees Fahrenheit or higher as required at start-up.

B. Each thermostat must be installed outside, preferably in a shady area as close to the equipment as possible.

4.0 Gear Reducers:

4.1 If supplied, each gear reducer usually will be shipped lubricated. Lubricant may leak during shipment. Thus, the shipping container or skid should be checked for signs of leakage. It is recommended that each gear reducer be checked and filled to proper lubrication levels per manufacturer specifications. Reference reducer section for details.

A. If supplied with standard quality oil, Mobilgear600 (or equal) is the manufacturer recommended lubricant. Only add standard oil to existing standard oil. If synthetic oil is preferred, the reducer must be drained of existing oil before replacing with synthetic oil.

B. If supplied with high quality synthetic oil, Mobile SHC630 (or equal) is the manufacturer recommended lubricant. Only add synthetic oil to exiting synthetic oil. ***WARNING: NEVER MIX SYNTHETIC OIL WITH STANDARD OIL***

4.2 Each gear reducer vent plug (breather) is designed to prevent dirt and water from entering the gear reducer. Without proper air venting, the increase in air pressure may force lubricant through the oil seals resulting in oil seal leakage and damage. Do not restrict the operation of the vent with paint or other obstruction. Reference reducer section for details.

A. Each gear reducer may be shipped with a rubber seal (strip or plug) installed in the vent hole (breather) and MUST be removed before each gear reducer is placed into operation.

B. Each gear reducer may be shipped with a hex-head metal plug in the vent hole (breather), which MUST be removed and the attached pressure relief vent plug must be inserted into the filler/vent hole of the reducer, before the unit is placed into operation.

DRAFT

C. Each gear reducer may be shipped with an Auto-vent breather, which operates as needed. Hydro-Dyne Engineering recommends inspection for leaks and replace as needed.

5.0 Drive Motors:

5.1 If commissioning service is provided by Hydro-Dyne Engineering, do not power up any motor installed onto the equipment, as damage to the motor and equipment may occur. Each motor will be powered at start-up by the Hydro-Dyne Engineering service technician.

A. During Start-up, each motor will be validated as wired per manufacturer recommendations for appropriate voltage and orientation. Each motor will be checked for proper rotation and speed.

B. During Start-up, each motor will have a full load amp draw test documented for future reference. The initial amp draw value should be compared to each successive full amp draw test to determine the integrity of the motor.

6.0 Wash Water Service:

6.1 As required, connect wash water service to equipment upon completion of installing wash water accessories as supplied. Verify each wash water accessory is properly installed and has no leakage present. Adjust or replace accessory as needed.

7.0 Electric Service:

7.1 If supplied with electrical components such as motors, pumps, transducers, solenoids, limit switches or freeze protection connection kit, connect electrical service as required.

8.0 Wiring Size:

8.1 It is the user's responsibility to verify that all interconnected wiring is sized and installed in conformance with the National Electrical Code (NEC) published by the National Fire Protection Association and the Canadian Electrical Code (CEC) and other applicable local codes.

8.2 Refer to the controller and motor nameplates for electrical data. Electrical drawings are in the controls section of this manual as well as in the control panel itself.

DRAFT

WHITETIP SHARK WASHING COMPACTOR
INSTALLATION PROCEDURE

Important! The Hydro-Dyne Engineering equipment installation layout drawings (as built) in the Operations & Maintenance Manual must be reviewed and comprehended prior to the development of the installation plan. Hydro-Dyne recommends applying a food grade anti-seize compound on all hardware to be installed by contractor to facilitate removal and replacement as needed. White Knight NSF H1 (or equal) is the recommended anti-seize compound.

Important! The Hydro-Dyne Engineering equipment may use components not manufactured by Hydro-Dyne Engineering. It is imperative that the contractor/owner read and follow all installation instructions for each component supplied, including those not manufactured by Hydro-Dyne Engineering. Reference various sections of the Hydro-Dyne Operations & Maintenance Manual for details. Optional components may be referenced, (but not be supplied) within this document. For additional information, please contact Hydro-Dyne Engineering customer service at 813-818-0777.

1.0 Safety Precautions:

1.1 **DANGER:** This equipment should be installed, adjusted and serviced by qualified electrical and mechanical personnel. The personnel must be familiar with the construction and operation of this equipment and the hazards involved. Fatal injury could occur if this precaution is not observed.

A. Be sure to always wear safety glasses, gloves and hard hats as required.

B. Be sure the power input disconnect is in the correct position. Power either on or off depending on the work to be performed.

C. Have a backup technician who is always in sight and ready to assist in the case of an emergency.

D. Be sure the motor frame is connected to earth ground.

2.0 Installation of Washing Compactor/Sluice:

2.1 **Important!** Secure compactor with lifting straps. Each compactor may be provided with lifting eyes. Do not lift equipment using the gear motor lifting eye. If no lifting eyes are provided, then lifting should be done with straps on full pipe section and on drive adapter spool section.

2.2 Care should be taken to protect lubrication fittings, automatic grease dispensers (if supplied) and drive during lifting and installation.

2.3 Each compactor must be installed as located on the detailed Hydro-Dyne layout drawings relative to the screen discharge chute or sluice.

A. Each compactor collection hopper or collection flange must be fastened to the screen discharge chute or sluice as detailed on the installation layout drawings.

DRAFT

B. If supplied with sluice, loosely assembly entire sluice, then loosely assemble sluice to compactor. Then loosely assemble sluice to screen for proper fit prior to anchoring equipment or support stands.

2.4 If supplied with sluice or discharge chute support stand(s), loosely secure stand(s) onto the screen with supplied hardware. Then anchor stand(s) onto top of channel. Grout as needed for leveling. Ensure stand(s) are flush to mounting surface. Anchor equipment securely to top of channel then secure to screen.

2.5 Anchor equipment (without casters) securely.

A. Mark each anchor location, move compactor or stands out of way, drill and install anchors, lift compactor down over anchors and secure.

B. Be certain to drill to embed depth as shown on drawings or per manufacturer's specifications were applicable.

C. If anchors have not been specified per HDE Installation layout drawings, use ½ inch dia. torque setting anchors.

2.6 If compactor is supplied with casters. Ensure to lock the wheels after set in place. Ensure to leave conduit slack and flexible plumbing to enable the compactor the ability to move out from under the screen.

3.0 Accessory Components:

3.1 **Important!** Hydro-Dyne Engineering does not provide installation of any accessories or piping, unless noted per the Manufacturer's Scope of Work. As each application differs, Hydro-Dyne Engineering does not typically supply any piping, mounting brackets or flange accessories unless noted per the Manufacturer's Scope of Work. Reference installation drawings for details.

A. If wash water is required, upon installing any plumbing to any wash water header inlet, a union coupling (or true union valve) is necessary to facilitate appropriate adjustment as needed.

B. Hydro-Dyne Engineering recommends the use of a true union ball valve installed in-line with each wash water header inlet (if supplied). This will facilitate the maintenance of each wash water header and nozzles without having to shut off the water supply at the main and will enable the ability to control the amount of water being used.

3.2 If supplied, install all wash water accessories such as sediment filters, strainers, solenoid valves, ball valves, check valves, needle valves, flow meters, pressure gauges and pumps. Reference accessory section for details.

3.3 If supplied, install all level sensing accessories, such as transducers, sensors and float switches. Reference controls section for details.

3.4 If supplied, install all freeze protection, thermal or speed control accessories, such as motion sensors, thermostats and heat tracing. Reference accessory section and controls section for details.

DRAFT

A. **Important!** If supplied with an ambient thermostat or heat trace thermostat, the device setting must be verified to be set at a minimum 40 degrees Fahrenheit or higher as required.

B. Each thermostat must be installed outside, preferably in a shady area as close to the equipment as possible.

4.0 Gear Reducers:

4.1 If supplied, each gear reducer usually will be shipped lubricated. Lubricant may leak during shipment. Thus, the shipping container or skid should be checked for signs of leakage. It is recommended that each gear reducer be checked and filled to proper lubrication levels per manufacturer specifications. Reference reducer section for details.

A. If supplied with standard quality oil, Mobilgear600 (or equal) is the manufacturer recommended lubricant. Only add standard oil to existing standard oil. If synthetic oil is preferred, the reducer must be drained of existing oil before replacing with synthetic oil.

B. If supplied with high quality synthetic oil, Mobile SHC630 (or equal) is the manufacturer recommended lubricant. Only add synthetic oil to exiting synthetic oil. ***WARNING: NEVER MIX SYNTHETIC OIL WITH STANDARD OIL***

4.2 Each gear reducer vent plug (breather) is designed to prevent dirt and water from entering the gear reducer. Without proper air venting, the increase in air pressure may force lubricant through the oil seals resulting in oil seal leakage and damage. Do not restrict the operation of the vent with paint or other obstruction. Reference reducer section for details.

A. Each gear reducer may be shipped with a rubber seal (strip or plug) installed in the vent hole (breather) and MUST be removed before each gear reducer is placed into operation.

B. Each gear reducer may be shipped with a hex-head metal plug in the vent hole (breather), which MUST be removed and the attached pressure relief vent plug must be inserted into the filler/vent hole of the reducer, before the unit is placed into operation.

C. Each gear reducer may be shipped with an Auto-vent breather, which operates as needed. Hydro-Dyne Engineering recommends inspection for leaks and replace as needed.

5.0 Drive Motors:

5.1 If commissioning service is provided by Hydro-Dyne Engineering, do not power up any motor installed onto the equipment, as damage to the motor and equipment may occur. Each motor will be powered at start-up by the Hydro-Dyne Engineering service technician.

DRAFT

A. During Start-up, each motor will be validated as wired per manufacturer recommendations for appropriate voltage and orientation. Each motor will be checked for proper rotation and speed.

B. During Start-up, each motor will have a full load amp draw test documented for future reference. The initial amp draw value should be compared to each successive full amp draw test to determine the integrity of the motor.

6.0 Wash Water Service:

DRAFT

SECTIONAL SLUICE
INSTALLATION PROCEDURE

Important! The Hydro-Dyne Engineering equipment installation layout drawings (as built) in the Operations & Maintenance Manual must be reviewed and comprehended prior to the development of the installation plan. Hydro-Dyne recommends applying a food grade anti-seize compound on all hardware to be installed by contractor (such as the filler plates) This will facilitate future removal and replacement as needed. White Knight NSF H1 (or equal) is the recommended anti-seize compound.

Important! The Hydro-Dyne Engineering equipment may use components not manufactured by Hydro-Dyne Engineering. It is imperative that the contractor/owner read and follow all installation instructions for each component supplied, including those not manufactured by Hydro-Dyne Engineering. Reference various sections of the Hydro-Dyne Operations & Maintenance Manual for details. Optional components may be referenced, (but not be supplied) within this document. For additional information, please contact Hydro-Dyne Engineering customer service at 813-818-0777.

1.0 Safety Precautions:

1.1 **DANGER:** This equipment should be installed, adjusted and serviced by qualified electrical and mechanical personnel. The personnel must be familiar with the construction and operation of this equipment and the hazards involved. Fatal injury could occur if this precaution is not observed.

A. Be sure to wear safety glasses, gloves and hard hats as required always.

B. Be sure the power input disconnect is in the correct position. Power either on or off depending on the work to be performed.

C. Have a backup technician who is always in sight and ready to assist in the case of an emergency.

D. Be sure the motor frame is connected to earth ground.

2.0 Installation Sectional Sluice:

2.1 **Important!** If sluice sections are provided with lifting eyes Use the lifting eyes on individual piece lift. Do not use any sluice lifting eyes to lift entire assembly. The fully assembled sluice must be lifted with straps.

2.2 Care should be taken to protect any fittings or access cover hardware (if provided).

2.3 Do not anchor or fully tighten any part of sluice until entire assembly is together.

2.4 Fully assemble sluice and support legs with gaskets installed at operating level (upper level). Adjoin flanges and loosely secure bolts about a ¼" turn past hand tight.

2.5 Move sluice into rough position as shown on the layout drawing. Do not anchor supports at this time. Temporary shoring may be required as sluice may be unstable until anchored.

DRAFT

2.6 Roughly position compactor(s) as shown on equipment drawing installation layout and per the compactor installation procedure.

2.7 If provided with a discharge chute, assemble discharge chute and lift into position using straps to check compactor center location.

A. Do not use any lifting eyes on sluice sections for entire lift. If provided, the lifting eyes are for individual section lifts only.

B. Do not assemble discharge chute to compactor. Only check for compactor centers and position. Supports are slotted for adjustability. Set discharge chute aside until installation.

2.8 Move sluice into position and bolt to compactor(s) with gaskets. Tighten bolts about 1/4 turn past hand tight. Sluice position will now allow screen(s) to be positioned.

2.9 Install screen(s) into channel as shown on equipment drawing installation layouts and per the screen installation procedure. Ensure each screen is set on level channel invert (grout level if needed).

A. If installing multiple screens, each screen can only be installed into one dedicated channel as determined by sluice connection height (highest sluice connection away from compactors, lowest nearest compactors).

B. Position of screen(s) in channel should allow sluice connection smoothly and should be approximately on channel center-line. Screen filler plates will bend slightly when bolting to channel walls to take care of any slight off-center.

2.10 Verify fit-up locations and ensure sluice connections are not forcing screen(s) out of plumb.

2.11 Secure the single discharge chute into position per the equipment drawings installation layout and anchor stand as required.

A. The position of chute should not put pressure on compactor discharge elbows. Support is from stand not from elbows.

2.12 Working from discharge chute, pull flanges tight together with gaskets, torque bolts approximately 3/4 past hand tight in a star pattern.

2.13 Perform final screen position adjustment, mark holes in invert, remove screen for concrete bolt drilling, set bolts and re-position screen over bolts, tighten screen mounting bolts. Install and tighten screen upper channel supports and filler plates.

2.14 Anchor each compactor and its sluice legs. Each compactor may need to be slid away to get to anchor bolts.

2.15 Tighten flanges from sluice to compactor inlet with gaskets, then to screen(s) with gaskets.

2.16 Check for leaks and re-tighten as required.

DRAFT

2.17 If only one screen is going in at a time, install sluice blank-off plates with gaskets as required.

2.18 Plumb compactor drain as shown on the installation layout drawings.

2.19 Install wash water accessory components and piping per the HDE recommended plumbing arrangement and per each component manufacturer installation procedure.

2.20 Install electrical to wash water accessory components per manufacturer recommendation.

3.0 Accessory Components:

3.1 **Important!** As each application differs, Hydro-Dyne Engineering does not supply any piping, mounting brackets or flange accessories unless noted per the Manufacturer's Scope of Work. Reference installation drawings and accessory section for details.

A. If wash water is required, upon installing any plumbing to any wash water header inlet, a union coupling (or true union valve) is necessary to facilitate appropriate adjustment as needed.

B. Hydro-Dyne Engineering recommends the use of a true union ball valve installed in-line with each wash water header inlet (if supplied). This will facilitate the maintenance of each wash water header and nozzles without having to shut off the water supply at the main and will enable the ability to conserve water by controlling the amount of water being used.

3.2 If supplied, install all wash water accessories such as sediment filters, strainers, solenoid valves, ball valves, check valves, needle valves, flow meters, pressure gauges and pumps. Reference accessory section for details.

3.3 If supplied, install all level sensing accessories, such as transducers, sensors and float switches. Reference controls section for details.

3.4 If supplied, install all freeze protection, thermal or speed control accessories, such as motion sensors, thermostats and heat tracing. Reference accessory section and controls section for installation details.

A. **Important!** If supplied with an ambient thermostat or heat trace thermostat, the device setting must be verified to be set at a minimum 40 degrees Fahrenheit or higher as required at start-up.

B. Each thermostat must be installed outside, preferably in a shady area as close to the equipment as possible.

4.0 Wash Water Service:

4.1 As required, connect wash water service to equipment upon completion of installing wash water accessories as supplied. Verify each wash water accessory is properly installed and has no leakage present. Adjust or replace accessory as needed.

DRAFT

5.0 Electric Service:

5.1 If supplied with electrical components such as motors, pumps, transducers, solenoids, limit switches or freeze protection connection kit, connect electrical service as required.

6.0 Wiring Size:

6.1 It is the user's responsibility to verify that all interconnected wiring is sized and installed in conformance with the National Electrical Code (NEC) published by the National Fire Protection Association and the Canadian Electrical Code (CEC) and other applicable local codes.

6.2 Refer to the controller and motor nameplates for electrical data. Electrical drawings are in the controls section of this manual as well as in the control panel itself.

SAND SHARK GRIT TRAP
INSTALLATION PROCEDURE

Important! The Hydro-Dyne Engineering equipment installation layout drawings (as built) in the Operations & Maintenance Manual must be reviewed and comprehended prior to the development of the installation plan. Hydro-Dyne recommends applying a food grade anti-seize compound on all hardware to be installed by contractor to facilitate removal and replacement as needed. White Knight NSF H1 (or equal) is the recommended anti-seize compound. Hardware may be preinstalled, which will need to be removed prior to component assembly.

Important! The Hydro-Dyne Engineering Grit Trap Slewing Gearbox Assembly is shipped without oil due to shipping and installation requirements. Each Grit Trap Slewing gearbox must be filled per specification prior to start-up. Reference maintenance section for detail.

Important! The Hydro-Dyne Engineering equipment may use components not manufactured by Hydro-Dyne Engineering. It is imperative that the contractor/owner read and follow all installation instructions for each component supplied, including those not manufactured by Hydro-Dyne Engineering. Reference various sections of the Hydro-Dyne Operations & Maintenance Manual for details. Optional components may be referenced, (but not be supplied) within this document. For additional information, please contact Hydro-Dyne Engineering customer service at 813-818-0777.

1.0 Safety Precautions:

1.1 **DANGER:** This equipment should be installed, adjusted and serviced by qualified electrical and mechanical personnel. The personnel must be familiar with the construction and operation of this equipment and the hazards involved. Fatal injury could occur if this precaution is not observed.

A. Be sure to always wear safety glasses, gloves and hard hats as required.

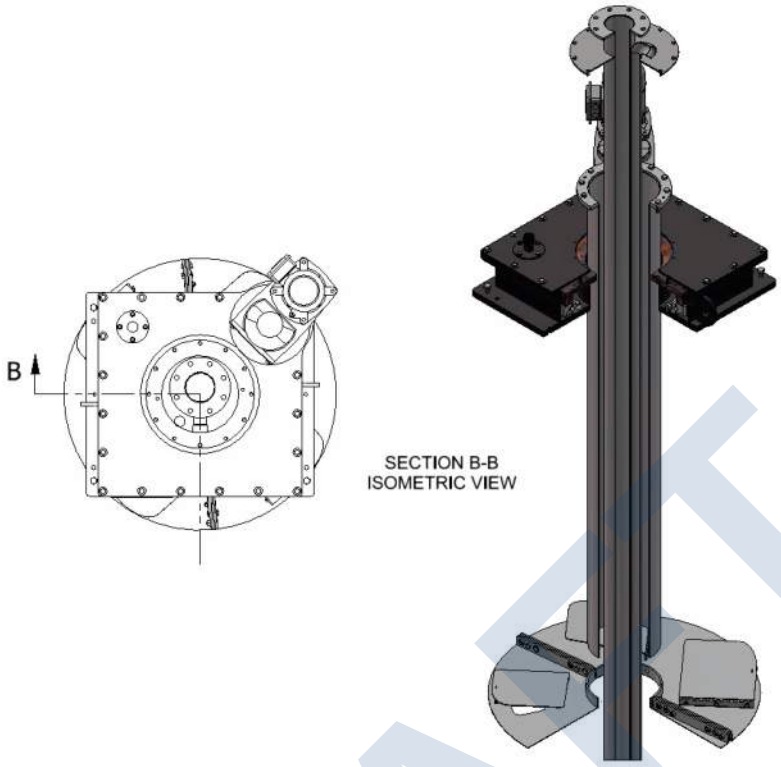
B. Be sure the power input disconnect is in the correct position. Power either on or off depending on the work to be performed.

C. Have a backup technician who is always in sight and ready to assist in the case of an emergency.

D. Be sure the motor frame is connected to earth ground.

2.0 Installation of Grit Trap (Top Mount Option):

2.1 **Important!** Use the lifting eyes on the Grit Trap Slewing Gearbox to lift over the chamber into position. Use two straps crossed from corner to corner with a clevis on the end of each strap and one clevis in the center of the ‘X’.



2.2 Care should be taken to protect lubrication fittings, drive(s) and other accessory components supplied during lifting and installation.

2.3 Each Grit Trap Assembly must be installed as located on the detailed Hydro-Dyne installation layout drawings, relative to the Grit Classifier installation.

2.4 Remove (12) bolts attached to Drive Pipe Assembly (torque tube) Flange.

DRAFT

2.5 Lower torque tube onto Grit Trap Drive from above. Block under gearbox approximately 12 inches. Set the Grit Trap in place and position to easily access oil drain plug.

2.6 Lower torque tube through the opening in Bridge. At bottom of angled sides (just above grit settlement area) use 2x4's to support bottom of tube approximately 12 inches above bottom corner of angled sides.

2.7 Install torque tube flange bolts into gearbox flange and torque all bolts to 200 in-lbs. Torque lock nuts from above to 200 in-lbs. Torqueing should be done in a star pattern to ensure proper alignment.

2.8 Remove blocking from below, lift Grit Trap Drive off blocking and set on bridge. Grout to level as needed.

2.9 Anchor equipment securely.

A. Mark anchor locations, lift Grit Trap out of the way, drill and install anchors, lift Grit Trap down over anchors and secure. Anchors size minimum is 5/8" with 4.5" minimum concrete embedment.

B. Be certain to drill to embed depth as shown on drawings or per manufacturer's specifications were applicable.

2.10 Bolt Vane Assembly to bottom of torque tube at desired level above bottom of angled sides (usually 3-8 inches). Use double nuts for locking position bolt. Torque all bolts to 200 in-lbs.

2.11 Install flanged fluidizing / suction pipes through center of gear-box into torque tube. Secure using hardware provided.

DRAFT

A. Be certain fluidizing tube is pointing away from drive motor.

B. Torque all bolts to 200 in-lbs. Torqueing should be done in a star pattern to ensure proper alignment.

2.12 If supplied, with Grit Trap Suction Pipe Support, install support (adjust as needed) and anchor securely to sides of channel.

3.0 Installation of Grit Trap (Flood Suction Option):

3.1 **Important!** Use the lifting eyes on the Grit Trap Slewing Gearbox to lift over the chamber into position. Use two straps crossed from corner to corner with a clevis on the end of each strap and one clevis in the center of the 'X'.

3.2 Care should be taken to protect lubrication fittings, drive(s) and other accessory components supplied during lifting and installation.

3.3 Each Grit Trap Assembly must be installed as located on the detailed Hydro-Dyne installation layout drawings, relative to the Grit Classifier installation.

3.4 Lower Grit Trap Drive over the chamber into position. Set the Grit Trap in place and position to easily access oil drain plug. Grout to level as needed.

3.5 Anchor equipment securely.

A. Mark anchor locations, move Grit Trap out of way, drill and install anchors, lift Grit Trap down over anchors and secure. Anchors size minimum is 5/8" with 4.5" minimum concrete embedment.

B. Be certain to drill to embed depth as shown on drawings or per manufacturer's specifications were applicable.

3.6 Remove Flood Suction Top Cover and retain hardware.

3.7 Lift drive pipe into position and secure using supplied hardware with Loctite 242.

3.8 Install propeller/impeller clamp and secure hardware using Loctite 242.

3.9 Install one half of propeller/impeller and secure hardware using Loctite 242.

3.10 Install second half of propeller/impeller and secure hardware using Loctite 242.

3.11 Reinstall Grit Trap Flood Suction Top Cover and secure using retained hardware.

3.12 If supplied, with Grit Trap Suction Pipe Support, install support (adjust as needed) and anchor securely to sides of channel.

3.13 Install Grit Pump Assembly. Install piping, accessory components and electric service as needed.

4.0 Installation of Grit Trap (Airlift Assembly Option):

DRAFT

4.1 **Important!** Use the lifting eyes on the Grit Trap Slewing Gearbox to lift over the chamber into position. Use two straps crossed from corner to corner with a clevis on the end of each strap and one clevis in the center of the 'X'.

4.2 Care should be taken to protect lubrication fittings, drive(s) and other accessory components supplied during lifting and installation.

4.3 Each Grit Trap Assembly must be installed as located on the detailed Hydro-Dyne installation layout drawings, relative to the Grit Classifier installation.

4.4 Lower Grit Trap Drive over the chamber into position. Set the Grit Trap in place and position to easily access oil drain plug. Use jacking bolts to make torque tube plumb and level. Grout to level as needed.

4.5 Anchor equipment securely.

A. Mark anchor locations, move Grit Trap out of way, drill and install anchors, lift Grit Trap down over anchors and secure. Anchors size minimum is 5/8" with 4.5" minimum concrete embedment.

B. Be certain to drill to embed depth as shown on drawings or per manufacturer's specifications were applicable.

4.6 Lift drive pipe into position and secure using supplied hardware with Loctite 242.

4.7 Install propeller/impeller clamp and secure hardware using Loctite 242.

4.8 Install one half of propeller/impeller and secure hardware using Loctite 242.

4.9 Install second half of propeller/impeller and secure hardware using Loctite 242.

4.10 Install Grit Trap Airlift Assembly and secure using retained hardware.

4.11 If supplied, with Grit Trap Airlift Pipe Support, install support (adjust as needed) and anchor securely to sides of channel.

4.12 Install Airlift Pump Assembly

A. Install piping, accessory components and electric service as needed

5.0 Accessory Components:

5.1 **Important!** Hydro-Dyne Engineering does not provide installation of any accessories or piping, unless noted per the Manufacturer's Scope of Work. As each application differs, Hydro-Dyne Engineering does not typically supply any piping, mounting brackets or flange accessories unless noted per the Manufacturer's Scope of Work. Reference installation drawings and accessory section for details.

A. If wash water is required, upon installing any plumbing to any wash water header inlet, a union coupling (or true union valve) is necessary to facilitate appropriate adjustment as needed.

DRAFT

B. Hydro-Dyne Engineering recommends the use of a true union ball valve installed in-line with each wash water header inlet (if supplied). This will facilitate the maintenance of each wash water header and nozzles without having to shut off the water supply at the main and will enable the ability to conserve water by controlling the amount of water being used.

5.2 If supplied, install all wash water accessories such as sediment filters, strainers, solenoid valves, ball valves, check valves, needle valves, flow meters, pressure gauges and pumps. Reference accessory section for details.

5.3 If supplied, install all level sensing accessories, such as transducers, sensors and float switches. Reference controls section for details.

5.4 If supplied, install all freeze protection, thermal or speed control accessories, such as motion sensors, thermostats and heat tracing. Reference accessory section and controls section for installation details.

A. **Important!** If supplied with an ambient thermostat or heat trace thermostat, the device setting must be verified to be set at a minimum 40 degrees Fahrenheit or higher as required at start-up.

B. Each thermostat must be installed outside, preferably in a shady area as close to the equipment as possible.

6.0 Gear Reducers & Slewing Gearbox:

6.1 Each Grit Trap Slewing Gearbox Assembly is shipped without oil due to shipping and installation requirements. Each Grit Trap Slewing gearbox must be filled per prior to start-up. Mobilgear600 (or equivalent) is the recommended lubricant. The Grit Trap slewing gearbox oil capacity is approximately 3 gallons. The appropriate leve1 should be verified using the dipstick markers. Unscrew filler breather dipstick and verify level is above red mark and below green mark on dipstick. Do not use tools to tighten filler breather dipstick, hand tighten only.

6.2 If supplied, each gear reducer usually will be shipped lubricated. Lubricant may leak during shipment. Thus, the shipping container or skid should be checked for signs of leakage. It is recommended that each gear reducer be checked and filled to proper lubrication levels per manufacturer specifications. Reference reducer section for details.

A. If supplied with standard quality oil, Mobilgear600 (or equal) is the manufacturer recommended lubricant. Only add standard oil to existing standard oil. If synthetic oil is preferred, the reducer must be drained of existing oil before replacing with synthetic oil.

B. If supplied with high quality synthetic oil, Mobile SHC630 (or equal) is the manufacturer recommended lubricant. Only add synthetic oil to exiting synthetic oil. ***WARNING: NEVER MIX SYNTHETIC OIL WITH STANDARD OIL***

6.3 Each gear reducer vent plug (breather) is designed to prevent dirt and water from entering the gear reducer. Without proper air venting, the increase in air pressure may force lubricant through the oil seals resulting in oil seal leakage and damage. Do

DRAFT

not restrict the operation of the vent with paint or other obstruction. Reference reducer section for details.

A. Each gear reducer may be shipped with a rubber seal (strip or plug) installed in the vent hole (breather) and MUST be removed before each gear reducer is placed into operation.

B. Each gear reducer may be shipped with a hex-head metal plug in the vent hole (breather), which MUST be removed and the attached pressure relief vent plug must be inserted into the filler/vent hole of the reducer, before the unit is placed into operation.

C. Each gear reducer may be shipped with an Auto-vent breather, which operates as needed. Hydro-Dyne Engineering recommends inspection for leaks and replace as needed.

7.0 Drive Motors:

7.1 If commissioning service is provided by Hydro-Dyne Engineering, do not power up any motor installed onto the equipment, as damage to the motor and equipment may occur. Each motor will be powered at start-up by the Hydro-Dyne Engineering service technician.

A. During Start-up, each motor will be validated as wired per manufacturer recommendations for appropriate voltage and orientation. Each motor will be checked for proper rotation and speed.

B. During Start-up, each motor will have a full load amp draw test documented for future reference. The initial amp draw value should be compared to each successive full amp draw test to determine the integrity of the motor.

8.0 Wash Water Service:

8.1 As required, connect wash water service to equipment upon completion of installing wash water accessories as supplied. Verify each wash water accessory is properly installed and has no leakage present. Adjust or replace accessory as needed.

9.0 Electric Service:

9.1 If supplied with electrical components such as motors, pumps, transducers, solenoids, limit switches or freeze protection connection kit, connect electrical service as required.

10.0 Wiring Size:

10.1 It is the user's responsibility to verify that all interconnected wiring is sized and installed in conformance with the National Electrical Code (NEC) published by the National Fire Protection Association and the Canadian Electrical Code (CEC) and other applicable local codes.

10.2 Refer to the controller and motor nameplates for electrical data. Electrical drawings are in the controls section of this manual as well as in the control panel itself.

SAND SHARK GRIT CLASSIFIER
INSTALLATION PROCEDURE

Important! The Hydro-Dyne Engineering equipment installation layout drawings (as built) in the Operations & Maintenance Manual must be reviewed and comprehended prior to the development of the installation plan. Hydro-Dyne recommends applying a food grade anti-seize compound on all hardware to be installed by contractor to facilitate removal and replacement as needed. White Knight NSF H1 (or equal) is the recommended anti-seize compound.

Important! The Hydro-Dyne Engineering equipment may use components not manufactured by Hydro-Dyne Engineering. It is imperative that the contractor/owner read and follow all installation instructions for each component supplied, including those not manufactured by Hydro-Dyne Engineering. Reference various sections of the Hydro-Dyne Operations & Maintenance Manual for details. Optional components may be referenced, (but not be supplied) within this document. For additional information, please contact Hydro-Dyne Engineering customer service at 813-818-0777.

1.0 Safety Precautions:

1.1 **DANGER:** This equipment should be installed, adjusted and serviced by qualified electrical and mechanical personnel. The personnel must be familiar with the construction and operation of this equipment and the hazards involved. Fatal injury could occur if this precaution is not observed.

A. Be sure to always wear safety glasses, gloves and hard hats as required.

B. Be sure the power input disconnect is in the correct position. Power (either on or off depending on the work to be performed).

C. Have a backup technician who is always in sight and ready to assist in the case of an emergency.

D. Be sure the motor frame is connected to earth ground.

2.0 Installation of Grit Classifier:

2.1 **Important!** Secure classifier with lifting straps. Each classifier may be provided with lifting eyes. Do not lift equipment using the gear motor lifting eye. If no lifting eyes are provided, then lifting should be done with straps on full pipe section and on drive adapter spool section.

2.2 Care should be taken to protect lubrication fittings, automatic grease dispensers (if supplied) and drive during lifting and installation.

2.3 Each Grit Classifier must be installed as located on the detailed Hydro-Dyne installation layout drawings, relative to the Grit Trap installation.

2.4 Lower each Grit Classifier into position and set in place.

A. Each Grit Classifier may be supplied with support stands, which may need to be secured to the top of the channel or as specified per manufacturer recommended specifications.

DRAFT

B. Leveling is obtained by adjustment of each support leg. Ensure supports are flush to mounting surface. Grout as needed for leveling.

2.5 Anchor equipment securely.

A. Mark anchor locations, move Classifier/support stands out of way, drill and install anchors, lift Grit Classifier down over anchors and secure. Use ½ inch dia. torque setting anchors, if anchors have not been specified per HDE Installation layout drawings.

B. Be certain to drill to embed depth as shown on drawings or per manufacturer's specifications were applicable.

2.6 Each Grit Classifier must be piped to each Grit Trap Assembly.

A. If supplied with a Flood Suction Option, the piping will connect from the Grit Pump to the Classifier Degritting Cyclone.

B. If supplied with a Top Mount option, the piping from the Grit Pump will connect to the Classifier Degritting Cyclone.

C. If supplied with an Airlift Pump System, the piping will connect to the Classifier Top Tank Assembly.

3.0 Accessory Components:

3.1 **Important!** As each application differs, Hydro-Dyne Engineering does not supply any piping, mounting brackets or flange accessories unless noted per the Manufacturer's Scope of Work. Reference installation drawings and accessory section for details.

A. If wash water is required, upon installing any plumbing to any wash water header inlet, a union coupling (or true union valve) is necessary to facilitate appropriate adjustment as needed.

B. Hydro-Dyne Engineering recommends the use of a true union ball valve installed in-line with each wash water header inlet (if supplied). This will facilitate the maintenance of each wash water header and nozzles without having to shut off the water supply at the main and will enable the ability to conserve water by controlling the amount of water being used.

3.2 If supplied, install all wash water accessories such as sediment filters, strainers, solenoid valves, ball valves, check valves, needle valves, flow meters, pressure gauges and pumps. Reference accessory section for details.

3.3 If supplied, install all level sensing accessories, such as transducers, sensors and float switches. Reference controls section for details.

3.4 If supplied, install all freeze protection, thermal or speed control accessories, such as motion sensors, thermostats and heat tracing. Reference accessory section and controls section for installation details.

DRAFT

A. **Important!** If supplied with an ambient thermostat or heat trace thermostat, the device setting must be verified to be set at a minimum 40 degrees Fahrenheit or higher as required at start-up.

B. Each thermostat must be installed outside, preferably in a shady area as close to the equipment as possible.

4.0 Gear Reducers:

4.1 If supplied, each gear reducer usually will be shipped lubricated. Lubricant may leak during shipment. Thus, the shipping container or skid should be checked for signs of leakage. It is recommended that each gear reducer be checked and filled to proper lubrication levels per manufacturer specifications. Reference reducer section for details.

A. If supplied with standard quality oil, Mobilgear600 (or equal) is the manufacturer recommended lubricant. Only add standard oil to existing standard oil. If synthetic oil is preferred, the reducer must be drained of existing oil before replacing with synthetic oil.

B. If supplied with high quality synthetic oil, Mobile SHC630 (or equal) is the manufacturer recommended lubricant. Only add synthetic oil to exiting synthetic oil. ***WARNING: NEVER MIX SYNTHETIC OIL WITH STANDARD OIL***

4.2 Each gear reducer vent plug (breather) is designed to prevent dirt and water from entering the gear reducer. Without proper air venting, the increase in air pressure may force lubricant through the oil seals resulting in oil seal leakage and damage. Do not restrict the operation of the vent with paint or other obstruction. Reference reducer section for details.

A. Each gear reducer may be shipped with a rubber seal (strip or plug) installed in the vent hole (breather) and MUST be removed before each gear reducer is placed into operation.

B. Each gear reducer may be shipped with a hex-head metal plug in the vent hole (breather), which MUST be removed and the attached pressure relief vent plug must be inserted into the filler/vent hole of the reducer, before the unit is placed into operation.

C. Each gear reducer may be shipped with an Auto-vent breather, which operates as needed. Hydro-Dyne Engineering recommends inspection for leaks and replace as needed.

5.0 Drive Motors:

5.1 If commissioning service is provided by Hydro-Dyne Engineering, do not power up any motor installed onto the equipment, as damage to the motor and equipment may occur. Each motor will be powered at start-up by the Hydro-Dyne Engineering service technician.

DRAFT

A. During Start-up, each motor will be validated as wired per manufacturer recommendations for appropriate voltage and orientation. Each motor will be checked for proper rotation and speed.

B. During Start-up, each motor will have a full load amp draw test documented for future reference. The initial amp draw value should be compared to each successive full amp draw test to determine the integrity of the motor.

6.0 Wash Water Service:

6.1 As required, connect wash water service to equipment upon completion of installing wash water accessories as supplied. Verify each wash water accessory is properly installed and has no leakage present. Adjust or replace accessory as needed.

7.0 Electric Service:

7.1 If supplied with electrical components such as motors, pumps, transducers, solenoids, limit switches or freeze protection connection kit, connect electrical service as required.

8.0 Wiring Size:

8.1 It is the user's responsibility to verify that all interconnected wiring is sized and installed in conformance with the National Electrical Code (NEC) published by the National Fire Protection Association and the Canadian Electrical Code (CEC) and other applicable local codes.

8.2 Refer to the controller and motor nameplates for electrical data. Electrical drawings are in the controls section of this manual as well as in the control panel itself.

9.0 Grit Classifier Sand Bed Seeding:

9.1 Optional instructions to immediately produce grit discharge to the dumpster at startup. The grit classifier tank can be seeded with 100 pounds of playground sand prior to introducing any wet product into the classifier. The purpose of doing this is to fill the 1/2-inch gap designed between the auger and the classifier tank bottom. This gap is designed for the auger to ride on a bed of grit or sand for better wear life.

9.2 To seed the classifier, load 100 pounds of playground sand into the lowest point of the dry classifier tank. Turn on the auger which will evenly distribute the sand into the space or gap. Capture any sand discharged and repeat until no more sand is accepted.

9.3 If this seeding step is not done, then the grit classifier will take hours if not days to discharge grit product to the dumpster with no technical consequences. There simply will be a delay in grit discharge to the dumpster, since the newly captured grit will be forming the bed in the gap between the auger and the classifier tank.

DRAFT

Included:

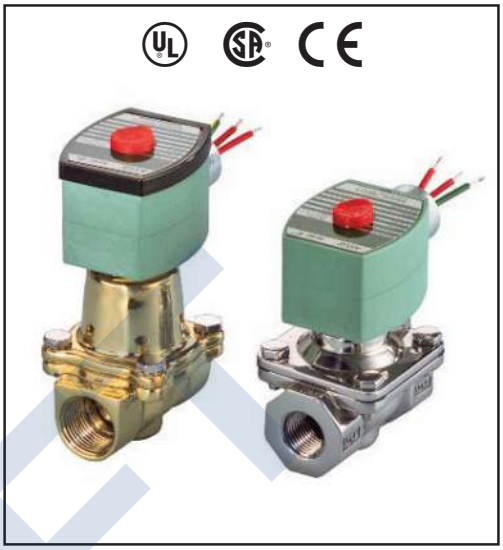
Solenoid Valve
Union Valve
Sediment Strainer
Pressure Gauge
Wedge Anchors (by others)
Epoxy (by others)
Krebs Cyclone
Grit Pump (by others)

The valve outlined below is a stand-alone unit. All wiring devices including conduit and junction boxes which may be required when wiring power to these valves, is supplied by others.

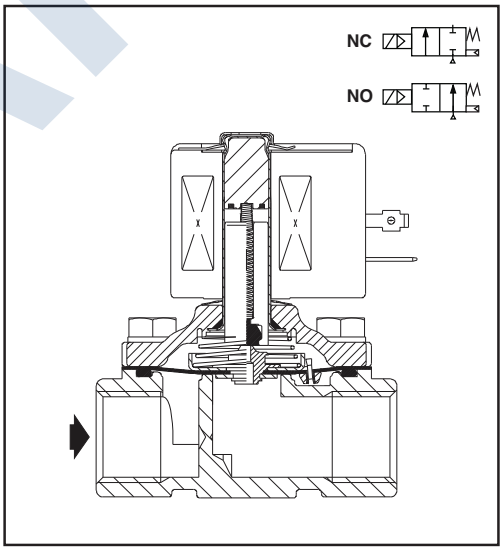
ASCO® RedHat

Pilot Operated

General Service Solenoid Valves



Brass or Stainless Steel Bodies
3/8" to 2 1/2" NPT



2/2 SERIES 8210

2-WAY

Features

- Wide range of pressure ratings, sizes, and resilient materials provide long service life and low internal leakage
- High flow valves for liquid, corrosive, and air/inert gas service
- Industrial applications include:
  - Car wash
  - Laundry equipment
  - Air compressors
  - Industrial water control
  - Pumps

Construction

Valve Parts in Contact with Fluids		
Body	Brass	304 Stainless Steel*
Seals and Discs	NBR or PTFE	
Disc-Holder	PA	
Core Tube	305 Stainless Steel	
Core and Plugnut	430F Stainless Steel	
Springs	302 Stainless Steel	
Shading Coil	Copper	Silver

*Catalog Numbers 8210G127, 8210G129, 8210G132, 8210G133 have 316L Stainless Steel bodies.

① 5 psi on Air; 1 psi on Water.
② Valve provided with PTFE main disc.
③ Valve includes Ultem (G.E. trademark) piston.
④ Letter "D" denotes diaphragm construction; "P" denotes piston construction.
⑤ ❍ Safety Shutoff Valve; ● General Purpose Valve.
Refer to Engineering Section (Approvals) for details.
⑥ Valves not available with Explosionproof enclosures.
⑦ On 50 hertz service, the watt rating for the 6.1/F solenoid is 8.1 watts.
⑧ AC construction also has PA seating.
⑨ No disc-holder.
⑩ Stainless steel disc-holder.
† UL listed for fire protection systems per UL429A.
‡ DC constructions must have solenoid mounted vertical and upright.
✓ ATEX/IECEx certified with prefix "EV".
▼ ATEX/IECEx certified for DC only with prefix "EV".

DRAFT

The valve is a stand-alone unit. All wiring devices including conduit and junction boxes which may be required when wiring power to these valves, is supplied by others.

ASCO®

Optional Features

How to Select and Specify

Not all optional features are appropriate or available for all valves.

Table 1 lists the optional electrical feature prefixes available for each RedHat II solenoid and coil. Specify these features by adding the indicated prefixes to the valve catalog number.

For those prefixes marked with a "●" or for optional RedHat electrical features not covered here, contact your local ASCO sales office.

Table 2 lists the suffixes for optional construction features available for each valve Series. Specify these features by adding the indicated suffixes to the valve catalog number.

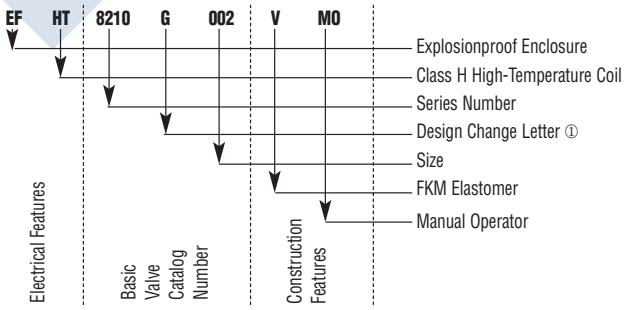

Table 1: Optional RedHat II Electrical Feature Prefixes (For RedHat optional electrical features, contact your local sales office.)

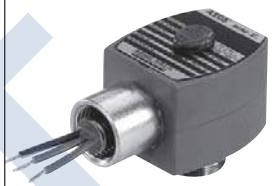
Code	Solenoid
EF	Class I, Division 1 Explosionproof
EV	Class I, Division 1 Explosionproof with 316 Stainless Steel Hub and Stainless Steel Base Plate
EE	Class I, Division 2 General Purpose
GP	Panel Mount Type 1 General Purpose Solenoid
J	Junction Box
JP	Panel Mount Junction Box
OF	Open Frame Spade and Screw Terminal Solenoids
OP	Panel Mount Spade, Screw and DIN Terminal Solenoids
Code	**Coil**
HB	Class H - Intermediate Power
● HC	Class H - Battery Charging Coil
HT	Class H - High Temperature
KB	Class H - Intermediate Power - Screw Terminals
● KC	Class H - Battery Charging Circuit - Screw Terminals
KF	Class F - High Temperature - Screw Terminals
KH	Class H - High Temperature - Screw Terminals
KP	Class F - Intermediate Power - Screw Terminals
SC	Class F - High Temperature - DIN Connection
SD	Class F - Intermediate Power - DIN Connection
SF	Class F - High Temperature - Spade Terminals
SP	Class F - Intermediate Power - Spade Terminals
SS	Class H - Intermediate Power - Spade Terminals
ST	Class H - High Temperature - Spade Terminals
SU	Class H - High Temperature - DIN Connection
SV	Class H - Intermediate Power - DIN Connection
● SW	Class H - Battery Charging Circuit - Spade Terminals
VT	Class F - High Temperature - Micro 4 Pin Connector
VB	Class F - Intermediate Power - Micro 4 Pin Connector
ZT	Class F - High Temperature - Mini 3 Pin Connector
ZB	Class F - Intermediate Power - Mini 3 Pin Connector
Code	**Feature**
● L	72" continuous leads
● X	Other special constructions
Note: See chart on next page for specific power and temperature ratings.	

Table 2: Suffixes for Optional Construction Features

SUFFIX I		SUFFIX II		SUFFIX III	
Code	**Seat/Disc/Etc. Material**	**Code**	**Form of Flow**	**Code**	**Feature**
E	EPDM (Ethylene Propylene)	F ①	Normally Closed	HW ①	Hot Water Construction
J	CR (Chloroprene, Neoprene)	G ①	Normally Open	LT ①	Low Temperature
K ①	Air Operated, 3-30 psi	U ①	Universal	M	Metering Device
N	Oxygen			MB ①	Mounting Bracket
Q ①	Long-Life Construction			MO	Manual Operator
R ①	Resilient			MS	Screw Type Manual Operator
T	PTFE			VH ①	High Vacuum
V	FKM			VM ①	Medium Vacuum
① Covered on the pages of the Series in which it is used.					

An example of an ASCO valve catalog number with prefixes and suffixes:



① The Design Change Letter indicates a major design change affecting spare parts kits, rebuild kits, and coils. The correct replacement parts for each change letter are shown in ASCO's Rebuild Kits and Coils Catalog.

DRAFT

ASCO®

Optional Features
Electrical

Important Note: One-piece molded epoxy RedHat II solenoids are a unique combination of coil and enclosure. When ordering some RedHat II options, it may be necessary to specify the appropriate catalog number prefixes for both the enclosure and the coil.

Type 1 **General Purpose Solenoids with Class F High-Temperature Coils**	**Enclosures:** • Also meet Type 2 Dripproof, Types 3 and 3S Raintight, and Types 4 and 4X Watertight requirements. • Supplied standard with 1/2" threaded conduit hub and built-in strain relief for leads. **Coils:** • Insulation system for coil temperatures up to 311°F (155°C). ① • *For ambient temperature requirement, refer to specific Series and charts in Engineering Information Section.* • Suitable for 50 and 60 Hz. ②	**Ordering Information:** Supplied standard on all RedHat II valves.	
Type 1 **General Purpose Solenoids with Class H High-Temperature Coils**	**Enclosures:** • Same as Class F. **Coils:** • Insulation system suitable for coil temperatures up to 356°F (180°C).① • *For ambient temperature requirements, refer to specific Series and charts in Engineering Information Section.* • Suitable for 50 and 60 Hz. ②	**Ordering Information:** Depending on wattage, use catalog number prefix "HT" or "HB" (e.g., HT8210H002).	
Panel Mount Type 1 **General Purpose Solenoids with Class F or H High-Temperature Coils**	**Enclosures:** • Same as above, but with provision for mounting on a panel (panel not included). **Coils:** • Same as Class F or H above.	**Ordering Information:** For Class F coil, use catalog number prefix "GP" (e.g., GP8210G2) and specify voltage. For Class H coil, depending on wattage, use catalog number prefix "GPHT" or "GPHB" (e.g., GPHT8210G002) and specify voltage.	
Type 7 (A, B, C, and D) **Explosionproof Solenoids with Class F High-Temperature Coils**	**Enclosures:** • Also meets Types 3 and 3S Raintight, Types 4 and 4X Watertight, Types 6 and 6P Submersible, and Type 9 (E, F, and G) Dust Ignitionproof requirements. *Refer to Engineering Information Section.* **Coils:** • Insulation systems suitable for coil temperatures up to 311°F (155°C). ① • *For ambient temperature requirements, refer to specific Series charts in Engineering Information Section.* • Suitable for 50 and 60 Hz. ②	**Approvals:** UL listed; CSA certified. **Ordering Information:** Use catalog number prefix "EF" (e.g., EF8210G002) and specify voltage.	

① UL limitations are 284°F (140°C) for Class F insulation systems and 320°F (160°C) for Class H insulation systems.
② Can be supplied for 50 Hz at a reduced voltage, which is standard throughout the world; i.e., 120/60, 110/50.

DRAFT

TRUE UNION 2000 INDUSTRIAL BALL VALVES

Features – PVC, CPVC

This multi-featured, space saving quarter-turn shutoff valve is designed to meet the demands of today's industrial and chemical processing applications. PVC and CPVC valves are available in IPS sizes 1/2" through 6" with socket/regular thread, SR (Special Reinforced) thread, flanged or spigot end connectors and 8" Venturied valve with socket or flanged ends. Also available in metric socket and BSP thread sizes 1/2" through 2".

- Chemical & Corrosion Resistant PVC or CPVC Construction
- Also Available in **Spears® LXT™** High Purity, Low Extractable PVC Material
- Interchangeable with all True Union 2000 Valves Mates with Union 2000 Pipe Unions
- High Impact Polypropylene Handle
- Built-in Handle Lockout
- Schedule 80 Full-Bore Design
- Strong, Buttress Thread Union Nuts
- Spears® Double O-ring Safe-T-Shear® Stem Design
- EPDM or Viton® O-rings
- Spears® Safe-T-Blocked® Seal Carrier
- Self Adjusting PTFE Floating Seat Design
- Fully Serviceable, Replaceable Components
- Sizes 1/2" - 4" pressure rated to 235 psi @ 73°F. Sizes 6" and 8" Venturied and all Flanged to 150 psi @ 73°F.
- NSF Certified for Potable Water use
- Suitable for Vacuum Service
- Assembled with Silicone-Free, Water Soluble Lubricants
- Manufactured to ASTM F 1970

Sample Engineering Specification

All thermoplastic ball valves shall be True Union 2000 Industrial type manufactured to ASTM F 1970 and constructed from PVC Type I, ASTM D 1784 Cell Classification 12454 or CPVC Type IV, ASTM D1784 Cell Classification 23447. All O-rings shall be EPDM or Viton®. All valves shall have Safe-T-Shear® stem with double O-ring stem seals. All valve handles shall be polypropylene with built-in lockout mechanism. All valve union nuts shall have Buttress threads. All seal carriers shall be Safe-T-Blocked®. All valve components shall be replaceable. All valves shall be certified by NSF International for use in potable water service. All 1/2" through 4" valves shall be pressure rated to 235 psi, all 6" and 8" Venturied and all flanged valves shall be pressure rated to 150 psi for water at 73°F.

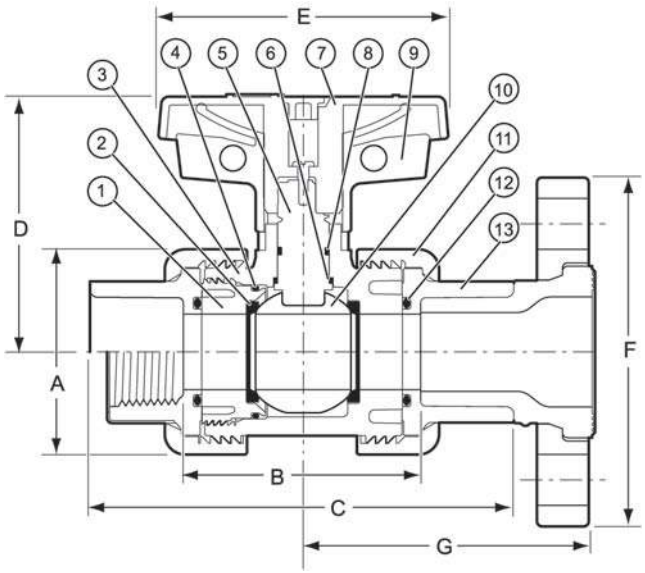
	Viton®	1832-080	—	—	1833-080	—	

1) For CPVC, add the letter "C" following the size code of part number listed (e.g.,1829-005**C**, 1821-005**C**SR)
2) For Special Ball Vent Design, add the letter "V" before the dash separator (e.g.,1829**V**-005, 1821**V**-005CSR)
3) 8" Venturied Valves are 6" ball valves fitted with 6x8 end connector adapters.

Optional Vented Ball Valves

Same valve with special ball vent design for sodium hypochlorite (bleach) and other chemical applications where entrapped fluids may form caustic crystalline residues and pressure build up from gases developed. Valve has a 1/8" vent hole in ball to equalize internal fluid pressures. Install valve with ball vent on the pressure (upstream) side when in closed position.



Optional Accessories*

- Retro-Fit End Connector Sets for Valve Replacement
- Split-Nut Repair Kits for Union Nut Replacement
- Supplemental End Connectors
- Round Safety Handles
- Handle Lockout Ring
- Stem Extension Kits
- Square Operator Nuts
- Multi Mount Valve/Actuation Mounting Kits
- Mini-Mount Actuation Mounting Kits

* See ***"BALL VALVE ACCESSORIES"*** section for details of individual products.

1: Valve Lay Length
2: Torque required at valve maximum internal pressure rating, 5ft/sec. Flow velocity; due to adjustment differences during installation, actual valves may vary.
3: Gallons per minute at 1 psi pressure drop. Valves calculated from laying length, based on derivative of Hazen-Williams equation with surface roughness factor of C=150.
4: 8" Venturied Valves are 6" ball valves fitted with 6x8 end connector adapters.

NOTE: Flanged Valves have a base pressure rating of 150 psi.

NOT FOR USE WITH COMPRESSED AIR OR GASES

DRAFT

True Union 2000 Standard Ball Valves

Features – PVC, CPVC

Economical, low profile quarter-turn shutoff valve is excellent for general purpose and many O.E.M applications. PVC and CPVC valves are available in IPS sizes 1/2" through 4" with socket, regular thread, SR threaded (Special Reinforced), flanged or spigot end connectors.

- Chemical & Corrosion Resistant PVC or CPVC Construction
- Interchangeable with all True Union 2000 Valves, Mates with Union 2000 Pipe Unions
- High Impact Polypropylene Handle
- Schedule 80 Full-Bore Design
- Strong, Buttress Thread Union Nuts
- Spears® Single O-ring Safe-T-Shear® Stem Design
- Spears® Safe-T-Blocked® Seal Carrier
- Replaceable PTFE/HDPE Floating Seat Design
- EPDM or FKM O-rings
- Sizes 1/2" - 2" pressure rated to 235 psi @ 73°F
- Sizes 2-1/2" - 4" and all flanged pressure rated to 150 psi @ 73°F
- EPDM valves NSF® Certified for Potable Water use
- Suitable for Vacuum Service
- Assembled with Silicone-Free, Water Soluble Lubricants
- Manufactured to ASTM F 1970

Sample Engineering Specification

All thermoplastic ball valves shall be True Union 2000 Standard type manufactured to ASTM F 1970 and constructed from PVC Type I, ASTM D 1784 Cell Classification 12454 or CPVC Type IV, ASTM D 1784 Cell Classification 23447. All O-rings shall be EPDM or FKM. All valves shall have Safe-T-Shear® stem with O-ring stem seal. All handles shall be polypropylene. All union nuts shall have Buttress threads. All seal carriers shall be Safe-T-Blocked®. All EPDM valves shall be certified by NSF International for use with potable water. All 1/2" - 2" valves shall be pressure rated to 235 psi, all 2-1/2" - 4" and all flanged valves to 150 psi for water @ 73°F, as manufactured by Spears® Manufacturing Company.

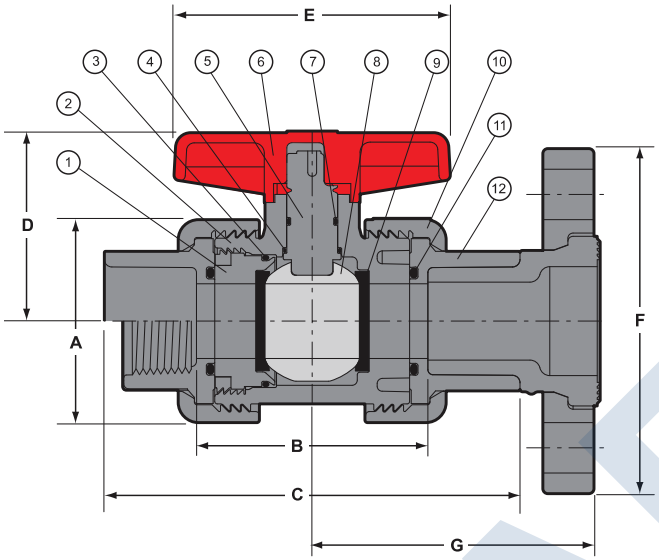
1: For CPVC valve, add the letter "C" to the part number (e.g., 3629-005**C**, 3621-005**C**SR)



Optional Accessories*

- Retro-Fit End Connector Sets for Valve Replacement
- Split-Nut Repair Kits for Union Nut Replacement
- Supplemental End Connectors
- Round Safety Handles
- Stem Extension Kits
- Square Operator Nuts
- Multi Mount Valve/ Actuation Mounting Kits
- Mini-Mount Actuation Mounting Kits

* See ***"BALL VALVE ACCESSORIES"*** section for details of individual products.

ZURN WILKINS

Model SXL

Cast Bronze "Y" Type Strainer

Application

Ideal for use on potable water lines where Lead-Free* fittings are required. Recommended for a variety of water service lines including residential and commercial irrigation, swimming pools and cooling tower water. They are also designed to protect delicate equipment such as regulators and backflow preventers by filtering sediment which could cause premature failure.

NSF/ANSI 61

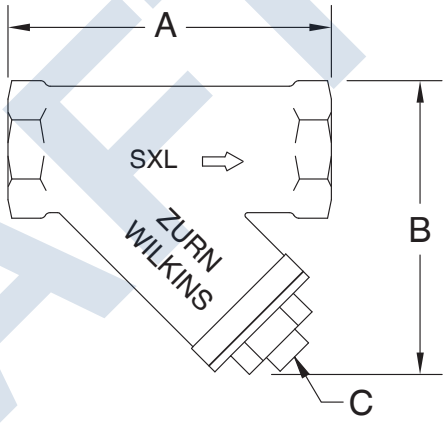
Standards Compliance

- Meets the requirements of NSF/ANSI 61*

*(0.25% MAX. WEIGHTED AVERAGE LEAD CONTENT)

Materials

Main valve body	Low Lead Cast Bronze ASTM B 806
Access covers	Low Lead Cast Bronze ASTM B 806
Screens	20 Mesh Stainless Steel, 300 Series



Features

Sizes: 3/8", 1/2", 3/4", 1", 1 1/4", 1 1/2", 2", 2 1/2", 3"

Temperature/pressure rating	180°F 300 psi WOG
Threaded connections (FNPT) (Supplied with brass closure plug)	ANSI B1.20.1

Options

☐ C - with copper sweat connections (3/4" & 1")

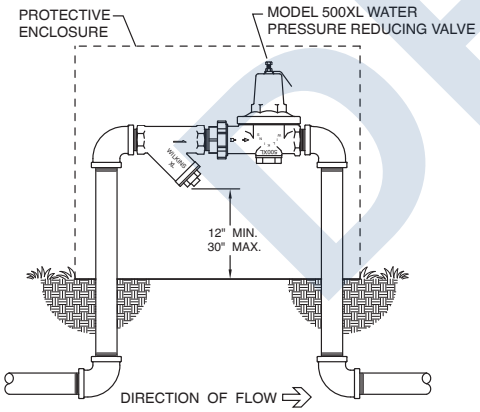
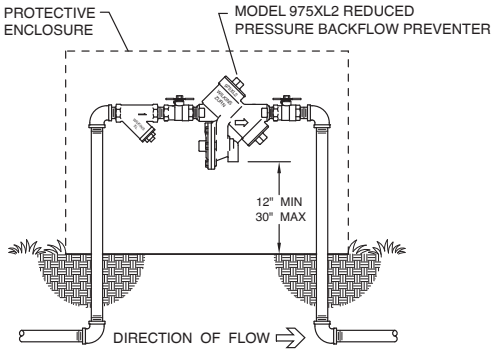
Flow Characteristics





Typical Installation

Local codes shall govern installation requirements. Unless otherwise specified, the assembly shall be mounted in accordance with the latest edition of the Uniform Plumbing Code. If installed below grade, be certain adequate drainage is provided to prevent the device from being submerged. Horizontal installation with the strainer cap facing downward is the preferred installation orientation; however the strainer will provide protection in any orientation.

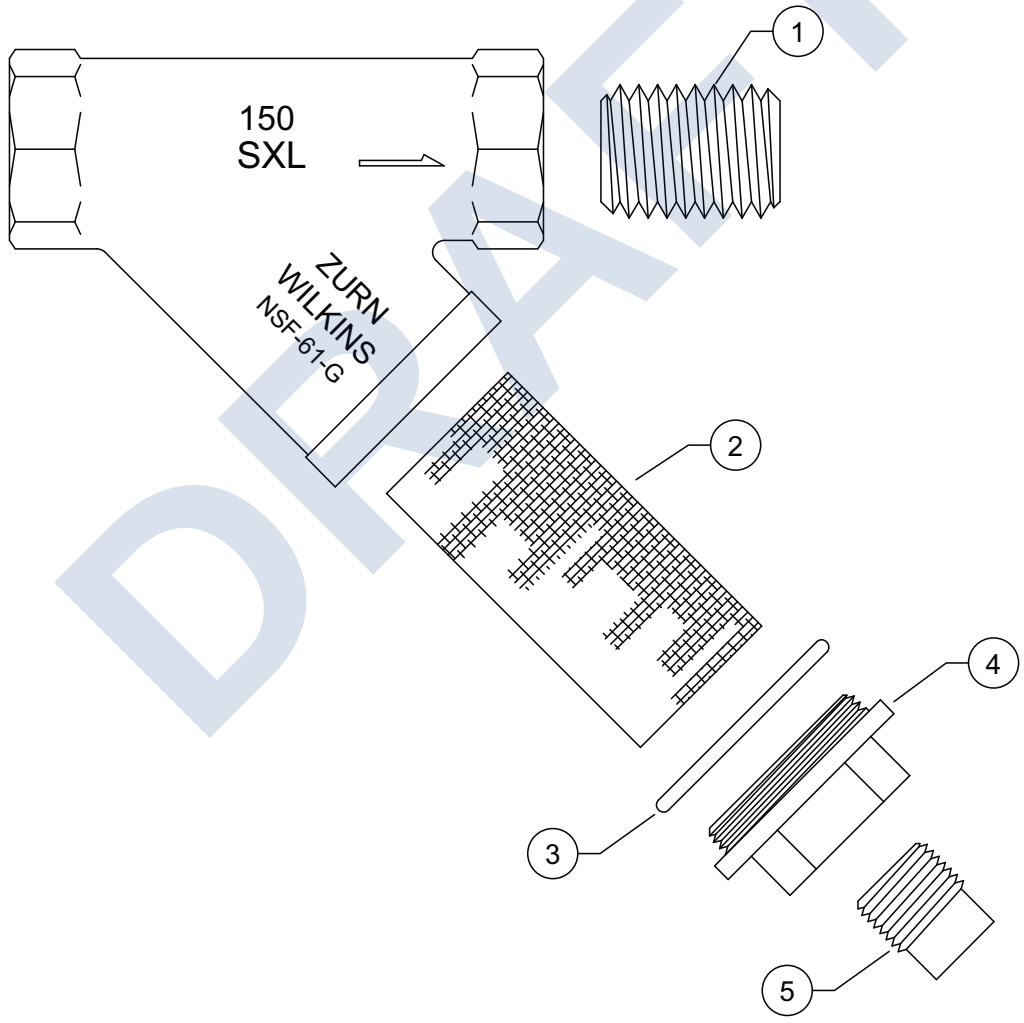
OUTDOOR INSTALLATION

OUTDOOR INSTALLATION

Specifications



The "Y" type strainer shall be a manufactured import certified to NSF/ANSI 61. The main body and cover shall be low lead cast bronze (ASTM B 806), the strainer screen shall be 20 mesh 300 series stainless steel and accessible for maintenance without removing the device from the line. The "Y" type strainer shall be a ZURN WILKINS Model SXL.

Mechanical Pressure Measurement

Bourdon Tube Pressure Gauge Stainless Steel Construction Model 21X.53

Standard pressure indication range - 0-160 psi / 0-11 BAR

Applications

- Intended for adverse service conditions where pulsating or vibration exists (with liquid filling)
- Hydraulics & compressors
- Suitable for gaseous or liquid media that will not obstruct the pressure system

Special Features

- Vibration and shock resistant (with liquid filling)
- Stainless steel case
- Pressure ranges up to 15,000 psi

Bourdon Tube Pressure Gauge Model 21X.53

Standard Features

Design
ASME B40.100 & EN 837-1

Sizes
2", 2½" & 4" (50, 63 & 100 mm)

Accuracy class
2" & 2½": ± 2/1/2% of span (ASME B40.100 Grade A)
4": ± 1% of span (ASME B40.100 Grade 1A)

Ranges
Vacuum / Compound to 200 psi
Pressure from 15 psi to 15,000 psi
Pressure from 15 psi to 10,000 psi - 2" size
or other equivalent units of pressure or vacuum

Working pressure

2 & 2½":	Steady:	¾ full-scale value
	Fluctuating:	⅔ full-scale value
	Short time:	full-scale value
4":	Steady:	full-scale value
	Fluctuating:	0.9 x full-scale value
	Short time:	1.3 x full-scale value

Operating temperature
Ambient: -40°F to +140°F (-40°C to +60°C) - dry
-4°F to +140°F (-20°C to +60°C) - glycerine filled
-40°F to +140°F (-40°C to +60°C) - silicone filled
Medium: +140°F (+60°C) maximum

Temperature error
Additional error when temperature changes from reference temperature of 68°F (20°C) ±0.4% for every 18°F (10°C) rising or falling. Percentage of span.

Weather protection
Weather tight (NEMA 4X / IP 65)

Pressure connection
Material: copper alloy
Lower mount (LM) or center back mount (CBM) - 2" & 2½"
Lower mount (LM) or lower back mount (LBM) - 4"
⅛" NPT, ¼" NPT or ½" NPT limited to wrench flat areaABS (2" & 2½") and white aluminum (4")

DRAFT

Bourdon tube
2½" Size- Material: Copper alloy
30" Hg (VAC) to 800 psi - C-type (soldered)
1000 psi to 15,000 psi - helical type (soldered)
Changes to stainless steel at 7,500 psi brazed
4" Size- Material: Copper alloy ≤ 1,000 psi
316 stainless steel ≥ 1,500 psi
30" Hg (Vac) to 1,000 psi- C-type (soldered)
1,500 psi to 15,000 psi- helical type (brazed)
Changes to stainless steel at 1,500 psi

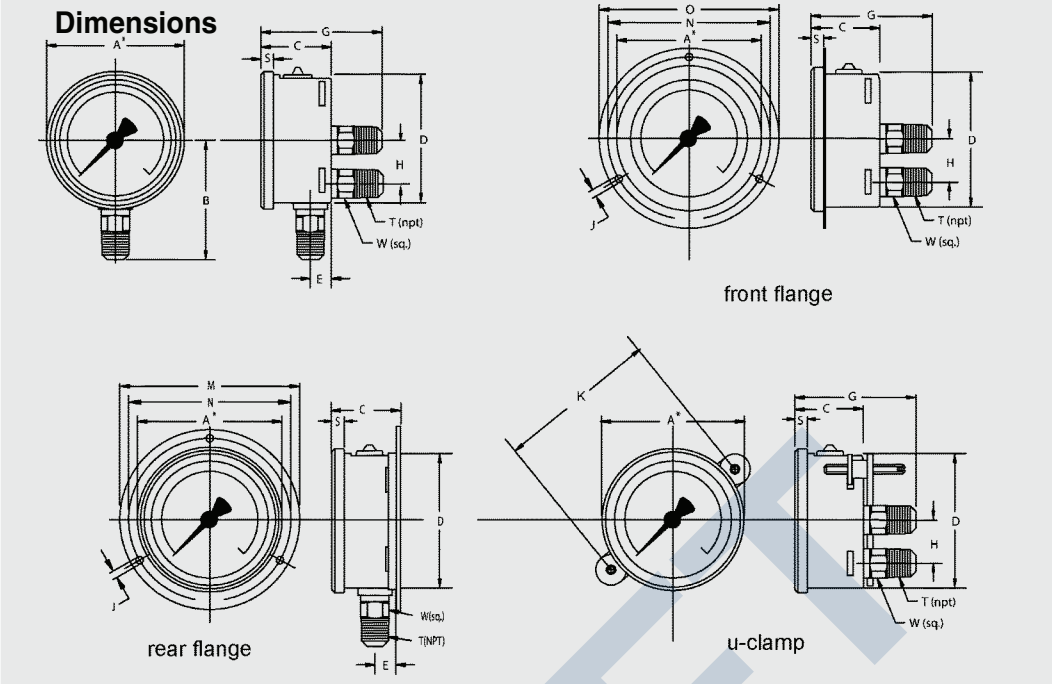
Movement
Copper alloy

Dial
White ABS (2" & 2½") and white aluminum (4")

Pointer
Black aluminum

Case
304 stainless steel with vent plug and stainless steel crimp ring. Suitable for liquid filling.

Case connection sealed with O-ring, (O-ring material dependent on the case fill):
- 2½": EPDM O-ring for Glycerine case fill; Viton O-ring for Silicone fill
- 4": EPDM O-ring for Glycerine or Silicone case fill; Viton O-ring for Halocarbon or Fluorolube fill



Window
Polycarbonate with Buna-N gasket

Case fill
Glycerine 99.7% - Type 213.53

Optional extras
- Brass restrictor
- Stainless steel front or rear flange - 2½" & 4"
- Zinc-plated steel or SS U-clamp bracket (field installable)
- External zero adjustment (2½" only)
- Red drag pointer or mark pointer
- Silicone or Fluorolube case filling
- Special connections limited to wrench flat area
- Custom dial layout
- Other pressure scales available
  bar, kPa, MPa, kg/cm^2 and dual scales

DRAFT

DRAFT

Red-Head 316SS expansion anchors SWW-38503/8" X 5.0" 316SS WEDGE ANCHOR (RED HEAD), or Simpson equivalent wedge anchors are acceptable here besides what is listed below. Note - These Expansion Style Anchors are used for Submerged grit baffle only, All others Hilti Epoxy - All anchors supplied by others.

BRIG TON BEST, INC.
COMMERCIAL ANC OR - ENGINEERING DATA S EET

Products

Wedge Anchors – Carbon Steel, Zinc-Plated and Hot Dip Galvanized

Wedge Anchors – Stainless Steel, Types 304, 316

Drop In Anchors – Carbon Steel

The load data is based on testing in accordance with ASTM E488-15, *Standard Test Methods for Strength of Anchors in Concrete Elements,* performed by CEL Consulting and documented in CEL Test Report No. 20B435.

Tables with average ultimate loads from the testing are included plus tables with allowable strength design (ASD) values based on a safety factor of 4 applied to the average ultimate loads. It is noted that building codes in the United States require ultimate strength design (USD) also called load factor and resistance design (LFRD) for design of anchorages to concrete. ASD values are provided to facilitate use by those who want to use ASD.

Installation Requirements

General:

- Drill holes using a rotary hammer drill in the percussion mode perpendicular to the concrete surface. Use drill bits of the correct diameter meeting the requirements of ANSI B212.15-1994, *Carbide-Tipped Masonry Drills and Blanks for Carbide-Tipped Masonry Drills.*
- Concrete thickness must be at least two times anchor nominal diameter greater than the drilled hole depths.
- Follow all applicable safety requirements.

Wedge Anchors (all types):

- Drill holes perpendicular to the concrete surface to the minimum nominal embedment (see table below) or deeper if specified, plus 1/2” for 3/8” through 5/8” diameters and plus 3/4” for 3/4” diameter.
- Remove drilling debris from the holes using compressed air or by hand using a blow out bulb or plastic tubing. A clean hole is necessary to insure the minimum embedment and full expansion.
- Drive the anchor into the hole with a hammer to the required embedment taking care to avoid damaging the threads.
- Position the fixture to be attached over the hole, install the washer and nut and tighten to the required torque value (see table below) using a torque wrench. Alternatively, the fixture may be positioned over the hole and the anchor driven through the clearance hole in the fixture.

DRAFT

BRIG TON BEST, INC.
COMMERCIAL ANC OR - ENGINEERING DATA S EET

- If torque is not achieved in 8 turns of the nut, loosen the nut, drive the anchor back into the hole to the required embedment and retorque the anchor. If torque still cannot be achieved, remove the anchor and install another anchor at deeper embedment of at least two anchor diameter more than the original embedment.

Anchor Diameter, in.	Minimum Nominal Embedment, in. [1]	Installation Torque, ft.-lbs.
3/8	2 1/4	25
1/2	2 1/2	40
5/8	3 1/2	80
3/4	4	110

[1] Measured from the concrete surface to the embedded end of the anchor

Drop In Anchors:

- Drill holes perpendicular to the concrete surface to a depth equal to the length of the anchor (see table below) or slightly deeper
- Remove drilling debris from the holes using compressed air or by hand using a blow out bulb or plastic tubing. A clean hole is necessary to insure the minimum embedment and full expansion.
- Place the anchor into the hole and drive in with a hammer to at least flush with the concrete surface.
- Insert the setting tool supplied with the anchors into the anchor and apply sharp blows with a hammer to drive the setting tool into the anchor until the shoulder of the setting tool contacts the top of the anchor body.
- Install the fixture to be attached over the hole, install the bolt through the fixture into the anchor and tighten.

Anchor Type	Anchor Diameter, in.	Anchor Length, in. [1]
Standard	3/8	1 9/16
	1/2	2
Shorty	3/8	13/16

[1] Hole depth measured from the concrete surface

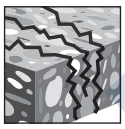
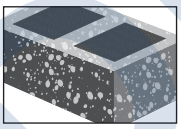
No need for piston plug with 3/8" dia anchors. For 1/2 " horizontal anchors use 1xIP 9/16" NG piston plug (by others) if required to keep epoxy from flowing

3.2.2 HIT-HY 200 ADHESIVE ANCHORING SYSTEM



PRODUCT DESCRIPTION

HIT-HY 200 with HIT-Z rods, Threaded Rod, Rebar, and HIS-N/RN Inserts



Anchor System		Features and Benefits
	Hilti HIT-HY 200-R Cartridge	• Two great products with equal performance data • User can select product gel time suitability based on temperature of the base material and jobsite time requirements • No hole cleaning requirement when installed SafeSet™ hollow drill bit technology
	Hilti HIT-HY 200-A Cartridge	• No hole cleaning requirement when installing HIT-Z anchor rods in dry conditions with hammer drilled holes • ICC-ES approved for cracked concrete and seismic service
	Hilti HIT-Z Anchor Rod	• May be installed in diamond cored holes with HIT-Z anchor rod only when addition cleaning steps are employed
	Hilti HAS Threaded Rod	• ICC-ES approved for grout-filled concrete masonry
	Rebar	
	Hilti HIS-N/RN

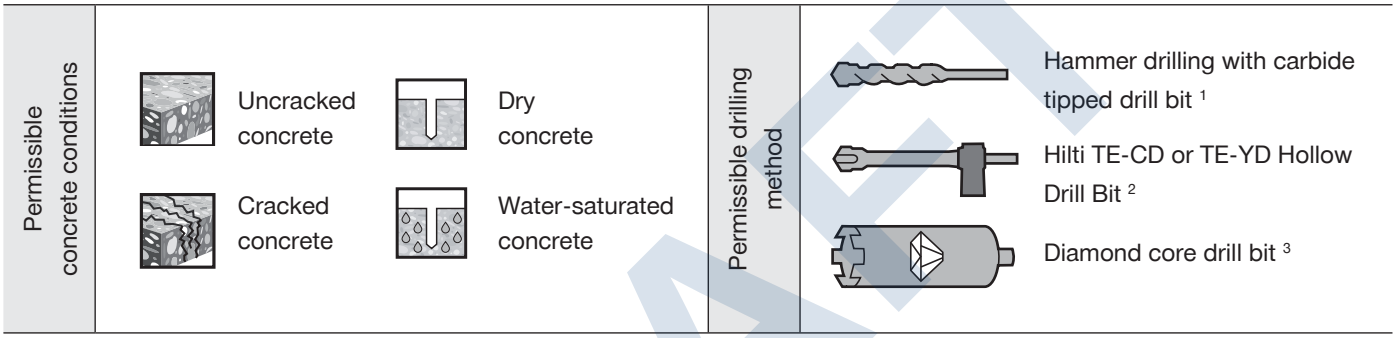
MATERIAL SPECIFICATIONS

For material specifications for anchor rods and inserts, please refer to section 3.2.8.

DESIGN DATA IN CONCRETE PER ACI 318



ACI 318-14 Chapter 17 design

The load values contained in this section are Hilti Simplified Design Tables. The load tables in this section were developed using the Strength Design parameters and variables of ESR-3187 and the equations within ACI 318-14 Chapter 17. For a detailed explanation of the Hilti Simplified Design Tables, refer to section 3.1.8. Data tables from ESR-3187 are not contained in this section, but can be found at www.icc-es.org or at www.hilti.com.

HIT-HY 200 adhesive with HIT-Z and HIT-Z-R anchor rods

Figure 1 - Hilti HIT-Z and HIT-Z-R installation conditions

1 Anchor may be installed in a hole drilled with a carbide-tipped bit without cleaning the drilling dust from the hole. Temperature must be 41° F or higher. Drilling dust must be removed from the hole if the temperature is below 41° F. See Manufacturer's Published Installation Instructions (MPII).
2 When temperatures are below 41° F, TE-CD or TE-YD Hollow Drill Bits used with a Hilti vacuum cleaner are viable methods for removing drilling dust from the hole.
3 Holes drilled by diamond coring require cleaning with a wire brush, a water hose and compressed air. See MPII.

DRAFT

INSTALLATION INSTRUCTIONS

Installation Instructions For Use (IFU) are included with each product package. They can also be viewed or downloaded online at www.hilti.com. Because of the possibility of changes, always verify that downloaded IFU are current when used. Proper installation is critical to achieve full performance. Training is available on request. Contact Hilti Technical Services for applications and conditions not addressed in the IFU.

1 It is permitted to install Hilti HIT-HY 200 with HIT-Z anchor rod down to 14° F (-10° C) provided the drilled hole has the drilling dust fully removed. This can be done with Hilti TE-CD or TE-YD hollow drill bit or with cleaning procedures used with standard threaded rod.

Resistance of cured Hilti HIT-HY 200 to chemicals

Chemical		Behavior
Acetic acid	10%	+
Acetone		●

Key: – non-resistant
+ resistant
● limited resistance

Samples of the HIT-HY 200 adhesive were immersed in the various chemical compounds for up to one year. At the end of the test period, the samples were analyzed. Any samples showing no visible damage and having less than a 25% reduction in bending (flexural) strength were classified as “Resistant.” Samples that had slight damage, such as small cracks, chips, etc. or reduction in bending strength of 25% or more were classified as “Limited Resistance” (i.e. exposed for 48 hours or less until chemical is cleaned up). Samples that were heavily damaged or destroyed were classified as “Non-Resistant.”

Note: In actual use, the majority of the adhesive is encased in the base material, leaving very little surface area exposed.

	Strength reduction factor for shear[2]	ϕ	-	0.60							

For SI: 1 inch ≡ 25.4 mm, 1 lbf = 4.448 N, 1 psi = 0.006897 MPa.
For pound-inch units: 1 mm = 0.03937 inches, 1 N = 0.2248 lbf, 1 MPa = 145.0 psi

[1] Values provided for common rod material types are based on specified strengths and calculated in accordance with ACI 318-11 Eq. (D-2) and Eq. (D-29). Nuts and washers must be appropriate for the rod.
[2] For use with the load combinations of IBC Section 1605.2, ACI 318-14 5.3 or ACI 318-11 9.2, as set forth in ACI 318-14 17.3.3 or ACI 318-11 D.4.3. If the load combinations of ACI 318-11 Appendix C are used, the appropriate value of ϕ must be determined in accordance with ACI 318-11 D.4.4. Values correspond to a brittle steel element.
[3] A4-70 Stainless (M8- M24); A4-502 Stainless (M27- M30)

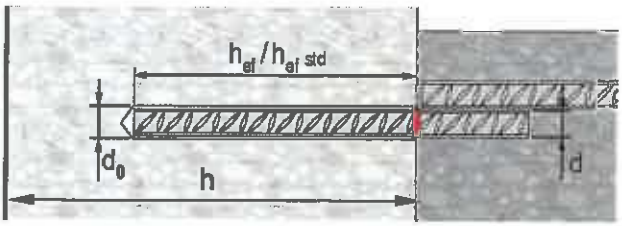
		ϕ_{d}, ϕ_{ws}	-	0.65						
Reduction for seismic tension		$\alpha_{N,seis}$	-	0.88	0.88	1.0	1.0	0.97	0.97	0.97



For SI: 1 inch ≡ 25.4 mm, 1 lbf = 4.448 N, 1 psi = 0.006897 MPa.
For pound-inch units: 1 mm = 0.03937 inches, 1 N = 0.2248 lbf, 1 MPa = 145.0 psi

[1] Bond strength values correspond to concrete compressive strength f'_c = 2,500 psi (17.2 MPa). For concrete compressive strength, f'_c, between 2,500 psi (17.2 MPa) and 8,000 psi (55.2 MPa) [minimum of 24 MPa is required under ADIBC Appendix L, Section 5.1.1], the tabulated characteristic bond strength may be increased by a factor of $(f'_c / 2{,}500)^{0.1}$ [For SI: $(f'_c / 17.2)^{0.1}$]. See Section 4.1.4 of this report for bond strength determination.

[2] Temperature range A: Maximum short term temperature = 130°F (55°C), Maximum long term temperature = 110°F (43°C).
Temperature range B: Maximum short term temperature = 176°F (80°C), Maximum long term temperature = 110°F (43°C).
Temperature range C: Maximum short term temperature = 248°F (120°C), Maximum long term temperature = 162°F (72°C).
Short term elevated concrete temperatures are those that occur over brief intervals, e.g., as a result of diurnal cycling. Long term concrete temperatures are roughly constant over significant periods of time.

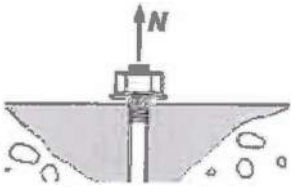
For SI: 1 inch ≡ 25.4 mm

[1] See Figure 5 for description of drilled hole condition.



[2] Linear interpolation is permitted to establish an edge distance and spacing combination between case 1 and case 2. Linear interpolation for a specific edge distance c, where $c_{min,1} < c < c_{min,2}$, will determine the permissible spacing, s, as follows:

$$s \geq s_{min,2} + \frac{(s_{min,1} - s_{min,2})}{(c_{min,1} - c_{min,2})}(c - c_{min,2})$$

HIT-V, HAS and HIT-Z

Hilti Anchor Rod Specifications and Technical Data

Hilti HIT-V and HAS Threaded Rod and Hilti HIT-Z Anchor Rod

Specifications and Technical Data

Hilti has provided threaded rod for many years for post-installed anchoring applications for Hilti adhesive anchor systems. In 2013 Hilti released the Hilti HIT-Z Anchor Rod as part of Hilti SAFEset™ technology along with the new Hilti HIT-HY 200 adhesive. And in 2014 Hilti introduced the new Hilti HIT-V threaded rod. The HIT-V threaded rod is the latest addition to the Hilti anchor rod portfolio and designed for reliable performance in a wide range of chemical anchoring applications in combination with Hilti HIT Injectable adhesive anchor systems.

Hilti HIT-Z Anchor Rod (SAFEset™)

For use with Hilti HIT-HY 200 adhesive, the Hilti HIT-Z anchor rod provides the ultimate in safety and load capacity combined with up to 60% faster installation due to zero-cleaning SAFEset™ * technology

* Zero-cleaning with SAFEsetTM technology with the Hilti HIT-Z anchor rod is currently for use at a base material temperature above 41 °F (+5 °C). For use below 41 °F (+5 °C) and for full installation procedures refer to the product instructions for use on the product packaging or contact Hilti.

Hilti HAS Threaded Rod

Broad portfolio including high-strength and stainless steel for the demand of increased performance and usability with capsule systems

Hilti HIT-V Threaded Rod

Reliable Hilti quality to fulfill the basic needs of chemical anchoring applications (cannot be used with Hilti HVU capsule system)

NEW

HIT-V, HAS and HIT-Z Anchor Rods

Specifications and Physical Properties of Hilti HIT-V, HAS, and HIT-Z Threaded Rods

	Threaded Rod Specification	Units	Minimum Specified Ultimate Strength, f_{uta}	Minimum Specified Yield Strength 0.2% Offset, f_{ya}	f_{uta} / f_{ya}	Elongation, Min. % [9]	Reduction of Area, Min. %	Specification for Nuts and Washers
CARBON STEEL	**HIT-V** Conforms to ultimate strength of ASTM A 307 Grade A [1,10]	psi (MPa)	60,000 (414)	37,500 [(2)] (259)	1.60 [(2)]	10 [(3)]	-	Nuts: SAE J995 Grade 5 Washers: ASTM F884, HV and ANSI B18.22.1 Type A Plain
	HAS-E ISO 898-1 class 5.8 [4,10]	psi (MPa)	72,500 (500)	58,000 (400)	1.25	10 [(5)]	-	Nuts: SAE J995 Grade 5 Washers: ASTM F884, HV and ANSI B18.22.1 Type A Plain
	HAS Super ASTM A 193, Grade B7 [6,10,11]	psi (MPa)	125,000 [(7)] (862) [(7)]	105,000 (724)	1.19	16	50	Nuts: ASTM A 194, Grade 2H, Heavy Washers: ASTM F884, HV and ANSI B18.22.1 Type A Plain
	HIT-Z Anchor Rod 3/8-in. to 5/8-in. - AISI 1038 3/4-in. - AISI 1038 or 18MnV5 [10]	psi (MPa)	94,200 (650)	75,300 (519)	1.25	8	20	Nuts: ASTM A 563 Grade A Washers: ASTM F884, HV and ANSI B18.22.1 Type A Plain
STAINLESS STEEL	**HAS-R 304 / 316** 3/8-in. to 5/8-in. AISI Type 304 / 316 ASTM F 593 CW1 [8]	psi (MPa)	100,000 (690)	65,000 (448)	1.54	20	-	Nuts: ASTM F 594 Washers: ASTM A 240 and ANSI B18.22.1 Type A Plain
	HAS-R 304 / 316 3/4-in. to 1-1/2-in. AISI Type 304 / 316 ASTM F 593 CW2 [8]	psi (MPa)	85,000 (586)	45,000 (310)	1.89	25	-	
	HIT-Z-R Anchor Rod Grade 316 DIN-EN 10263-5 X5CrNiMo 17-12-2+AT	psi (MPa)	94,200 (650)	75,300 (519)	1.25	8	20	Nuts: ASTM F 594 Washers: ASTM A 240 and ANSI B18.22.1 Type A Plain

1 Standard Specification for Carbon Steel Bolts and Studs, 60,000 psi Tensile Strength
2 ASTM A 307 does not have a minimum specified yield strength. Published yield strength is based on Hilti manufacturer specifications and maximum value of f_{uta} / f_y = 1.6 as specified in ACI 318-11 Appendix D section RD.5.1.2.
3 Hilti HIT-V threaded rods do not meet the minimum elongation requirements for ASTM A 307. HIT-V needs to be considered a brittle steel element.
4 Mechanical properties of fasteners made of carbon steel and alloy steel — Part 1: Bolts, screws and studs
5 Hilti HAS-E threaded rods do not meet the minimum elongation requirements for ISO 898-1. HAS-E needs to be considered a brittle steel element.
6 Standard Specification for Alloy-Steel and Stainless Steel Bolting Materials for High-Temperature Service
7 For designs according to CSA A23.3-04 (R2010) Annex D, the maximum value of f_{ut} is 860 MPa (124,700 psi) per clause D.6.1.2.
8 Standard Steel Specification for Stainless Steel Bolts, Hex Cap Screws, and Studs
9 Based on 2-in. (50 mm) gauge length except for A 193, which are based on a gauge length of 4d and ISO 898, which is based on 5d.
10 All HIT-V, HAS-E, HAS Super (except 7/8-in.), and HIT-Z carbon steel rods, nuts, and washers are zinc plated to ASTM B 633 SC 1.
11 7/8-inch HAS Super rods hot-dip galvanized in accordance with ASTM A 153.

1 Values provided for Hilti threaded rod materials based on published strengths and calculated in accordance with ACI 318-11 Appendix D Eq. (D-2) and Eq. (D-28). Nuts and washers must be appropriate for rod strength.
2 HIT-V does not comply with % elongation requirements of ASTM A 307 Grade A steel.
3 For use with the load combinations of IBC Section 1605.2.1 or ACI 318 Section 9.2 as set forth in ACI 318 D.4.3. If the load combinations of ACI 318 Appendix C are used, the appropriate value of Φ must be determined in accordance with ACI 318 D.4.4.
4 HAS-E does not comply with % elongation requirements of ISO 898-1 Class 5.8 steel.

DRAFT

Strength Design According to ACI 318 Appendix D

The following are strength design values calculated from data on the previous page. This is intended for adhesive anchors designed in accordance with ACI 318 Appendix D and can be used in conjunction with the Hilti Simplified Strength Design Tables (refer to Section 3.1.7 of the 2014 Hilti Anchor Fastening Technical Guide for more information on the Hilti Simplified Tables). This includes Hilti HIT-HY 200, HIT-RE 500-SD and HIT-HY 100.

1 Values provided for Hilti threaded rod materials based on published strengths and calculated in accordance with CSA A23.3-04 (R2010) Annex D Eq. (D-2) and Eq. (D-30). Nuts and washers must be appropriate for rod strength.
2 HIT-V does not comply with % elongation requirements of ASTM A 307 Grade A steel.
3 For use with the load combinations of CSA A23.3-04 (R2010) Clause 8.
4 HAS-E does not comply with % elongation requirements of ISO 898-1 Class 5.8 steel.
5 The current publication of CSA A23.3-04 (R2010) Annex D is for cast-in anchors and post-installed anchors that do not include adhesive post-installed anchors. It is the position of Hilti that the steel strength reduction factor, R, that is noted in this document, determined from CSA A23.30-04 (R2010) Annex D, would be appropriate for the design of threaded rods used for post-installed adhesive anchors.

DRAFT

Limit States Design According to CSA A23.3-04 (R2010) Annex D

The following are strength design values calculated from data on the previous page. This is intended for adhesive anchors designed in accordance with CSA A23.3-04 (R2010) Annex D and can be used in conjunction with the Hilti Simplified Strength Design Tables (refer to Section 3.1.7 of the 2014 Hilti Anchor Fastening Technical Guide for more information on the Hilti Simplified Tables). This includes Hilti HIT-HY 200, HIT-RE 500-SD, and HIT-HY 100.

DRAFT

Technical Data — Allowable Stress Design (ASD)

The following strength design technical data is for adhesive anchors that will be designed in accordance with the Allowable Stress Design Method (ASD). This includes Hilti HIT-HY 70 for masonry, HIT-RE 500, HIT-ICE, HIT-HY 10 PLUS, HFX, HTE 50 and HVU Capsules.

Note:
- Hilti HIT-V threaded rods are not applicable for use with Hilti HVU Capsules since the end of the rod does not have a chisel point to break and mix the capsules during installation.
- Hilti HIT-Z Anchor Rods do not have ASD load data since they are only used in conjunction with Hilti HIT-HY 200.

Allowable Steel Strength for Hilti HIT-V and HAS Threaded Rods [1]

Krebs Sewage Degritting Cyclones

Krebs Sewage Degritting Cyclones are used extensively in sewage treatment plants to remove grit, sand, and other inorganic solids from the primary clarifier or grit chamber underflow. Cyclones are more efficient and cost less than gravity sedimentation systems. Debris such as pencils, bottle caps, and other debris found in the raw sewage cause abrasive wear on process equipment and can damage the operation of the digester. Deposited inorganic material causes loss of digester capacity and will eventually result in a complete plant shutdown for cleaning and renovation.

Krebs Sewage Degritting Cyclones are designed to remove at least 98% of the grit entering the feed inlet that is larger than 150 mesh and having specific gravity of 2.65 or greater.

Features & Benefits:

- Fabricated and cast carbon steel housings
- Involuted feed entry
- Neoprene replaceable liners — other liners available on request
- Hinged apex housing to allow access for cleanout without disconnecting any piping
- Nihard vortex finder
- Choice of manually adjustable or fixed apex

Proposal No.: DH 713001-2 Rev 2

Ms. Tyser,

Based upon the information provided, FLSmidth USA, Inc. offers the following proposal. Please note that the attached drawings are for reference only and not for construction.

Sewage Degritting Hydrocyclone

One (1) Krebs Model D10LB-844-SDM Hydrocyclone .....
Complete with fabricated carbon steel housings, replaceable neoprene liners for all housing
Δ2 sections, a 3.5" nihard vortex finder, 9.6 sq. in. neoprene inlet head liner and a fixed 2" neoprene apex liner. The inlet and overflow connections are standard victaulic grooves. Also included are quick release toggle clamps for the apex and 1.25" pressure gauge connections on the inlet adapters.

Pressure Gauge Assembly.....

Complete with a protective diaphragm, 0 to 30 psi dial and 1.25" connection

Victaulic Connections.....

Includes one 4" Victaulic flange for the cyclone inlet; one 6" Victaulic 11.25° elbow, one 6" Victaulic coupling, and one 6" Victaulic flange for the cyclone overflow.

References: Similar to Drawing No. S844-SDM-160846U

***Mounting brackets are to be parallel to inlet.

Additional Information

For Combined Sewer systems or any system with potential for large amounts of rocks, or large particles longer than ½" in any dimension we recommend the following to prevent orbiting and premature wear on the cyclone which can then disrupt performance and if not watched closely then the wear can go through the liners to the housings.

- Installing finer screens or other equipment to remove and prevent these particles going to the cyclone
- Stopping the cyclone at least every 1-4 hours and allow the cyclone to completely discharge (at least 10 seconds) before starting the pump and therefore cyclone again.
- Installing the cyclone at 45 degrees and stopping the cyclone and allowing it to discharge completely as described above to ensure any particles and large rocks discharge and do not cause orbiting and premature wear.
- Inspecting the cyclone more frequently for these types of systems looking for wear, for any particles remaining in the cyclone, any plugging of the apex, inlet or any other part of the cyclone and piping.
- Install a larger apex decreasing likelihood of plugging.

<u>If any of these non-standard methods will be used, you need to ask for more information and a requote as they may require different options.</u>

APEX TYPE

Fixed apex: If change in apex size is needed you can easily remove and order a new apex. Neoprene or BPC rubber apex insert available. Apex can be accessed to be inspected, cleaned or changed while cyclone is installed using quick disconnect clamp setup.

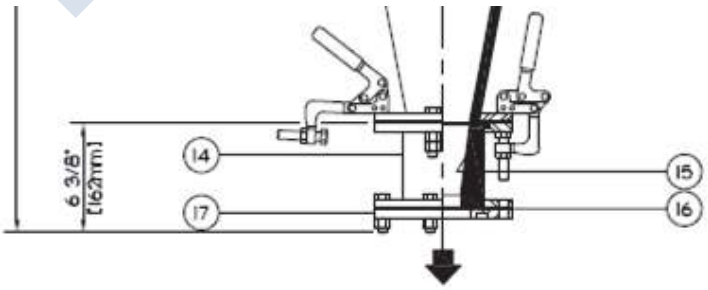

Fig. 1 Fixed Apex Assembly

MOUNTING BRACKETS

You need to specify the mountain brackets to be perpendicular or parallel to the inlet with the order (same price). Otherwise we will use the standard parallel to inlet.

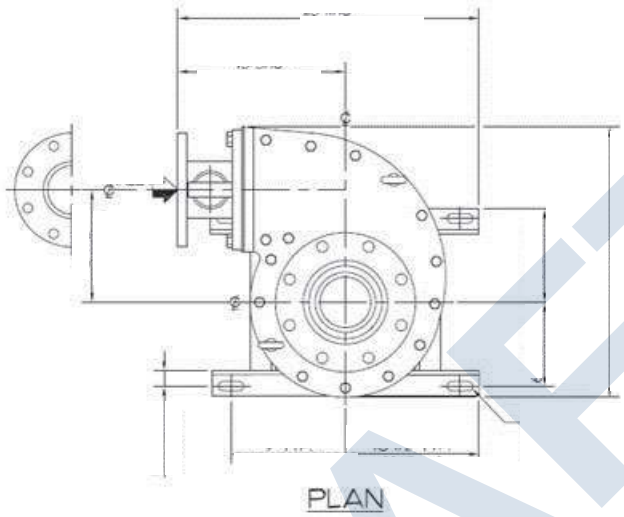

Fig. 2 Above is the standard mounting bracket (parallel to the inlet)

SIPHON CONTROL

****Important note**** siphon prevention. Siphoning can occur if the overflow pipe (stream with water with grit removed) path goes below ıe elevation of the cyclone inlet/inlet pipe. Siphoning disrupts cyclone operation anc must be prevented. The most common method is a vent pipe. The vent should connecl on the run from the cyclone overflow to the elbow (the highest elevation on the cyclc ıe overflow pipe). The vent pipe should be at least half of the overflow pipe diamete and extend at least 3 feet above the level of the pipe top elevation on the inlet to t e cyclone.

Below sketch showing the siphon vent setup as it relates to the cyclone.

Siphon vent setup or some siphon prevention required to prevent siphoning if overflow pipe goes below cyclone inlet maximum elevation.

The information transmitted by this document is the proprietary and confidential property of FLSmidth and may not be duplicated, disclosed or utilized without written consent from FLSmidth.

FLSmidth SA, Inc.

Ph: 520-744-8200 – Fax: 520-744-8300

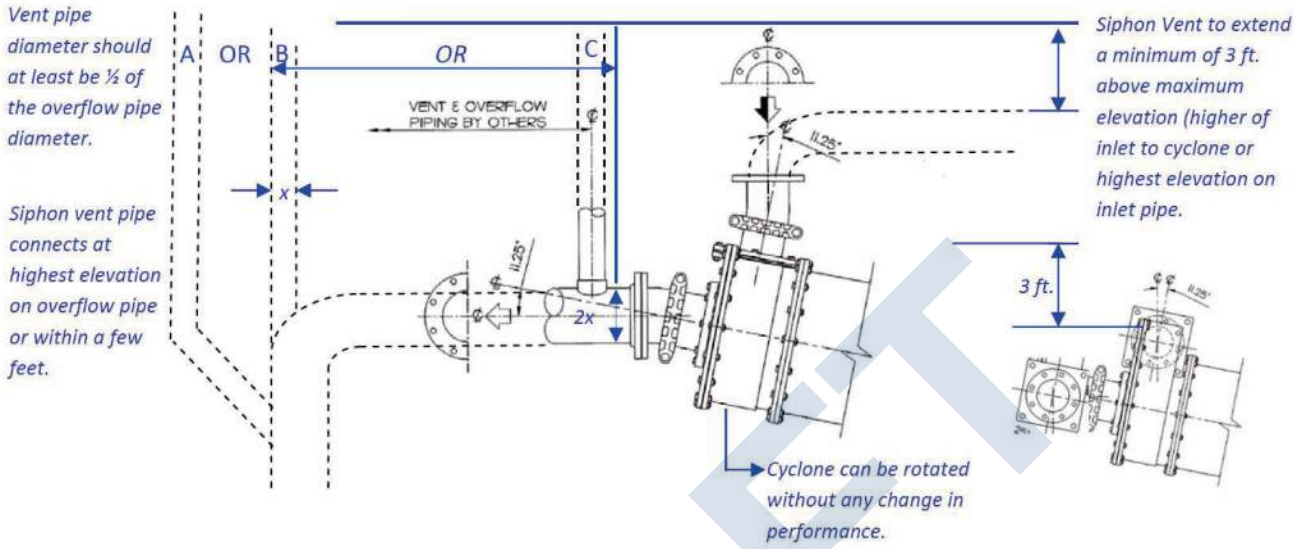

Fig. 3 Siphon Vent Setup & Recommendation for Minimum Requirement

Position A is best to prevent splashing. Position B is ok. Position C will sometimes splash if it's close to the cyclone. Extending the vent pipe higher usually helps prevent splashing.

Clarification and Exceptions:

Please be advised all, or part, of the Technical Specifications were not made available to FLSmidth Krebs at the time of this proposal in the selection of equipment and peripheral items. Once available for review, a revised proposal may be required.

- Welding will be in accordance with AWS D1.1 specifications. Steel will be general structural grade steel (Q235B).
- If required by the contract, structural calculations can be provided in accordance with the IBC (International Building Code) for an additional fee.

TECHNICAL ASSISTANCE:

If requested Krebs can provide technical or mechanical troubleshooting assistance at a rate of $1,320 USD per day plus normal travel expenses, meals, and hotel accommodations plus 10% supported by invoices will be assessed. Schedule to be coordinated with Krebs Sales Engineer to find mutually agreeable dates.

Delivery:

Without approval drawings:

(GA Drawing shall be produced and sent to you as "FINAL- Manufacturing has commenced". The order will immediately go into production)

- Shipment of equipment: *8-10 weeks after the date of receipt of Purchase Order.
- The above proposal is quoted as Incoterms 2010 Ex-Works Factory.

***NOTES:**

- *If improved delivery is needed, please contact FLSmidth and request target lead time, we might be able to improve at no extra cost. If an urgent rush is necessary we may have the ability to expedite further at extra cost if needed.*
- *Once production has commenced any request for change/s may result to change order and a change in delivery date will be applicable.*
- *If required, GA drawings for approval can be provided at a COST ADDER and shall be produced and sent to you as "FOR APPROVAL- Manufacturing will not commence until approval is received".*

5. NO PAYMENT FOR CUSTOMER MODIFICATIONS, BACK CHARGES, OR ANY OTHER CHANGES WILL BE ACCEPTED, UNLESS PREVIOUSLY AUTHORIZED BY FLSmidth KREBS.
6. QUANTITIES SHOWN ARE FOR THE ASSEMBLY OF ONE CYCLONE.

Mounting brackets as shown are parallel to the inlet. Parallel as shown is standard but perpendicular to the inlet (rotated 90 degrees) is available at no additional cost. Please confirm with orders the orientation of brackets to be parallel or perpendicular to the inlet.

Vortex Finder and apex sizing to be confirmed before or with order. We can size them for you if you provide flow rate, acceptable pressure drop and % of flow to underflow for sizing apex standard apex size is 1/2 size of vortex finder size which when mounted 11.25 from horizontal gives 3% of inlet flow to underflow.

Description & Features:

- Most economical all purpose pressure gauge
- 1.5" to 4" sizes
- Friction bezel rings
- Black Steel Case
- Brass internals
- Grade B Accuracy (3%-2%-3%)
- CRN Registered

Applications:

- Plumbing, Heating, Air Conditioning, Pneumatic, Hydraulic, Water tanks, Air Compressors, OEM part.

Specifications	
Dial:	White aluminum with black and red markings
Case:	Steel painted black (plastic avail.)
Lens:	1 1/2" (40mm), 2" (50mm), 2 1/2" (63mm): polycarbonate, 4" (100mm): glass
Ring:	1 1/2" (40mm), 2" (50mm): steel, painted black, 2 1/2" (63mm), and 4" (100mm): steel, chrome plated
Pointer:	Steel, painted black
Socket:	Brass
Connection:	1/8" NPT or 1/4" NPT standard
Bourdon Tube:	Phosphor bronze
Movement:	Brass
Welding:	Silver alloy
Over-pressure Limit:	25% of full scale value
Working Pressure:	Maximum 75% of full scale value
Ambient Temperature:	-40°F to 150°F (-40°C to 65°C)
Process Temperature:	-40°F to 150°F (-40°C to 65°C)
Accuracy:	± 3%-2%-3% accuracy (ANSI/ASME Grade B)
Enclosure Rating:	IP52

Krebs Non-Plugging Gauge Guard

FOR ISOLATION OF GAUGES FROM SLURRIES CARRYING SUSPENDED SOLIDS

- 1¼" NPT f tting is oversized to prevent accumulation of solids in guard housing.
- PVC housing is corrosion resistant and allows operating pressures to 200 PSI.
- BUNA N "rolling" diaphragm for temperatures to 150°F.
- No special technique required to f ll top of housing with light weight oil.
- ¼ inch purge connection, option of ¾ inch purge connection.
- Pressure gauges in 0-30 PSI, 0-60 PSI, 0-2 bar, and 0-4 bar, increment faces.

NON-PLUGGING

The Model S-875 "Slurry" gauge guard provides gauge protection and is specif cally designed for slurry use, with 1¼" NPT f tting, to prevent plugging of the guard with accumulated solids.

Net weight 1½ pounds, shipping weight 2½ pounds.

SUBJECT: SPECIFICATION FOR POLYURETHANE COATING

DEPARTMENTS AFFECTED: ENGINEERING, PURCHASING & PRODUCTION

AUTHORIZATION: 7.3.13 **Manager of Production**

7.3.13 **QA Manager**

JF Beyaert 7/3/13. **Engineering Director**

1. **SURFACE PREPARATION:** All surfaces to be coated shall present a clean finished appearance, free of all dirt, rust, grease, weld spatter, loose mill scale and any other deleterious coating, and shall be blast cleaned per Steel Structures Painting Council Specification SSPC-SP 6-63. Commercial Blast Cleaning or ISO Standard 8501-01, ISO-Sa2, Thorough Blast Cleaning.

2. **BASE PRIMER:** The base primer shall be one coat of National Coating Red Oxide modified epoxy primer 251-R-27-A (FLSmidth Krebs P/N PT-NC-251R27A). 1-1/2 to 3 mils nominal dry film thickness (dft).

3. **FINISH COAT:** One coat of Two Component, Modified Acrylic Polyurethane, color "Krebs Blue" manufactured by National Coatings Inc. (RAL 5023), as (Krebs P/N PT-NCI-RAL5023). 2 to 8 mils nominal dry film thickness (dft).

4. **INSPECTION PROCEDURE:** Coatings are visually inspected and are to be free of runs, sags, voids, drips, over spray, loss of adhesions, blistering, peeling, flaking, mud cracking or inadequate spray. Defects are to be corrected as they are detected.

5. **APPLICATION:** Carbon steel or stainless steel surfaces as specified per order requirements.

NOTES:

A) Recommended dry film thickness as specified above.
B) Application temperatures and drying time are per manufacturer's specification.

PLEASE DO WHAT CAN BE DONE TO PROTECT PAINT DURING TRANSIT

CDSW

All Gauges, Valves (except valve in drain kit), Anchor Bolts, etc. by Others. C1D2 5 hp continuous duty electric motor suitable for a 460/3/60 supply and rated for a Class 1 Div. 2 explosion proof. As a minimum, the motor will be TEFC with an IP55 enclosure rating and will conform to NEMA MG-1 requirements. no mods. included. No pump or motor testing included.

Components May Vary - Typical Installation Shown.

Description

Designed to provide easy case drainage when the pump requires maintenance. Casing drain plug in pump is replaced by pipe fittings, ball valve and quick-connect male adaptor.

Separate hose assembly consists of reinforced plastic hose with cast aluminum quick-connect female coupler on one end.

ASSEMBLY INSTRUCTIONS

1. REMOVE .500 PIPE PLUG ON BACKSIOE OF VOLUTE.
2. LOCATE AND DRILL THERMOSTAT MOUNTING HOLES.
3. MOUNT THERMOSTAT (P/N 47811-201) IN POSITION WITH MACHINE SCREWS (P/N CF*08-01) ANO LOCK WASHERS (P/N J*08). FOR SST VOLUTES, USE (2) BM*04-04 ORIVE SCREWS IN LIEU OF MACHINE SCREWS.
4. APPLY PIPE SEALANT G-R P/N 18771-055 TO THE THREADS OF PIPE BUSHINGS (P/N AP1208 & 27184-502) ANO INSTALL IN JUNCTION BOX (P/N 27144-011) OUTLETS.
5. INSTALL BUSHING (P/N AP1208), HEATER PROBE (REF. NO. 9) AND JUNCTION BOX (P/N 27144-011) IN SEQUENCE WITH JUNCTION BOX CAP. CAP POSITION (UP OR DOWN) TO ALLOW ROOM FOR CAP REMOVAL. HEATER PROBE LEADS ARE TO BE THREADED INTO JUNCTION BOX.
6. ATTACH CONNECTOR (P/N 27151-102) TO LEFT OUTLET OF JUNCTION BOX.
7. THREAD THERMOSTAT LEADS INTO CONOUIT (P/N 31412-066) ANO SECURE CONOUIT WITH CONNECTORS ON THERMOSTAT ANO JUNCTION BOX.
8. ATTACH (1) THERMOSTAT LEAD ANO ONE (1) HEATER PROBE LEAD TOGETHER USING CONNECTOR (P/N 27284-003).
9. INSTALL JUNCTION BOX CAP
10. REMAINING JUNCTION BOX OUTLET TO BE USED BY CUSTOMER TO WIRE IN APPROPRIATE POWER SOURCE.

11 MOUNT JUNCTION BOX AS SHOWN TO ALLOW REMOVAL OF ROTATING ASS'Y WITHOUT OISCONNECTING HEATER ASS'Y.

NOTES:

1. THE THERMOSTAT MAY BE INSTALLEO ON THE OPPOSITE SIDE OF THE CASING BY USING THESE INSTRUCTIONS.

   WHEN USED ON TWO PUMPS POSITIONED SIDE-BY-SIDE IN A LIFT STATION, INSTALL THE THERMOSTATS TOWARD THE INSIOE OF THE STATION, SO THE PUMP ROTATING ASSEMBLIES CAN BE REMOVED THROUGH THE LIFT STATION DOOR OPENINGS WITHOUT HAVING TO DISCONNECT THE CASING HEATERS.
2. CHECK THERMOSTAT WIRES WITH A CONTINUITY LIGHT BEFORE CONNECTING TO HEATER PROBE AT ASSEMBLY. (SWITCH SHOULO BE OPEN)
3. KITS TO BE SHIPPED SHOULD BE INSPECTED BY SAME METHOO BEFORE GOING TO CUSTOMER.

ADVERTISING FORM NO.: GL-05220

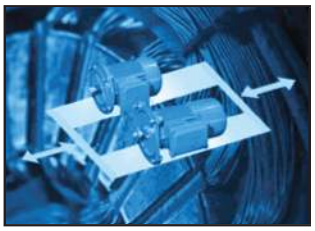
Drive Motors



DRAFT

Included:

Performance Specifications & Features
Motor Data Sheets

PREMIUM EFFICIENT MOTORS
HIGH PERFORMANCE & ENERGY SAVINGS

NORD DRIVESYSTEMS

Mounting Styles

- Integral motor for use with speed reducer
- NEMA C-face flange
- NEMA T-Frame footed motor mount
- DIN B5, IEC FF metric face flange mount
- DIN B14, IEC metric face flange mount
- DIN B3, IEC metric foot mount

Inverter Duty & Inverter Duty Options

- Motors conform with NEMA MG-1-2006 Section 31.4.4.2
- Insulated with double coated magnet wire
- Speed range 5:1 constant torque from 60Hz to 12Hz
- 10:1 speed range : constant torque from 60Hz to 6Hz
- 20:1 speed range : constant torque from 80Hz to 4Hz
- 1000:1 speed range : constant torque from 60Hz to 0Hz
- Blower cooling fans
- Incremental encoder

Standard Construction Features

- Ambient temperature of 40° C (104° F)
- 3300 feet of elevation without derating
- Class B temperature rise : 105° C (221° F)
- Class F insulation system : 155° C (311° F)
- IP55 enclosure protection
- Totally Enclosed Fan Cooled (TEFC)
- Low rotor inertia
- Ball bearings & high temperature bearing grease
- Squirrel cage rotor
- Dynamically balanced, anti-corrosion coated rotor
- Corrosion resistant aluminum alloy housing
- 1045 carbon steel shaft with shaft lip seals on both end bells
- Sealed stator to end bell connections
- Gasket sealed conduit boxes
- Four conduit box & threaded cable entry locations
- Double coated magnet wire insulation
- Insulation lined slots
- Inorganic insulation for tropical protection
- Phase paper & separators
- First turn winding protection
- Varnish dipped stator
- Non sparking low inertia fan
- Terminal block power connector
- Reverseable roatation direction

Product Options

Thermal Winding Protection Options

- Thermistat Sensor (TW)
- Thermistor Sensor (TF)

Brakemotors

- Ready to go…wired by factory
- Manual hand release lever included
- Downward adjustable torque is included,specification is required
- AC to DC voltage rectifier is included
- IP55 enclosure protection is included

Brakemotor Options

- NSD+ severe duty protection
- Corrosion protection (RG)
- Dust protection (SR)
- Lockable hand release lever (FHL)
- Oversize & Undersize brake
- Inverter duty modifications
- Faster torque release enhancement
- Faster torque stopping enhancement
- Current sensing relay (IR)
- Heating circuit (BSH)
- Micro switch wear indicator
- IP 66 enclosure

Environmental Protection Options

- NSD+ severe duty protection
- Encapsulated windings for IEEE45 Marine Duty
- IP66 enclosure
- End bell drain holes
- Drip cover (RD)
- Wind protected double drip cover (RDD)
- Space heater (SH)
- Epoxy coated interior surfaces

Other Options

- Class H insulation system
- Over-running clutch (FK)
- Anti-rotation backstop (RLS)
- Extended motor shaft (WE)
- High inertia metal fan for soft start (Z)
- Quick power disconnect plug (MS1)

Motor Data Sheet

3 phase motor	Motor type: **80SP/4 CUS TW**

Electrical data:		
Frequency (f):	60	Hz
Output (P):	0.55	kW
Speed (n):	1735	1/min
Connection of stator:	YY/Y	
Voltage (V):	230/460	V
Current (I):	2.30/1.15	A
Voltage range (U_{WB}):	USABLE AT 208YY	V
Wide range current (I_{WB}):		A
Starting current/Current (I_A/I):	6.11	
Rated motor torque (M_N):	3.03	Nm
Starting motor torque (M_A):	8.59 (2.83)*	Nm
Minimum motor torque (M_S):	7.67 (2.53)*	Nm
Breakdown motor torque (M_K):	10.30 (3.40)*	Nm
cos phi:	0.72	Last
Eta(%):	83.40	100%
Eta(%):	82.70	75%
Eta(%):	79.80	50%
Service Faktor:	1.15	
Code letter:	J	

Tested data:		
Connection of stator:	YY/Y	
Voltage (V):	230/460	V
No load current (I_0):	1.52/0.76	A
No load output (P_0):	0.071	kW
Noise level (L_{PA}):	51	dB(A)
Resistance stator winding at 20°C (R):	5.2 T1-T4	Ohm
Temperature rise (T):	25.70	K
(at the stator resistance method)		
Insulation resistance ($R_{isol.}$):	100	Mega Ohm
Winding test:	2352	V/4 sek.
Class of vibration:		A

Order data:			
Order No.:	13242526		
Customer reference No.:			
Serial No.:			
Motor No.:			
Stator No.:	13242526		

General data:			
Direction of rotation:	CW/CCW		
Design:	762 Mot moun.acc. IEC B14 Ø120		
Duty:	S1		
Type bearing:			
Housing material:	Aluminium		
Insulation class:	F		
Type of protection:	IP 66		
Cable entry:	1 III		
Moment of inertia:	0.00145	kgm^2	
Maximum altitude of site:	1,000	m	
Ambient temperature:	-20°C	to	+40°C
Fan Type:	Standard IC 411		

Classification authorities:

NEMA (ELECTRICAL), EISACT 2007

Motor options:

TW: Thermostat

- Ball bearings & high temperature bearing grease
- Squirrel cage rotor
- Dynamically balanced, anti-corrosion coated rotor
- Corrosion resistant aluminum alloy housing
- 1045 carbon steel shaft with shaft lip seals on both end bells
- Sealed stator to end bell connections
- Gasket sealed conduit boxes
- Four conduit box & threaded cable entry locations
- Double coated magnet wire insulation
- Insulation lined slots
- Inorganic insulation for tropical protection
- Phase paper & separators
- First turn winding protection
- Varnish dipped stator
- Non sparking low inertia fan
- Terminal block power connector
- Reverseable roatation direction

Product Options

Thermal Winding Protection Options

- Thermistat Sensor (TW)
- Thermistor Sensor (TF)

Brakemotors

- Ready to go…wired by factory
- Manual hand release lever included
- Downward adjustable torque is included,specification is required
- AC to DC voltage rectifier is included
- IP55 enclosure protection is included

Brakemotor Options

- NSD+ severe duty protection
- Corrosion protection (RG)
- Dust protection (SR)
- Lockable hand release lever (FHL)
- Oversize & Undersize brake
- Inverter duty modifications
- Faster torque release enhancement
- Faster torque stopping enhancement
- Current sensing relay (IR)
- Heating circuit (BSH)
- Micro switch wear indicator
- IP 66 enclosure

Environmental Protection Options

- NSD+ severe duty protection
- Encapsulated windings for IEEE45 Marine Duty
- IP66 enclosure
- End bell drain holes
- Drip cover (RD)
- Wind protected double drip cover (RDD)
- Space heater (SH)
- Epoxy coated interior surfaces

Other Options

- Class H insulation system
- Over-running clutch (FK)
- Anti-rotation backstop (RLS)
- Extended motor shaft (WE)
- High inertia metal fan for soft start (Z)
- Quick power disconnect plug (MS1)

Global Vision, Local Support

NORD makes its wide product range easily available through a global network that includes representation in over 60 countries. By providing all of our customers with prompt delivery, and expert support services, we are firmly committed to exceeding customer expectations and being responsive to the ideas and specifications of every customer, anywhere in the world.

3 phase - motor

Type : 71 L/4

Output : 0,50 hp / 0,37 kW

Connection of stator : YY/Y

Voltage: 230 / 460 V

Frequency : 60 Hz

Current : 1,90 / 0,95 A

Speed : 1720 rpm

pf : 0,69 Duty: Cont

Type of enclosure: IP 55

Direction of rotation : both

Design :

Code Letter: F

Service factor: 1.15

Resistances [20°C] T1, T4: 13,65 Ohm Insul.Cl. F

Standard: LR112560 E191510 NEMA, EN 60034

Measurement-values:

U (V)	I (A)	rpm	f (Hz)	Rating
230 / 460	1,48 / 0,74	1800	60	no load
/	/			
/	/			
230 / 460	1,90 / 0,95	1720	60	full load

Performance Specifications & Features
Data Sheets

NORD DRIVESYSTEMS

PARALLEL HELICAL CLINCHER

SHAFT DATA

- AISI 1045 or 4140 input and output shaft material
- Input and output shaft key dimensions are according to AISI B17 [in]
- Input and output shaft key dimensions are according to DIN 747 [mm]
- Standard output shaft drill and tap
- 2 hollow shaft keys
- Shrink disc size range [in] : 1.188 to 7.000
- Shrink disc size range [mm] : 30 to 180
- Minimum gripping safety factor range [h6 fit] : 2.2 to 5.9

SHAFT DATA OPTIONS
Double solid output shaft, Shaft fixing element, Custom shaft diameters, Hollow spline per DIN 5480, Custom spline, Cross drilled holes, 304 stainless steel

MOTOR MOUNTING

- Integral motor : 1/6 to 250 HP
- C-face adapter frame size range : 56C to 360TC
- IEC adapter [B5] frame size range : IEC 63 to IEC 315
- Sugar scoop motor availability : 56 to 365T
- Top mount platform motor availability : 56 to 405T

MOTOR MOUNTING OPTIONS
Custom motor adapter, Custom coupling diameter

GEARING

- Up to AGMA Class 13 gear quality rating
- 58 Rockwell C minimum gear hardness
- Ground or skive hobbed hard gear teeth finishing
- Standard drop forged gear blanks
- 275% momentary overload capacity
- Standard hunting tooth ratios

HOUSING

- Class 35 gray iron housing material
- Single setup machining method
- UNICASE™ one piece housing design
- Seals directly contact main housing
- Exceptional housing torsional stiffness
- Thick housing wall section
- Castings are dip sealed

BEARINGS

- ABEC-1 quality bearings
- Standard output ball bearings
- Tapered or spherical heavy-duty output bearings

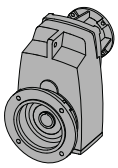
LUBRICANT & SEALING COMPONENTS

- Factory filled ISO 220 mineral oil
- Standard AUTOVENT™ breather style
- QUADRILIP™ output seal design
- 1 double lip & 1 single lip output shaft oil seals
- Nitrile rubber oil seals

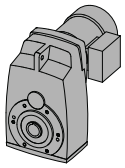
LUBRICANT & SEALING OPTIONS
Custom synthetic lubricating oil, Custom temperature lubricating oil, Fluid grease lubricant, Food grade lubricating oil, Long term storage preparation, Magnetic drain plug, Bulls eye sight glass, Custom drain plug, Fluorinated rubber oil seal material, Custom oil seals

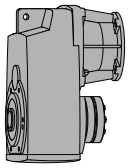
INTERNAL PARTS ASSEMBLY

- Heavy press fit assembly method
- Standard reversing duty
- Typical backlash range [arc minutes] : 6 to 11

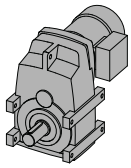


INTERNAL PARTS ASSEMBLY OPTIONS
Internal backstop





ENVIRONMENTAL PROTECTION



- Exterior primer coverage on all metal exterior surfaces
- Water Based Resin paint type
- 316 stainless steel flake paint additive
- H1 USDA incidental contact exposure

ENVIRONMENTAL OPTIONS
NSD+ protection, Custom paint, Shaft seal covers, High pressure washdown IP66 oil seals

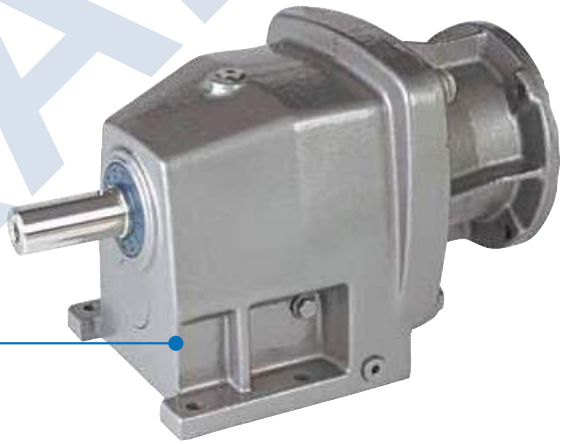
Intelligent Drivesystems

NORD SEVERE DUTY EXTREME

ENHANCED CORROSION PROTECTION

NORD DRIVESYSTEMS

PERFORMANCE RANGE



With many standard features to help maximize operational processes, all of NORD's motors and speed reducers are constructed to provide a high level of protection against wet and severe environments – both inside and outside of your facilities. Extremely well-sealed against permeating moisture, our products use corrosion – and moisture – resistant components to reduce the effects of harmful environmental exposure. NSD-X3 sealed motor and gear units use a primer undercoat and stainless steel finish and clear top coat applied to the surface for increased protection in wet and outdoor installations. With a durable solvent-based coating, NSD-X3 units provide maximum protection for your extreme application conditions.

NSD-X3W White Coating

TYPICAL APPLICATION

- Indoor applications that are wet, dirty or include a chemical washdown
- Outdoor applications that are unprotected and exposed to severe environmental conditions

NSD-X3 Stainless Coating

Additionally a variety of coating options are available including our Severe Duty coatings:

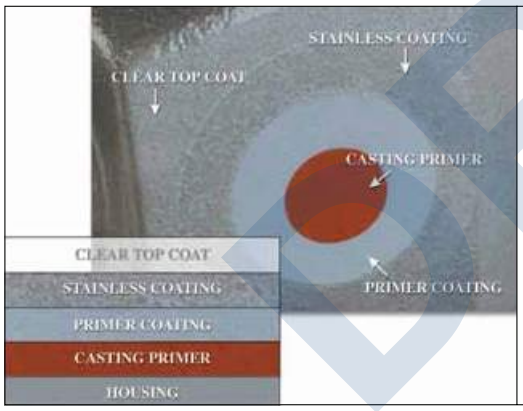
Finish	Color	Coating	Use
NSD X3			
NORD Severe Duty Extreme NSD-X3	Stainless steel silver (Gray)	1 x Primer high solid alkyd system 1 x Stainless steel (316) (polyurethane) 1 x Clear top coat (polyurethane)	Indoor or outdoor more severe environment
NORD Severe Duty Extreme NSD-X3W	White	1 x Primer high solid alkyd system 1 x White (polyurethane) 1 x Clear top coat (polyurethane)	Indoor or outdoor more severe environment
Alternate color NSD-X3	Black, Blue, Red, Orange	1 x Primer high solid alkyd system 1 x Color (polyurethane) 1 x Clear top coat (polyurethane)	Indoor or outdoor more severe environment

Special colors and paints possible please contact NORD with your specific requirements.

DRAFT

NORD SEVERE DUTY EXTREME

STANDARD PROTECTIVE



REDUCERS

- Unicase® housing design
- Autovent™ pressure relief breather or sealed housing
- Gear housing internally and externally prime painted
- Quadrilip™ or double lip output shaft seals
- Stainless steel nameplate
- Factory oil-filled
- Stainless steel (316) protective paint coating – Suitable for use in a USDA inspected facility

MOTORS

- Shaft lip seals on both ends of the motor shafts
- Stator to end bell connections sealed to exclude moisture
- Double coated magnetic wire insulation
- Moisture-resistant varnish-dipped windings
- Inorganic insulating components for tropical protection
- Moisture-resistant motor windings
- Conduit box sealed with gaskets
- Corrosion resistant alloy materials
- Stainless steel (316) protective paint coating – USDA/H compliant Suitable for use in a USDA inspected facility

ADDED NSD-X3 PROTECTIVE BENEFITS

- Solvent-based paint for increased durability
- Includes additional primer undercoat for improved corrosion protection
- Clear top coat for added protection
- Outstanding exterior durability and corrosion resistance
- Superior chemical resistance when exposed to industrial solvents : laquer thinner, acetone, gasoline, Xylol, lubricants and cutting oils
- Cured coating develops 2H hardness, yet exhibits excellent high impact resistance
- Stands up to heat and humidity (tested for 500 hours at 100% humidity and 100°F)
- Available in stainless steel (316) – or white finish

Input Section

Input

NORD's modular design allows for many different types of inputs to be added to gear reducers. All inputs are bolt on and include machined pilots to ensure simple and accurate assembly. NORD offers the following different input types:

- Integral motor
- Solid input shaft
- NEMA C-face motor adapter
- IEC B5 motor adapter
- Servo motor adapter
- Top mount motor platform
- Scoop mount motor platform
- Custom mounting interface

Nomenclature

After the letters, 'SK' Reducer sizes are indicated followed by the dash (-), then the input device such as:

- SK32 – 90L/4 (Integral motor)
- SK32 – W (Solid input shaft)
- SK32 – 140TC (NEMA C-face motor adaptor)
- SK32 – IEC80 (IEC B5 motor adaptor)
- SK32 – SEP100 (Servo motor adaptor)
- SK32 – MK140T (Top mount motor platform)
- SK32 – S140T (Scoop mount motor platform)
- SK32 – WII (Custom mounting interface)

Example Nomenclature

SK32 - W

- **Solid Input Shaft**
- **Gear unit**

Gear unit with solid input shaft.

SK32 -140TC

- **NEMA 140 TC Motor Adaptor**
- **Gear unit**

Gear unit to recieve standard NEMA C-Face motor adaptor.

SK32 - IEC80

- **IEC 80 B5 Motor Adaptor**
- **Gear unit**

Gear unit to recieve standard metric IEC B5 flange mount motor adaptor.

DRAFT

Simple, Reliable & Efficient

Simplicity - the NORD SCP screw conveyor package eliminates the need for costly separate V-belt drives by providing integral gearmotors or direct coupled motors to a NEMA C-face reducer.

SCP - PRODUCT FEATURES

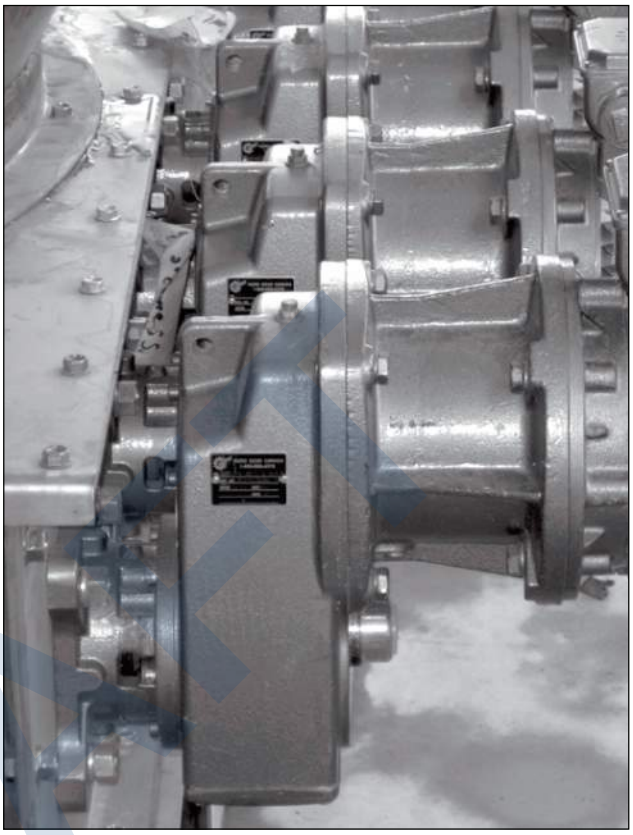
OPTIMIZED SEALING SYSTEM
- Dual Viton lip seals
- Grease impregnated packing seal
- Dual gap seals (excludes particles) – 0.03" gap
- Material evacuation ports
- Shaft material ditch
- Quadrilip™ sealing

MOUNTING
- Standard CEMA mounting
- Versatile flange – multiple bolt patterns
- 3-Hole tapered CEMA drive shaft
  - Easy mounting
  - Easy removal (less fretting – due to less material contact)
- Reduced bearing loads – tapered shaft allows for screw pipe misalignment
- Quick external removal feature

FLANGE
- Standard CEMA mounting
- High strength class 35 gray cast iron
- Versatile flange – multiple bolt patterns

HIGH EFFICIENCY

The NORD SCP design is extremely effective due to the direct coupled gearmotor or NEMA C-face input design. Belted input systems have significantly lower total drive performance. You can further increase the overall efficiency by applying the NORD "H" line of energy efficient motors.



NORD DRIVESYSTEMS

DRAFT

SCP Overview

Screw Conveyor Package Overview

The NORD Screw Conveyor Package (SCP) offers a compact and cost effective alternative to traditional screw conveyor drives. Closely stepped speed reduction ratios combined with a directly coupled gearmotor or NEMA C-face input design eliminates the need for top motor mounts, pulleys, belts or guards. Minimizing parts and eliminating the belted input systems provides for easier system maintenance, increased reliability, and superior drive performance.

The SCP design is available for both CLINCHER™ Parallel Shaft gear units and Helical-Bevel Right Angle gear units. The CEMA flange and shaft assembly are a unique NORD design to offer superior protection against unwanted debris. A slight lead taper on the reducer shaft provides for easy mounting and removal, allowing for some screw pipe misalignment and reduced bearing loads.

Benefits

- Reduced cost
- Large ratio range
- Direct drive motor options (Integral or C-face)
- No belt maintence or belt guarding required.
- Reduced parts / higher reliability / space savings
- Higher efficiency
- More direct torque transfer.

Ratings Overview

CLINCHER™ SCP

- Torque Capacity: Up to 53,100 lb-in
- Power Range: 0.16 – 60 Hp
- Ratio Range: 4.32:1 – 1585.08:1
- Output Speed: 1.0 – 405 rpm
- Efficiency: Up to 97%
- CEMA Drive Shaft Sizes:
  1-1/2", 2", 2-7/16", 3", 3-7/16"

HELICAL-BEVEL SCP

- Torque Capacity: Up to 42,480 lb-in
- Power Range: 0.16 – 30 HP
- Ratio Range: 8.09:1 – 4246.38:1
- Output Speed: 0.41 – 216 rpm
- Efficiency: Up to 95%
- CEMA Drive Shaft Sizes:
  1-1/2", 2", 2-7/16", 3", 3-7/16"

SCP Overview

Screw Conveyor Package Overview

The NORD Screw Conveyor Package (SCP) offers a compact and cost effective alternative to traditional screw conveyor drives. Closely stepped speed reduction ratios combined with a directly coupled gearmotor or NEMA C-face input design eliminates the need for top motor mounts, pulleys, belts or guards. Minimizing parts and eliminating the belted input systems provides for easier system maintenance, increased reliability, and superior drive performance.

The SCP design is available for both CLINCHER™ Parallel Shaft gear units and Helical-Bevel Right Angle gear units. The CEMA flange and shaft assembly are a unique NORD design to offer superior protection against unwanted debris. A slight lead taper on the reducer shaft provides for easy mounting and removal, allowing for some screw pipe misalignment and reduced bearing loads.

Benefits

- Reduced cost
- Large ratio range
- Direct drive motor options (Integral or C-face)
- No belt maintence or belt guarding required.
- Reduced parts / higher reliability / space savings
- Higher efficiency
- More direct torque transfer.

Simple, Reliable & Efficient

Simplicity - the NORD SCP screw conveyor package eliminates the need for costly separate V-belt drives by providing integral gearmotors or direct coupled motors to a NEMA C-face reducer.

SCP - PRODUCT FEATURES

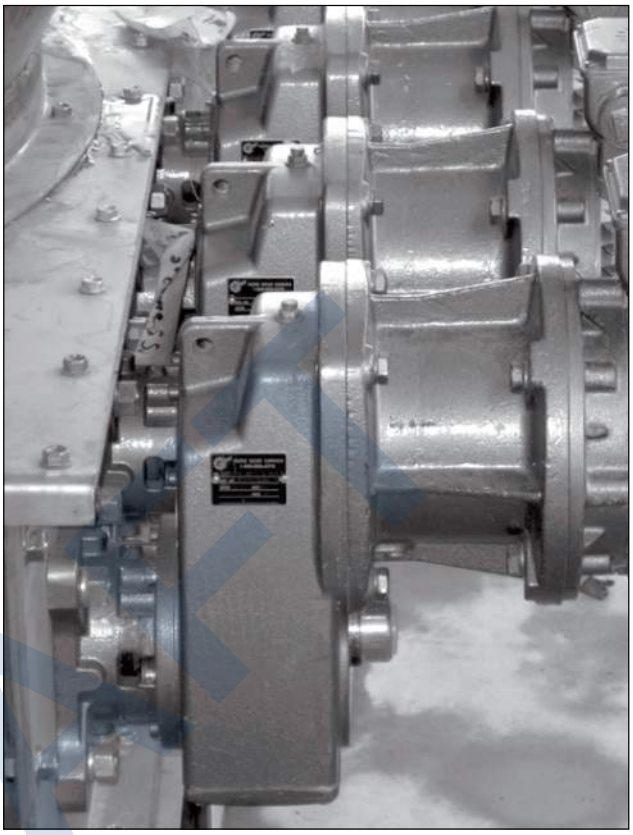
OPTIMIZED SEALING SYSTEM
- Dual Viton lip seals
- Grease impregnated packing seal
- Dual gap seals (excludes particles) – 0.03" gap
- Material evacuation ports
- Shaft material ditch
- Quadrilip™ sealing

MOUNTING
- Standard CEMA mounting
- Versatile flange – multiple bolt patterns
- 3-Hole tapered CEMA drive shaft
  - Easy mounting
  - Easy removal (less fretting – due to less material contact)
- Reduced bearing loads – tapered shaft allows for screw pipe misalignment
- Quick external removal feature

FLANGE
- Standard CEMA mounting
- High strength class 35 gray cast iron
- Versatile flange – multiple bolt patterns

HIGH EFFICIENCY

The NORD SCP design is extremely effective due to the direct coupled gearmotor or NEMA C-face input design. Belted input systems have significantly lower total drive performance. You can further increase the overall efficiency by applying the NORD "H" line of energy efficient motors.



NORD DRIVESYSTEMS

DRAFT

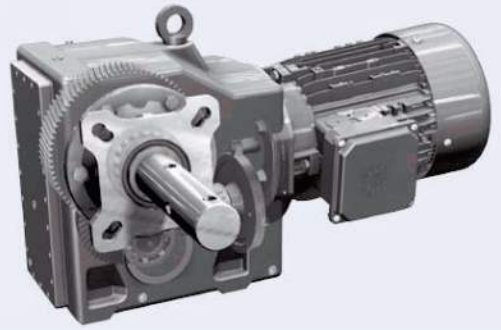
SCP Overview

Screw Conveyor Package Overview

The NORD Screw Conveyor Package (SCP) offers a compact and cost effective alternative to traditional screw conveyor drives. Closely stepped speed reduction ratios combined with a directly coupled gearmotor or NEMA C-face input design eliminates the need for top motor mounts, pulleys, belts or guards. Minimizing parts and eliminating the belted input systems provides for easier system maintenance, increased reliability, and superior drive performance.

The SCP design is available for both CLINCHER™ Parallel Shaft gear units and Helical-Bevel Right Angle gear units. The CEMA flange and shaft assembly are a unique NORD design to offer superior protection against unwanted debris. A slight lead taper on the reducer shaft provides for easy mounting and removal, allowing for some screw pipe misalignment and reduced bearing loads.

Benefits



- Reduced cost
- Large ratio range
- Direct drive motor options (Integral or C-face)
- No belt maintence or belt guarding required.
- Reduced parts / higher reliability / space savings
- Higher efficiency
- More direct torque transfer.

Ratings Overview

CLINCHER™ SCP

- Torque Capacity: Up to 53,100 lb-in
- Power Range: 0.16 – 60 Hp
- Ratio Range: 4.32:1 – 1585.08:1
- Output Speed: 1.0 – 405 rpm
- Efficiency: Up to 97%
- CEMA Drive Shaft Sizes:
  1-1/2", 2", 2-7/16", 3", 3-7/16"

HELICAL-BEVEL SCP

- Torque Capacity: Up to 42,480 lb-in
- Power Range: 0.16 – 30 HP
- Ratio Range: 8.09:1 – 4246.38:1
- Output Speed: 0.41 – 216 rpm
- Efficiency: Up to 95%
- CEMA Drive Shaft Sizes:
  1-1/2", 2", 2-7/16", 3", 3-7/16"

HYDRO-DYNE ENGINEERING INC.
EQUIPMENT WARRANTY

Hydro-Dyne Engineering (HDE) affirms that the portion of the equipment that are both designed and manufactured by HDE is warranted from defects in material and workmanship for the warranty period of 2 year(s).

The warranty period commencement date is the earlier of ninety (90) days from the date of delivery of the equipment or the date the equipment is beneficially occupied by the owner. Equipment delivered in stages will have commencement dates staggered in accordance with delivery dates or beneficial occupancy dates.

If any portions of equipment warranted has material defects or fails to maintain workmanship standards, the equipment owner must notify HDE of the suspect failure within the warranty period and no later than 5 days after the equipment owner discovers the suspect failure.

Portions of the equipment warranted by HDE that the owner has deemed failed will be examined by HDE to establish the failure has occurred under normal use and service operation in accordance with the guidelines stated in the applicable Hydro-Dyne Engineering Operation and Maintenance Manual and within the warranty period.

Provided, that if it would be impracticable for the equipment or portion of the equipment to be returned to Hydro-Dyne Engineering's facility as determined by HDE, HDE will visit the Owner's job site to inspect the suspect failure; however, if it is determined by HDE after inspection that HDE is not responsible under the Warranty, the owner will pay HDE's published service rates for all of the travel and associated costs of HDE with respect to the site visit. Equipment repaired or replaced under the terms of this warranty remain warranted under the original warranty period only. Proof of maintenance logs as dictated in the applicable Hydro-Dyne Engineering Operation and Maintenance Manual will be required by HDE from the owner.

Hydro-Dyne Engineering will repair or replace, at its option, free of charge to the owner at the owner's location or other location designated by HDE. Costs for labor to remove, install and ship equipment or parts is not included in this warranty and will be the responsibility of the equipment owner.

This warranty does not apply if any defect in material or workmanship is caused in whole or in part by any acts or omissions of Owner or any other person or entity other than Hydro-Dyne Engineering. Acts and omissions include but are not limited to negligence, willful misconduct, or alterations to the equipment by any person or entity other than HDE, failure to operate or maintain equipment under normal operating conditions in accordance with applicable Hydro-Dyne Engineering Operation and Maintenance Manual(s), compromising equipment protection via controls changes, or any event (e.g., an accident during transit) or condition (e.g. decomposition of equipment by chemical action, erosion or corrosion or wear to equipment or due to conditions of temperature, moisture and dirt), beyond the reasonable control of HDE, including any Force Majeure event. The Warranty does not apply to any products that are not designed and manufactured by Hydro-Dyne Engineering (e.g., parts, equipment, accessories or components that were either manufactured or were designed by any person or entity other than Hydro-Dyne Engineering itself), but if there is any pass-through warranty that HDE is permitted to pass-through to the equipment owner in connection with the portions of the products that are not designed or manufactured by Hydro-Dyne Engineering, HDE will do so.

Hydro-Dyne Engineering, Inc. values each of our customers/users and will continue to devise better ways of maintaining excellence in our products and services. For additional information, please contact Hydro-Dyne Engineering Service Department at 813-818-0777.

Certificate of Registration

nqa global assurance

This is to certify that the Quality Management System of:

Hydro-Dyne Engineering

4750 118th Ave. N.
Clearwater FL 33762
United States of America

applicable to:

Design, fabrication, assembly, refurbish, service and test of screening and grit removal equipment for municipal and industrial water and wastewater facilities

has been assessed and approved by
National Quality Assurance, U.S.A., against the provisions of:

ISO 9001:2015

DRAFT

Certificate Number:	17258
EAC Code:	18
Certified Since:	November 21, 2017
Valid Until:	November 20, 2026
Reissued:	November 21, 2023
Cycle Issued:	November 21, 2023

For and on behalf of NQA, USA

ANAB ACCREDITED ISO/IEC 17021 MANAGEMENT SYSTEMS CERTIFICATION BODY

This approval is subject to the company maintaining its system to the required standard, which will be monitored by NQA, USA, 289 Great Road, Suite 105, Acton, MA 01720, an accredited organization under the ANSI National Accreditation Board.

HYDRO DYNE ENGINEERING

Designed to Protect. Built to Perform.™

Coarse Screens

Extremely reliable and versatile screens through robust design. With a wide variety of models and grid options, our coarse screens easily remove large solids for unsurpassed downstream protection.

Bull Shark
Through Flow Screen

- Heavy-duty, high capacity system
- Unlimited support against deflection

Tiger Shark
Multi-Rake Screen

- No submerged sprockets
- Dry unloading of screenings

Dusky Shark
Septage Receiving Station

- Effortlessly screens high TSS and FOG flows
- Monitoring and billing control available

Saw Shark
Filter Stepper

- Low flow step-style screen
- Designed for smaller processes

Fine Screens

Our fine screens have been independently certified to have among the highest screening capture ratios available. Through flow, center flow and dual flow models capture solids as small as 0.5mm.

Great White Shark
Center Flow Screen

- Low headloss and no carryover
- Ideal for sensitive process protection

Bull Shark
Through Flow Screen

- Proprietary sealing eliminates ragging
- Multiple models and grid types

Dusky Shark
Septage Receiving Station

- All maintenance above tank
- Dual spray wash unloading

Great White Shark
Dual Flow Screen

- Side entrance/rear exit
- Ideal in influent chambers

Screenings Handling

Multiple models are designed for a variety of needs – from simple conveyance to sophisticated washing and compaction. Custom-designed equipment to perfectly complement a plant's screening system.

Whitetip Shark
Washing Compactor

- Collects, transports, washes, dewaters and compacts screenings
- Reduces disposal weight and volume

Thresher Shark
Washing Machine

- Highest capture of inorganics with no emulsification
- Excellent return of organics and fecals to plant

Spinner Shark
Screw Conveyor

- Effective transportation of solids
- Shafted and shaftless flights

Sluice Systems

- Proprietary bolt-on actuated gates available to retrofit existing sluice systems

Grit Removal

Highly efficient all stainless steel grit traps and classifiers effectively remove grit particles at variable flow rates with very little headloss. Durable and rugged equipment easily retrofits existing systems.

Sand Shark
Grit Trap

- Highly efficient vortex-style system
- Sized to trap 95% of 300 micron grit

Sand Shark
Grit Classifier & Hydro-Cyclone

- Specifically designed for de-gritting wastewater
- Elevates, dewaters and disposes grit

Equipment Sizing

Hammerhead
On-site Screen Sizing

- Proprietary technology to analyze a plant's unique flow to properly design equipment
- Decreases capital and maintenance costs of the entire plant

DRAFT

Hydro-Dyne Engineering

Our formula for success is simple: intelligently design and skillfully manufacture exceptional quality equipment that provides extraordinary value to our customers. We do so by having complete control of our products from start to finish. As a full-service manufacturer, all design, fabrication, assembly and testing is handled in-house. Since 1978, our time-proven designs in custom engineered water and wastewater screening equipment have been trusted at more than 2,000 installations worldwide. At Hydro-Dyne Engineering, our solutions are ***Designed to Protect. Built to Perform.***

At-a-glance

- In-house design, fabrication and assembly
- Time-proven design
- 2,000+ installations worldwide since 1978
- Exceptional quality equipment and services
- Custom engineered solutions
- All stainless steel fabrication
- 110,000 sq. ft (10,000 m^2) manufacturing facility
- Made in the U.S.A.

Applications

Municipal Wastewater
- Combined storm overflow
- Correctional facilities
- Headworks for wastewater treatment plants
- Membrane bioreactor (MBR) protection
- Package plants
- Pump and lift stations
- Sludge and septage screening

Municipal Water
- Algae removal
- Desalination plant/RO protection
- Drainage canals
- Membrane protection
- Raw water intake
- Stormwater

Industrial
- Agriculture
- Chemical processing
- Cooling water intake
- Food processing
- Manufacturing
- Membrane protection
- Mining
- Petroleum
- Pulp and paper
- Textiles

Service

At Hydro-Dyne Engineering our factory-trained technicians take great pride in providing exceptional service to our customers around the world. From on-site screen sizing, equipment start-up, scheduled maintenance, service contracts, optional equipment, replacement parts and equipment remanufacturing, our experts support our customers throughout the life of their equipment.

SHOP DRAWING REVIEW

Project: **San Luis West WWTP Improvements**

Submittal No. **#X3-001 Valve List**

Vendor No. **X3 Valve List**

Date Received: **12/11/2025**

Job #: **B777**

Comments:

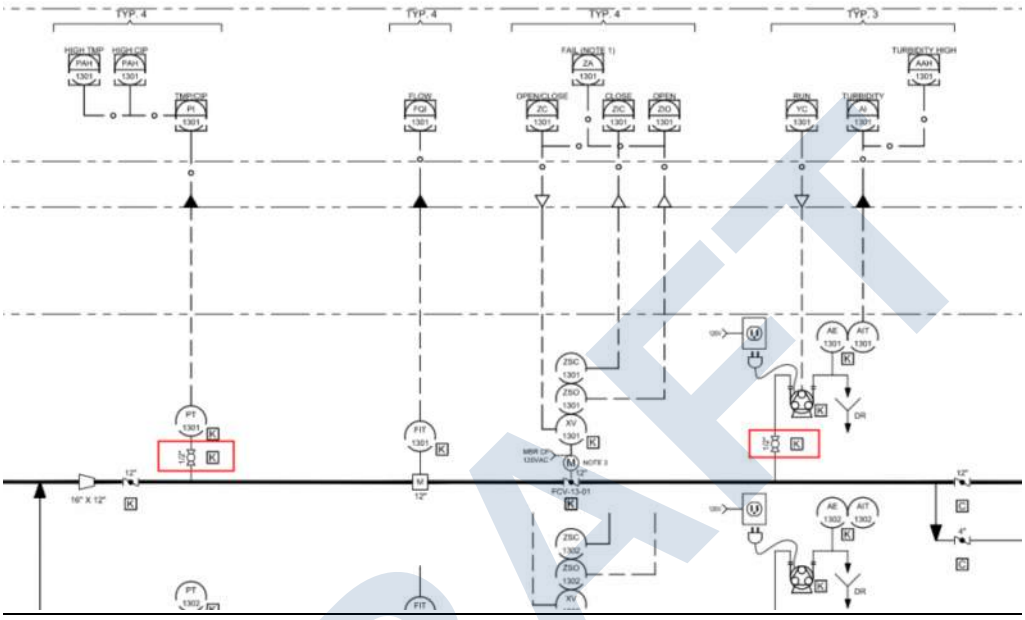
No Exceptions Taken..... ☐
Submit Specific Item ..... ☒
Accepted with Corrections Noted..... ☒
Revise and Resubmit..... ☐
Rejected ..... ☐

Note:
Review is only for general conformance with the design concept of the project and general compliance with the information included in the Contract Documents. Any action shown is subjected to the requirements of the drawings and the specifications. Contractor is responsible for correlating and confirming dimensions at the job site, choice of fabrication processes and techniques of construction: coordination of his work with that of other trades; and performing the work in a safe satisfactory manner.

DATE: 12/19/2025 BY: DD/NT

Contractor to Note:

Submittal Comments:



Accepted with Corrections:

1. Items #54, 63, 73 (Dwyer 1" valve) all state quantity of 3 (9 total valves). It is understood that each train has a single 1" air relief ball valve (for a total of 3). Please verify quantities provided.
2. Verify material, manufacturer, and installation type (lug, wafer, etc.) for the 3" permeate valves. Valve list shows them as CI Bray valves, scope of supply has indicated these as PVC valves by Asahi.
3. Items #76-78 (12" Permeate Control Valves) are marked as Stainless Steel due to comments from the Actuated Valves Submittal. Following discussions with Kubota and piping material changes, these valves are no longer required to be SS.
4. Item #96 calls out Flanged valve, CIP drawing by Kubota appears to show Wafer. Verify connection type to update within plans.

DRAFT

8723 E. Via de Commercio, #A-204 | Scottsdale, AZ 85258
P: (480) 991-3595 F: (480) 751-1810 | www.pacewater.com

5. Additional minor isolation and check valves are required for the CIP system. It is acceptable that the valve list does not include every minor valve for the CIP, but it is understood that Kubota is providing all of these items.
6. Item #100, please change Tag to “PRV-04424A”.
7. It is noted that the minor valves required for instrumentation connection, e.g. isolation valves for pressure transmitters and turbidity analyzers are not included within the Valve List. Verify if the valves necessary for instrumentation connection and isolation are provided by Kubota (as marked on Kubota P&ID Submittal – see reference photo below)

Submit Specific Item:

1. The 6” WAS plug valves & actuators are missing from this submittal, please provide.

	VORTEX SENSOR
	TARGET TYPE SENSOR
	VENTURI TUBE
	SONIC FLOWMETER
D	DENSITY METER

GENERAL NOTES:

NOTE 1: CONTROL FAIL ALARM. FOR TROUBLESHOOTING, CHECK FIELD SWITCHES, MCC, PROTECTION MODULE, LOCAL CP AND/OR WIRES.

NOTE 2: SEE RECOMMENDED MOTOR CONTROL SCHEMATIC FOR DETAIL.

NOTE 3: STANDARD BRAY MODEL IS ASSUMED FOR ALL MODULATING AND ON/OFF VALVES EXCEPT FOR DEGAS VALVES. MODIFY BASED ON FINAL SELECTION.

NOTE 4: APPLY TRANSPARENT PIPE WITH 3" MIN. ON EACH PERMEATE PIPE BRANCH FOR GRAVITY FILTRATION WITH SUBMERGED PIPING.

SHOP DRAWING REVIEW

Project: **San Luis West WWTP Improvements**

Submittal No. **#O1-04 Kubota Membrane Units**

Vendor No. **A4_001**

Date Received: **05/22/2025**

Job #: **B777**

Comments:

No Exceptions Taken..... ☐
Submit Specific Item ..... ☐
Accepted with Corrections Noted..... ☒
Revise and Resubmit..... ☐
Rejected ..... ☐

Note:
Review is only for general conformance with the design concept of the project and general compliance with the information included in the Contract Documents. Any action shown is subjected to the requirements of the drawings and the specifications. Contractor is responsible for correlating and confirming dimensions at the job site, choice of fabrication processes and techniques of construction: coordination of his work with that of other trades; and performing the work in a safe satisfactory manner.

DATE: 7/25/2025 BY: DD /NE

Submittal Comments:

1. Please revise ancillary equipment list. This list seems to be generic and needs to be revised to remove any items that is already part of Kubota's scope and to list equipment required by the Contractor that is specific to this project. Cross out any items that are not relevant. For example, cross "suction filtration" and " siphon Filtration".
2. No exceptions taken on the SMU Membrane Units.

Submerged Membrane Unit (SMU) Specification Sheet

DRAFT

Specifications of KUBOTA Submerged Membrane Unit™

● Specifications of Product

Model			SP900-A
Dimensions (Height x Width x Length)			H5,257mm × W944mm × L2,186mm
Mass	Upper Membrane Block	Dry Mass	920 kg
	Lower Membrane Block	Dry Mass	920 kg
	Diffuser Block	Dry Mass	70 kg
	Attachment*1	Dry Mass	6 kg
	Unit Lifting Tool*2	Dry Mass	210 kg
	Maximum Lifting Load*3		3,230 kg
Number of Membrane Modules			80 modules
Effective Membrane Surface Area			900 m^2
Pore Size of Membrane Sheet			0.2 μm
Initial Flow Rate with Clean Water*4			492 L/min (20℃, 5 kPa)
Diffuser Air Supply Rate		Required	2.53 Nm^3/min
		Maximum*5	4.00 Nm^3/min
Pressure Loss in Diffuser			10 kPa or less
Filtration Pressure*6			20 kPa or less
Chemical Injection Pressure			10 kPa or less
Diameter of Pipe Connection		Air	JIS VP75, ASTM 3", or DIN d90 x 1
		Permeate	JIS VP75, ASTM 3", or DIN d90 x 2
Replacement Parts			Diffuser Rubber
			Membrane Module
Optional Parts (These parts shall be ordered separately)			Unit Lifting Tool
			Module Lifting Tool
Precautions in Storage			Avoid direct sunlight and wetness
			Keep fire away

3.5 TONS

*1 The attachement includes Manifold Adapter, Bracket, Pipe Support, and Diffuser Adapter all of which are attached to Membrane Unit.
*2 Optional part
*3 Assuming that all the gaps between the Membrane Elements are clogged. Mass of Lower Membrane Block, Diffuser Block, Attachment, and Unit Lifting Tool which is fully filled with water are also included.
*4 This does not indicate the treatment capacity with real mixed liquor.
*5 Supplying more air flow than this maximum value may cause damage on the Membrane Unit.
*6 Difference (P1-P2) between the pressures while the filtration is OFF (P1) and ON (P2).

DRAFT

● Design Considerations

Usage Conditions	Intended Use*7		Solid-Liquid Separation of Activated Sludge
	Filtration Method		Gravity, Suction, or Siphon Filtration
	Water Temperature		5~40 ℃
	pH		5~10
	Required min. Water Level		5,700 mm
	Sludge Properties*8 (recommended)	MLSS	5,000~13,000 mg/L
		Viscosity*9	120 mPa·s or less
		Paper Filtration Test	10 mL/5min or more
		DO	1 mg/L or more
		Water Temperature	15~35 ℃
		pH	6~8
Method of Fixation		Membrane Unit	Guide Set
Ancillary Equipment (to be provided by Customer)			
	Guide Set*10		
	Membrane Blower		
	Devices to discharge Permeate*11 (example)	Gravity Filtration	Motorized Valve (or Solenoid Valve), Pressure Gauge, Constant Flow Valve (or Flow Regulator and Flow Meter)
		Suction Filtration	Permeate Pump, Pressure Gauge (Negative Gauge or Combination Gauge), Constant Flow Valve (or Flow Regulator and Flow Meter)
		Siphone Filtration	Siphon formation equipment, Motorized Valve (or Solenoid Valve), Pressure Gauge (Negative Gauge or Combination Gauge), Constant Flow Valve (or Flow Regulator and Flow Meter)
	Chemical Injection Port or Equipment		
	Recommended Piping Diameter	Blower	JIS VP75, ASTM 3", or DIN d90
		Permeate*12	JIS VP75, ASTM 3", or DIN d90
Precautions in Operation			Avoid aeration while filtration stops as much as possible.
			Stop filtration when aeration stops.
			Provide continuous aeration when filtration is conducted.

*7 Pretreatment may be required for the following types of wastewater:
- Wastewater with oil, trash, or debris
- Wastewater with high contents of iron, manganese, calcium, or silicon

*8 Use these values as rough targets for treatment control.

*9 This is the value measured by an viscometer model TVC-10 (Rotor No.1, Speed 20 rpm) by Toki Sangyo Co., LTD. If measured by an viscometer model VT-03 by Rion Co., LTD., it is 60 mPa·s or less instead.

*10 Refer to "Instruction Manual" for details.

*11 Configuration of devices to discharge permeate is not limited to these examples. Refer to "Instruction Manual".

*12 Design the system so as to prevent permeate backflow and air trap while filtration stops.

● Maintenance Considerations

In Situ Chemical Cleaning	Chemical type	Sodium Hypochlorite	0.6% or less when MLSS is more than 10,000 mg/L
			0.3% or less when MLSS is 10,000 mg/L or less
		Oxalic Acid*13	1.0 % or less
	Dosage Volume		3,200 L
	Timing		When filtration pressure rises by 5~10 kPa from the initial or every six months or more often
Diffuser Pressure Loss Prevention		Procedure	Blow down
		Timing	Once a day, for one minute

*13 If calcium carbonate precipitates in the tank, dose hydrochloric acid or citric acid (1.0% or less).

Notes

1. This drawing shows an example that Membrane Block (L) is placed as upper Membrane Block of SP675-512-A.
   Each model may be different in outline and dimensions.
2. The upper and lower Membrane Blocks are replaceable mutually.
3. This drawing conforms to JIS standards.
4. The Guide Set has to be prepared by Customer.
5. Membrane Block (Lower) and Diffuser Block are fixed with bolts. Never use bolts to fix the Membrane Block (Upper) and Membrane Block (Lower).
6. For lifting up Membrane Unit, use the specified Unit Lifting Tool.
7. Use Module Lifting Tool in taking out Membrane Modules.

How to use Module Lifting Tool

Model	a	b	c	d	e	f	g	Mass (kg) Membrane Block (Upper and Lower), Diffuser Block,and Adapter dry	Mass (kg) Membrane Block (Upper and Lower), Diffuser Block,and Adapter wet *1	Mass (kg) Lifting Tool	Maximum lifting load (kg) *2
SP450W-508-A	1877	3165	3600	2146	3434	1874	3162	1110	3070	210	1850

KUBOTA Corporation

KUBOTA Submerged Membrane Unit ™

Instruction Manual (SP Type)

DRAFT

- Please read this manual carefully before using this product.
- Please keep this manual in a place where the operator has easy access.

61MU300012 (SP)

DRAFT

Introduction

Thank you for selecting KUBOTA Submerged Membrane Unit ™ (SMU). This manual shows an overview of the KUBOTA SMU and describes in detail how to handle, store, install, operate, and maintain the SMU.
First of all, please read and understand “The Safety Precautions”, which explains compliance rules that prevent danger to users and everyone concerned and damage on properties.
Please note that it is important to read this manual carefully in order to use this product safely and properly. Additionally, retaining a copy of this manual for future reference is recommended.
Please consult with the corresponding engineering company or KUBOTA if you have any questions or need further information about this manual, or if you find abnormalities during operation even when following the instructions properly.
Please also note that although the configuration of purchased products may not conform to those in this manual due to changes in Product Specification or other causes, no disruptions in explaining are expected.

* KUBOTA Submerged Membrane Unit™ is a trademark of KUBOTA Corporation.

DRAFT

Safety Precautions

The following contents are intended to minimize risks to users and property damage.
Please read and understand the following contents before proceeding with this manual as to comply with safety rules.

- The following markings indicate potential causes of physical injury, and are classified and explained according to seriousness of consequences.

Danger	Failure to comply with this information will imminently result in death or severe injury.
Warning	Failure to comply with this information could result in death or severe injury
Caution	Failure to comply with this information could result in minor injury or property damage

- The following markings classify and explain compliance rules about product handling and operation management.

Prohibited	Prohibited action
Important	Important rules to be complied with

Danger

Keep safe working environment in tanks

When working in a tank, keep the working environment safe by measuring the required items including oxygen and hydrogen sulfide in observance of local regulations/standards of each country/region. Failure to follow the procedure could result in a fatal accident such as anoxia.

Never mix sodium hypochlorite and acid

In the Chemical Cleaning, never mix sodium hypochlorite and acids such as Oxalic, Hydrochloric, and Citric Acid. Doing so will produce toxic chlorine gas, which may cause severe accident.

DRAFT

Warning

Select lifting equipment with an adequate strength

Mass of a Membrane Unit can increase by sludge adhesion to Membrane Modules, Membrane Block, and Diffuser Block, as well as sludge clogging of Membrane Modules. Select adequate lifting equipment also considering the maximum mass of Membrane Unit and the dynamic load.
Lack of strength can cause falling accident.

Never go beneath a lifted Membrane Block, Diffuser Block, Membrane Unit, or Membrane Module

If they fall down, fatal accident may occur.

Take safety measures to prevent falling accident

Ensure the safety of workers by installing handrails, scaffolding and safety equipment to prevent a fall accident. Pay particular attention near the tank opening because the floor may be slippery by wetness.
Poor safety measures may result in fatal accident.

Caution

Never climb on the Membrane Unit

Climbing on the Membrane Unit may cause you falling. Furthermore, climbing may tumble the Membrane Unit, causing fatal accident and equipment breakage.

Never wet the Lifting Tool (Optional Parts) nor expose it to corrosive gas.

If the Lifting Tool gets corroded, its strength may decrease to a critical level, resulting in a drop accident.

Before using Lifting Tool, make sure that they have no abnormality

Before using Lifting Tools supporting load, check if crack, corrosion, rust, abrasion, and deformation. And also, check the Slings of the KUBOTA's Lifting Tool for abnormalities such as a cut, abrasion, scratch, broken stitch, discoloration, coloration, fusion, and melting.
Immediately replace the tools with abnormality. Continued use of them may cause human accident by product dropping.

Do not use chemicals stimulating corrosion of stainless steel materials (e.g. Ferric chloride).

Corrosive chemicals that stimulate corrosion may cause corrosion of stainless steel materials of Membrane Unit or optional parts.
It may cause dropping accident by lack of strength.

DRAFT

⚠ Caution

Immediately replace the Membrane Unit and parts with abnormality
If any defects of parts or SMU abnormality such as cracks or corrosion are found upon inspection, replace the parts or SMU as soon as possible. Continuous usage of them will cause an accident.

Wear protective equipment before using chemicals
Before using chemicals, carefully read the Material Safety Data Sheet (SDS), and wear protective equipment such as masks, goggles, gloves, etc. Misuse of them may result in physical accident.

Wear adequate gloves such as cotton work gloves during work.
Working with bare hands may result in unexpected injuries.

Ventilate well
If the membrane bioreactor (MBR) tank and/or aeration tank are installed in a building with poor ventilation, prepare equipment for improving the ventilation to prevent health problem.

Lifting Tools should be used by four point lifting
When lifting up a Membrane Block, Diffuser Block, Membrane Unit, or Membrane Modules, always hang it at four points. If lifted at three or two points, it may drop or swing and result in a fatal accident.

Be sure to check that there are no slacks of Shackles, Eyebolts, and Catch Rings.
If the Shackles, Eyebolts, or Catch Rings come off, the product will drop down and result in fatal accident or damage on the surrounding equipment.

Lift Membrane Block, Diffuser Block, Membrane Unit, or Membrane Modules straight up and quietly using a Lifting Tool
When lifting it out of the tank, lift it straight up slowly and safely. If it swings, physical injuries and/or damage on surrounding equipment may occur.

Never lift a Membrane Block or Membrane Unit containing chemical solution or water in its Membrane Modules.
Spillage of the contained solution or damage of the Membrane Modules may cause physical injury or damage to equipment.

Conduct the lifting work by two or more persons.
If the crane or chain block operator alone conducts all the work, his risk prediction ability will significantly decrease due to increased blind spots.

DRAFT

⚠ Caution

Do not place any part of your body between a Lifting Tool and a Membrane Block or a Diffuser Block.

Do not place any part of your body, such as a hand or a head, between a Lifting Tool and a Membrane Block or a Diffuser Block. It may cause a fatal accident under unsafe operation or during an unexpected drop accident.

Check the slings for twist before use.

Make sure that a set of slings have the same length and no kinks while it is attached on the Unit Lifting Tool. Otherwise the load may be supported by only three or two slings, resulting in an accident.

Use eyebolts when lifting up a Diffuser Block by the Unit Lifting Tool.

When lifting up a Diffuser Block, always use the four eyebolts which are accompanied with the Unit Lifting Tool. If lifted in an unstable condition, it may drop or swing and result in a fatal accident.

Securely bolt the Membrane Block and Diffuser Block.

If the Membrane Block and Diffuser Block are not bolted securely, the Diffuser Block will drop off to cause a fatal accident.

1. Definition of Terms

Table 1-1 shows the definitions of the major terms used in this instruction manual.

Table 1-1 Definitions of Major Terms in This Manual

Term	Definition
Filtration Pressure	Differential pressure (P1-P2) when the filtration is suspended (P1) and conducted (P2).
Permeate	Water that permeates through membrane by the Filtration Pressure.
MBR Tank	Tank(s) where the activated sludge is retained and the SMU(s) are submerged and installed.
Permeate Pump	The pump(s) that generates the Filtration Pressure on the SMU(s). They vacuum the Permeate from the inlet side which connects to SMU(s) and discharge the Permeate from outlet side.
Membrane Blower	The blower(s) dedicated to providing air to the SMU(s).
Diffuser Air Pressure	Pressure of the air supplied to Membrane Unit. This is an important parameter for the management of the Diffuser of a Membrane Units.
Aeration Blower	The blower(s) dedicated to providing air to bioreactor tank(s) except the SMU(s).
Air Header	Header pipe to distribute air to multiple SMU(s) (see Fig. 1-1).
Permeate Header	Header pipe to collect Permeate from multiple SMU(s). In the dual-header configuration (see Fig. 1-1), the 2 headers can join into a single pipe before the Permeate Pump. Single-header configuration is also possible (see Fig. 1-2).
Permeate Piping	Piping to connect the Permeate Header and the SMU(s) (see Fig. 1-1).
Air Piping	Piping to connect the Air Header and the SMU(s) (see Fig. 1-1).
Suction Filtration	Filtration method by which the Filtration Pressure is generated by the Permeate Pump.
Gravity Filtration	Filtration method in which the Filtration Pressure is generated by level difference between the MBR Tank and the open-to-air point in the Permeate Piping (see Fig. 1-3).
Siphon Filtration	Filtration method in which the Filtration Pressure is generated by level difference between the MBR Tank and the Permeate Tank (see Fig. 1-3).
Blow-down	Operation method in which supply of air to the Diffuser(s) of the SMU(s) is temporarily stopped in order to restrain increase of the Diffuser Air Pressure caused by substance such as slime adhering on the Diffuser.
Filtration without Aeration	To conduct filtration while aeration is suspended (membrane surface is not scoured by bubble).
Aeration without Filtration	Continued aeration (membrane scouring) under the condition where filtration is suspended.

2. Overview of KUBOTA Submerged Membrane Unit ™

2.1 Functions

KUBOTA Submerged Membrane Unit ™ (SMU) is used for a solid-liquid separation that can be used to filter high-quality treated water from mixed liquor. The membranes serve as a physical barrier, preventing passage of particles with diameters larger than their pores while allowing the free passage of biologically treated water.

2.2 Models and Identifications

Different models can be recognized by the code described as follows:

SP	400	ND	-A

2.3 SMU Specification

Table 2-1 Specification of SMU

Model	Membrane Block Dry Weight [kg]		Diffuser Block Dry Weight [kg]	Maximum Weight *1 [kg]	Number of Membrane Modules	Effective Membrane Area [m^2]	Initial Flow Rate in Clean Water, minimum*2 [L/min]	Diffuser Air Supply Rate [Nm^3/min]*3 ([Sm^3/min]*3)	
	Upper	Lower						Required*4	Max*5
SP200	480	-	70	1,850	20	200	123	2.00 (2.15)	4.00 (4.29)
SP300	660	-	70	2,540	30	300	185	2.00 (2.15)	4.00 (4.29)
SP400	840	-	70	3,230	40	400	246	2.00 (2.15)	4.00 (4.29)
SP600	660	660	70	2,540	60	600	369	2.00 (2.15)	4.00 (4.29)
SP800	840	840	70	3,230	80	800	492	2.25 (2.41)	4.00 (4.29)
SP225-A	520	-	70	1,850	20	225	123	2.25 (2.42)	4.00 (4.29)
SP337-A	720	-	70	2,540	30	337.5	185	2.25 (2.42)	4.00 (4.29)
SP450-A	920	-	70	3,230	40	450	246	2.25 (2.42)	4.00 (4.29)
SP675-A	720	720	70	2,540	60	675	369	2.25 (2.42)	4.00 (4.29)
SP900-A	920	920	70	3,230	80	900	492	2.53 (2.72)	4.00 (4.29)

*1 The maximum weight includes maximum weight of the Membrane Block, Diffuser Block, Accessories and Unit Lifting Tool (Optional Parts) which is filled with water.
Maximum Membrane Block Weight is the weight when sludge clogs up all the gaps between membranes. If any other debris or screenings pile up on the SMU, the total maximum weight could exceed the weight shown in the above table.

*2 The table does not indicate a filtration capacity of SMU in activated sludge or mixed liquor.
Measurement Condition: Water temperature 20 [deg. C], Filtration pressure 5 [kPa]

*3 The unit of "Nm^3/min" means air flow rate measured at 0 [deg. C] and 1 [atm]. The unit of "Sm^3/min" means air flow rate measured at 20 [deg. C] and 1 [atm].

*4 The aeration equipment (e.g. Blower) must be capable of meeting the required Air Supply Rate. Insufficient air supply may deteriorate membrane permeability.

*5 The aeration equipment should have lower air supply capacity than the maximum diffuser Air Supply Rate. Using a blower with a greater rate may cause damage on SMU.

Important

Strictly observe the Diffuser Air Supply Rate

Insufficient air supply may cause filter performance deterioration and fouling. Excess air supply may cause membrane damage. Select a blower that can supply the indicated range of air considering the piping resistance and water level.

DRAFT

2.4 SMU Structure

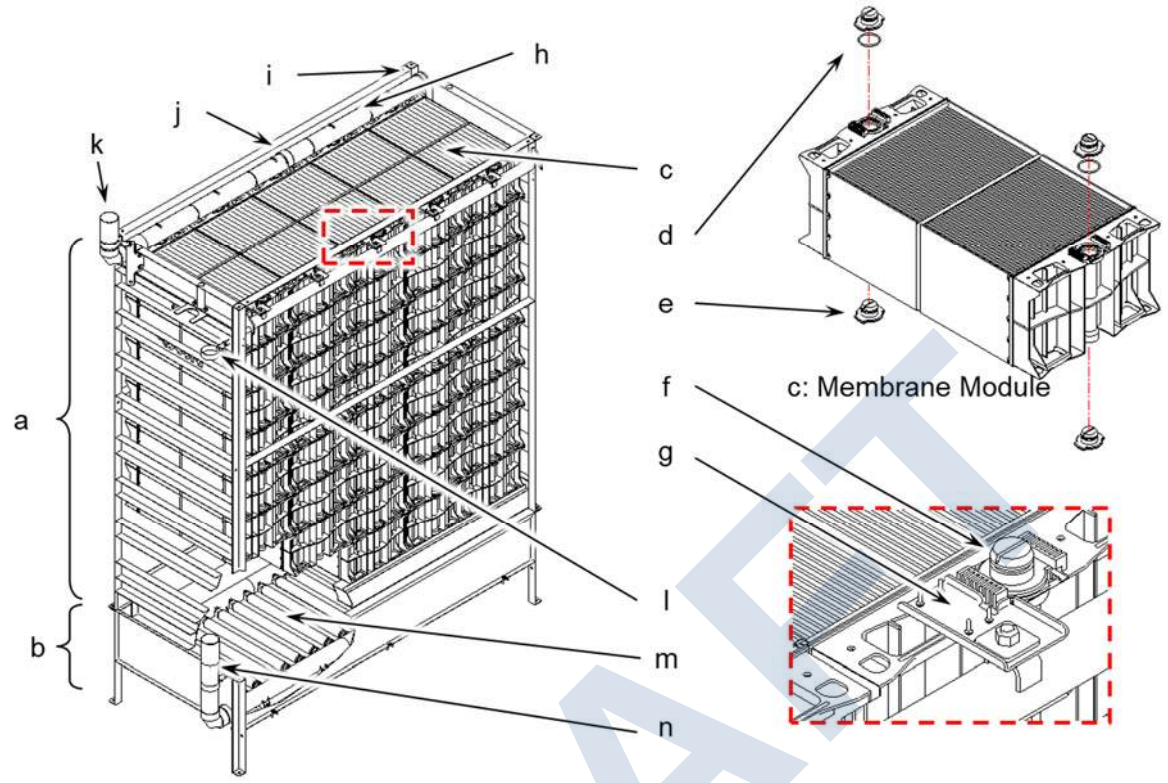

Fig. 2-1 Schematics of SMU

n	Diffuser Adapter	Connecting the Diffuser to the Air Piping and Diffuser Cleaning Piping

DRAFT

2.5 Scope of KUBOTA and Ancillary Equipment

The SMU functions with supports of ancillary equipment, not by itself. The ancillary equipment is roughly categorized into:

- The ancillaries needed for installation of SMU(s)
- The ancillaries needed for operation and control of SMU(s).

These ancillaries are NOT supplied by KUBOTA.

2.5.1 Ancillaries needed for installation of SMU(s) (piping is included)

Table 2-3 shows the ancillaries needed for installation of SMU.

Table 2-3 Ancillaries needed for Installation of SMU and KUBOTA's Provision

Item	KUBOTA Provision	Detailed Description
SMU	YES	The area surrounded by red broken line in Fig. 2-2.
Guide Set	NO	Structure to fix the SMU at proper position in the membrane tank. Please consult the corresponding engineering company for design information.
Unit Lifting Tool	YES	Tool to lift up a SMU. It is shown in Fig. 2-3, surrounded by the red broken line. A Unit Lifting Tool includes eight shackles, four Unit Slings, two Crane Slings, four Eyebolts, four Stoppers, and two Stands. See "Lifting Tool Instruction Manual" for details.
Piping		
Permeate Header	NO	
Air Header	NO	
Permeate Piping	NO	JIS VP75, DIN d90 or ASTM 3inch straight pipe can be connected to the Manifold Adapter.
Air Piping	NO	JIS VP75, DIN d90 or ASTM 3inch straight pipe can be connected to the Diffuser Adapter.

DRAFT

2.5.2 Ancillaries needed for Operation and Control of SMU

Table 2-4 shows the ancillaries needed for operation and control of SMU. They are NOT supplied by KUBOTA.

Table 2-4 Ancillaries needed for operation and control of SMU and KUBOTA's Provision

Equipment	KUBOTA Provision	Equipment and supportive ancillaries
Suction Filtration Equipment (for Suction Filtration)	NO	Control the permeate flow rate and filtration pressure using a Permeate Pump, a pressure gauge*1*2 and a constant flow valve (or a flow control valve and a flow meter*3). Flow rate can be controlled by frequency of the Permeate Pump or opening degree of motor valve.
Gravity Filtration Equipment (for Gravity Filtration)	NO	Control the permeate flow rate and filtration pressure using a motor-operated valve (or a solenoid valve), a pressure gauge*2, and a constant flow valve (or a flow control valve and a flow meter*3).
Siphon Filtration Equipment (for Siphon Filtration)	NO	Control the permeate flow rate and filtration pressure using a motor-operated valve (or a solenoid valve), a pressure gauge*2, and a constant flow valve (or a flow control valve and a flow meter*3). In this case siphoning equipment is needed to make and keep siphon.
Membrane Blower Equipment	NO	Air Supply Rate should be managed using a Membrane Blower with a flow meter. Control the Air Supply Rate to the Diffuser of a SMU within the range of "Diffuser Air Supply Rate" shown in Table 2-1.
Chemical Cleaning Equipment	NO	Chemical Feed Pump, a pressure gauge, and flow meter are required. An air vent valve is also needed at Permeate Header. In addition, piping configuration and/or controlling system are needed to limit the chemical feed pressure*4 under 10 [kPa].
Air Elimination Equipment (as needed)	NO	When air trap is anticipated to grow in the Permeate Piping, install air elimination equipment (for example, air separation tank and vacuum pump) around the anticipated points.

*1 The filtration pressure gauge should be installed at upstream of on-off valve in the suction side of the Suction Pump. The required measuring range depends on the installed site. If the installing site is not clearly determined, use a combination gauge (-100 ~ 100 [kPa].)

*2 Reading of the filtration pressure gauge is affected by the water level of the MBR Tank. In the case that the level is anticipated to fluctuate, install a level gauge in the MBR Tank to correct the filtration pressure gauge by the reading of the level gauge. For example, when the water level of the MBR Tank lowered by 100 [mm], the reading of the filtration pressure gauge will lower by about 1 [kPa].

*3 Recommended permeate flow meter is a direct-reading and integrating one.

*4 Chemical feed pressure is the pressure acting inside Membrane Modules during the chemical feed. The chemical feed pressure can be monitored by checking the difference in pressure indicated by the nearest pressure gauge to SMU. The difference between the pressure indicated when chemical feed pump is stopped (but the pipe between the pump and the SMU should be full) and the pressure indicated when the chemical feed pump is running is the chemical feed pressure.

DRAFT

2.6 Usage Conditions for SMU

Usage conditions for SMU are as follows. If using under other conditions, please consult with us.

Table 2-5 Usage Conditions for SMU

Item	Usage Condition
Purpose	Solid-Liquid Separation of Activated sludge
Filtration Condition	Gravity, Suction or Siphon Filtration
Diffuser Supply Air Flow Rate	See “Table 2-1”
Filtration Pressure*1	20 kPa or less
Chemical Feeding Pressure*2 (In-Situ Chemical Cleaning)	Continuous: 10 kPa or less
Cleaning Chemical*2 (for cleaning Membrane Module)	Sodium Hypochlorite Recommended effective chloride is: 0.6% or less when MLSS > 10,000 mg/L 0.3% or less when MLSS < 10,000 mg/L (Use with less than 1.0% effective chloride) Mainly for organic foulant
	Oxalic Acid Use at less than 1.0% concentration. (Adjust according to clogging degree) Mainly for inorganic foulant If Calcium Carbonate precipitate in the tank, use at less than 1.0% of chloric or citric acid instead.
Water Temperature*3	5~40 degree C
pH*3	5~10

*1 Filtration pressure means the difference (P1-P2) between the pressures in permeate pipe when filtration is suspended (P1) and filtration is conducted (P2).

*2 Refer to "【Outline of In-Situ Chemical Cleaning】" for additional information about the chemical cleaning.

*3 The water temperature and pH described above do not represent the operational condition of activated sludge process.

DRAFT

3. How to Unload and Store SMU

3.1 Before Unloading SMU

- Plan carefully an unloading route to the tank where the SMU is to be installed.
- Prepare the equipment (crane, hoist, and forklift) that will be used to unload the SMU shipment.
- Secure a temporary storage space for the SMU.
- Make sure that MBR Tank is finished in construction and carefully cleaned up.
- To prevent the SMU from welder or grinder sparks during construction work, adjust the time schedule. Covering it with fireproof sheet (Customer's Provision) is recommended.
- Combination of Membrane Block and Diffuser Block with different delivery date cannot be used due to design change or other reasons. Consult with us.

Prohibited	**Keep away from fire and spark** Keep SMU and Membrane Modules away from fire (and also spark from welding, fusing, and grinding). They may cause damage on parts of SMU, especially the membrane sheet can get holes and be no use.

Prohibited	**Never expose to high temperature or sunlight** Never leave out SMU (or Membrane Block or Diffuser Block) where they will be exposed to high temperature or sunlight such as daylight. This condition changes the shape or quality of the SMU parts so that proper operation cannot be conducted.

Prohibited	**Avoid wetting of Membrane Modules** Do not wet the Membrane Cartridges before use. When wet Membrane Cartridges dry, their filterability decreases significantly. Put a protective covering such as tarpaulin as needed.

Prohibited	**Do not remove the protective vinyl sheet on the Membrane Block before use** Do not remove the vinyl sheet on the Membrane Block until operation starts. It protects Membrane Modules from dust.

Prohibited	**Be careful not to damage the membrane surface** Hurt on the Membrane surface can cause Suspended Solids contamination in the permeate water. Because damaged membranes cannot be repaired, replacement will be needed.

DRAFT

3.2 How to Unload the Membrane Block and Diffuser Block

A Membrane Block and a Diffuser Block is shipped with the individual package. To unload a Membrane Block and a Diffuser Block, use a forklift, a crane or hoist with the Unit Lifting Tool.

3.2.1 Unload of Membrane Block

During shipment, the whole Membrane Block is wrapped up with plastic bag and fixed on a wooden pallet. Please follow below procedures to unload the Membrane Block.

(a) Unload using a forklift

Insert the fork under the wooden pallet on which the Membrane Block is fixed to unload it from a truck or container (see Fig. 3-1).

(b) Unload using a crane/hoist

In the case using a crane or hoist, always use Unit Lifting Tool (optional parts). **For more information about how to use the Unit Lifting Tool, see "Lifting Tool Instruction Manual".**

(1) Ensure safety of the components to which loads are imposed before use. Make sure that they are free from abnormality such as crack, corrosion, rust, abrasion, or wear before use.

(2) Attach Unit Slings to the holes (Catch) of the Unit Lifting Tool. Remove all Shackles at the lower end of the Unit Slings. And attach Hangers to the holes (Release) of the Unit lifting Tool and flip up them (see Fig. 3-1). **Please use the Unit Sling only for lifting a dry new Membrane Block (for unloading or assembling of Membrane Unit), Diffuser Block (for unloading), or Membrane Unit (for assembling of Membrane Unit or first installation to the tank). Please do not use the Unit Sling for lifting a wet or clogged Membrane Unit.**

(3) Lift up the Unit Lifting Tool using Crane Slings and move the Unit Lifting Tool to right above the Membrane Block. Be careful not to touch the lower end of the Unit Sling to Membrane Modules.

(4) Tear the plastic bag near Hooks (4 pcs) of the Membrane Block and attach Eye at lower end of the Unit Sling to the Hook (see Fig. 3-1). Do not tear the plastic more than necessary.

(5) Attach Stoppers to all the four (4) Hooks (see Fig. 3-1).

(6) Lift the Unit Lifting Tool slowly while checking safety to unload the Membrane Block.

DRAFT

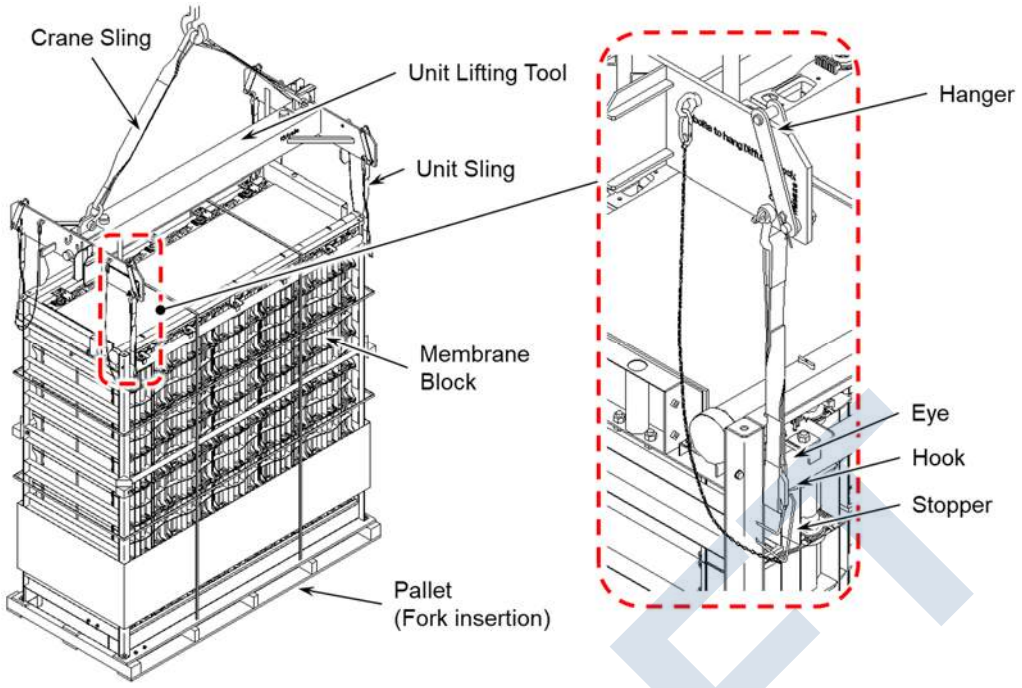

Fig. 3-1 Packing style and unloading way of Membrane Block

3.2.2 Unload of Diffuser Block

At shipping, up to 3 Diffuser Blocks are stacked up and capped with a plastic bag. **A stacked Diffuser Block is fixed to each other with bolts, nuts and washers (see Fig. 3-2). Store those bolts, nuts, and washers including those fixed on the top Diffuser Block until the assembly of SMU, because they will be reused for connecting the Membrane Block and Diffuser Block.** However, the bolts fixing the pallet and bottom Diffuser Block are not reused for the assembly.
Be careful not to damage the Diffuser and proceed the unloading work while checking safety.

(a) Unload using a forklift

In the case using a forklift, insert the fork under the wooden pallet to unload it from a truck or container (see Fig. 3-2).

(b) Unload using a crane/hoist

In the case using a crane or hoist, always use Unit Lifting Tool (optional parts). **For more information about how to use the Unit Lifting Tool, see "Lifting Tool Instruction Manual".**

(1) Ensure safety of the components to which loads are imposed before use. Make sure that they are free from abnormality such as crack, corrosion, rust, abrasion, or wear before use.

(2) Attach Unit Slings to the holes (Catch) of the Unit Lifting Tool. Attach Shackles at the lower end of the Unit Slings. Attach hangers to the holes (Release) of the Unit Lifting Tool and flip up them. And remove Stoppers. **Please use the Unit Sling only for lifting a dry new Membrane Block (for unloading or assembling of Membrane Unit), Diffuser Block (for unloading), or Membrane Unit (for assembling of Membrane Unit or first installation to the tank). Please do not use the Unit Sling for lifting a wet or clogged Membrane Unit.**

DRAFT

(3) Lift up the Unit Lifting Tool using Crane Slings and move the Unit Lifting Tool to right above the Diffuser Block. Be careful not to touch the lower end of the Unit Sling to Diffuser.

(4) Remove four (4) bolts at top corners of top Diffuser Block. Attach four (4) Eyebolts which are accompanied with the Unit Lifting Tool to the top corners of the top Diffuser Block (see Fig. 3-2). **Store the removed bolts from the top Diffuser Block until the assembly of SMU, because they will be reused for connecting the Membrane Block and Diffuser Block.**

(5) Connect the Shackles of the Unit Slings to Eyebolts (see Fig. 3-2).

(6) Lift the Unit Lifting Tool slowly while checking safety to unload the Diffuser Block. Up to 3 stacked Diffuser Blocks can be lifted up at once.

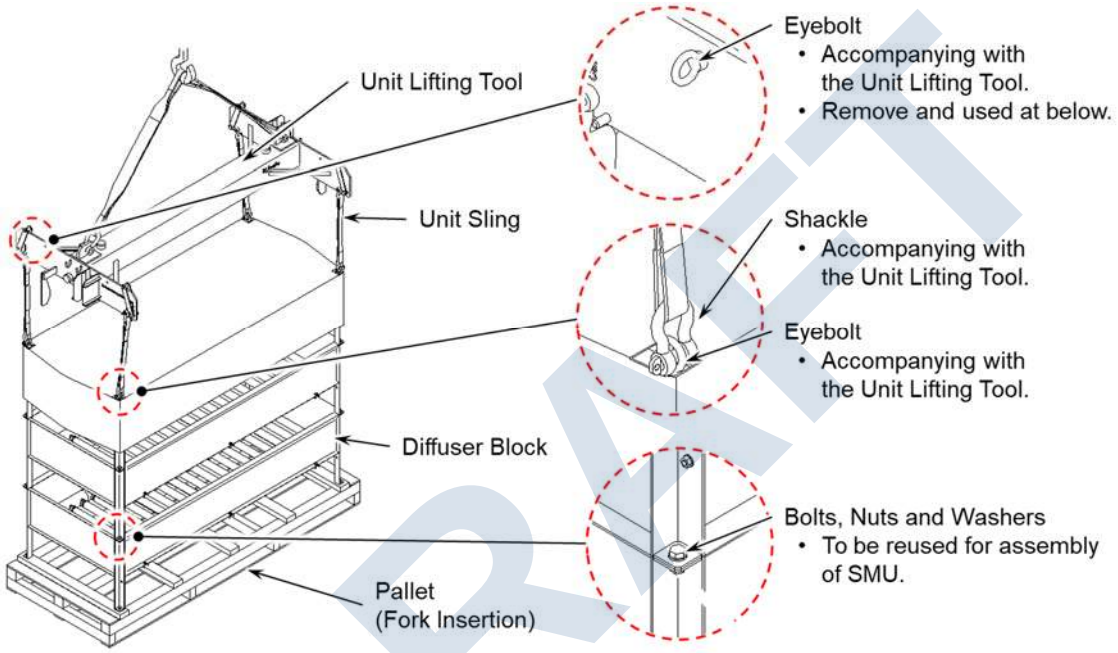

Fig. 3-2 Packing style and unloading way of Diffuser Block

Warning

Take safety measures not to cause fall accident

Ensure safety of workers by using handrails, scaffolds and safety belt or other devices when using the Unit Lifting Tool. Pay particular attention near the tank opening because the floor may be slippery by wetness.

Never climb on the Membrane Unit.

Poor safety measures may result in fatal accident.

Warning

Never go beneath a lifted Membrane Block or Diffuser Block

If they fall down, fatal accident may occur.

DRAFT

Caution

Check the Lifting Tool for abnormalities

Before using Lifting Tools supporting load, check if crack, corrosion, rust, abrasion, and deformation. And also, check the Slings of the KUBOTA's Lifting Tool for abnormalities such as a cut, abrasion, scratch, broken stitch, discoloration, coloration, fusion, and melting.

Immediately replace the tools with abnormality. Continued use of them may cause human accident by product dropping.

Caution

Lift a Membrane Block or Diffuser Block with the Lifting Tool straight up and quietly.

Lift a Membrane Block or Diffuser Block with the Lifting Tool straight up, quietly, and without swing. Swung Block may cause physical injuries and/or damage on surrounding equipment.

Caution

Conduct the lifting work by two or more persons.

If the crane or chain block operator alone conducts all the work, his risk prediction ability will significantly decrease due to increased blind spots.

Caution

Do not place any part of your body between a Lifting Tool and a Membrane Block or a Diffuser Block.

Do not place any part of your body, such as a hand or a head, between a Lifting Tool and a Membrane Block or a Diffuser Block. It may cause a fatal accident under unsafe operation or during an unexpected drop accident.

Caution

Be sure to check that there are no slacks of Shackles and Eyebolts. .

If the Shackles or Eyebolts come off, the product will drop down and result in fatal accident or damage on the surrounding equipment.

Caution

The Lifting Tools should be used by four point lifting.

When lifting up a Membrane Block or Diffuser Block, always hang it at four points. If lifted at three or two points, it may drop or swing and result in a fatal accident.

Caution

Check the slings for twist before use.

Make sure that a set of slings have the same length and no kinks while it is attached on the Unit Lifting Tool. Otherwise the load may be supported by only three or two slings, resulting in an accident.

DRAFT

Caution	**Use eyebolts when lifting up a Diffuser Block by the Unit Lifting Tool.** When lifting up a Diffuser Block, always use the four eyebolts which are accompanied with the Unit Lifting Tool. If lifted in an unstable condition, it may drop or swing and result in a fatal accident.

Caution	**Wear adequate gloves such as cotton work gloves during work.** Use work gloves such as cotton work gloves when handling the SMU. Bare-hand work may cause an unexpected injury.

Prohibited	**Never use the Lifting Tool for the purpose other than lifting a SMU.** The Unit Lifting Tool (optional part) is for lifting a Membrane Block, Diffuser Block, or Membrane Unit safely. Never use the Lifting Tool for any other purpose.

Prohibited	**Do not remove the protective vinyl sheet on the Membrane Block before use** When unloading, do not remove the vinyl sheet on the Membrane Block. It protects Membrane Modules from dust.

3.3 Things to be Checked When SMU Arrives

When a package of the SMU arrives, it is recommended to check the followings:

- Confirm that the package contains all the components and parts indicated in the packing list.
- Make sure all the components and parts are not damaged during the shipment.

3.4 Storage of SMU

Take care of the following matters in storage of SMU.

- SMU must be stored on a level and flat place.
- Always cover the SMU with the plastic bags during the storage.
- To avoid wetting of the SMU, put a protective covering such as tarpaulin as needed.
- Avoid an exposure to direct sunlight, and store SMU indoors at the room temperature between 5 and 40 degree C.
- Avoid high humidity or dusts during storage.
- Spare Membrane Modules for replacement should also be stored indoors. Refer to "11.3 Replacement Parts" for detail.

DRAFT

Prohibited	**Keep away from fire and spark** Keep SMU and Membrane Modules away from fire (and also spark from welding, fusing, and grinding). They may cause damage on parts of SMU, especially the membrane sheet can get holes and be no use.

Prohibited	**Never expose to high temperature or sunlight** Never leave out SMU (or Membrane Block or Diffuser Block) where they will be exposed to high temperature or sunlight such as daylight. This condition changes the shape or quality of the SMU parts so that proper operation cannot be conducted.

Prohibited	**Avoid wetting of Membrane Modules** Do not wet the Membrane Modules before use. When wet Membrane Modules dry, their filterability decreases significantly. Put a protective covering such as tarpaulin as needed.

Prohibited	**Do not remove the protective vinyl sheet on the Membrane Block before use** When unloading, do not remove the vinyl sheet on the Membrane Block. It protects Membrane Modules from dust.

Prohibited	**Be careful not to damage the Membrane Surface** Hurt on the Membrane surface can cause Suspended Solids contamination in the permeate water. Because damaged membranes cannot be repaired, replacement will be needed.

DRAFT

4. How to Assemble

Unpack the Membrane Block and Diffuser Block and fix the Membrane Block onto the Diffuser Block (see Fig. 4-6). In the case of double stack unit, upper Membrane Block is installed without connecting Diffuser Block.

4.1 Unpacking the Membrane Block

(1) Remove pallet and the Lashing Hooks (see Fig. 4-1).

(2) Remove Guide Plates which are attached to the pallet and attach them to the Membrane Block using bolts and nuts which are accompanied with the Membrane Block (see Fig. 4-1). The tightening torque of the bolts (size : M12) should be 50 - 60 N·m.

(3) Do not remove the plastic bag until the clean water test starts. **Do not tear it more than necessary,** during the procedure of (1) and (2).

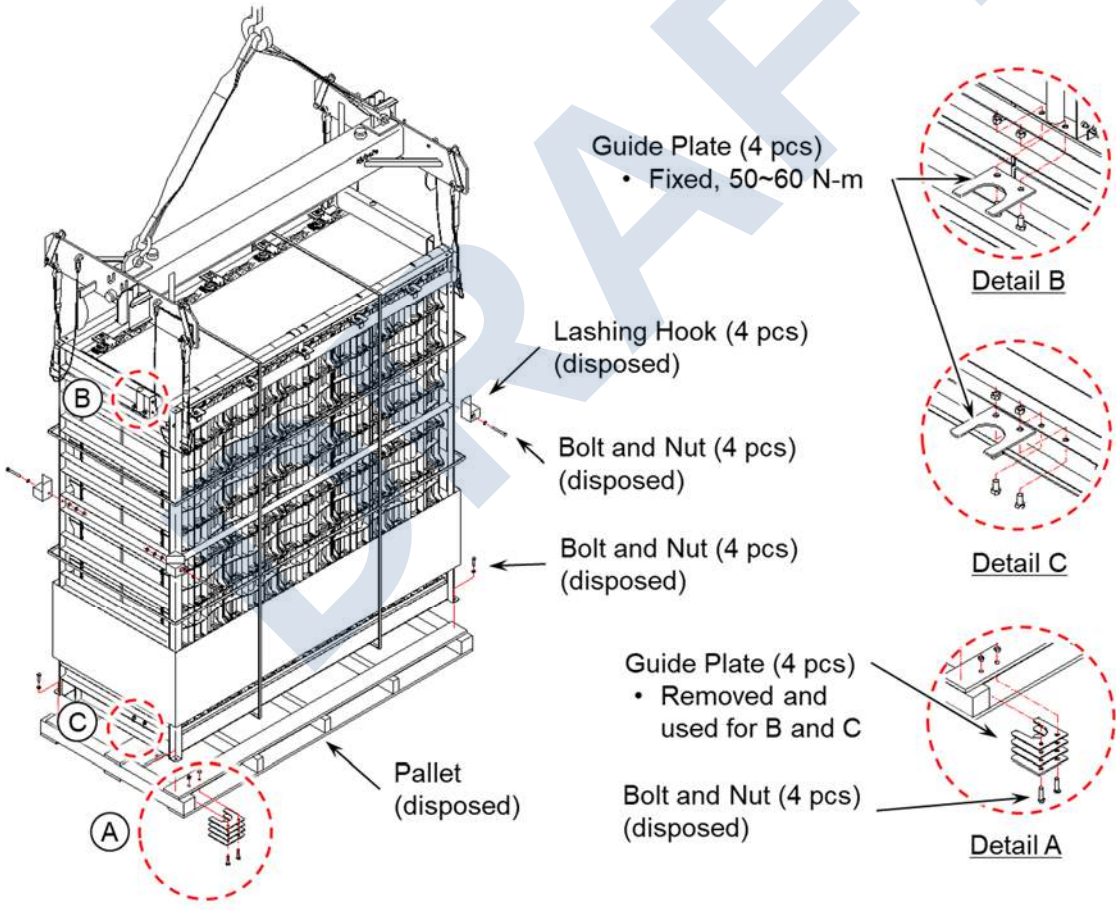

Fig. 4-1 How to unpack the Membrane Block

DRAFT

4.2 Unpacking the Diffuser Block

(1) Remove the plastic wrap.
(2) Remove the 4 Lashing Hooks (see Fig. 4-2).
(3) Remove the bolts, nuts, and washers at the four corners of the top Diffuser Block in the stack. **Keep them until the assembly of a SMU because they are reused to couple a Membrane Block and Diffuser Block** (see Fig. 4-2).
(4) Install the eyebolts (attached to the Unit Lifting Tool) at the four corners where the preinstalled bolts are removed in (3). Then fix the shackles of the Unit Lifting Tool onto the eyebolts (see Fig. 4-2 and Fig. 4-3).

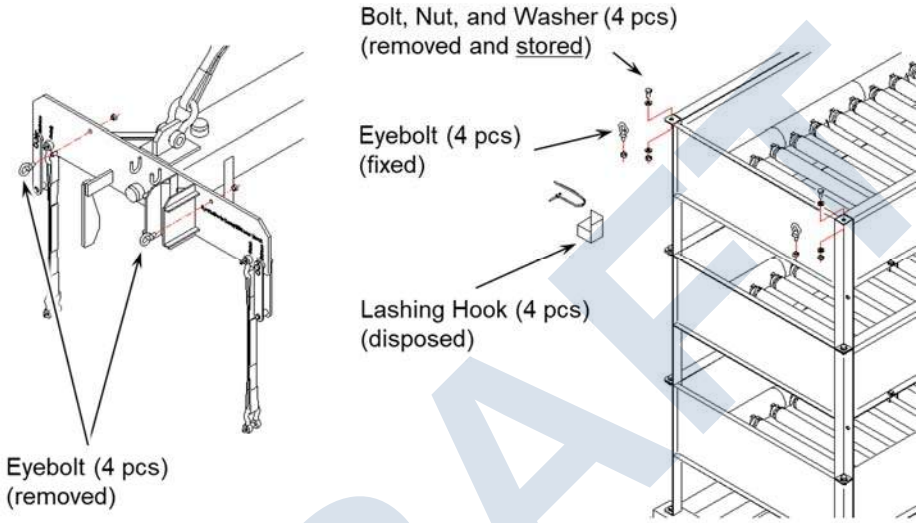

Fig. 4-2 How to Install Eyebolts and Remove the Lashing Hook

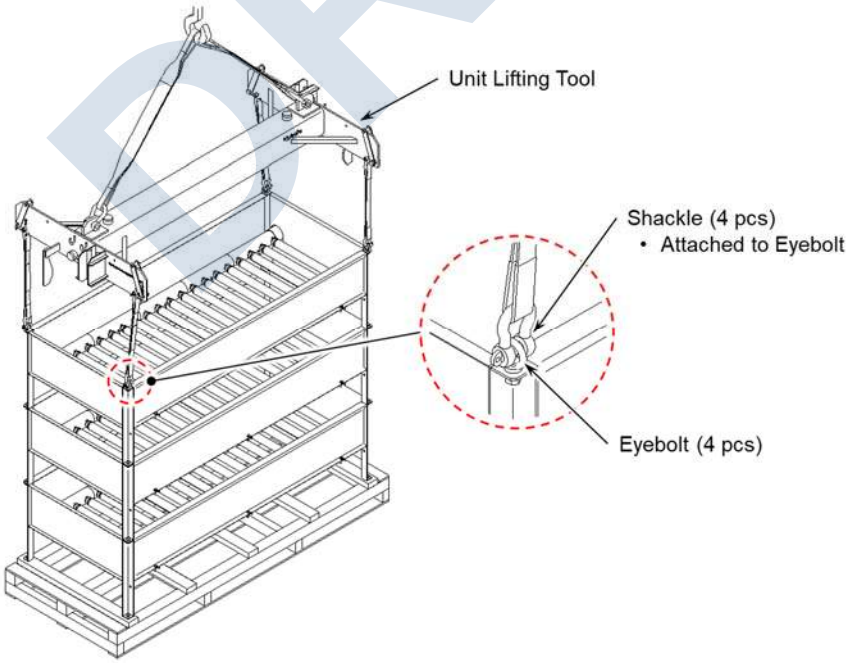

Fig. 4-3 How to attach the Unit Lifting Tool on to the top Diffuser Block

DRAFT

(5) Remove the bolts, nuts, and washers that connects the top Diffuser Block and the 2nd top Diffuser Block (see Fig. 4-4). **Keep them until the assembly of a SMU because they are reused to couple a Membrane Block and a Diffuser Block.**

(6) Lift up the top Diffuser Block only and place it on a flat ground (see Fig. 4-4).

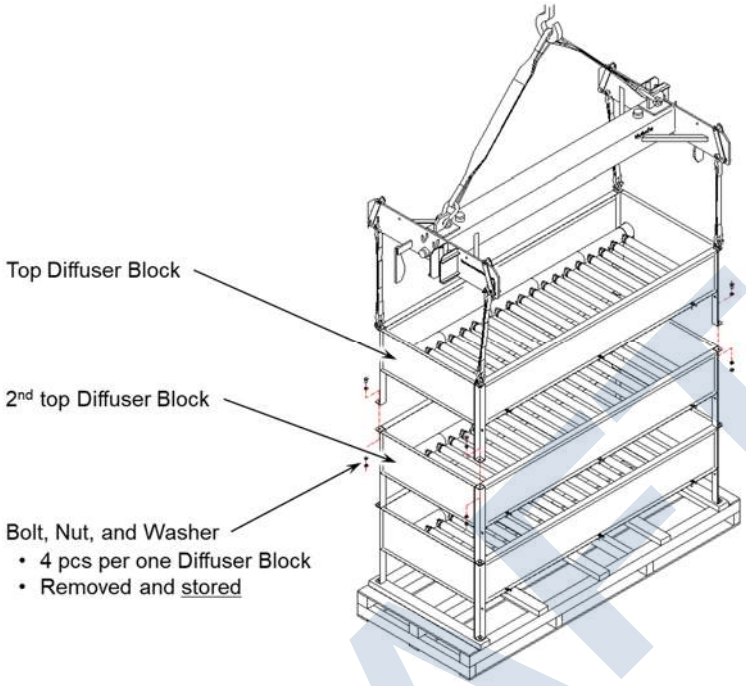

Fig. 4-4 How to Divide the Stacked Diffuser Blocks

(7) In the same way, place all the Diffuser Block on the flat ground.

(8) Remove the pallet from the bottom Diffuser Block (see Fig. 4-5). The bolts and washers on the pallet are not to be reused for the assembly of SMUs.

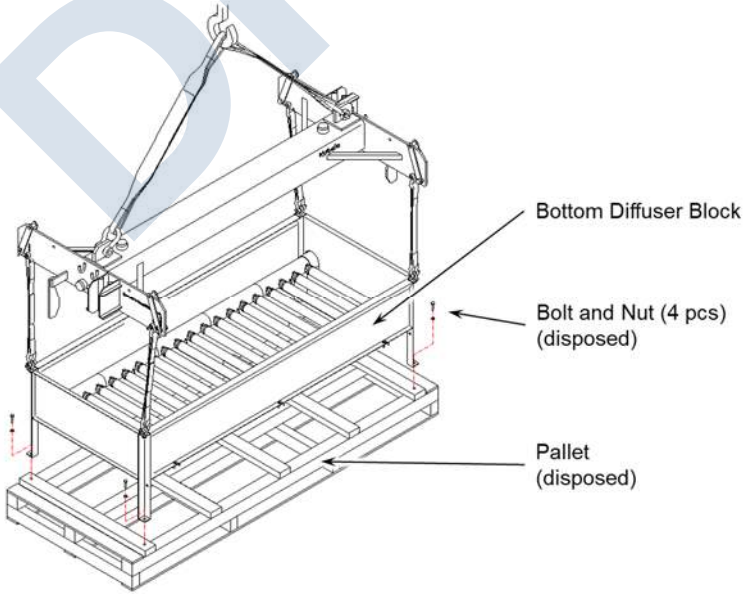

Fig. 4-5 How to Remove the Pallet

DRAFT

4.3 Assembly of SMU

(1) Place the Diffuser Block on a level and firm ground.

(2) Lift up the Membrane Block with a Unit Lifting Tool. Then place it on the Diffuser Block (see Fig. 4-6).

(3) Connect the Membrane Block and Diffuser Block with the bolts, nuts and washers which were removed when the Diffuser Block was disassembled. The tightening torque of the bolts (size: M12) should be 50 - 60 N·m.

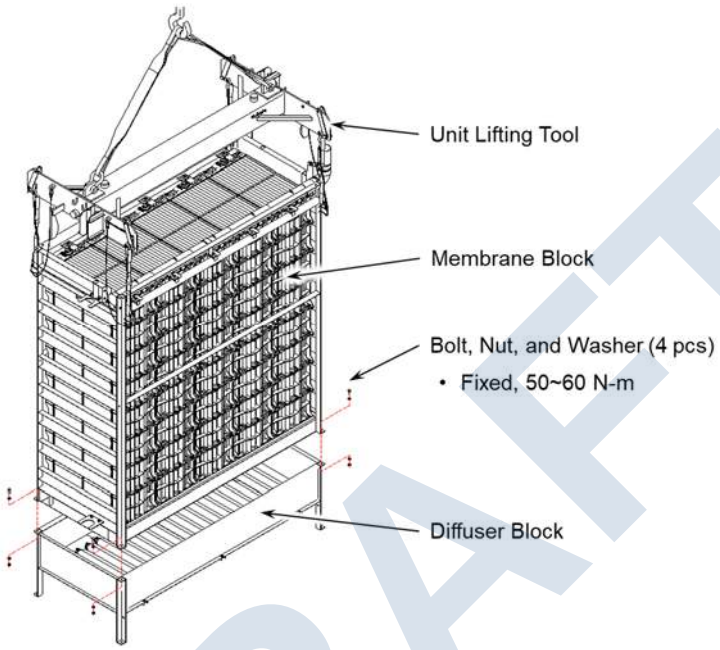

Fig. 4-6 How to Couple the Membrane Block and the Diffuser Block

(4) Glue Diffuser Adapters (1 pc) and Manifold Adapters (1 pc) onto the pipes in the SMU (see Fig. 4-7 and Fig. 4-8 respectively).

- Remove the dust and oil on the adhering surface.
- Use a commercial adhesive bond for PVC.
- Procedure of adhesion is same for general PVC pipes.
- Insert the Adapters until the mark-off line disappears in the sockets of the Diffuser and the Manifold.
- Using one of two pipe supports accompanying the Diffuser Adapter, fix the Diffuser Adapter to the Diffuser Block. The tightening torque of the bolts (size: M8) should be 14 - 17 N·m. **Remove and store the other pipe support from the Diffuser Adapter for later use for fixing Air Piping to the Membrane Block.**
- Remove a Bracket accompanying the Manifold Adapter temporarily. Once the Manifold Adapter is glued to Manifold, fix the Manifold Adapter to the Membrane Block by using the Pipe Support and Bracket. The tightening torque of the bolts (size : M8) should be 14 - 17 N·m. Also, tighten nuts of the Manifold Saddle this time because the nuts are not tightened perfectly at factory in order to avoid deformation of the Manifold during transportation. The tightening torque of the bolts (size : M8) should be 14 - 17 N·m. Note that the same assembly works need to be done for upper Membrane Block in the case of double deck unit.

DRAFT

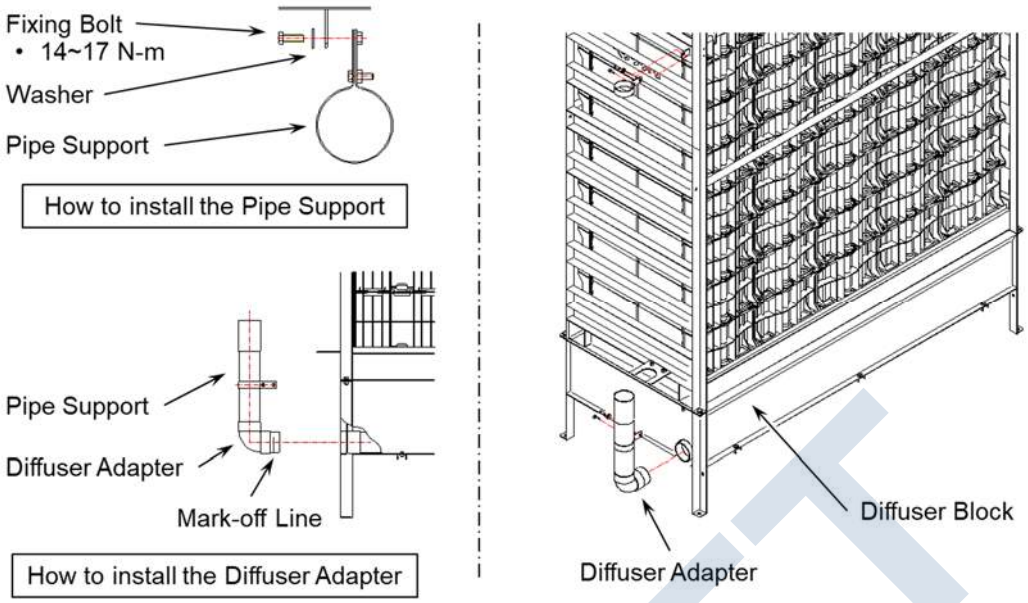

Fig. 4-7 How to Install Diffuser Adapter

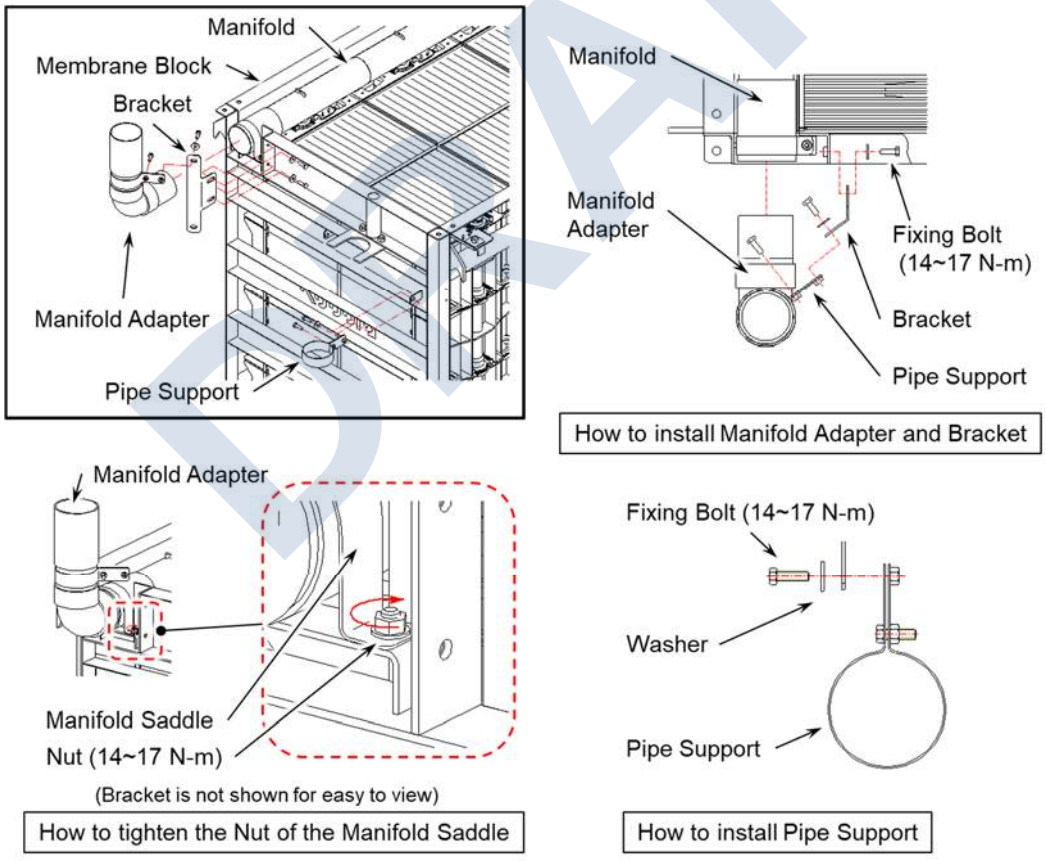

Fig. 4-8 How to Install Manifold Adapter

DRAFT

Warning

Take safety measures to prevent falling accident

Ensure the safety of workers by installing handrails, scaffolding and safety equipment to prevent a fall accident. Pay particular attention near the tank opening because the floor may be slippery by wetness.

Poor safety measures may result in fatal accident.

Warning

Never go beneath a lifted Membrane Block, Diffuser Block, Membrane Unit, or Membrane Module

If they fall down, fatal accident may occur.

Caution

Before using Lifting Tool, make sure that they have no abnormality

Before using Lifting Tools supporting load, check if crack, corrosion, rust, abrasion, and deformation. And also, check the Slings of the KUBOTA's Lifting Tool for abnormalities such as a cut, abrasion, scratch, broken stitch, discoloration, coloration, fusion, and melting.

Immediately replace the tools with abnormality. Continued use of them may cause human accident by product dropping.

Caution

Conduct the lifting work by two or more persons.

If the crane or chain block operator alone conducts all the work, his risk prediction ability will significantly decrease due to increased blind spots.

Caution

Securely bolt the Membrane Block and Diffuser Block.

If the Membrane Block and Diffuser Block are not bolted securely, the Diffuser Block will drop off to cause a fatal accident.

Caution

Do not place any part of your body between a Lifting Tool and a Membrane Block or a Diffuser Block.

Do not place any part of your body, such as a hand or a head, between a Lifting Tool and a Membrane Block or a Diffuser Block. It may cause a fatal accident under unsafe operation or during an unexpected drop accident.

Caution

Be sure to check that there are no slacks of Shackles and Eyebolts.

If the Shackles or Eyebolts come off, the product will drop down and result in fatal accident or damage on the surrounding equipment.

DRAFT

Caution	**Lift a Membrane Block or Diffuser Block straight up slowly and safety by using a Lifting Tool** When lifting a Membrane Block or Diffuser Block, lift it straight up slowly and safely. If it swings, physical injuries and/or damage on surrounding equipment may occur.

Caution	**The Lifting Tools should be used by four point lifting.** When lifting up a Membrane Block or Diffuser Block, always hang it at four points. If lifted at three or two points, it may drop or swing and result in a fatal accident.

Caution	**Check the slings for twist before use.** Make sure that a set of slings have the same length and no kinks while it is attached on the Unit Lifting Tool. Otherwise the load may be supported by only three or two slings, resulting in an accident.

Caution	**Wear adequate gloves such as cotton work gloves during work.** Working with bare hands may result in unexpected injuries.

Prohibited	**Never use the Lifting Tool for lifting other thing or for other purpose** The Unit Lifting Tool is for lifting up a Membrane Block or Diffuser Block safety. Do not lift other things or use for other purpose.

Prohibited	**Do not remove the protective vinyl sheet on the Membrane Block before use** Do not remove the vinyl sheet on the Membrane Block. It protects Membrane Modules from dust.

Prohibited	**Keep away from fire and spark** Keep SMU and Membrane Modules away from fire (and also spark from welding, fusing, and grinding). They may cause damage on parts of SMU, especially the membrane sheet can get holes and be no use.

Important	**Use the specified Lifting Tool to lift up the Membrane Block or Diffuser Block.** It can lift up the Membrane Block or Diffuser Block without too much load.

DRAFT

5. Installation of SMU

This section explains procedures of installation of SMU into the tank where there is no water/mixed liquor. To lift the SMU, always use Unit Lifting Tool (optional parts). **For more information about how to use the Unit Lifting Tool, see "Lifting Tool Instruction Manual".**

5.1 Installation of Guide Set

Install the Guide Set following to the instruction by corresponding engineering company. In this section, installation procedure of KUBOTA's recommended Guide Set is explained. Please check installation location of the SMU based on equipment layout drawing etc. and determine installation location of the Guide Set in advance.

(1) Installation of Base Plate
- Determine installation location of the Base Plates so as to keep pitch of the paired Guide Poles as 2290 [mm] in longer direction and 350 [mm] in shorter direction.
- Fix the Base Plates so as to keep distance from bottom of the tank by 50 [mm] (for mortar installation).
- The Base Plates should be installed so as to make horizontality of the paired Base Plates be 5 [mm] or less.

(2) Installation of Support Bracket
- Determine installation location of the Support Brackets so as to keep pitch of the paired Guide Poles as 2290 [mm] in longer direction and 350 [mm] in shorter direction.
- The Support Bracket should be fixed to tank wall so as to touch the surface of the Support Bracket onto the surface of the tank wall.

(3) Installation of Guide Pole
- Install the Guide Pales so as to keep pitch of the paired Guide Poles over whole length as 2290 [mm] in longer direction and 350 [mm] in shorter direction.

DRAFT

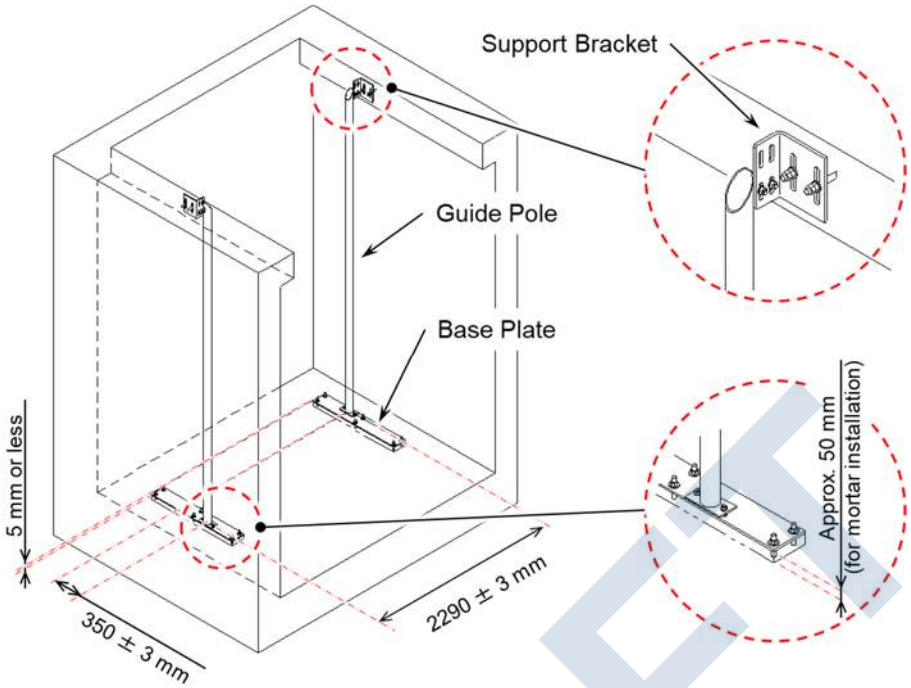

Fig. 5-1 Required Accuracy for Installation of Guide Set

5.2 Lifting Up of SMU

(1) Ensure safety of the components to which loads are imposed before use. Make sure that they are free from abnormality such as crack, corrosion, rust, abrasion, or wear before use.

(2) Attach Unit Slings to the holes (Catch) of the Unit Lifting Tool. **Please use the Unit Sling only for lifting a dry new Membrane Block (for unloading or assembling of Membrane Unit), Diffuser Block (for unloading), or Membrane Unit (for assembling of Membrane Unit or first installation to the tank). Please do not use the Unit Sling for lifting a wet or clogged Membrane Unit.**

(3) Remove Shackles at the lower end of the Unit Sling.

(4) Attach Hangers to the holes (Release) of the Unit Lifting Tool and flip up them (see Fig. 5-2 "Detail A").

(5) Lift up the Unit Lifting Tool and move it to right above the SMU.

(6) Attach the Unit Slings of the Unit Lifting Tool to Hooks at four corner of the SMU (see Fig. 5-2 "Detail B").

(7) Attach Stoppers (4 pcs) to the Membrane Block (see Fig. 5-2 "Detail B").

(8) Lift up the SMU.

DRAFT

5.3 Installation of SMU into the Tank

(1) While checking direction of the SMU, lower the SMU slowly toward bottom of the Tank so as to let Guide Plates of the SMU run along the Guide Pole (see Fig. 5-2 "Detail C").

(2) Detach the Stopper from the SMU and detach the Unit Sling from the Hook. Then lift up the Unit Lifting Tool only.

(3) In the case of double deck unit, install Upper Membrane Block on top of the Lower Membrane Block by following to the similar procedure above.

(4) After completing installation of the SMU, remove dirt from the Unit Lifting Tool, and dry the Unit Lifting Tool. Then store the Unit Lifting Tool indoor.

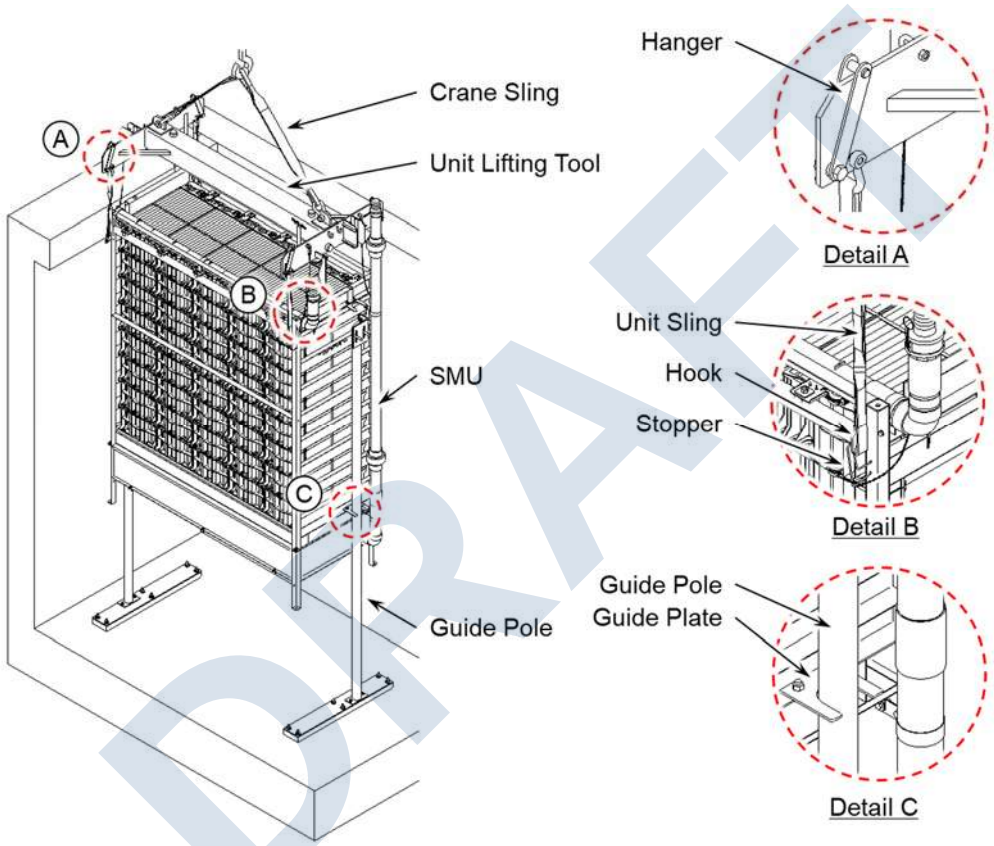

Fig. 5-2 How to Install SMU into Tank

5.4 Installation of Stabilizer

(1) Install Stabilizers in order to avoid flotation of SMU due to buoyancy while the SMU is submerged in the water or mixed liquor.

(2) Insert the Stabilizer into a hole on top of Membrane Block and fix top end of the Stabilizer to Support Bracket using bolts (see Fig. 5-3).

DRAFT

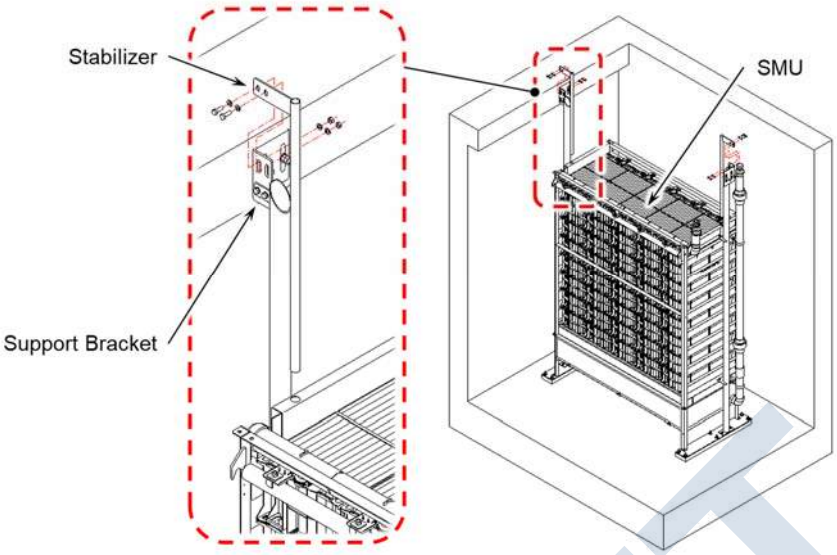

Fig. 5-3 How to Install Stabilizer

Warning

Take safety measures to prevent falling accident

Ensure the safety of workers by installing handrails, scaffolding and safety equipment to prevent a fall accident. Pay particular attention near the tank opening because the floor may be slippery by wetness.

Poor safety measures may result in fatal accident.

Warning

Never go beneath a lifted Membrane Block, Diffuser Block, Membrane Unit, or Membrane Module

If they fall down, fatal accident may occur.

Caution

Never wet the Lifting Tool nor expose it to corrosive gas.

If the Lifting Tool get corroded, its strength may decrease to a critical level, resulting in a drop accident.

Caution

Before using Lifting Tool, make sure that they have no abnormality

Before using Lifting Tools supporting load, check if crack, corrosion, rust, abrasion, and deformation. And also, check the Slings of the KUBOTA's Lifting Tool for abnormalities such as a cut, abrasion, scratch, broken stitch, discoloration, coloration, fusion, and melting.

Immediately replace the tools with abnormality. Continued use of them may cause human accident by product dropping.

Caution

Conduct the lifting work by two or more persons.

If the crane or chain block operator alone conducts all the work, his risk prediction ability will significantly decrease due to increased blind spots.

DRAFT

Caution	**Do not place any part of your body between a Lifting Tool and a Membrane Unit.** Do not place any part of your body, such as a hand or a head, between a Lifting Tool and a Membrane Unit. It may cause a fatal accident under unsafe operation or during an unexpected drop accident.

Caution	**Be sure to check that there are no slacks of Shackles and Eyebolts.** If the Shackles or Eyebolts come off, the product will drop down and result in fatal accident or damage on the surrounding equipment.

Caution	**Lift a Membrane Unit straight up slowly and safety by using a Lifting Tool** When lifting a Membrane Unit, lift it straight up slowly and safely. If it swings, physical injuries and/or damage on surrounding equipment may occur.

Caution	**The Lifting Tools should be used by four point lifting.** When lifting up a Membrane Unit, always hang it at four points. If lifted at three or two points, it may drop or swing and result in a fatal accident.

Caution	**Check the slings for twist before use.** Make sure that a set of slings have the same length and no kinks while it is attached on the Unit Lifting Tool. Otherwise the load may be supported by only three or two slings, resulting in an accident.

Caution	**Wear adequate gloves such as cotton work gloves during work.** Working with bare hands may result in unexpected injuries.

Prohibited	**Never use the Lifting Tool for lifting other thing or for other purpose** The Unit Lifting Tool is for lifting up a Membrane Unit, Membrane Block or Diffuser Block safety. Do not lift other things or use for other purpose.

Prohibited	**Keep away from fire and spark** Keep SMU and Membrane Modules away from fire (and also spark from welding, fusing, and grinding). They may cause damage on parts of SMU, especially the membrane sheet can get holes and be no use.

DRAFT

6. Piping Connection to SMU

6.1 Instruction of Piping

Design the piping around the SMU considering the location of Headers. Example piping layout is shown as Fig. 6-2.

(1) Install PVC piping from Manifold and Diffuser Adapter. For easy disassembly, install union joints, flange, or lever couplings at the connections of Membrane Block and Diffuser Block (see Fig. 6-1).

(2) Using a pipe support accompanying the Diffuser Adapter, bolt the Air Piping to the Membrane Block. The tightening torque of the bolts (size : M8) should be 14 - 17 N·m.

(3) Avoid any air-accumulating points in the Permeate Piping and/or Header.

(4) The piping connections from SMU are all sockets. Straight pipes with the diameter shown in Table 6-1 are applied to these sockets.

(5) **Never use flexible hose made of soft resin (e.g. soft PVC) for air piping.** The ingredient of the soft resin is delivered to Diffusers by air from blowers and it deteriorates materials of the Diffusers.

Table 6-1 Connection Diameter of Manifold and Diffuser and Its Number

SMU Model	Manifold Connection (Manifold Adapter)		Diffuser Connection (Diffuser Adapter)	
	Pipe Size	Nos. of Connection	Pipe Size	Nos. of Connection
SP200 SP300 SP400 SP225-A SP337-A SP450-A	JIS 75A, ASTM 3 inch, or DIN d90	1	JIS 75A, ASTM 3 inch, or DIN d90	1
SP600 SP800 SP675-A SP900-A	JIS 75A, ASTM 3 inch, or DIN d90	2	JIS 75A, ASTM 3 inch, or DIN d90	1

6.2 Connection of Permeate Piping and Air Piping to Headers

Note the following items in connecting Permeate Piping and Air Piping to the Headers (see Fig. 6-2).

- Install flanges or couplers at connections to Headers in order for piping and Headers to be decoupled easily at the time of maintenance. When using hoses to connect them, the length of hoses should NOT be too long. However, **never use the flexible hose which is made of soft resin for air piping.**
- Install union joints or flanges at every 2 m on the piping in order to avoid excess load on the Manifolds and the Diffuser.
- Design the Header so that permeate and air can be evenly distributed.

DRAFT

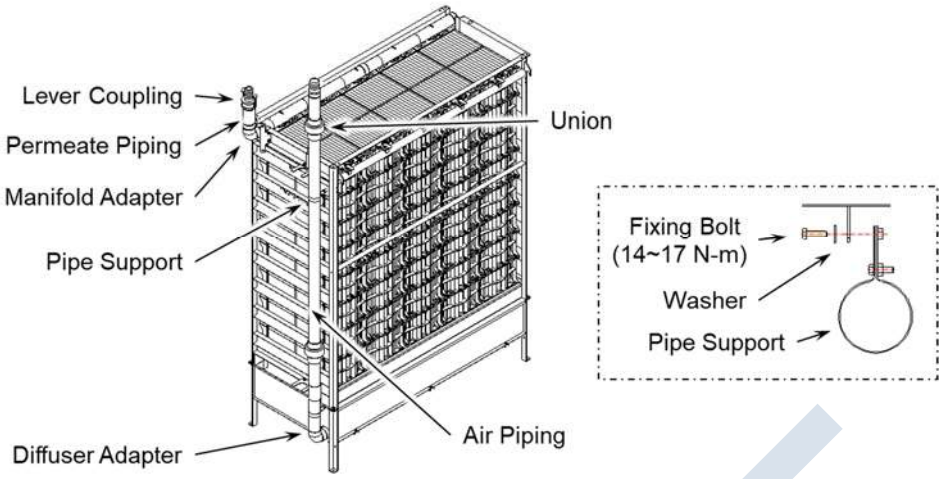

Fig. 6-1 How to Install Piping on SMU

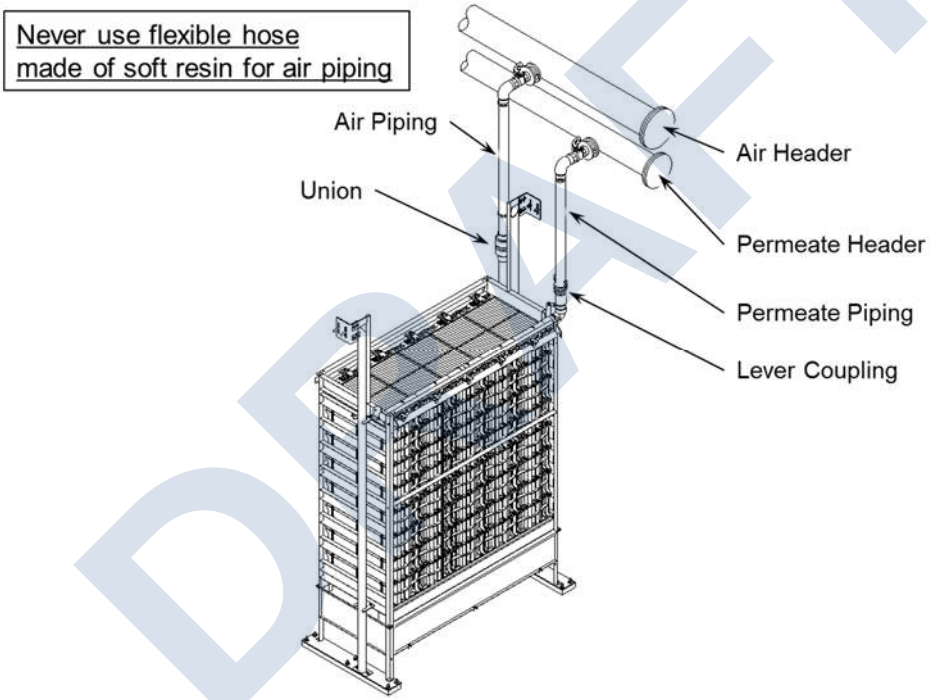

Fig. 6-2 Example of Piping Configuration around SMU

Prohibited	**Do not hammer on the pipes.** When connecting pipes to the Manifolds and Diffuser, do not insert them by hammering because they may be broken.

Prohibited	**Do not remove the protective vinyl sheet on the Membrane Block before use.** Do not remove the vinyl sheet on the Membrane Block. It protects Membrane Modules from dust.

DRAFT

Prohibited

Never use flexible hose made of soft resin for air piping.
The ingredient of the soft resin is delivered to diffusers by air from blowers and it may deteriorate the materials of the Diffusers.

Important

Remove cutting chips from the connecting pipes.
Remove the cutting chips from inside the connecting pipes to the Manifolds before connecting the pipes. Chips contaminating into SMU may cause membrane injury.
Remove the cutting chips from inside the connecting pipes to the Diffuser before connecting the pipes. Otherwise the chips discharged with aeration air may injure membranes.

Important

Use hoses of proper length.
The hose connected to the permeate header may get slack and cause air lock if it is too long.
The hose connected to the air header may cause unexpected vibration, resulting in breakage or abrasion of piping, if it is too long.

Important

Design the permeate piping so as not to cause air trap.
The dissolved gas in the permeate may gasify to make gas trap. Design the piping configuration hard to make gas trap. Air lock in the permeate piping may not only decrease the filtration performance but also break the membranes.

Important

Design the piping configuration such that the Manifold or the Diffuser are not under load
Design the piping configuration such that the Manifold or the Diffuser are not applied load nor vibration during operation.
Use unions or flanges to disconnect Permeate Pipes when lifting the Membrane Modules.

Important

Design the permeate piping to avoid backflow of the permeate.
A massive backflow to Membrane Unit from Permeate Tank or other tanks at the time of suspension infiltration causes damage to Membrane Modules or Membrane Units.

DRAFT

7. Pretreatment Equipment

7.1 Fine Screen

If the raw water or other influent contains considerable amount of debris and screenings, remove them by a fine screen prior to the Membrane Tank.

- The recommended fine screen is a 2mm perforate and a capture rate of more than 90%.
- The raw water never bypasses or overflows the fine screen.
- Drain from the screen washer and compactor never bypasses the fine screen.

Important	**Do not let screenings, debris, or any other solid substances flow into Membrane Tank.** If screenings, debris, or any other solid substance are flown into the Membrane Tank, they may cause clogging in the Diffuser or between membranes, and cause decrease in membrane performance. Hard debris such as sand and charcoal may cause damage to membrane and Membrane Unit or accelerate damage and degradation of piping and pipe support.

7.2 FOG Separation

If the influent contains a significant amount of fat, oil, and grease (FOG), remove them prior to the biological treatment.

- The raw water contains more than the following FOG, remove the FOG with Dissolved Air Flotation or other equipment.

  Animal and plant oil: 15% of influent BOD or less
  Mineral oil: 10 mg/L or less

Important	**Do not let a significant FOG flow into Membrane Tank** If the raw water contains significant amount of oil, it may adhere on the membrane surface to deteriorate filtration performance.

7.3 Calcium Removal

If a high concentration of calcium is contained in the inflow, calcium carbonate may precipitate on the membranes and obstruct the filtration. If the influent contains a significant amount of calcium, be sure to remove it by coagulation settling process or other methods to sufficiently reduce the calcium concentration flowing into the biological reaction tank.

- A rough criterion for the need for calcium removal is 100 [mg/L] influent calcium concentration (equivalent to 250 [mg/L] hardness). However, there are cases where calcium carbonate precipitates at less than 100 mg/L calcium concentration or where it does not precipitate even with more than 100 [mg/L] calcium concentration because the precipitation is affected by various parameters.

DRAFT

- Operation countermeasure is described in “10.11 Countermeasures against Calcium Problem”.

Important	**Do not let in high concentration of calcium flow into Membrane Tank** High concentration of calcium may precipitate into such as calcium carbonate crystals on the membranes to cause fouling and even break of membranes.

DRAFT

8. Operation of Kubota SMU

To operate an SMU properly, note the followings points:

8.1 Water Level of Membrane Tank

Keep the water level of 300 mm or more from the top of the Membrane Unit.

8.2 Management of Filtration Pressure

Do not conduct filtration under the filtration pressure over the specified value (20 kPa). Continued operation under such a pressure will cause membrane clogging and reduce the effect of chemical cleaning.

8.3 Prohibition of Filtration without Aeration

Filtration should not be conducted when Diffuser of the SMU does not supply air (air is not supplied to surface of the Membrane Cartridges) due to such reasons that the Membrane Blower is not running, Blow-down is conducted, and so on. Filtration without cleaning effect by scouring the membrane surface with aeration bubble causes rapid membrane fouling or clogging between membranes, resulting in significant deterioration of filtration performance.

8.4 Prohibition of Aeration without Filtration

Suspend aeration while filtration is suspended, except the short suspension of filtration in intermittent filtration (relaxation) during normal filtration mode (see “8.5.1 Normal Mode”).
More than 10 minutes of continued aeration without filtration will tend to shorten the life of the membranes or even break them.

8.5 Mode of Operation

To prevent long-time aeration without filtration, prepare “Low-Loading Mode” and “Normal Mode” and let both of the two modes can be automatically switched each other.

8.5.1 Normal Mode

“Normal Mode” is the operation mode when design flow rate of influent flows into the plant and biological process and membrane process are operated continuously near design conditions.

(a) Filtration

Intermittent filtration (e.g. OFF/ON = 1 min / 9 min) is recommended. To control the intermittent filtration, turn on or off the permeate pump. If using gravity filtration or siphon filtration, open or close a motorized or solenoid valve to control the intermittent filtration.

DRAFT

(b) Operation of Membrane Blower

Basically the Membrane Blower should run constantly. Even in the intermittent operation on the Normal Mode, the Membrane Blower should constantly run. Adjust the flow rate of the blowers as necessary.

8.5.2 Low-Loading Mode

"Low-Loading Mode" is the operation mode to prohibit long-term aeration without filtration in the period when the inflow rate is low (no flow into the bioreactor tank). Build the control system so that the operation modes can automatically switch.

(a) Switching of Operation Mode

Switch to the Low-Loading Mode when the influent flow rate into the bioreactor tank becomes zero (when filtration is not required).

(Example) When level of Equalization tank or RAS tank hits Low limit or after a certain time has passed since the water level of those tanks hits Low Limit.

When the influent starts to flow into the bioreactor tank again, switch to the Normal Mode (when filtration is resumed).

(Example) When the water level of Equalization tank or RAS tank hits Middle or High Limit.

Configurations of system vary from site to site. Thus the criteria for switching between the two modes should be determined as suitable for each site.

(b) Filtration

Stop the filtration because there is no flow into the bioreactor tank.

(c) Operation of Membrane Blower

To prevent aeration without filtration, reduce aeration time as much as possible.

(Example) Intermittent aeration: ON/OFF = 5 min/55 min.

The intermittent aeration schedule should be determined considering the operational conditions of aeration tank (degree of degradation of organic pollutants, degree of sludge settling, etc.).

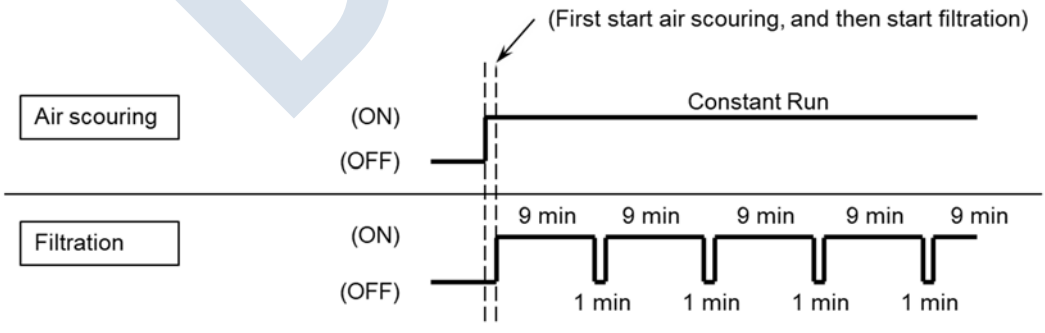

Fig. 8-1 ON/OFF schedule of Membrane Blower and Filtration in Normal Mode (Example)

DRAFT

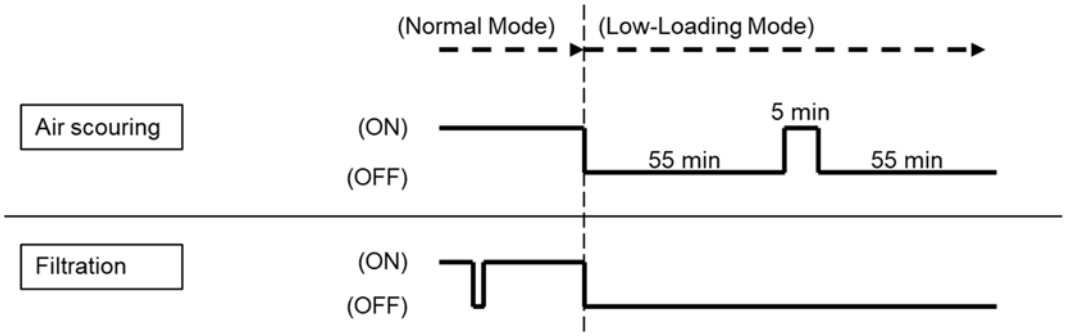

Fig. 8-2 ON/OFF schedule of Membrane Blower and Filtration in Low-Loading Mode (Example)

Prohibited	**Aeration without filtration is prohibited.** Suspend aeration to SMU as long as possible while filtration is suspended. Long-time aeration without filtration may cause damage to membranes.

Prohibited	**Filtration without aeration is prohibited.** Suspend filtration anytime aeration to SMU is suspended or Blow-down is executed. If filtration is done during such a time, rapid clogging of membrane and sludge clogging between membranes would occur, resulting in reduced filtration performance.

DRAFT

9. Clean Water Test

After completion of the installation of the wastewater treatment plant with KUBOTA Submerged Membrane Unit™, always conduct a clean water test before actual operation.
In the clean water test, check the following points:

- Levelness of the installed Membrane Units (uniformity of aeration)
- Secureness of pipe connection (leak from permeate or air piping)
- Performance of ancillary equipment (aeration rate, permeate flow)
- Correctness of sequential control and interlocks (actions of ancillaries such as Permeate Pumps and Membrane Blowers)

Be sure to adjust or repair the plant before actual operation if any abnormality is found during the clean water test.

Caution	**Ventilate Well** If the Membrane Tank and/or aeration tank are installed in a building with poor ventilation, be sure to ventilate the building. Filling gas in the air may cause health problem.

9.1 Before filling the water into the Membrane Tank

Before filling the MBR Tank with clean water, perform the following inspections and preparations.

- Make sure to clean the inside of Aeration Tanks and MBR Tanks completely before filling it with clean water. Dust and chips remaining in the MBR Tank can damage / foul membranes.
- Re-check if each SMU is leveled within the required deviation (5 mm).
- Re-check if multiple SMUs are leveled within the required deviation (10 mm).
- Re-check the Air Piping connection and the Permeate Piping connection.
- Make sure that all the required equipment for filtration is properly installed. The equipment are described in “Table 2-4”.
- In early stage of the clean water test or others, Membrane Tank or Permeate Tank may foam heavily and overflow because of the hydrophilic agent on the membrane surface. Be careful of such foaming event.
- When using secondary clarifier effluent from the existing sewage treatment plant instead of clean water, feed PAC or poly-ferric sulfate into the effluent. Feed concentration should be determined by jar test. Please consult with the corresponding engineering company when using secondary clarifier effluent.

After performing above the inspection and preparation, feed clean water such as tap or underground water to the operation level of the biological reaction tank. Make sure to open the valves at the Chemical Feeding Port or other location to vent the gas in the membrane.

Important	**Clean the Tank.** Remaining trash, sand, and dust in the tank can cause membrane break and clogging.

DRAFT

Important	**Release the air in the Membrane Modules when filling water into the Membrane Tank.** When filling water into the Membrane Tank, open the valve at Chemical Feeding Port or other locations to release the air in the Membrane Modules. No release of air causes increased inner pressure of Membrane Modules and break of the Membrane Sheet. Close the valve as soon as filling the water is finished. Foreign matter may enter the valve and cause clogging of tubes/pipes and trouble in Suction Pump.

9.2 Clean Water Test

After the MBR Tank is filled with clean water, perform clean water test operation according to the following procedure.

9.2.1 Membrane Blower

Start the Membrane Blower and check the followings:

- The Membrane Blower emits no abnormal noise or vibration.
- Required air flow rate is achieved.
- No leakage from air piping.

Hydrophilic agent in the membrane sheets may cause foaming in the Membrane Tank or permeate water tank in the early phase of operation including the clean water test. It is not an abnormal phenomenon. Manage it with antifoam agent as required.

9.2.2 Levelness of Membrane Units

If the horizontality of Membrane Units is not secured, uneven aeration bubble will deteriorate filtration. Run the Membrane Blower to check the followings:

- Measure pressure of the membrane blower, air rate, and level of the membrane tank.
- Check for uneven aeration in one Membrane Unit.
- When multiple SMUs are aerated by one Membrane Blower, check if the air flows to all the SMUs are even.
- If significant uneven aeration is found, check the piping configuration (e.g. narrow diameter of Header Pipe) and the installation levelness of Diffusers.

9.2.3 Blow-down

Blow-down is conducted to prevent Diffuser air pressure increase. Run the Blow-down program to check the followings:

- Check that air not supplied to the Membranes.
- Check that filtration is stopped.

Refer to "【Diffuser Blow-down】" for more information.

DRAFT

9.2.4 Status of Filtration

After starting the Membrane Blower to supply air to membrane surface, check the followings:

- Conduct filtration and make sure that permeate is discharged.
- No leak in permeate piping.
- Measure the flow rate, filtration pressure and temperature with clean water.

Be careful in early stage of filtration of foaming of permeate due to the hydrophilic agent on membrane sheet.

9.2.5 Control System

Check the control of Membrane Blower and Filtration Equipment to prevent membrane fouling or break of Membrane Cartridge.

- Make sure that filtration is stopped while the Membrane Blower is suspended or Diffuser Blow-down is performed.
- Make sure that if the Low-Loading Mode functions correctly.

After the clean water test finishes, stop filtration and then stop aeration.

Prohibited	**Prohibition of Filtration without Aeration** Suspend filtration anytime aeration to SMU is suspended or Diffuser Blow-down is executed. If filtration is done during such a time, clogging of the membrane would occur.

Important	**Complete the clean water test as soon as possible.** After finishing the operation check of Membrane Blower, immediately stop the Blower, because long-time aeration without filtration causes damage to Membrane Cartridge. In addition, do not perform the clean water test longer than required because long-time filtration may cause membrane clogging by dust and dirt in the tank.

Important	**Do not dry the Membranes** After the clean water test, if the membrane surfaces dry out, membranes get hydrophobic and permeate flow rate will drop. Do not drain the tank nor lift the SMU out of the tank until seed sludge is fed to the tank.

DRAFT

10. Actual Operation

After completing the clean water test, move to actual sludge operation. In the actual sludge operation, daily monitor the following items:

- Filtration Status (Permeate Flow Rate, Filtration Pressure, SS Leak)
- Aeration Status (Air Supply Rate, Uneven Aeration)
- Diffuser Blow-down
- Water Quality Check (Foreign Materials, Sludge Quality)

Caution	**Ventilate Well** If the Membrane Tank and/or aeration tank are installed in a building with poor ventilation, be sure to ventilate the building. Filling gas in the air may cause health problem.

10.1 Sludge Seeding

Feed seed sludge to start-up the biological treatment immediately before actual sludge operation.

- Required seed sludge is recommended to be fresh sludge of suspended activated sludge process such as biological nitrification denitrification process. The more quantity of seed sludge makes the more stable start-up operation.
- Feed the seed sludge so that the MLSS in Membrane Tank exceeds 3,000 mg/L (preferably 5,000 mg/L or more).

Important	**Be sure to feed the seed sludge** Membrane filtration of the raw water without feeding seed sludge causes membrane fouling. To get best performance of membranes, prepare seed sludge.

Important	**Remove foreign materials in seed sludge** Remove the foreign materials in seed sludge before feeding it into the tank. Otherwise membrane damage or Diffuser clogging will happen.

Important	**MLSS in seed sludge shall be 5,000 mg/L or more** Feed the seed sludge so that the MLSS in Membrane Tank exceeds 3,000 mg/L (preferably 5,000 mg/L or more). Seed sludge with 3,000 mg/L or less MLSS causes membrane fouling.

DRAFT

Important	**Do not use decayed seed sludge** Feed the seed sludge just before starting the actual sludge operation. Long time with no wastewater flow will cause decayed sludge and membrane fouling. If the seed sludge smells of decay, aerate it until the smell disappears (1 hour at the maximum) before starting filtration. Filtration with decayed sludge causes membrane fouling.

10.2 Check the Permeate Quality

Check if the SS leak in permeate. If significant amount of SS mixes in permeate by membrane damage or tube disconnection, treated water quality exceeds discharge standards. In this case, immediately stop filtration and take the required measures before restart.

Important	**Check the Permeate SS** Check of permeate SS is not only for the monitoring discharge water quality but also for finding of abnormality in membranes or ancillary equipment in early stage. Installation of turbidity meter in permeate piping makes easy permeate monitoring.

10.3 Managing Permeate Flow Rate and Filtration Pressure

Check the Permeate Flow and Filtration Pressure to understand filtration status.

- When the permeate flow rate stabilized, measure the temperature, flow rate, and filtration pressure in actual sludge filtration.

Important	**Daily monitor permeate flow rate and filtration pressure.** Monitoring of permeate flow rate and filtration pressure is essential to check the operation status of SMU. Collecting continuous data is recommended.

10.4 Managing Air Scour Flow Rate

Check if appropriate air supply rate is provided to SMU.

- Check if the monitored air supply rate is within the Diffuser Air Supply Rate described in “Table 2-1”.

Important	**Supply proper air flow rate to SMU** Too high air supply flow rate causes damage of the Membrane Cartridges. Too low air supply flow rate causes clogging between Membrane Cartridges and diffuser clogging.

DRAFT

10.5 Visual Check of Aeration

Visually check for abnormality in aeration of SMU.

- Aeration uniformity among multiple SMUs.
- Aeration uniformity in each SMU.
- No unusual non-uniform aeration

Important	**Check the uniformity in aeration** Diffuser clogging and clogging between membranes cause non-uniform aeration. To keep the filtration performance, check if there is no non-uniform aeration.

10.6 Diffuser Blow-down

To prevent the increase of the Diffuser Air Pressure due to the slime or the like on the Diffuser, periodically conduct Diffuser Blow-down. Procedure for Diffuser Blow-down is described in "【Diffuser Blow-down】".

- Conduct Diffuser Blow-down once a day.
- Check that filtration is stopped during Diffuser Blow-down.

The Blow-down does not always prevent diffuser clogging. If the Blow-down cannot recover the Diffuser Air Pressure, lift up the Membrane Unit out of the tank and check the Diffuser. Then wash by water (clean the Diffuser surface with brush) or replace the Diffuser if necessary.

Important	**Periodically conduct Diffuser Blow-down** Conduct Diffuser Blow-down periodically for 1 minutes once a day. If the diffuser becomes blocked, the aeration pressure increases so that the blowers be damaged and membranes get clogged to lose filtration ability.

Important	**Suspend filtration during Diffuser Blow-down** Never fail to stop the filtration during the Diffuser Blow-down because membrane scouring is stopped. Filtration during Diffuser Blow-down causes membrane fouling, resulting in decrease in filtration performance.

10.7 Removal of Debris

Check that the fine screen or other equipment properly works and foreign materials and debris is surely removed.

- Check if the raw water bypass or overflow the fine screen.
- Debris content in the mixed liquor taken from membrane tank should be checked periodically by 1 mm mesh CSS test (see "【1 mm mesh CSS test】" for detail procedure).
- Proper range of the debris content is below 30 [dry-mg/L]. If the debris content becomes 30 [dry-mg/L] or more, possibility of generation of dewatered sludge between the Membrane Modules becomes higher due to accumulation of such debris on the bottom of the Membrane Modules. In such a case, installation or operation of the fine screen should be reviewed and improved.

DRAFT

The debris flowing in the tank tangles with each other to grow large, causing clogging of diffuser and between membranes. Be sure to remove them.

Important

Do not let screenings, debris, or any other solid substances flow into Membrane Tank

If screenings, debris, or any other solid substance are flown into the Membrane Tank, they may cause clogging in the Diffuser or between Membrane Cartridges, and cause decrease in membrane performance.

Hard debris such as sand and charcoal may cause damage to membrane and Membrane Unit or accelerate damage and degradation of piping and pipe support.

10.8 Managing Mixed Liquor

Representative parameters to know the sludge characteristics in Membrane Tank are described in “Table 10-1”. Use the control values in the table as standard in operation adjustment.

Table 10-1 Representative Parameters to know Sludge Condition

Monitoring Parameters	Control Value	Remarks
Sludge Concentration (MLSS)	5,000~13,000 mg/L	Recommended; 8,000~12,000 mg/L
Viscosity	120 mPa·sec or less	Measured with a viscometer TVC-10 (Rotor No.1, Speed 20 rpm) by Toki Sangyo Co., LTD. If measured with a viscometer VT-03 by Rion Co., LTD., it is 60 mPa·s or less instead.
Paper Filtration Test	10 mL/5min or more	See 【Paper Filtration Test Method】
Dissolved Oxygen (DO)	1 mg/L or more (Average in Membrane Tank)	Recommended value is 2 mg/L or more when measured in the upper part of SMU

Important

MLSS in Membrane Tank shall be 5,000 mg/L or more

If MLSS in Membrane Tank decrease to less than 2,000 mg/L, add the seed sludge so that the MLSS in Membrane Tank exceeds 3,000 mg/L (preferably 5,000 mg/L or more). Operation in MLSS less than 3,000 mg/L causes membrane fouling.

Important

Operate with stable sludge condition

Even within the usage conditions of SMU, do not make rapid variation of flow or load in temperature, pH, and pressure. It may deteriorate sludge quality or reduce activity of the sludge, resulting in membrane fouling.

DRAFT

10.9 Control of Foaming

When using antifoaming chemical for controlling foam in Membrane Tank, note the following points:

- Use alcohol based antifoaming chemical. Silicone based antifoaming chemical may cause a membrane fouling. Our recommended product is Disfoam CC-118 made by NOF Corporation.
- Excess use of antifoaming chemical can be accumulated on the membrane surfaces and deteriorate the filtration performance. Use required-minimum quantity of antifoaming agent.
- Do not feed chemicals that makes adverse effect to activated sludge, poison, and a lot of oil. They decrease filterability of activated sludge and cause membrane fouling.

10.10 Influent Quality Management

Influent containing corrosive chemicals such as Ferric Chloride causes membrane fouling and corrosion in materials of stainless steel.

For example, if returning the dewaterer filtrate to Membrane Tank (Biological treatment), pay attention to the concentration of the remaining coagulants.

Caution	**Do not use chemicals stimulating corrosion of stainless steel materials.** Corrosive chemicals such as ferric chloride may cause corrosion of stainless steel materials of SMU or optional parts. It may cause dropping accident due to lack of strength.

10.11 Countermeasures against Calcium Problem

(a) Effect of Calcium Ion

If the raw water contains a significant content of calcium, the calcium ion precipitates as crystals of calcium carbonate. Since its solubility is quite low (15mg/L at 25 degree C), when operated near saturation, it will crystallize in a short time by change in operational conditions and deteriorate filtration performance.

If the calcium carbonate precipitates in the biological reaction tank, always remove calcium in pretreatment equipment.

(b) Operation Management Index

In wastewater treatment, the following changes in operational conditions are likely to cause crystallization.

- Rise in pH (addition of alkaline or increase in nitrogen removal rate)
- Rise in temperature
- Rise in filtration pressure

In addition, probability of calcium carbonate precipitation is estimated by the following value:

- Difference between “Alkalinity of sludge in Membrane Tank” and “Alkalinity of Permeate”

The longer this difference is, the longer the probability of calcium carbonate precipitation is. Periodic measurement of alkalinity is helpful to estimate precipitation of calcium carbonate.

DRAFT

(c) Chemical Cleaning

If the calcium carbonate is precipitated in the bioreactor tank, conduct chemical cleaning with citric or hydrochloric acid. If using oxalic acid, calcium oxalate will be precipitated. It will make the chemical cleaning be more difficult. Refer to "【Outline of In-Situ Chemical Cleaning】" for the details of chemical cleaning procedure.

Important	**Keep the calcium concentration low** Install calcium removal process (coagulation and settling, etc.), if calcium concentration is high. Raw water with high calcium concentration makes calcium precipitation (e.g. Calcium Carbonate), causing membrane fouling or membrane break due to the precipitated calcium.

DRAFT

【1 mm mesh CSS test】

The 1 mm mesh CSS test is used for checking amount of debris larger than 1 mm mesh in mixed liquor.

■ Measurement Procedure

(1) Prepare following apparatus
- Test sieve (JIS Z8801, aperture size 1 mm and wire diameter 0.56 mm)
- 25L bucket
- Beaker with handle
- Evaporating dish
- Drying oven (105 [deg. C])
- Analytical balance

(2) Sample 20 [L] of mixed liquor from membrane tank.
(3) Stir the sampled mixed liquor and pour it into the test sieve little by little using the beaker.
(4) Wash the surface of the sieve by tap water and filter mixed liquor (brown liquid) out of the sieve. Do not rub the surface of the sieve by hand.
(5) Repeat the above procedure #3 through #4 until a ball of the debris becomes around 40 [mm] diameter. The maximum amount of mixed liquor poured into the sieve should be 20 [L]. The amount of poured mixed liquor should be recorded.
(6) Measure weight of dry evaporating dish. Transfer the ball of the debris from the sieve to the evaporating dish and bake it in the oven at 105 [deg.C] overnight (more than 8 hours).
(7) After baking, transfer the dish and debris to desiccator for cooling down. Then measure total weight of the dish and debris. Calculate debris content in the mixed liquor using below equation.

$$\text{Debris content in the mixed liquor (mg/L)} = \frac{\text{Weight of deried dish and debris (mg)} - \text{Weight of dish (mg)}}{\text{Poured mixed liquor(L)}}$$

Fig. 10-1 1mm Test Sieve and Collected Debris

DRAFT

【Diffuser Blow-down】

(a) Purpose for the Blow-down

Purpose for Blow-down is to restrict the increase of Diffuser Air Pressure due to the substances adhering on the Diffuser Rubber such as slime.

(b) Procedure of the Blow-down

(1) Suspend Filtration

Because the membrane scouring effect is reduced during the Blow-down, suspend filtration.

- Turn off the permeate pump in suction filtration.
- Close the permeate valve in gravity filtration.

(2) Suspend the Air Flow to Membranes

Stop the air flow to the SMU(s). By this suspension of air flow to the SMUs, the inner pressure of the Diffuser decreases and the Diffuser Rubber shrinks. This shrinking action stimulates the removal of slime or other substances adhering on the Diffuser.

- Stop the Membrane Blower in the single train system.
- Suspend the air flow by closing the valve in the air header to the target train with the Membrane Blower running in the multiple train system.
- Before the execution, the procedure should be reviewed so as not to apply excessive load or pressure to the Membrane Blower or Air Piping.
- When closing the air supply valve to the target train with the Membrane Blower running, take countermeasure such as decreased flow rate of Membrane Blower so that the air supply rate to other trains will not exceed the maximum allowable rate of the Unit.

(3) Resuming after the Blow-down

Resume the air supply to the Diffuser where the Blow-down was conducted.

- Restart the suspended Membrane Blower or open the closed air header valve to the target train for resuming the air supply to the Diffuser.
- Because the specified rate of air flow cannot be sent stably immediately after the restart of air supply, filtration should be restarted about one minute after the air supply restarts.

(c) Blow-down Duration

- Blow-down time should be one minute or more. During the Blow-down, check if the Diffuser Air Pressure falls down to the static pressure corresponding to the water depth of the Diffuser.
- If the Diffuser Air Pressure cannot fall down to the static pressure of the Diffuser, extend the time of Blow-down.

(d) Blow-down Frequency

- The frequency of the Blow-down is recommended to be once a day at least.
- If the effect of the Blow-down was not been found, increase the frequency as needed.

DRAFT

【Paper Filtration Test Method】

The paper filtration test method is used to get an indicator to determine the filterability of activated sludge or mixed liquor.
Low filterability of activated sludge is one reason of low permeability of SMU. If decrease in filterability is found by this test, not only chemical cleaning to increase permeability of SMU but also increase in filterability by recovery of activated sludge status is required. The way to increase the filterability of the activated sludge includes change of MLSS concentration, improvement of biological treatment, and addition of coagulant.

Measure the filterability of activated sludge by the following procedure:

(1) Prepare the following apparatus:
- One piece of No. 5C filter paper with 185 mm diameter made by Toyo Roshi Co., Ltd. (equivalent to Type 5C specified in JIS P 3801)
- One 100 mL sample bottles
- Two 50 mL graduated cylinders
- One funnel
- One stop watch or clock

(2) Folds a filter paper into a cone shape as shown in the “Fig. 10-2”. The folded filter paper should have 16 equal partitions if folded properly.
(3) Set the folded filter paper into a funnel.
(4) Set the funnel into a graduated cylinder.
(5) Collect activated sludge to be tested into another 50 mL graduated cylinder from MBR Tank.
(6) Pour 50 mL of the collected activated sludge onto the filter paper in the funnel. After one droplet drops to the cylinder, start measuring the filtration time.
(7) After 5 minutes, remove the filter paper and funnel from the graduated cylinder.
(8) Measure the amount of the filtrate collected and record the value.

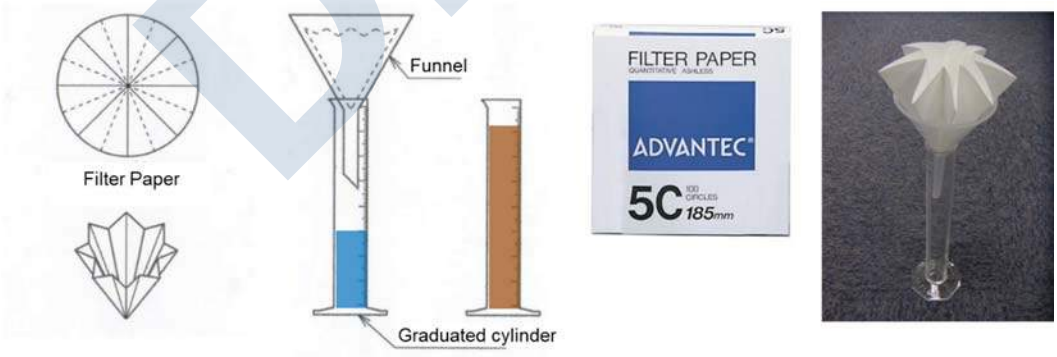

Fig. 10-2 Paper Filtration Test Method

Filtrate contains organic compounds which are eluted from the filter paper. Note that the TOC concentration of the filtrate may be higher than actual TOC which is contained in the liquid phase of the mixed liquor.

DRAFT

11. Maintenance

11.1 Cleaning of Membrane Module

In-Situ Chemical Cleaning or other cleanings are essential to keep permeability of the SMU. Conduct proper type of cleaning at proper timing.

11.1.1 In-Situ Chemical Cleaning of Membrane Modules

In-Situ Chemical Cleaning is a method feeding chemicals into Membrane Modules to clean membranes from inside. It can clean the SMU without lifting SMU out of the tank nor draining the tank.

(1) When Filtration Pressure increases by 5 to 10 kPa from the initial value, it is recommended to perform an in-situ chemical cleaning of the Membrane Modules.

(2) Even if no Filtration Pressure increase is found, it is important to perform a periodic in-situ chemical cleaning of the Membrane Modules at least once a half-year in order to keep stable operation.

For chemical cleaning procedure, see “【Outline of In-Situ Chemical Cleaning】”.

11.1.2 Ex-Situ Cleaning

Lift up the SMU to check and inspect in the following cases. If required, wash the membrane surface with water.

- Filtration pressure did not recover after the chemical cleaning.
- The gaps between membranes are clogged with sludge.

For drawing out the Membrane Modules, see “13 Replacement of Membrane Modules”.

11.2 Periodical Inspection

A Supplier’s periodical inspection every three years is recommended (The inspection service will be charged).

Please conduct Customer’s check and maintenance in addition to the Supplier’s periodical inspection.

- Please make sure that there is no crack, distortion, bend, corrosion or other abnormalities on any part of Membrane Blocks (especially, bolting points with Diffuser Block), Diffuser Blocks, and the Lifting Tools.

If using these parts in corrosive environment, increase the inspection frequency. If corrosion is found in any parts, replace them immediately.

Caution	**Immediately replace the SMU or parts with abnormality** If any abnormality in parts or SMU such as cracks or corrosion is found upon inspection, replace the parts or SMU as soon as possible. Continuous usage of them will cause an accident.

Caution	**Wear adequate gloves such as cotton work gloves during work.** Working with bare hands may result in unexpected injuries.

DRAFT

11.3 Replacement Parts

SMU has parts to be replaced depending on usage conditions.

11.3.1 Frequency of Replacement

- Membrane Module: 3 ~7 years (vary with usage condition)
- Diffuser Rubber: 3 ~ 7 years (vary with usage condition)

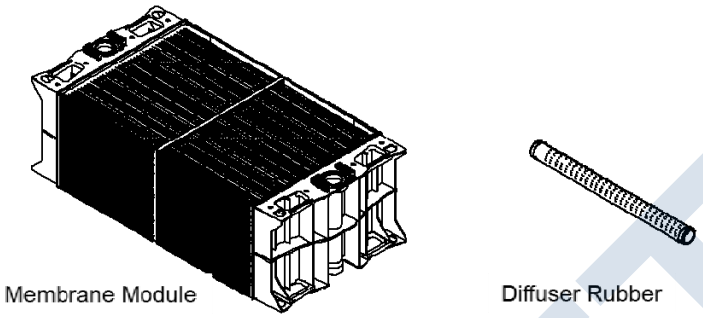

Fig. 11-1 Replacement Parts

Although other parts are not included in the Periodical Replacement Parts, they require replacement depending on usage conditions; for example, if O-Rings (see “17.1 Membrane Block”) are found to be worn at the periodical inspection, it is recommended to replace them.

11.3.2 Storage Instructions for Replacement Parts

For storage of the replacement parts, follow the instructions below. If the parts become deformed and/or change in quality, normal operation cannot be performed.

- Prevent the parts from exposure to direct sunlight and water. Store them indoors with temperature between 5 and 40 degree C.
- Replacements of Membrane Module are shipped in reinforced cardboard boxes. When storing the boxes, take care not to put them in a standing manner but stack them flat on a level and flat surface.
- Replacements of Diffuser Rubber are shipped as packages of one or multiple pieces. In their storage, flatly stack them on a flat floor.
- The stacking limit of the boxes by number is described in the pictorial marking on the box.
- Take protection measures against wetting and tumbling down by using protection sheet and reinforcement material.

Prohibited	**Never leave the replacement parts outdoors.** Never leave out replacement parts where they are exposed to sunlight or high temperature. This condition changes the shape or quality of the replacement parts and it disables proper operation.

Prohibited	**Do not wet the Membrane Modules before use.** Do not wet the Membrane Modules before use. When wet Membrane Modules becomes dry, their filterability decreases significantly.

DRAFT

【Outline of In-Situ Chemical Cleaning】

(1) Chemical Type and Amount

- Sodium Hypochlorite
  Organic fouling of the membrane micro-pores can be cleaned by using a dilute solution of bleach (sodium hypochlorite / NaClO). When the sludge concentration exceeds 10,000 mg/L, use solution of 0.6% or less. When sludge concentration is 10,000 mg/L or less, use solution of 0.3 % or less.
- Oxalic Acid
  Inorganic fouling (Iron, Aluminum, and/or others) of the membrane micro-pores can be cleaned by oxalic acid. Prepare oxalic acid solution of 1.0% or less. **If calcium concentration in the Membrane Tank is high, NEVER use oxalic acid. Hydrochloric acid or citric acid (1.0% or less) should be utilized.**
- Required chemical volume as diluted solution are shown in Table 11-1. Prepare the required volume of chemical considering the piping volume from chemical tank to SMU.

Table 11-1 Standard Volume of Chemical Solution and Feed Rate of One Membrane Unit

Model	Standard Volume [L]	Standard Feed Rate [L/min]
SP200 SP225-A	800	60 ~ 80
SP300 SP337-A	1,200	90 ~ 120
SP400 SP450-A	1,600	120 ~ 160
SP600 SP675-A	2,400 (1,200 for Upper, 1,200 for Lower)	180 ~ 240*1
SP800 SP900-A	3,200 (1,600 for Upper, 1,600 for Lower)	240 ~ 320*1

*1 In the case of SP600 / 800 / 675-A / 900-A, chemical feed to Upper Membrane Block and Lower Membrane Block should be carried out separately.
Standard volume of chemical and standard feed rate per **one Membrane Block of the SP600 / 675-A** will be same as those of SP300 / 337-A.
Standard volume of chemical and standard feed rate per **one Membrane Block of the SP800 / 900-A** will be same as those of SP400 / 450-A

Danger

Never mix sodium hypochlorite and acid
In the Chemical Cleaning, never mix sodium hypochlorite and acids such as oxalic, hydrochloric and citric acid. Doing so will produce toxic chlorine gas, which may cause severe accident.

Caution

Wear protective equipment before using chemicals
Before using chemicals, carefully read the Material Safety Data Sheet (SDS), and wear protective equipment such as masks, goggles, gloves, etc. Misuse of them may result in physical accident.

DRAFT

(2) Stop both filtration and aeration to SMUs.

- Stop filtration and aeration of SMU to be chemically cleaned.

(3) Chemical Feeding

- Feed the chemical by in-line method at a standard feed rate (see Table 11-1) from the Permeate Headers.
- **Be careful to prevent air entering into the Membrane Unit.** Involved air may make airlock which causes uneven feed rate among the Membrane Units.
- Do not aerate during the chemical cleaning.

(4) Inner Pressure of SMU

- **Design the piping configuration and feed system such that the chemical feed pressure will not exceed 10 [kPa] in the chemical cleaning (e.g. a feed system where the Chemical Feed Pump automatically stops when the chemical feed pressure reaches 10 [kPa]).**
- **Even when the standard volume cannot be fed, DO NOT try to push in the chemical.**

(5) Release of Reaction Gas

- The chemical reaction generates gas in SMU. The reaction gas has to be released because it raises the inner pressure in the SMU. When the chemical feeding process finishes, open the Air Relief Valve installed in the Permeate Header.
- Especially, when cleaning calcium carbonate fouling (caused by treating Calcium-rich wastewater) by acid, a careful attention should be paid because the chemical reaction would generate carbon dioxide gas, which may cause a sudden pressure rise.

(6) Soaking Time

- After feed, keep them still for one or two hours. As a guide, it takes approximately 2 hours for cleaning organic fouling, and 1 hour for cleaning inorganic fouling.
- Keep the air vent valve open because the reaction gas is generated even while the reaction.

(7) Resumption of Operation after Chemical Cleaning

- Just after restarting filtration, return more than twice volume of permeate compared to fed volume of chemical to the head of the plant where impact of the waste chemical to activated sludge can be mitigated as much as possible (usually to equalization tank or anoxic/denitrification tank).
- When using sodium hypochlorite, resume normal operation and start to discharge the permeate after the residual chlorine concentration in the permeate becomes less than the concentration that does not become a problem when the permeate is discharged to environment.
- When using acid, please neutralize waste chemical solution and MBR Tank, if necessary. After confirming that pH in all tanks is in normal range, restart the normal operation.

Because the chemical solution flows back slowly from the permeate side to activated sludge side by low pressure, it is more effective to clean the membrane before it is fully fouled, or during the period when increase in filtration pressure is still small since the operation has just started.
Never lift the SMU without conducting filtration for at least 30 minutes after the end of chemical cleaning. If a SMU is lifted up right after the chemical cleaning has finished, accidents due to chemical trickle and/or damage in Membrane Modules may occur.

DRAFT

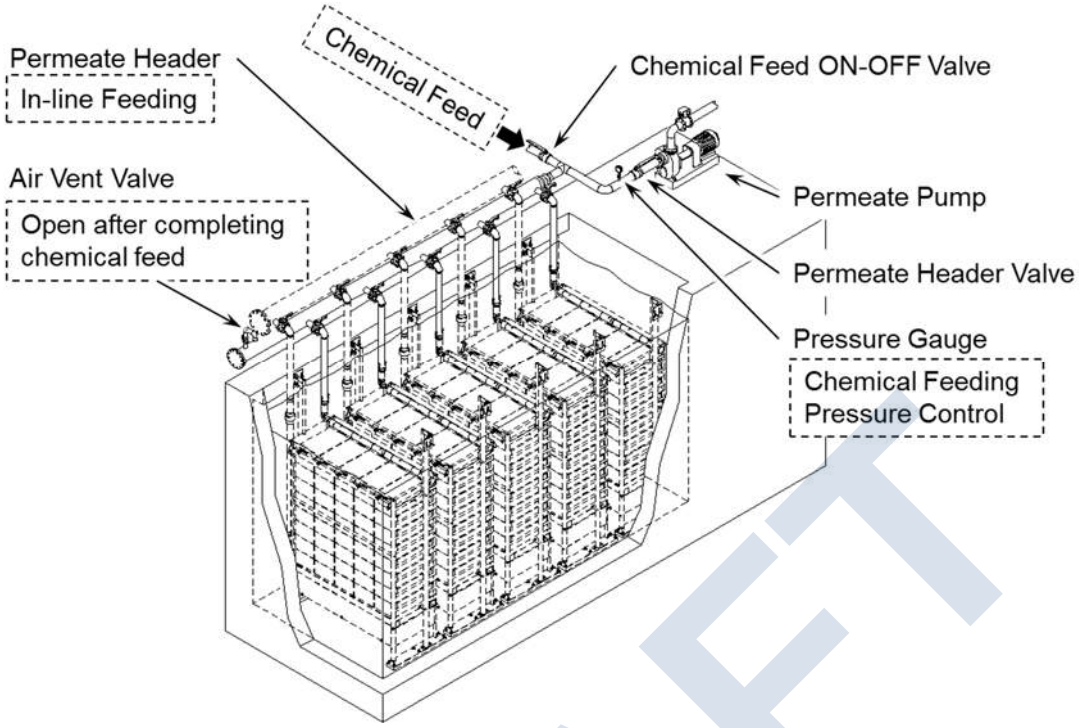

Fig. 11-2 Roles of Piping in Chemical Feed

DRAFT

12. Lifting up and reinstallation of SMU

In this section, procedures to lift and install SMU which is installed in membrane tank and submerged under water or mixed liquor out of the tank are described.

- Use the optional Unit Lifting Tool to lift and reinstall the Membrane Units. **For more information about how to use the Unit Lifting Tool, see "Lifting Tool Instruction Manual".**
- For SP200/300/400/225-A/337-A/450-A, the Membrane Block and the Diffuser Block should be combined during lifting and reinstallation.
- For SP600/800/675-A/900-A, the Lower Membrane Block and the Diffuser Block should be combined during lifting and reinstalled, although the Upper Membrane Block should be dealt singly. The same procedure described in this article can be applied to the Upper Membrane Block.
- This procedure is developed on condition that the SMU is installed with using Guide Set recommended by KUBOTA (see "15 Guide Set"). Since the accuracy of installation location of the Guide Set is important in this procedure, verify whether the accuracy is sufficient before commissioning of the plant.

Danger	**Keep safe working environment in tanks** When working in a tank, keep the working environment safe by measuring the required items including oxygen and hydrogen sulfide in observance of local regulations/standards of each country/region. Failure to follow the procedure could result in a fatal accident such as anoxia.

Warning	**Take safety measures to prevent falling accident** Ensure the safety of workers by installing handrails, scaffolding and safety equipment to prevent a fall accident. Pay particular attention near the tank opening because the floor may be slippery by wetness. Poor safety measures may result in fatal accident.

Warning	**Never go beneath a lifted Membrane Block, Diffuser Block, Membrane Unit, or Membrane Module** If they fall down, fatal accident may occur.

Caution	**Before using Lifting Tool, make sure that they have no abnormality** Before using Lifting Tools supporting load, check if crack, corrosion, rust, abrasion, and deformation. And also, check the Slings of the KUBOTA's Lifting Tool for abnormalities such as a cut, abrasion, scratch, broken stitch, discoloration, coloration, fusion, and melting. Immediately replace the tools with abnormality. Continued use of them may cause human accident by product dropping.

DRAFT

Caution	**Conduct the lifting work by two or more persons.** If the crane or chain block operator alone conducts all the work, his risk prediction ability will significantly decrease due to increased blind spots.

Caution	**Do not place any part of your body between a Lifting Tool and a Membrane Block.** Do not place any part of your body, such as a hand or a head, between a Lifting Tool and a Membrane Block. It may cause a fatal accident under unsafe operation or during an unexpected drop accident.

Caution	**Be sure to check that there are no slacks of Shackles and Eyebolts.** If the Shackles or Eyebolts come off, the product will drop down and result in fatal accident or damage on the surrounding equipment.

Caution	**Lifting Tools should be used by four point lifting** When lifting up a Membrane Block or Membrane Unit, always hang it at four points. If lifted at three or two points, it may drop or swing and result in a fatal accident.

Caution	**Lift Membrane Block or Membrane Unit straight up and quietly using a Lifting Tool** When lifting it out of the tank, lift it straight up slowly and safely. If it swings, physical injuries and/or damage on surrounding equipment may occur.

Caution	**Never lift a Membrane Block or Membrane Unit containing chemical solution or water in its Membrane Modules.** Spillage of the contained solution or damage of the Membrane Modules may cause physical injury or damage to equipment.

Caution	**Wear adequate gloves such as cotton work gloves during work.** Working with bare hands may result in unexpected injuries.

Important	**Use the specified Lifting Tool to lift up the Membrane Block or Membrane Unit.** It can lift up the Membrane Block or Membrane Unit without too much load.

Important	**Before lifting up a Membrane Block or Membrane Unit, remove connection pipes and Stabilizer.** If connection pipes or Stabilizer are not removed, pipes and/or Membrane Unit may be broken.

DRAFT

Important	**Do not damage the Manifold and Diffusers** Take care not to damage the Manifold and Diffusers during the lifting work of SMU. If damaged, they cannot be used and should be replaced. Pay attention not to apply the load of Permeate Piping/Air Piping to Manifold/Diffuser in order to prevent Manifold/Diffuser break.

12.1 Lifting up of SMU

(1) Ensure safety of the components to which loads are imposed before use. Make sure that they are free from abnormality such as crack, corrosion, rust, abrasion, or wear before use.
(2) Detach Unit Slings and Stoppers from Unit Lifting Tool. **Please do not use the Unit Sling for lifting a wet or clogged Membrane Unit.**
(3) Attach Hangers to "Catch" position of the Unit Lifting Tool and hang them down.
(4) Lift the Unit Lifting Tool up by crane.
(5) Move the Unit Lifting Tool to right above the SMU which is to be lifted up
(6) Disconnect piping around the SMU from headers.
(7) Remove Stabilizers. SMU may be floated in rare cases because of gas trapped in the SMU.
(8) After checking that the Hangers are hanged down, lower the Unit Lifting Tool slowly toward the water/mixed liquor while letting Guide Piece of the Unit Lifting Tool run along Guide Pole (see Fig. 12-1). Be sure to locate hook of the Crane at center of the SMU before lowering the Unit Lifting Tool.

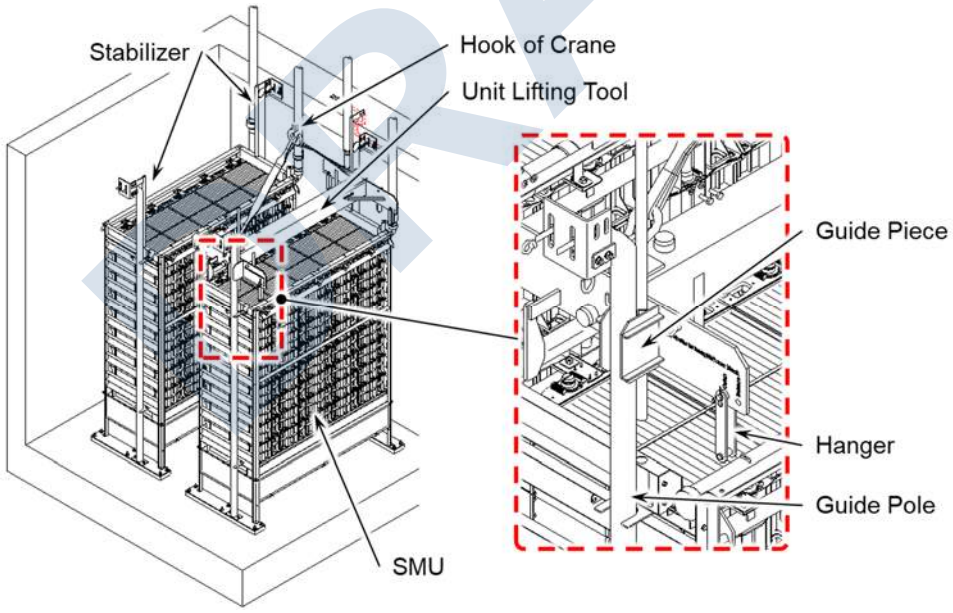

Fig. 12-1 How to Lower the Unit Lifting Tool

(9) Make sure that wire tension of the Crane is lowered when the Unit Lifting Tool arrives at top of the SMU. Then slowly lift up the Unit Lifting Tool. If it is found that abnormal load is applied to the crane, stop the lifting work immediately and carry out an inspection to find the cause by lowering water level of the tank.

DRAFT

(10) When top portion of the SMU appears above water surface, suspend the lifting work temporarily, and verify whether all four (4) Hangers attach to Hooks (4 pcs) of the SMU. Then, resume the lifting work. If the Hangers are not at right position, lower the SMU back to the initial position, and carry out an inspection by lowering water level.
(11) When SMU is completely above the water surface, attach Stoppers to the SMU (see Fig. 12-2).
(12) If Riser Pipe of Air/Permeate Piping can be disconnected at Union or Lever Coupling, disconnect them at this time (see Fig. 12-2).

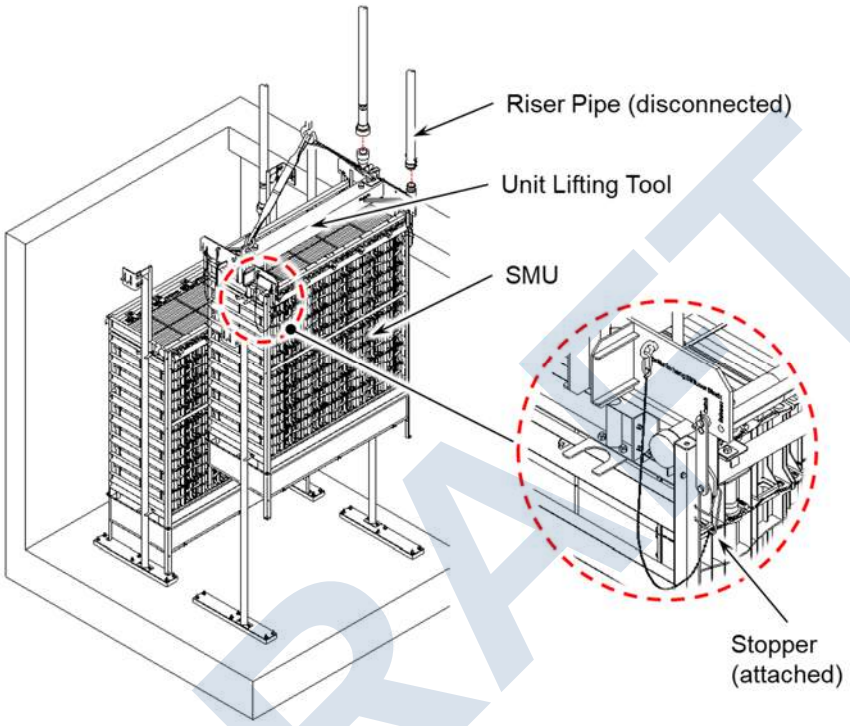

Fig. 12-2 How to Lift up the SMU

(13) Continue the lifting work till the SMU is completely out of the Guide Pole.
(14) Place the SMU onto the flat surface and leave the Unit Lifting Tool on top of the SMU.
(15) Detach Stopper from the Membrane Block.
(16) Flip Hangers up and detach the Unit Lifting Tool from the SMU.

In the lifting work right after the In-Situ Chemical Cleaning, to prevent an injury by dripping chemical or Membrane Module damage, the fed chemicals must be drained before starting the lifting work. To drain the chemical, never forget to restart the operation and filter more than twice volume of fed chemical after performing the In-Situ Chemical Cleaning.

DRAFT

12.2 Re-installation of SMU

(1) Ensure safety of the components to which loads are imposed before use. Make sure that they are free from abnormality such as crack, corrosion, rust, abrasion, or wear before use.
(2) Detach Unit Slings from Unit Lifting Tool. **Please do not use the Unit Sling for lifting a wet or clogged Membrane Unit.**
(3) Attach Hangers to "Release" position of the Unit Lifting Tool and flip them up.
(4) Fill the Unit Lifting Tool with water.
(5) Lift the Unit Lifting Tool up by crane.
(6) Slowly lower the Unit Lifting Tool onto top of the SMU while adjusting position of the Unit Lifting Tool so as to let four (4) Hangers be right above Hooks of the SMU.
(7) Hang down the Hangers and keep them inside of the Hooks, and then attach Stoppers (see Fig. 12-3).

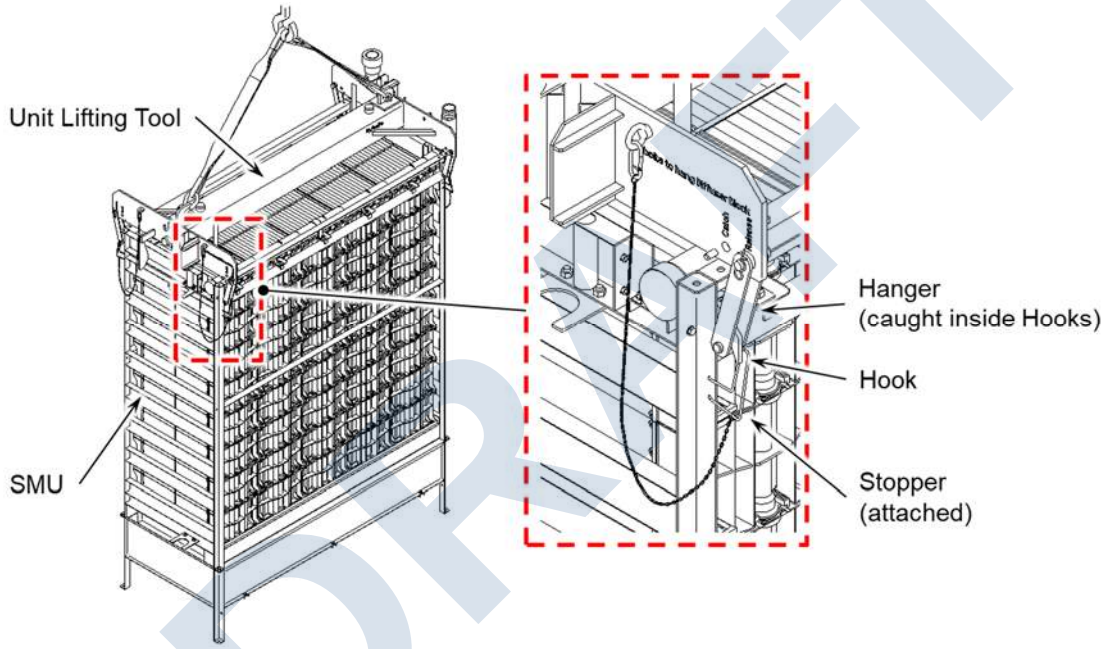

Fig. 12-3 How to connect the Unit Lifting Tool to SMU

(8) Lift the Unit Lifting Tool slowly. Make sure that all Hangers are caught inside the Hooks.
(9) Move the SMU to right above the place where the SMU is to be installed.
(10) Lower the SMU slowly while letting Guide Plates of the SMU run along Guide Poles.
(11) Suspend the lowering work when the Unit Lifting Tool is lowered enough to be reached by hand safely. Then detach Stoppers from both the SMU and the Unit Lifting Tool (see Fig. 12-4).
(12) Insert Stabilizers into hole on top of the SMU (see Fig. 12-4). **In the case of double stack SMU, insert the Stabilizers when re-installing Upper Membrane Block.**
(13) If Riser Pipes of Permeate/Air Piping were disconnected when SMU was lifted out of tank, connect them to the SMU at this time (see Fig. 12-4).

DRAFT

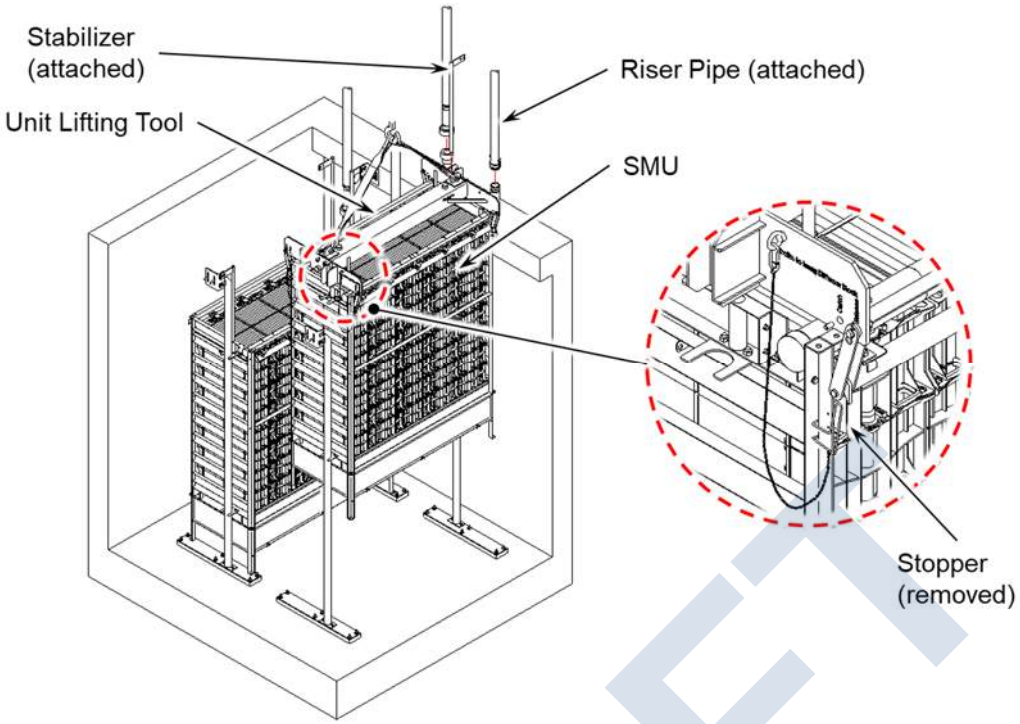

Fig. 12-4 How to re-install SMU

(14) Resume lowering the SMU and keep the lowering work till wire tension of crane is lowered when SMU arrives at installation location. Though the SMU may be forced to be floated due to gas trapped inside the SMU, leave the Unit Lifting Tool to sit on the SMU and submerge the SMU completely to bottom of tank by utilizing weight of the Unit Lifting Tool.

(15) After SMU arrives at the installation location, leave the Unit Lifting Tool on top of the SMU and fix top end of the Stabilizers to Support Brackets using bolts.

(16) Lift the Unit Lifting Tool slowly. If it is found that abnormal load is applied to the crane, stop the lifting work immediately and carry out an inspection to find the cause by lowering water level of the tank.

(17) Connect Air Piping and Permeate Piping to Headers.

(18) After completing the re-installation work, discharge water from the Unit Lifting Tool, and wash and dry the Unit Lifting Tool. Then, store the Unit Lifting Tool indoor.

In the case of double deck SMU, the Unit Lifting Tool needs to be lifted up after completing above step #(14). Lower Membrane Block and Diffuser Block may be floated up at this time, but they will be submerged again together with Upper Membrane Block later.

DRAFT

13. Replacement of Membrane Modules

Lift up a Membrane Unit from the Membrane Tank and then conduct replacement of the Membrane Module out of the tank. Procedure is as follows:

(1) Lifting up the Membrane Unit
(2) Replacement of Membrane Modules
(3) Installation of the Membrane Unit

Warning	**Take safety measures to prevent falling accident** Ensure the safety of workers by installing handrails, scaffolding and safety equipment to prevent a fall accident. Pay particular attention near the tank opening because the floor may be slippery by wetness. Poor safety measures may result in fatal accident.

Warning	**Never go beneath a lifted Membrane Unit, Membrane Block, or Membrane Module** If they fall down, fatal accident may occur.

Caution	**Before using Lifting Tool, make sure that they have no abnormality** Before using Lifting Tools supporting load, check if crack, corrosion, rust, abrasion, and deformation. And also, check the Slings of the KUBOTA's Lifting Tool for abnormalities such as a cut, abrasion, scratch, broken stitch, discoloration, coloration, fusion, and melting. Immediately replace the tools with abnormality. Continued use of them may cause human accident by product dropping.

Caution	**Conduct the lifting work by two or more persons.** If the crane or chain block operator alone conducts all the work, his risk prediction ability will significantly decrease due to increased blind spots.

Caution	**Do not place any part of your body between a Lifting Tool and a Membrane Block or Membrane Module.** Do not place any part of your body, such as a hand or a head, between a Lifting Tool and a Membrane Block or Membrane module. It may cause a fatal accident under unsafe operation or during an unexpected drop accident.

Caution	**Be sure to check that there are no slacks of Shackles and Catch Rings.** If the Shackles or Catch Rings come off, the product will drop down and result in fatal accident or damage on the surrounding equipment.

DRAFT

Caution

Lift Membrane Unit, Membrane Block, or Membrane Module straight up and quietly using a Lifting Tool

When lifting it out of the tank, lift it straight up slowly and safely. If it swings, physical injuries and/or damage on surrounding equipment may occur.

Caution

Lifting Tools should be used by four point lifting

When lifting up a Membrane Unit, Membrane Block, or Membrane Modules, always hang it at four points. If lifted at three or two points, it may drop or swing and result in a fatal accident.

Caution

Wear adequate gloves such as cotton work gloves during work.

Working with bare hands may result in unexpected injuries.

Important

Use the specified Lifting Tool to lift up the Membrane Unit, Membrane Block, or Membrane Module.

It can lift up the Membrane Unit, Membrane Block, or Membrane Modules without too much load.

Important

Membrane Modules should be put temporarily on a flat and smooth place.

Check that the temporal space to put the Membrane Modules is flat and smooth without protrusion or litter. If the membrane sheet get broken by protrusion, litter, or stone, it cannot be used.

Important

Be careful not to mistake the position of the top and bottom Membrane Module in the Membrane Block.

Top and bottom Membrane Module has plugs in addition to the joints. If you mistake their position, filtration cannot run normally and the Membrane Module may break.

Important

Handle the Membrane Module carefully one by one.

Take care not to admage the Membrane surface with a sharp edge and hard matters. The whole Membrane Module cannot be used and must be replaced with a new one if membrane is damaged.

DRAFT

13.1 Lifting up of SMU

When replacing Membrane Modules, take the SMUs out of the tank before the replacement work, according to "12.1 Lifting up of SMU". Choose a flat and smooth ground for temporary work space to prevent damage on Membrane Modules.

13.2 Pulling out of Membrane Modules

Pull the Membrane Modules out of the Membrane Block according to the following procedures. Always conduct the work by two people or more. **For more information about how to use the Module Lifting Tool, see "Lifting Tool Instruction Manual".**

(1) Ensure safety of the components to which loads are imposed before use. Make sure that they are free from abnormality such as crack, corrosion, rust, abrasion, or wear before use.

(2) Detach Manifold Saddle (2 pcs), Manifold Holder, Pipe Support, Manifold, and Retainer (10 pcs) (see Fig. 13-1).

(3) Reeve eyes (where hooks of Module Lifting Tool are attached) which are located at top end of four (4) Module Slings through handles of top Membrane Module in the stack which is to be pulled out.

(4) Wind top Sub-Slings around both bottom handles of top Membrane Module and top handles of Membrane Module which is underneath the top Membrane Module. Then fix the Sub-Slings with Catch Rings.

(5) Repeat the same procedure to wind Sub-Slings around the handles of two Membrane Modules as a pair which are located underneath the top two Membrane Modules and fix the Sub-Slings with corresponding Catch Rings. Note that the Module Slings should be passed through inner side of the handle of the Membrane Unit as shown in Fig. 13-2.

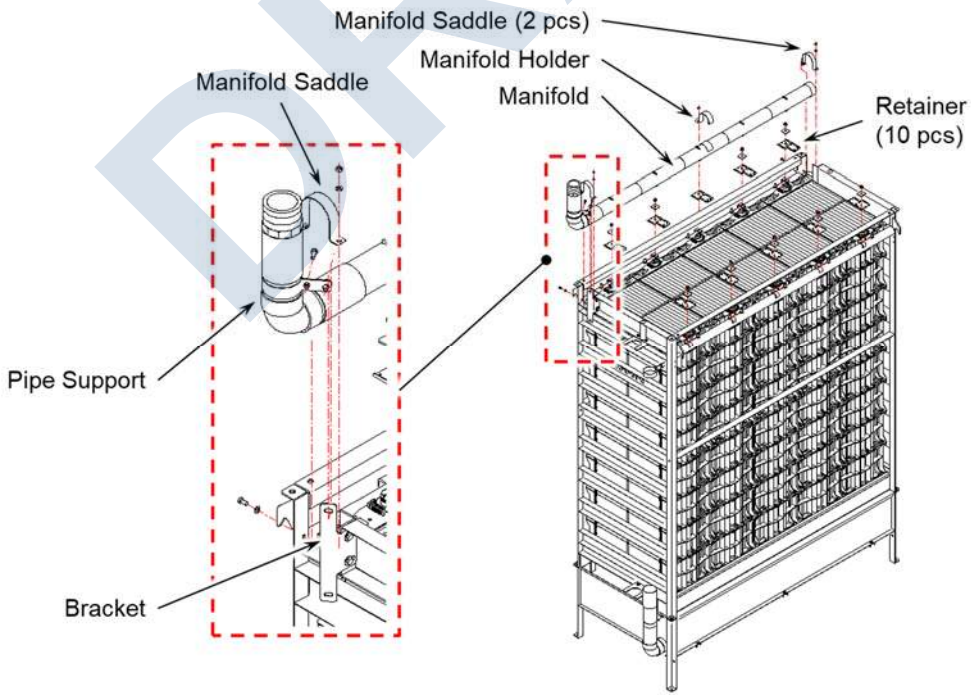

Fig. 13-1 How to disassemble SMU

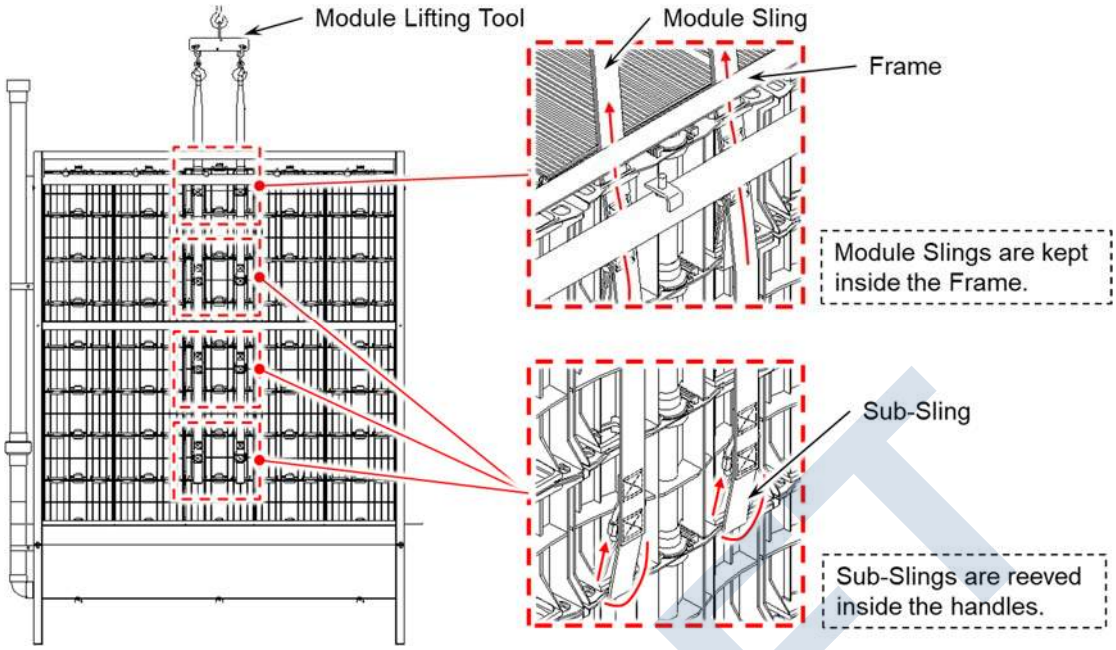
DRAFT



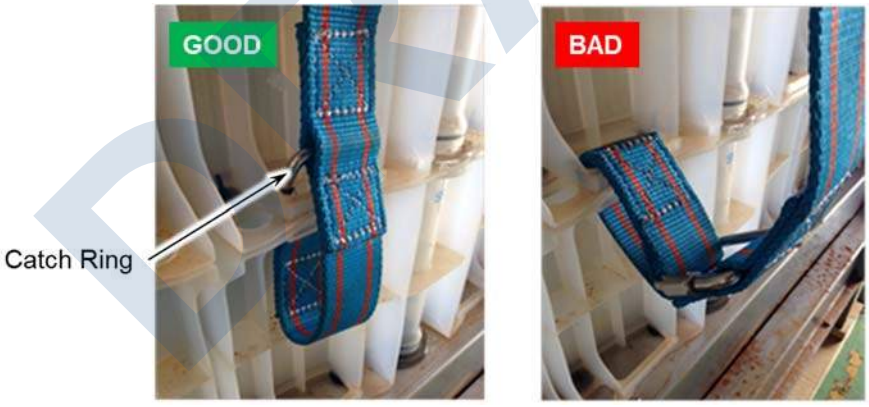


Fig. 13-2 Module Slings fixed onto the Membrane Modules to be pulled out

(6) Set the Module Sling such that the catch ring should locate the inner side of the handle before lifting (see Pic. 13-1 left). This is important for balanced lifting.

Pic. 13-1 Proper Position of Catch Ring

(7) After fixing the Module Slings, move the Module Lifting Tool to just above the Module Slings. Then attach Eyes of the Module Slings onto Hooks of Body of the Module Lifting Tool (see Fig. 13-3). Be careful that the surface of the Membrane Module shall not be touched with the Hooks of the Module Lifting Tool.

DRAFT

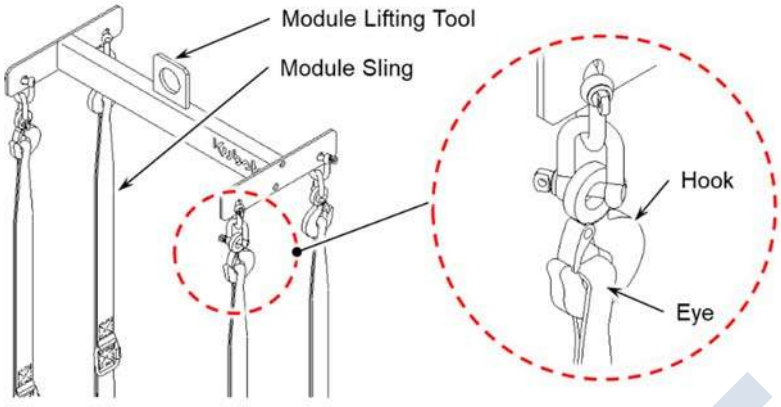

Fig. 13-3 Module Slings attached onto the Body of the Module Lifting Tool

(8) Slowly lift the Module Lifting Tool. Make sure that there is no distortion or trapping of the Catch Rings. (If there is a Catch Ring whose position is differ from others, Membrane Modules will be tilted during the lift because of inconsistency in lengths of the Sub-Slings.)

(9) Slowly place the Membrane Modules pulled out the Membrane Unit onto a flat level space. (Make sure that there is no substance such as stones which possibly damage the surface of the Membrane Module.)

(10) When stacking the separated Membrane Modules, slowly lower the Membrane Modules by two people while checking positions of two (2) joints.

(11) Maximum stackable number of Membrane Module is four because it is unstable to leave the stacked Membrane Modules on the ground. If one stack contains more than four (4) Membrane Modules, release only bottom four (4) Membrane Modules from Catch Rings and Sub-Slings.

(12) Slowly lift the rest Membrane Modules (other than the bottom four) and place them onto another flat level space.

(13) Release all Membrane Modules from the Catch Rings and the Sub-Slings and remove the eyes of the Module Slings from the Body of the Module Lifting Tool.

DRAFT

13.3 Assembly of Top-Stage Membrane Modules

Top-Stage Membrane Modules are indicated as the Membrane Modules circled in the red dashed line in Fig. 13-5. Attach the Joints, Plugs, and O-Ring P-46 on the new Membrane Module. O-rings must be securely attached. **The Membrane Module should be in standing position during this work.**

(1) Make sure every Joint has O-Ring P-34 on.

(2) Set O-Ring P-46 in the O-ring Grooves (see Fig. 13-4).

(3) Place the Joint and Plug over the O-Rings P-46 in such a way as “A” .Turn the Joint and Plug clockwise to fix in the Slits (see Fig. 13-6).

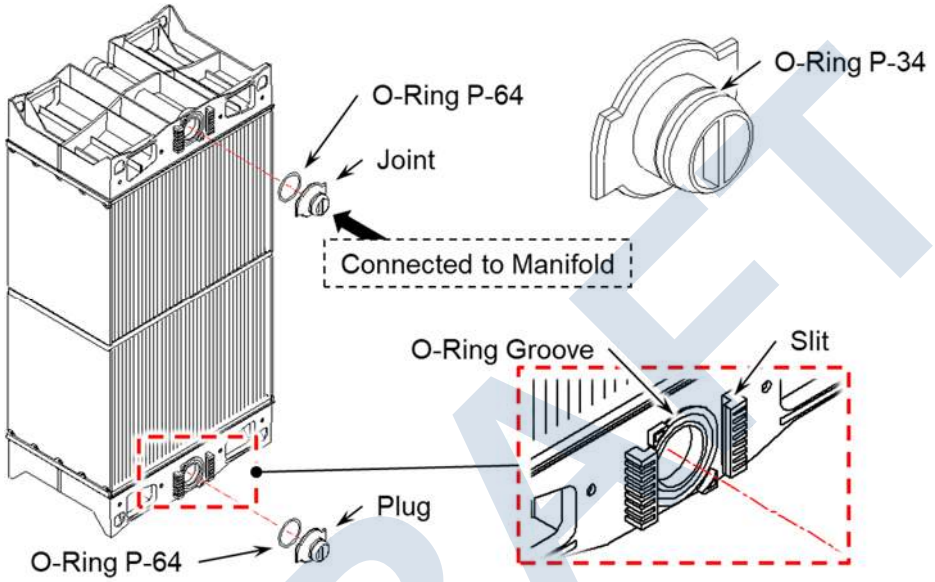

Fig. 13-4 How to Attach the Parts on a Top-Stage Membrane Module

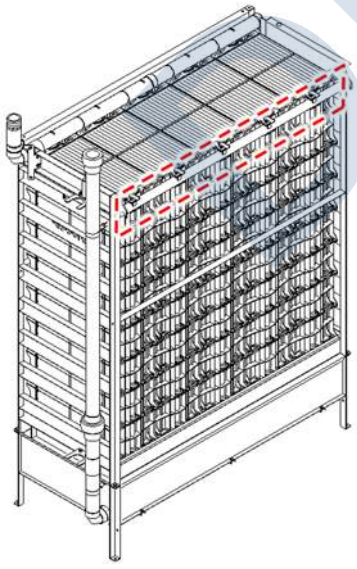

Fig. 13-5 Top-Stage Membrane Modules

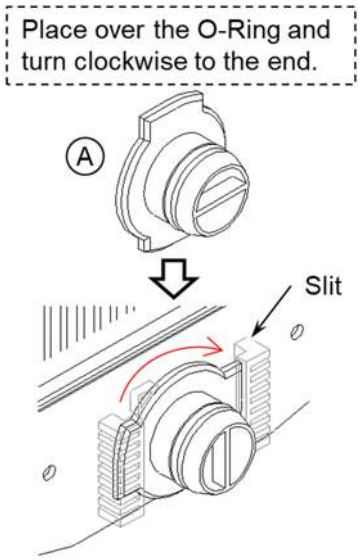

Fig. 13-6 How to fix the Plug and Joint

DRAFT

13.4 Assembly of Middle-Stage Membrane Modules

Middle-Stage Membrane Modules are indicated as the Membrane Modules circled in the red dashed line in Fig. 13-8. Attach the Joints, and O-Ring P-46 on the new Membrane Module. O-rings must be securely attached. **The Membrane Module should be in standing position during this work.**

(1) Make sure every Joint has O-Ring P-34 on.
(2) Set O-Ring P-46 in the O-ring Grooves (see Fig. 13-7).
(3) Place the Joint over the O-Rings P-46 in such a way as “A”. Turn the Joint clockwise to fix in the Slits (see Fig. 13-9).

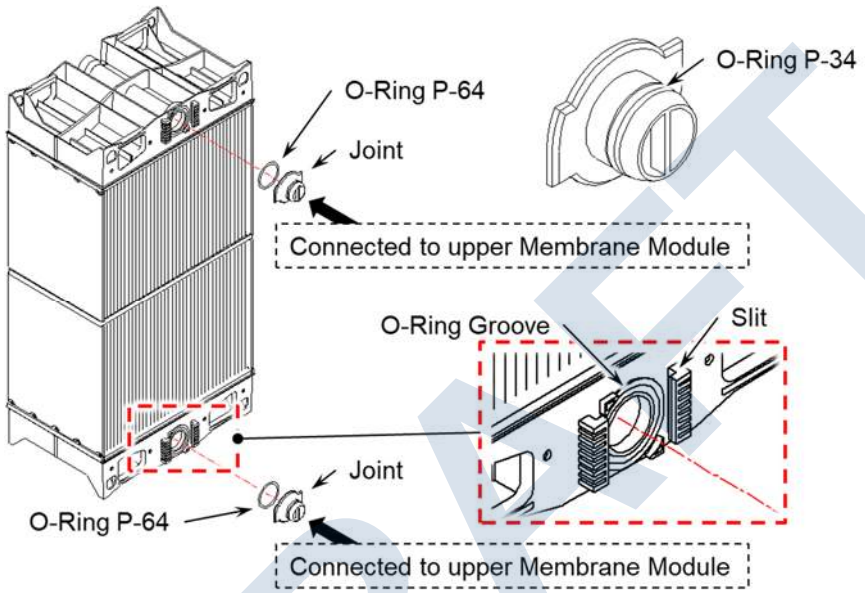

Fig. 13-7 How to Attach the Parts on a Middle-Stage Membrane Module

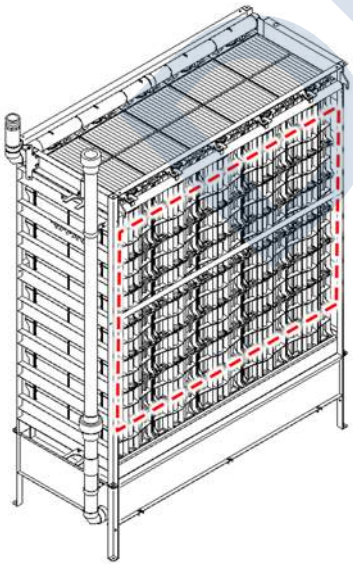

Fig. 13-8 Middle-Stage Membrane Modules

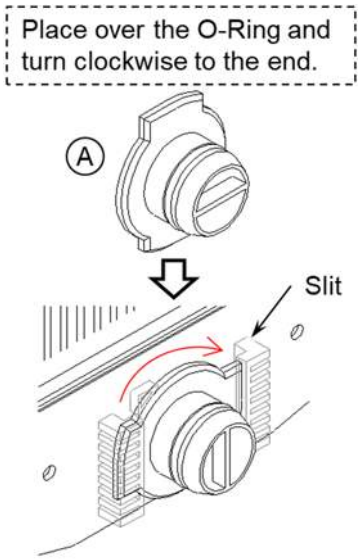

Fig. 13-9 How to Fix the Joint

DRAFT

13.5 Assembly of Bottom-Stage Membrane Modules

Bottom-stage Membrane Modules are indicated as the Membrane Modules circled in the red dashed line in Fig. 13-11. Attach the Joints, Plugs and O-Ring P-46 on the new Membrane Module. O-rings must be securely attached. **The Membrane Module should be in standing position during this work.**

(1) Make sure every Joint and Plug has O-Ring P-34 on.
(2) Set O-Ring P-46 in the O-ring grooves (see Fig. 13-10).
(3) Place the Joint over the O-Rings P-46 in such a way as “A”. Turn the Joint clockwise to fix in the Slits (see Fig. 13-12).
(4) Insert Plugs (with O-ring P-34) into bottom port of the Membrane Module (see Fig. 13-10).

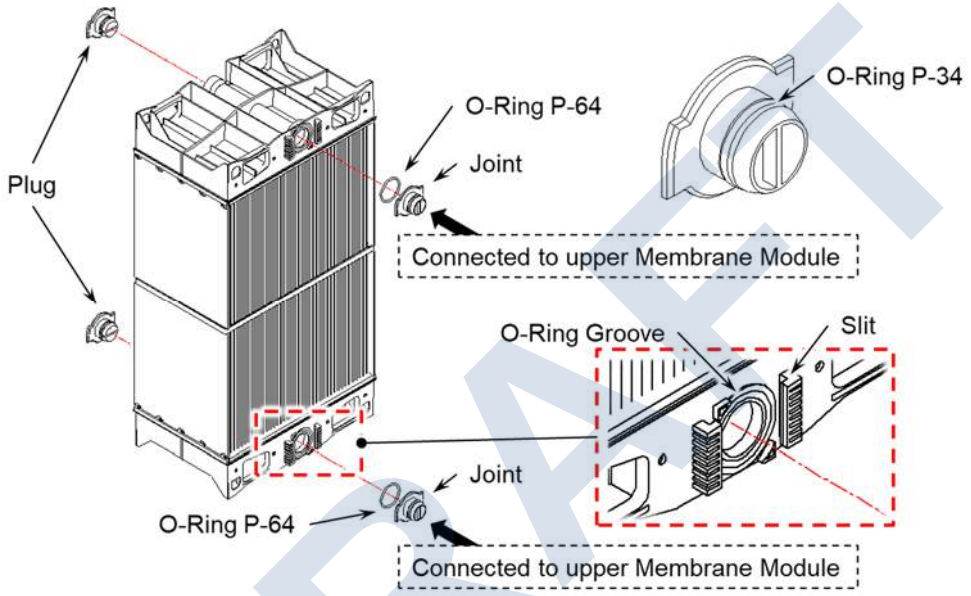

Fig. 13-10 How to Attach the Parts on a Bottom-Stage Membrane Module

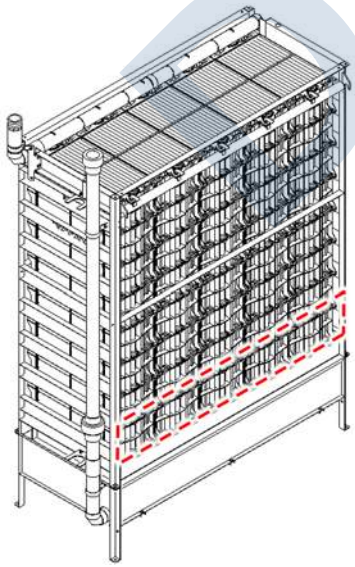

Fig. 13-11 Bottom-Stage Membrane Modules

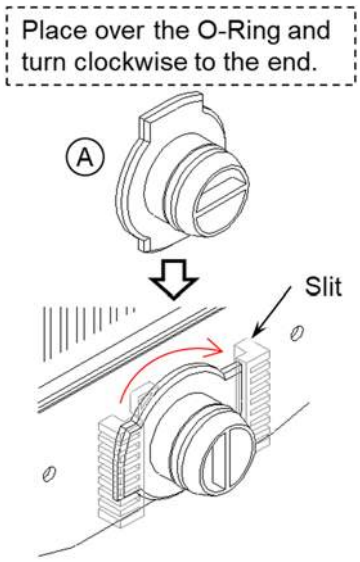

Fig. 13-12 How to Fix the Joint

DRAFT

13.6 Reload of Membrane Modules

Reload the Membrane Modules into the Membrane Block according to the following procedures. Always conduct the work by two people or more. **For more information about how to use the Module Lifting Tool, see "Lifting Tool Instruction Manual".**

(1) Ensure safety of the components to which loads are imposed before use. Make sure that they are free from abnormality such as crack, corrosion, rust, abrasion, or wear before use.
(2) Make sure that O-rings, Joints, and/or Plugs are properly fixed onto the Membrane Modules which are to be reloaded.
(3) Stack the Membrane Modules to be reloaded in the same order as they were pulled out so that misuse of Joints and Plugs will be prevented. Maximum stacks of Membrane Modules should be four (4) stacks and never stack five (5) or more Membrane Modules. When reloading more than five (5) Membrane Modules in a row, split the Membrane Modules into two (2) groups and stack them so that numbers of Membrane Modules in one group can be four (4) or less.
(4) Attach the Module Slings to Membrane Modules in the same way as they were pulled out "13.2 Pulling out of Membrane Modules". If the Membrane Modules were split to two stacks when they were pulled out, first attach the Module Slings to the Membrane Modules which are to be located on upper end, lift them up, lower them onto the Membrane Modules which are to be located on lower end, and attach the rest Sub-Slings to the Membrane Modules. Be careful not to touch the lower end of the Module Slings to Membrane Modules. When stacking the separated Membrane Modules, slowly lower the Membrane Modules by two people while checking positions of two (2) joints.
(5) Lift an entire row of the Membrane Modules and reload it into the Membrane Block. During the reload, the stack shall be slowly lowered with two persons standing at each side of the row in order to avoid interference with frame of the Membrane Unit or neighbor rows of Membrane Modules. Also, slowly lower the Membrane Modules as checking joints of the Membrane Modules are fit together when stacking two Membrane Modules together.
(6) After completing the reloading work, detach the Module Slings from both Membrane Modules and Module Lifting Tool.

13.7 Re-Assembly of SMU

Re-assemble the SMU and fix the piping according to the following procedures (see Fig. 13-1).

(1) Confirm that all the Membrane Modules are mounted in the SMU.
(2) Set the Retainers and temporarily tighten them.
(3) Place Manifold onto the Joints of the top Membrane Modules.
(4) Set Manifold Saddles, Manifold Holder and Pipe Support, and temporarily tighten them.
(5) Tighten all the Retainers. The tightening torque of the bolts (size: M12) should be 50 ~ 60 N-m.
(6) Tighten the Manifold Saddles, Manifold Holder, and Pipe Support. The tightening torque of the bolts (size: M8) should be 14 ~ 17 N-m.

DRAFT

13.8 Installation of Membrane Unit

After replacement of Membrane Modules, install the Membrane Unit to Membrane Tank. Referring to “12.2 Re-installation of SMU”, properly install the Membrane Unit.

Prohibited	**Do not operate with lack of Membrane Modules** Restart filtration with all the specified number of Membrane Modules installed. The Membrane Unit cannot be operated with lack of Membrane Module.

Important	**Submerge the Membrane Unit to allow trapped air in the Membrane Modules to escape.** Slowly submerge the Membrane Unit into the sludge or clean water to allow trapped air in the Membrane Modules to escape. If the Membrane Modules are forcedly immersed, the pressure inside the Membrane Modules would increase and may break the Membrane Sheet.

DRAFT

14. Replacement of Diffuser Rubbers

Lift up a Membrane Unit from the Membrane Tank and then conduct replacement of the Diffuser Rubbers out of the tank. Procedure is as follows:

(1) Lifting up the Membrane Unit
(2) Replacement of Diffuser Rubbers
(3) Installation of the Membrane Unit

- All Diffuser Rubbers in one SMU should be replaced at a time in order to avoid use of old ones and new ones in one SMU.
- When header piping controls the air flow rate to multiple SMUs, replace all the Diffuser Rubbers in the control range should be replaced at a time to avoid use of old and new ones in the same control range.

Warning

Take safety measures to prevent falling accident

Ensure the safety of workers by installing handrails, scaffolding and safety equipment to prevent a fall accident. Pay particular attention near the tank opening because the floor may be slippery by wetness.
Poor safety measures may result in fatal accident.

Warning

Never go beneath a lifted Membrane Block, Diffuser Block, Membrane Unit, or Membrane Module

If they fall down, fatal accident may occur.

Caution

Before using Lifting Tool, make sure that they have no abnormality

Before using Lifting Tools supporting load, check if crack, corrosion, rust, abrasion, and deformation. And also, check the Slings of the KUBOTA's Lifting Tool for abnormalities such as a cut, abrasion, scratch, broken stitch, discoloration, coloration, fusion, and melting.
Immediately replace the tools with abnormality. Continued use of them may cause human accident by product dropping.

Caution

Conduct the lifting work by two or more persons.

If the crane or chain block operator alone conducts all the work, his risk prediction ability will significantly decrease due to increased blind spots.

Caution

Do not place any part of your body between a Lifting Tool and a Membrane Block.

Do not place any part of your body, such as a hand or a head, between a Lifting Tool and a Membrane Block. It may cause a fatal accident under unsafe operation or during an unexpected drop accident.

DRAFT

Caution	**Lift a Membrane Unit or Membrane Block straight up slowly and safety by using a Lifting Tool** When lifting a Membrane Block or Diffuser Block, lift it straight up slowly and safely. If it swings, physical injuries and/or damage on surrounding equipment may occur.

Caution	**The Lifting Tools should be used by four point lifting.** When lifting up a Membrane Unit or Membrane Block, always hang it at four points. If lifted at three or two points, it may drop or swing and result in a fatal accident.

Caution	**Wear adequate gloves such as cotton work gloves during work.** Working with bare hands may result in unexpected injuries.

Important	**Use the specified Lifting Tool to lift up the Membrane Unit or Membrane Block.** It can lift up the Membrane Unit or Membrane Block without too much load.

Important	**Membrane Modules should be put temporarily on a flat and smooth place. Membrane Units should be put temporarily on a flat and smooth place.** Check that the temporal space to put the Membrane Units is flat and smooth without protrusion or litter. If the membrane sheet or Diffuser Rubber get broken by protrusion, litter, or stone, it cannot be used.

14.1 Lifting Out the SMU

Referring to “12.1 Lifting up of SMU”, lift the SMUs out of the tank before the replacement work. To prevent injury on the Diffuser Rubbers, temporary storage site should be flat and free of projection.

14.2 Separation of Diffuser Block

Divide the SMU into Membrane Block and Diffuser Block by the following procedure:

(1) Disconnect the connecting joint (union) at the rising part of air piping that was designed to separate the Membrane Block and Diffuser Block.

(2) Remove the bolts connecting the Membrane Block and Diffuser Block while the Unit Lifting Tool is attached to the Membrane Block to prevent falling of the Membrane Block.

(3) Lift up the Membrane Block with the Unit Lifting Tool.

DRAFT

14.3 Detachment and Disassembly of the Diffuser

Detach the Diffuser from the Diffuser Block and disassemble it into Diffuser Rubbers and Diffuser Headers by the following procedure:

(1) Decouple the pipe support of the Diffuser Adapter from the Diffuser Block Frame (See “Fig. 14-1 (a)”).

(2) Detach the bolts that connect the Diffuser Beam with the Diffuser Block Frame to remove the Diffuser and the Diffuser Beam from the Diffuser Block Frame (See “Fig. 14-1 (a)”).
To prevent drop of the Diffuser and the Diffuser Beam, support the whole Diffuser equipment from under with hands of two or more persons.

(3) Put the Diffuser and the Diffuser Beam on the floor slowly and move the Diffuser Block Frame to a place where it does not get in the way of the work.

(4) Detach the Diffuser Beam from the Diffuser. Be careful not to let the welded bolts on the Diffuser Beam touch the Diffuser Rubbers (See “Fig. 14-1 (b)”). For detaching the nuts between the Diffuser Rubbers, use an extension bar with the length of about 100 mm.

(5) Separate the Diffuser Headers and the Diffuser Rubbers by lightly hitting out the end of the Diffuser Header B with the Diffuser Header A fixed by the other hand. If some Diffuser Rubbers remained in the Diffuser Header, draw them out by hand to separate the Diffuser Headers and the Diffuser Rubbers completely (See “Fig. 14-1 (c)”).

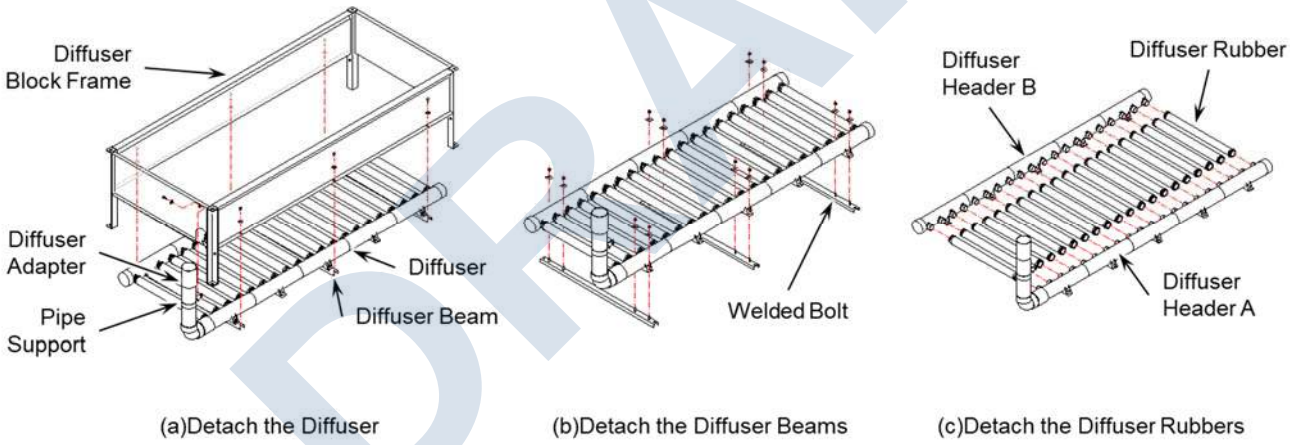

Fig. 14-1 How to Detach the Diffuser

14.4 Reassembly of Diffuser

Using new Diffuser Rubbers for replacement and the Diffuser Headers, assemble the Diffuser by the following procedure:

(1) If the connection of the Diffuser Header to the Diffuser Rubber is dirty, clean it off.

(2) Wet both ends of the Diffuser Rubber to insert the Diffuser Rubbers to the Diffuser Header smoothly.

(3) Insert the Diffuser Rubber to the Diffuser Header A with the triangle match marks on the Diffuser Rubber and the Diffuser Header fit (see “Fig. 14-2”). Go on to tap the Diffuser Rubber lightly with a larger plastic hammer until the Diffuser Rubber knock the end.

(4) After the first Diffuser Rubber is inserted, insert other Diffuser Rubbers one by one into the Diffuser

DRAFT

Header A.

(5) Rotate the Diffuser on the axis line of the Diffuser Header until it stands with the axis lines of the Diffuser Rubbers pointing vertically (see “Fig. 14-3”). Stand it slowly with hands of two persons on the center of Diffuser Rubbers not to drop the Diffuser Header or not to apply too much force to the Diffuser Header.

(6) Insert the Diffuser Header B to the Diffuser Rubber (see “Fig. 14-3”). Insert from one side in turn because it is difficult to insert all the Diffuser Rubbers at once.

(7) Tap the Tabs of the Diffuser Header lightly with a larger plastic hammer until all the Diffuser Rubbers approaches within 1mm from the Diffuser Header (see “Fig. 14-4”). Be careful for the Diffuser not to fall.

(8) Lay down the Diffuser into the usual direction.

(9) Put the Diffuser Beams under the Diffuser. Temporarily tighten the washers and nuts for temporary tightening of the Diffuser (see “Fig. 14-1 (b)”). For the temporary tightening of the nuts, use an extension bar with the length of about 100 [mm].

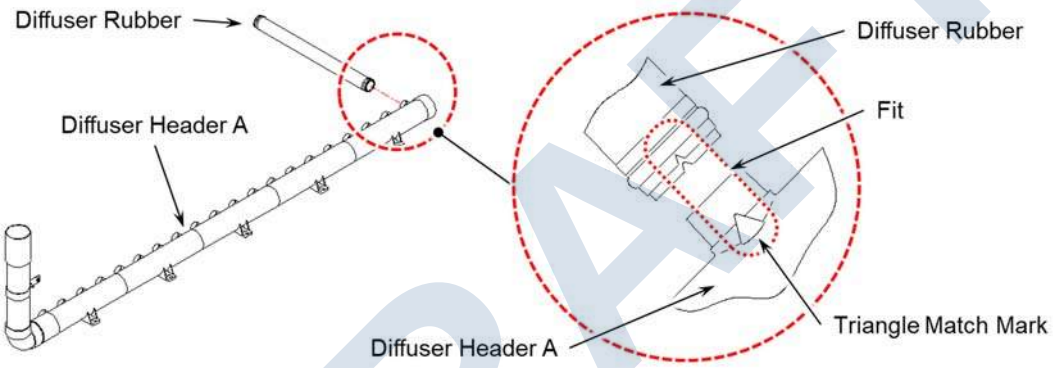

Fig. 14-2 How to Insert the Diffuser Rubber into Diffuser Header

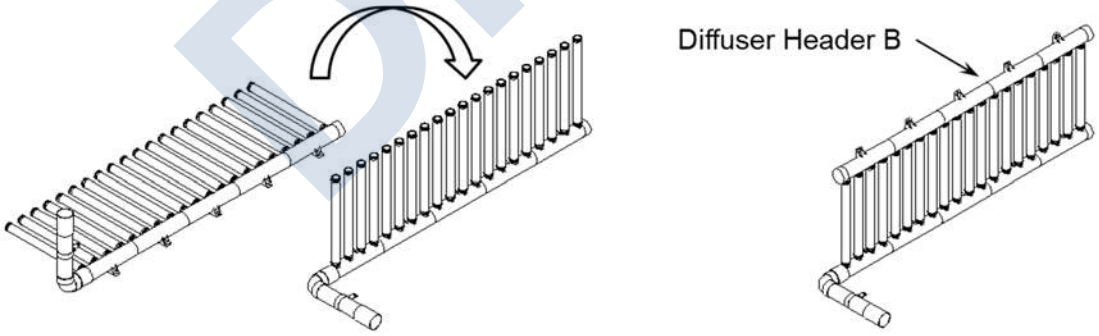

Fig. 14-3 How to Insert the Diffuser Header to Diffuser Rubbers

DRAFT

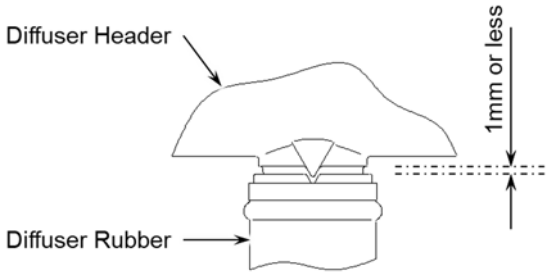

Fig. 14-4 Gap between the Diffuser Rubber and Diffuser Header

14.5 Attachment of the Diffuser to the Diffuser Block

Attach the Diffuser to the Diffuser Block by the following procedure:

(1) Place the Diffuser Block Frame on the Diffuser Beam and the Diffuser. Be careful that the legs of the Diffuser Block Frame will not hit the Diffuser.

(2) Raise the Diffuser and the Diffuser Beams by two or more persons. Temporarily fix the Diffuser Beams to the Diffuser Block Frame by bolts (see “Fig. 14-1”).

(3) Adjust the position of the Diffuser so that the gaps between the Diffuser Block Frame and the Diffuser Equipment are equal in every direction.

(4) Tighten all the nuts with the nominal diameter M8 for Diffuser, Diffuser Beams, and Pipe Support at the torque of 14~17 [N·m]. Use an extension bar with the length of about 100 [mm] to tighten the nuts when fixing the Diffuser to the Diffuser Beam.

14.6 Reassembly of the SMU

Reassemble the SMU by the following procedure:

(1) Combine the Membrane Block and the Diffuser Block by the procedure of “4.3 Assembly of SMU”.

(2) Connect the union joint in the riser part of air piping. If the center of the air piping and the union joint do not fit, adjust the position by loosening the bolt of Pipe Support and the bolts fixing the Diffuser Beams to Membrane Block Frame. After the adjustment is completed, tighten the bolts again.

14.7 Installation of Membrane Unit

After replacement of the Diffuser Rubbers, install the Membrane Unit to Membrane Tank. Referring to “12.2 Re-installation of SMU”, properly install the Membrane Unit.

DRAFT

15. Guide Set

"Guide Set" is a set of fabricated metal parts to install and keep position of SMU in a tank. Components of the Guide Set and their purposes are explained in Table 15-1.

- The Guide Set is NOT supplied by KUBOTA.
- For more information about design and fabrication condition of the Guide Set, please consult with corresponding engineering company.

Table 15-1 Components of Guide Set (By Others) and their Purpose

Item	Application / Objective	Note
Base Plate	・ Support Diffuser Block. ・ Secure horizontality of SMU. ・ Fix lower end of Guide Pole.	Please consult the corresponding engineering company for design information.
Support Bracket	・ Fix upper end of Guide Pole. ・ Secure verticality of Guide Pole.	
Guide Pole	・ Guide SMU when it is lifted up or lowered down. ・ Keep position of SMU at right place in tank.	
Stabilizer	・ Avoid floatation of SMU	

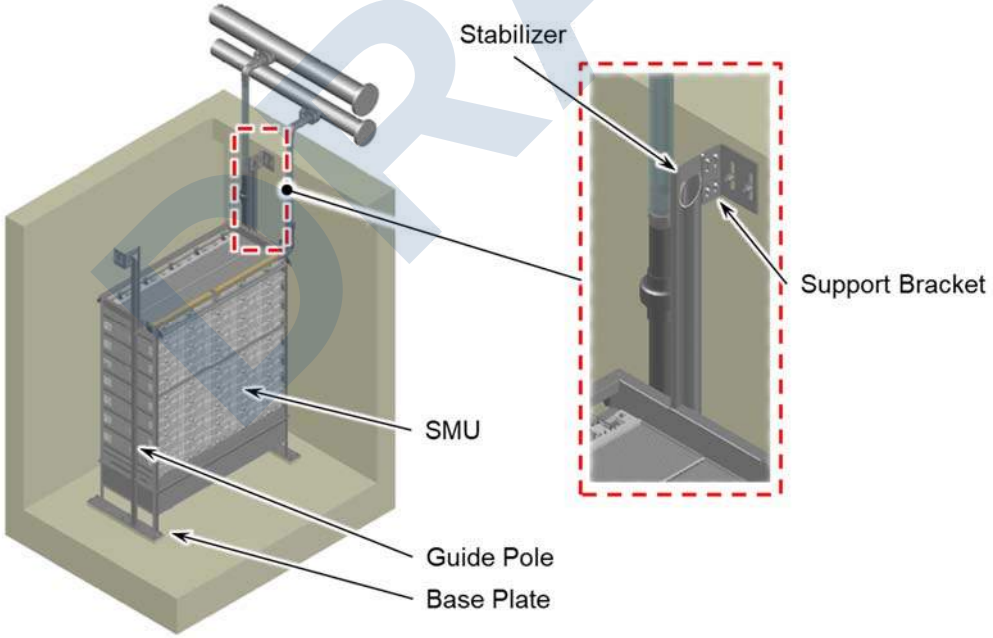

Fig. 15-1 Guide Set

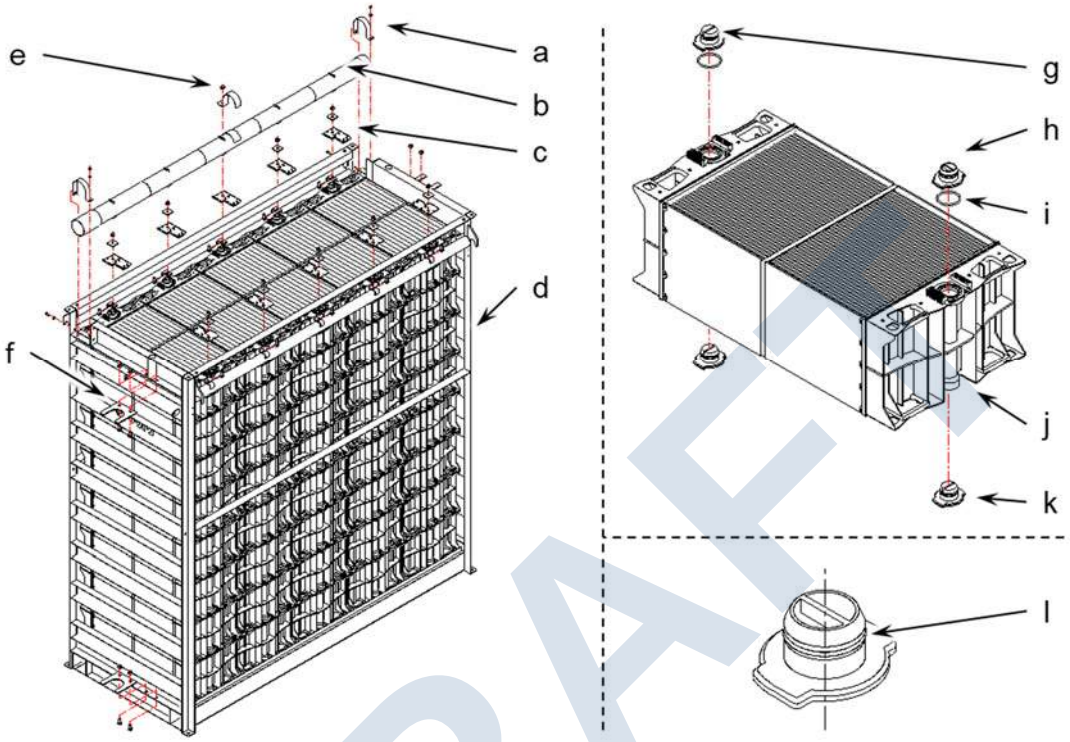
DRAFT

16. Trouble Shooting

	Problem	Possible Cause	Remedies
1	Airflow rate fails to reach the specified value.	Blower is failed	Repair or replace the blower(s).
		Slime adheres to the Diffuser.	Perform the Blow-down.
		Diffuser is clogged.	Clean the Diffuser(s).
2	Non-uniform aeration is observed in an individual SMU. Non-uniform aeration is observed among multiple SMUs.	Diffuser is clogged.	Clean the Diffuser(s).
		Diffuser is broken.	Replace the Diffuser(s).
		Base Plates are not leveled within the specified tolerance.	Adjust the levelness of the Base Plates within the tolerance.
3	Filtration Pressure is high (suction filtration or gravity filtration), or water level of membrane tank is high (gravity filtration), or design filtration flow rate cannot be achieved.	Operational flux is higher than the design flux.	Adjust flux to the design figure.
		Membrane surface is fouled.	Conduct chemical cleaning.
		Sludge clogging occurred between Membranes.	Conduct chemical cleaning after manual cleaning.
		Characteristics of the activated sludge are unfavorable. (e.g. low filterability or high viscosity)	Improve the sludge condition.
		Membrane surface is hydrophobic.	Treat the Membrane with a hydrophilic agent.
		Foreign substances tangles with the Membrane Modules.	Remove the foreign substances from the Membrane Modules by manual cleaning. Confirm the capture rate of the screen is 90% or higher.
4	Permeate is turbid and has not been properly treated.	Joints or Plugs comes off or get damaged.	Replace the joints or plugs.
		Membrane Module is damaged.	Replace the Membrane Module.
		Manifold is damaged.	Replace the Manifold.
		Connection of pipes is loosen.	Repair the connection.



If other problems as shown below are found even though operation and maintenance are performed in accordance with this manual, please immediately consult with corresponding engineering company.

- Uneven installation of Membrane Modules.
- Collecting paths on the sides of Membrane Modules visibly changes black.
- Corrosion on the KUBOTA's Lifting Tools and other metal parts
- Low permeate flow, high filtration pressure, etc.

Kubota SMU Lifting Tool Instruction Manual (for SP/SPC model)

DRAFT

KUBOTA Submerged Membrane Unit TM

Lifting Tool Instruction Manual (for SP/SPC model)

DRAFT

Check points upon delivery

Optional parts of the KUBOTA Submerged Membrane Unit™ are delivered according to purchase order.
Please confirm the following things once the purchase order has been checked.
(1) The shipment contains all the products shown in the packing list.
(2) The products have not been damaged during delivery.

- Please read this manual carefully before using this product.
- Please keep this manual in a place where the operator has easy access.

KUBOTA Corporation

61OP300014 (SP/SPC)

DRAFT

Introduction

This manual describes an overview, handling procedures, and precautions of Optional Parts for KUBOTA Submerged Membrane Unit™ (SMU).
First please read and understand the “Safety Precautions” which explains the compliance rules that prevent danger to users and everyone concerned and damage to properties.
It is important to read this manual carefully in order to use these optional parts safely and properly. Retaining a copy of this manual for future reference is recommended.
Please consult with engineering company who is in charge of your project if you have any questions or find any difficulty in using these products as described in this manual.
Please understand that there may be inconsistency between your delivered product and what is described in this manual because of changes in product specifications.

* KUBOTA Submerged Membrane Unit™ is a trademark of KUBOTA Corporation.

DRAFT

Safety Precautions

The following contents are intended to minimize risks to users and property damage.
Please read and understand the following contents before proceeding with this manual as to comply with safety rules.

■ The following markings indicate potential causes of physical injury, and are classified and explained according to seriousness of consequences

Danger	Failure to comply with this information will imminently result in death or severe injury.
Warning	Failure to comply with this information could result in death or severe injury
Caution	Failure to comply with this information could result in minor injury or property damage

■ The following markings classify and explain compliance rules about product handling and operation management.

Prohibited	Prohibited action
Important	Important rules to be complied with

DRAFT

Danger

Keep safe working environment in tanks

When working in a tank, keep the working environment safe by measuring the required items including oxygen and hydrogen sulfide in observance of local regulations/standards of each country/region. Failure to follow the procedure could result in a fatal accident such as anoxia.

Warning

Never go beneath a lifted Membrane Block, Diffuser Block, Membrane Unit, or Membrane Module

If they fall down, fatal accident may occur.

Take safety measures to prevent falling accident

Ensure the safety of workers by installing handrails, scaffolding and safety equipment such as helmets, gloves, and safety belts to prevent a fall accident. Pay particular attention near the tank opening because the floor may be slippery by wetness. Do not climb on a SMU. Neglecting the safety measures may cause falling accident.

Caution

Before using Lifting Tools, make sure that they have no abnormality

Before using Tools supporting load, check if crack, corrosion, rust, abrasion, and deformation. Check Slings for abnormalities such as a cut, abrasion, scratch, broken, stitch, discoloration, coloration, fusion, and melting.

Immediately replace the tools with abnormality. Continued use of them may cause human accident by product dropping.

Conduct the lifting work by two or more persons.

If a crane or chain block operator conducts all the work alone, his risk prediction ability will significantly decrease due to increased blind spots.

Do not place your hand or head between a Lifting Tool and a Membrane Block or others.

Do not place any part of your body between the Lifting Tool and the Membrane Block, the Diffuser Block, Membrane Unit, or the Membrane Module. It may cause a fatal accident under unsafe operation or during an unexpected drop accident.

Store the Lifting Tool without exposure to wetness or corrosive gas.

Exposure to water or corrosive gas may cause corrosion of Lifting Tool, resulting in decreased strength and drop accident

DRAFT

Be sure to check that there are no slacks of shackles or eyebolts.
If they drop off, a Membrane Block, a Diffuser Block, a Membrane Unit, or Membrane Modules may fall to cause human injury or equipment damage.

Wear adequate clothing and gloves such as cotton work gloves during work
Working in improper clothing or with bare hands may result in a caught-in accident or other unexpected injuries.

Lifting Tool should be used by four point lifting.
When lifting up a Membrane Block, a Diffuser Block, a Membrane Unit, or Membrane Modules, always hang it at four points. If lifted at three or two points, it may drop or swing and result in a fatal accident.

Always use Eyebolts when lifting up a Diffuser Block.
Eyebolts accompany at the Lifting Tool. If lifted unbalancedly, it may drop or swing and result in a fatal accident.

1. List of Optional Parts described in this Manual

For safety and usability, KUBOTA Corporation provides optional parts for KUBOTA Submerged Membrane Unit™ (SMU). This instruction manual describes each of the optional parts shown below:

1.1 Unit Lifting Tool

The Unit Lifting Tool is used for lifting a Membrane Block, a Diffuser Block or a Membrane Unit.
See “2 Unit Lifting Tool” for the details.

1.2 Module Lifting Tool

The Module Lifting Tool is used for lifting Membrane Modules at a time of replacement of the Membrane Modules.
See “3 Module Lifting Tool” for the details.

DRAFT

2. Unit Lifting Tool

2.1 Overview of the Unit Lifting Tool

2.1.1 Purpose

- To lift up a Membrane Block or a Diffuser Block at a time of unloading.
- To lift up a Membrane Block, a Diffuser Block, or a Membrane Unit at a time of assembly of the Membrane Unit or maintenance work.

2.1.2 Specification

- Material of Construction： Rolled Steels for General Structure (SS400 in JIS G3101) etc.
- Components： Body of the Unit Lifting Tool**,** Crane Slings, Unit Slings**,** Hangers, Stoppers, Shackles, Eyebolts and Stands

Table 2-1 Specifications of Unit Lifting Tool

Model	Applicable Membrane Unit*1	Mass (dry) [kg]	Mass with full of water [kg]	Tool Height*2 [mm]	Allowable Maximum Load*3 [kg]
TGSP508-R	SP/SPC series	210	280	1,500	3,300

*1 This means model of Membrane Unit to which the Unit Lifting Tool can be applied. It is possible to lift up the Membrane Unit in which a Membrane Block is combined with a Diffuser Block. However, it is impossible to lift up a double deck Membrane Unit (SPC600, SP600 / 800 / 675-A / 900-A) in which an Upper Membrane Block and a Lower Membrane Block is combined.

*2 This means the occupying height of the Unit Lifting Tool in the lifting work of Membrane Unit or others with using Hangers. In the lifting work, the height of the Membrane Unit needs to be counted in. When using Unit Slings, the occupying height including the Unit Slings becomes 2000 [mm] (see Fig. 2-1).

*3 The Allowable Maximum Load of the Unit Lifting Tool with using the Hangers is determined considering the total weight when all the Membrane Modules in the Membrane Unit are clogged up by sludge. Additionally, if there is something else deposited, attached, or loaded on the top or side faces of the Membrane Module, remove it before lifting to prevent excess load. **Please use the Unit Sling only for lifting a dry new Membrane Block (for unloading or assembling of Membrane Unit), Diffuser Block (for unloading), or Membrane Unit (for assembling of Membrane Unit or first installation to the tank). Please do not use the Unit Sling for lifting a wet or clogged Membrane Unit.**

DRAFT

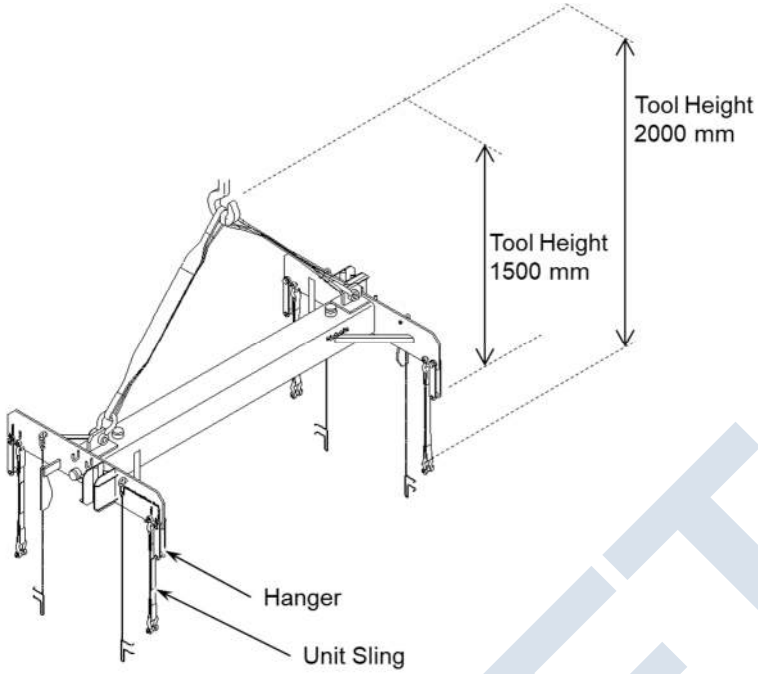

Fig. 2-1 Tool Height

2.1.3 Structure and Function

- Structure and components of the Unit Lifting Tool are shown in Fig. 2-2 and Table 2-2.
- Both two (2) Crane Slings should be attached to the Unit Lifting Tool and used in order to lift up the Unit Lifting Tool at two (2) points.
- Unit Slings and Shackles should be used when a Membrane Block or a Diffuser Block is unloaded or when they are assembled. The Unit Slings and Shackles should be attached to the holes (Catch) of the Unit Lifting Tool when using.
- Hangers should be used when lifting up a Membrane Unit which is submerged in water or when reinstalling the Membrane Unit into a tank under water level. The Hangers should be attached to the Unit Lifting Tool when using. The position of the Hangers needs to be changed based on a situation where the Unit Lifting Tool "catches" or "releases" the Membrane Unit.
- Carabiners, Leads, and Stoppers are used for preventing Hangers or Unit Slings from dropping off Hooks. The Carabiners should be attached to the Unit Lifting Tool, Stoppers should be attached to the Membrane Block near Hooks, and the Leads should be connected to the Carabiners and the Stoppers, as required.
- Eyebolts should be detached from the Unit Lifting Tool and attached to top four (4) corners of the Diffuser Block when the Diffuser Block is unloaded.
- Plugs are detached or attached when water is poured into or discharged from the Unit Lifting Tool.
- Stands are used when the Unit Lifting Tool is temporarily placed on ground or stored.

DRAFT

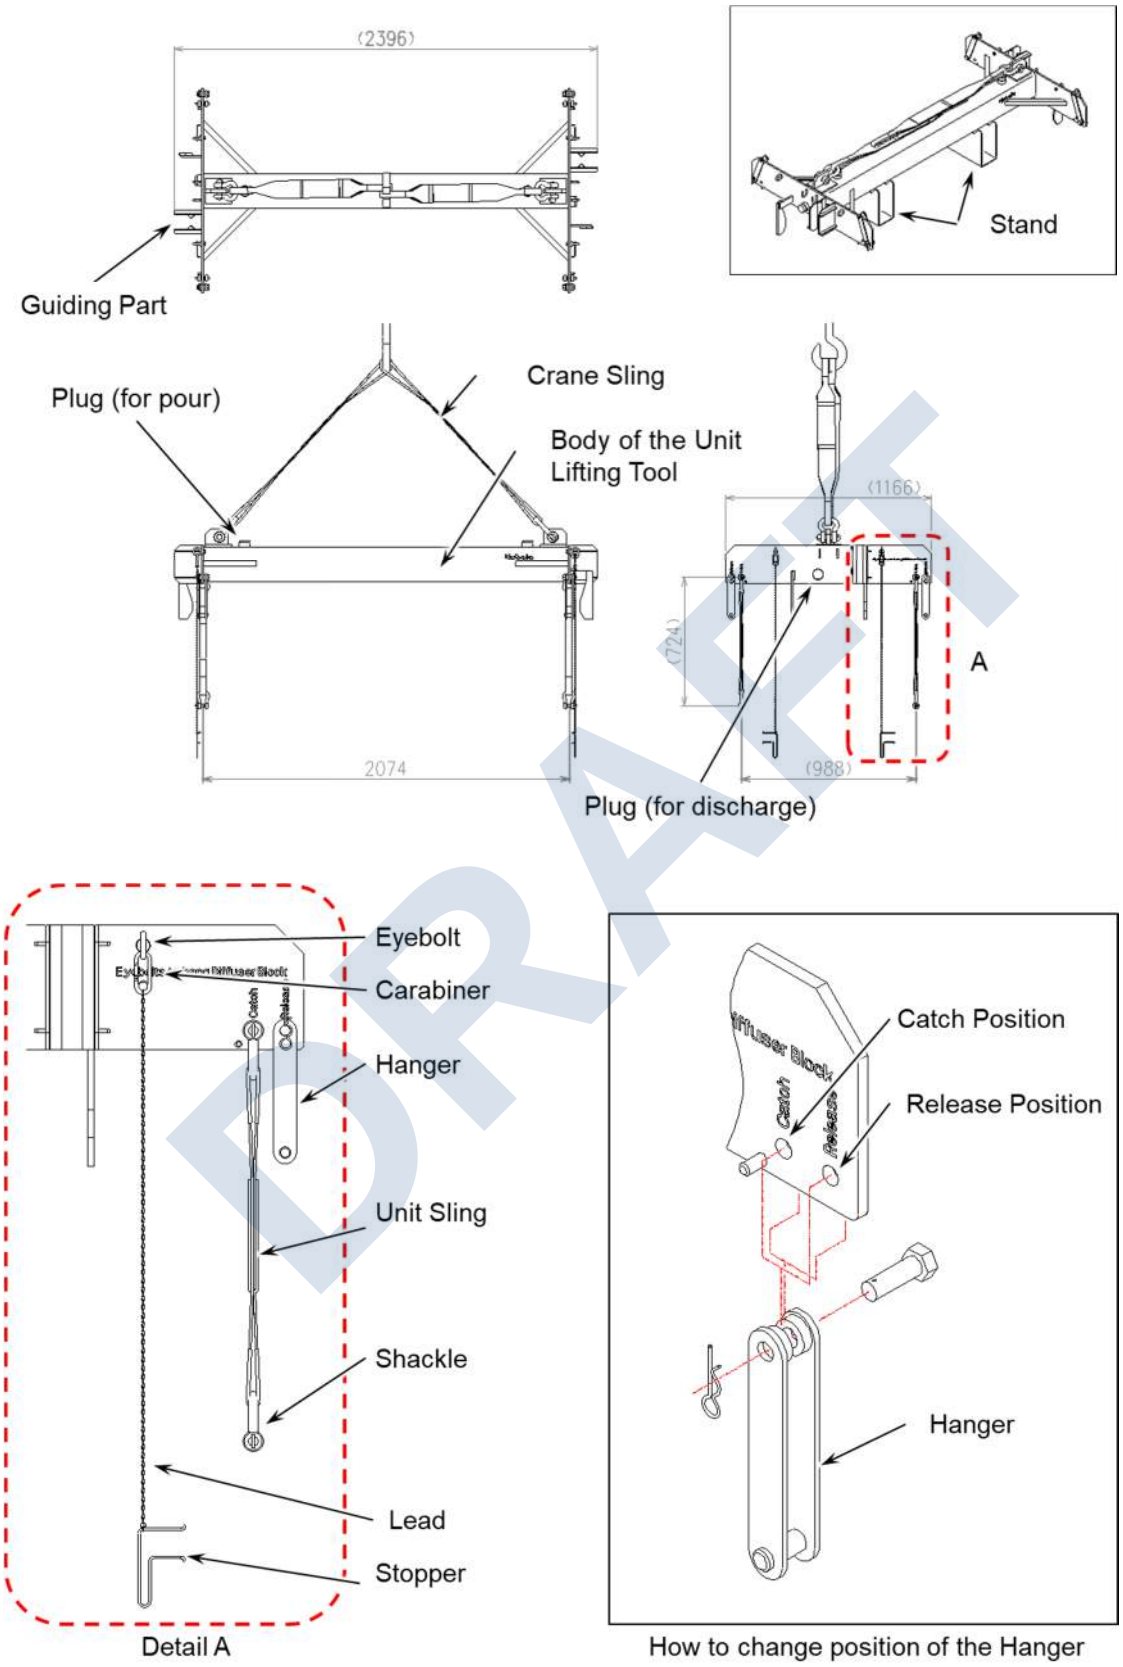

Fig. 2-2 Unit Lifting Tool (TGSP508-R)

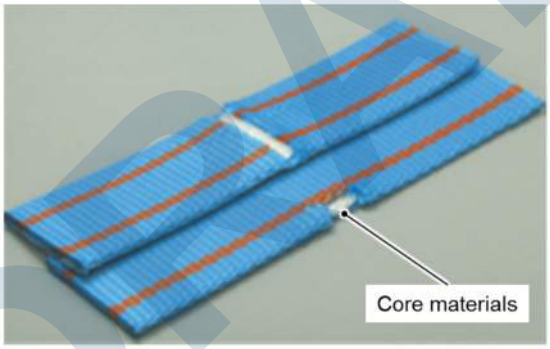
Table 2-2 Components of Unit Lifting Tool and their Purposes

Component	Purposes
Hanger	The Hangers are used for connecting a Unit Lifting Tool and a Membrane Unit when the Membrane Unit in water is lifted up or the Membrane Unit is reinstalled into water.
Catch Position	The Catch Position indicates the position to attach the Hanger when the Unit Lifting Tool catches the Membrane Unit in water (lifts the Membrane Unit up).
Release Position	The Release Position indicates the position to attach the Hanger when the Unit Lifting Tool releases the Membrane Unit in water (reinstalls the Membrane Unit into tank).
Guide Part	By having the Guide Parts along Guide Poles which are installed in a Membrane Tank, the Unit Lifting Tool will be properly positioned against a Membrane Unit.
Unit Sling	The Unit Slings are used for connecting the Unit Lifting Tool to a Membrane Block or a Diffuser Block when they are unloaded. The Unit Slings should be attached to the “Catch Position” of the Unit Lifting Tool when using. **Please use the Unit Sling only for lifting a dry new Membrane Block (for unloading or assembling of Membrane Unit), Diffuser Block (for unloading), or Membrane Unit (for assembling of Membrane Unit or first installation to the tank). Please do not use the Unit Sling for lifting a wet or clogged Membrane Unit.**
Eyebolt	The Eyebolts are attached to the Diffuser Block and used for connecting the Diffuser Block to Shackles when the Diffuser Block is lifted up.
Shackle	The Shackles should be attached at lower end of the Unit Slings when the Diffuser Block is lifted. The Shackles are used for connecting the Eyebolts to the Unit Slings. The Shackles should be detached from the Unit Slings when the Membrane Block is lifted up.
Carabiner	The Carabiners connect Leads and Unit Lifting Tool.
Lead	The Leads connect Stoppers and Carabiners.
Stopper	The Stoppers prevent the Unit Slings or Hangers from dropping off while the Membrane Unit is lifted up.
Crane Sling	The Crane Slings connect the Unit Lifting Tool and a hook of crane when the Unit Lifting Tool is lifted up.
Plug	The Plugs plug water inlet or outlet of the Unit Lifting Tool.
Stand	The Stands supports the Unit Lifting Tool in order to avoid deformation or damage of the Unit Lifting Tool when the Unit Lifting Tool is temporarily placed on ground or stored in an indoor storage.

DRAFT

2.2 Before Using the Unit Lifting Tool



2.2.1 Compliance

Observe the applicable laws and rules of each country and region. Particularly, kinds of work that require qualification or permission such as crane operation and slinging have to be conducted by a qualified person. Be sure to take safety measures such as scaffolding, safety belt, helmet, etc.

2.2.2 Prior-to-use Inspection

Perform inspection before using the Unit Lifting Tool to check for abnormalities.

- Check the Body of the Unit Lifting Tool, Crane Slings, Hangers, Unit Slings, Shackles, and Eyebolt for deterioration such as abrasion, crack, and/or corrosion, etc.
- Check the Body of the Unit Lifting Tool, Eyebolts, and Shackles for coming-off of plating. Do not use a rusted Lifting Tool due to damaged plating because its strength may have decreased.
- Check the Shackles for looseness.
- Check the Body of the Unit Lifting Tool for abrasion and deformity.
- Check the Crane Slings and Unit Slings of the Unit Lifting Tool for deterioration such as a cut, abrasion, scratch, broken stitch, discoloration, coloration, fusion, and melting.
- Do not use and immediately replace a sling belt if its core material is exposed as Pic. 2-1.

(The colors of the sling and the core material can differ depending on the model.)

Pic. 2-1 Sign of Replacement of the Sling Belt

Caution

Before using Lifting Tools, make sure that they have no abnormality

Before using Tools supporting load, check if crack, corrosion, rust, abrasion, and deformation. Check Slings for abnormalities such as a cut, abrasion, scratch, broken, stitch, discoloration, coloration, fusion, and melting. Immediately replace the tools with abnormality. Continued use of them may cause human accident by product dropping.

DRAFT

2.2.3 Prior-to-use Preparation

- Before mounting the Unit Lifting Tool, ensure safety of workers by using scaffolds and safety equipment such as helmets and safety belts to prevent a falling accident. Do not climb on a Membrane Unit.
- When working in a tank, keep the working environment safe by measuring the required items including oxygen and hydrogen sulfide in observance of local regulations/standards of each country/region.

Danger	**Keep safe working environment in tanks** When working in a tank, keep the working environment safe by measuring the required items including oxygen and hydrogen sulfide in observance of local regulations/standards of each country/region. Failure to follow the procedure could result in a fatal accident such as anoxia.

Warning	**Take safety measures not to cause fall accident** Ensure safety of workers by installing handrails, scaffolds and safety equipment such as helmets, gloves, and safety belts to prevent a fall accident when installing or lifting a SMU. Pay particular attention near the tank opening because the floor may be slippery by wetness. Do not climb on a SMU. Neglecting the safety measures may cause falling accident.

Caution	**Wear adequate clothing and gloves such as cotton work gloves during work.** Working in improper clothing or with bare hands may result in a caught-in accident or other unexpected injuries.

DRAFT

2.3 How to Use the Unit Lifting Tool

Per each work using the Unit Lifting Tool such as unloading of Membrane Block, assembly of Membrane Unit, installation of the Membrane Unit, and lifting up or re-installation of the Membrane Unit, ways of preparing and ways of using the Unit Lifting Tool are explained here. See "Instruction Manual for KUBOTA Submerged Membrane Unit™ (SP Type)" or "Instruction Manual for KUBOTA Submerged Membrane Unit™ (SPC Type)" for overall procedures including the steps where the Unit Lifting Tool is not used (such as connecting pipings and installing Stabilizers).

2.3.1 Attaching the Unit Lifting Tool to Hook of Crane

(1) Attach two (2) Crane Slings to the Unit Lifting Tool using two (2) Shackles.
(2) Hook eyes on upper end of the Crane Slings to the hook of the crane. The Unit Lifting Tool will be lifted at two-point.

2.3.2 Lifting the Membrane Block (when unloading the Membrane Block)

(1) Preparation

- Attach the Unit Slings (4 pcs), Carabiners (4 pcs), Leads (4 pcs) and Stoppers (4 pcs) to the Unit Lifting Tool (see Fig. 2-3).
- Remove Shackles (4 pcs) on the lower end of the Unit Slings (see Fig. 2-3).
- Flip Hangers (4 pcs) up (See Fig. 2-3).

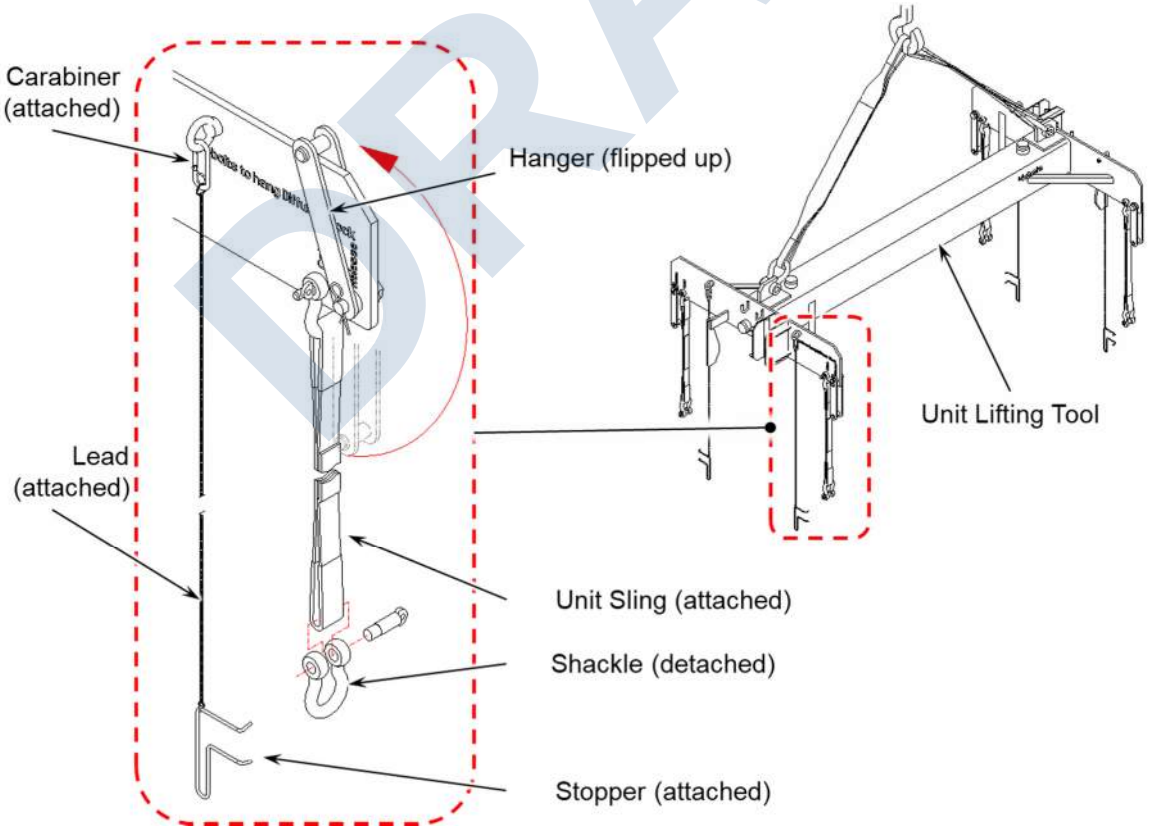


Fig. 2-3 Preparation of the Unit Lifting Tool (when unloading the Membrane Block)

DRAFT

(2) Attaching the Unit Lifting Tool to the Membrane Block

- Attach eyes of the Unit Slings (4 pcs) to Hooks (4 pcs) at four corners of the Membrane Block (see Fig. 2-4).
- Be sure to attach all of four (4) eyes to the Hooks in order to avoid two- or three-point lifting.

(3) Fall Protection

- Attach the Stoppers (4 pcs) to the specified positions in order to avoid a drop of the Membrane Block due to detachment of the Unit Slings from the Hooks during the lifting work (see Fig. 2-4). See "2.3.8 Attaching/Detaching the Stopper" for detailed information about the way of attaching or detaching the Stopper.

(4) Cautions during the Lifting Work

- Align center of the Unit Lifting Tool to center of the Membrane Block from both front view and side view.
- Lift the Membrane Block straight up slowly and safely to avoid any damage on the Membrane Block or surrounding equipment.
- Be careful not to get a part of your body caught in between the Unit Lifting Tool and the Membrane Block.
- **Please use the Unit Sling only for lifting a dry new Membrane Block (for unloading or assembling of Membrane Unit), Diffuser Block (for unloading), or Membrane Unit (for assembling of Membrane Unit or first installation to the tank). Please do not use the Unit Sling for lifting a wet or clogged Membrane Unit.**

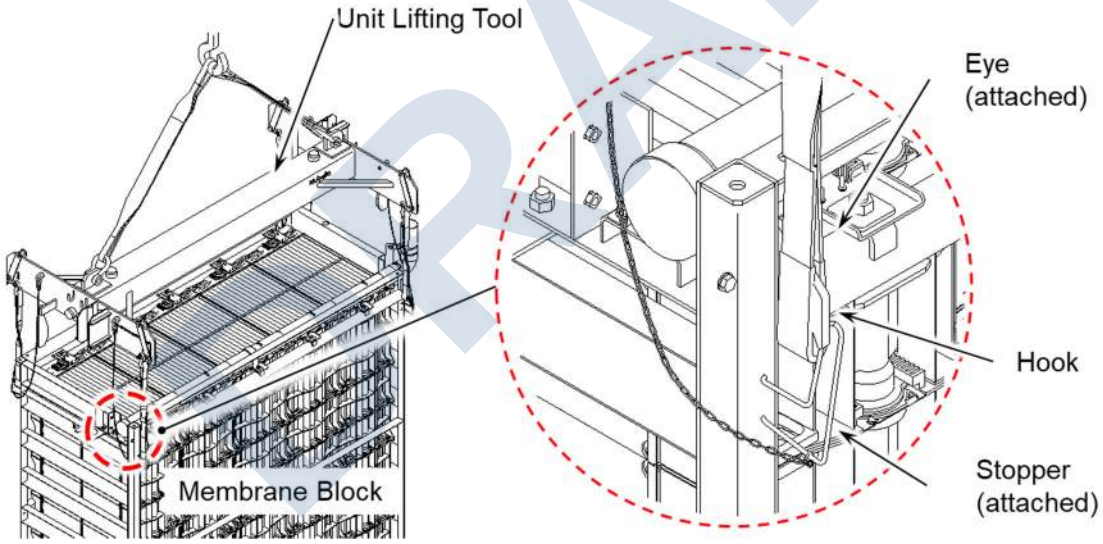

Fig. 2-4 How to use the Unit Lifting Tool (when unloading the Membrane Block)

2.3.3 Lifting the Diffuser Block (when unloading the Diffuser Block)

(1) Preparation

- Attach Unit Slings (4 pcs) and Shackles (4 pcs) to the Unit Lifting Tool (see Fig. 2-5).
- Detach Carabiners (4 pcs), Leads (4 pcs), Stoppers (4 pcs), and Eyebolts (4 pcs) from the Unit Lifting Tool (see Fig. 2-5).
- Flip Hangers (4 pcs) up (see Fig. 2-5).
- Attach Eyebolts (4 pcs) which are furnished with the Unit Lifting Tool to four (4) top corners of the Diffuser Block (see Fig. 2-6). Be sure to attach all four (4) Eyebolts to the Diffuser Block.

(2) Attaching the Unit Lifting Tool to the Diffuser Block

- Attach Shackles (4 pcs) at the lower end of the Unit Slings to Eyebolts (4 pcs) (see Fig. 2-6).
- Be sure to attach all of four (4) Shackles to the Eyebolts in order to avoid two- or three-point lifting.

(3) Fall Protection

- Avoid drop of the Diffuser Block during the lifting work by making sure that there are no slacks of the Shackles and Eyebolts.

(4) Cautions during the Lifting Work

- Align center of the Unit Lifting Tool to center of the Diffuser Block from both front view and side view.
- Lift the Diffuser Block straight up slowly and safely to avoid any damage on the Diffuser Block or surrounding equipment.
- Be careful not to get a part of your body caught in between the Unit Lifting Tool and the Diffuser Block.
- **Please use the Unit Sling only for lifting a dry new Membrane Block (for unloading or assembling of Membrane Unit), Diffuser Block (for unloading), or Membrane Unit (for assembling of Membrane Unit or first installation to the tank). Please do not use the Unit Sling for lifting a wet or clogged Membrane Unit.**

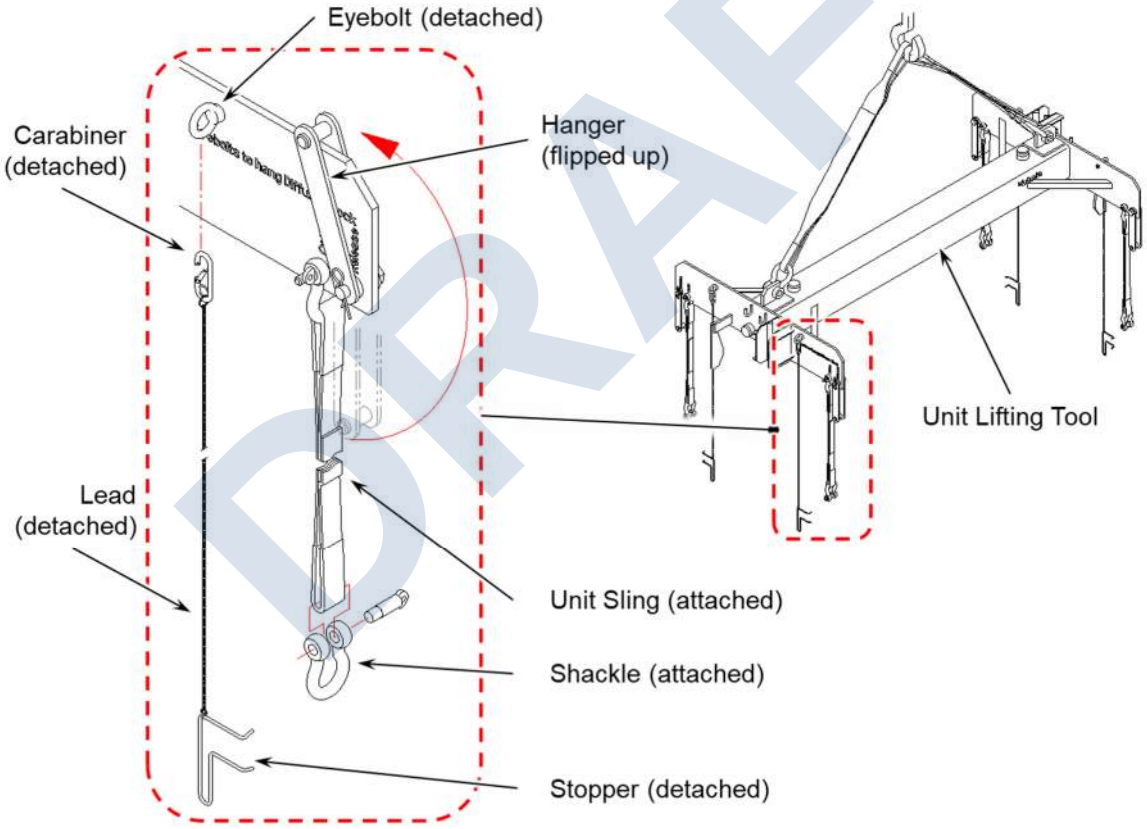

Fig. 2-5 Preparation of the Unit Lifting Tool (when unloading the Diffuser Block)

DRAFT

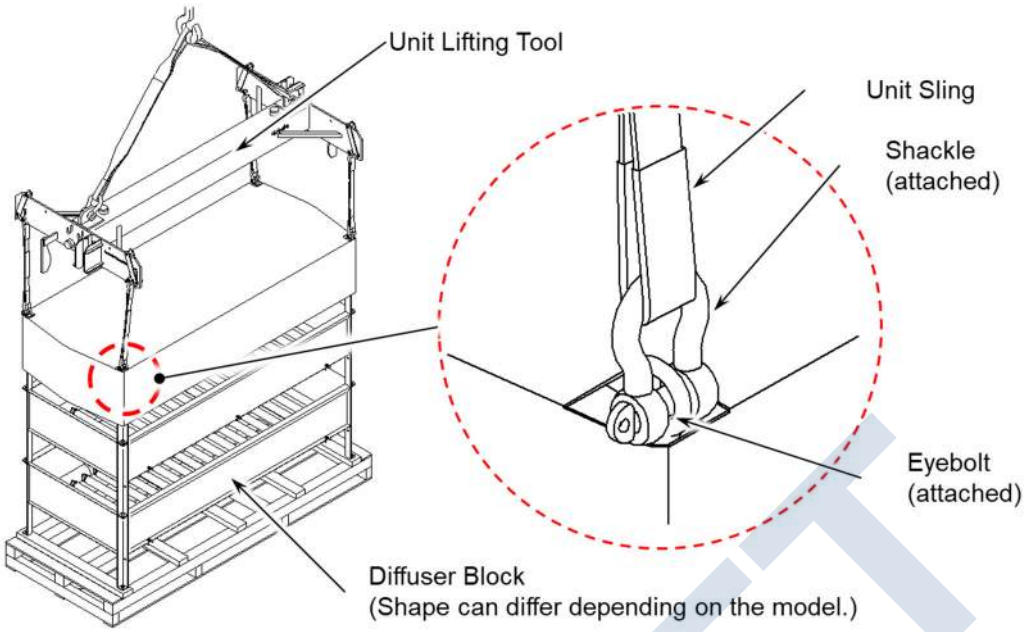

Fig. 2-6 How to use the Unit Lifting Tool (when unloading the Diffuser Block)

2.3.4 Lifting the Membrane Unit (when assembling the Membrane Unit etc.)

The way of using the Unit Lifting Tool is same as what is described in the above "2.3.2 Lifting the Membrane Block (when unloading the Membrane Block)".
Pay attention to below points when lifting the Membrane Unit.

- Align center of the Unit Lifting Tool to center of the Membrane Unit from both front view and side view.
- Lift the Membrane Unit straight up slowly and safely to avoid any damage on the Membrane Unit or surrounding equipment.
- Be careful not to get a part of your body caught in between the Unit Lifting Tool and the Membrane Unit.
- **Please use the Unit Sling only for lifting a dry new Membrane Block (for unloading or assembling of Membrane Unit), Diffuser Block (for unloading), or Membrane Unit (for assembling of Membrane Unit or first installation to the tank). Please do not use the Unit Sling for lifting a wet or clogged Membrane Unit.**

2.3.5 Lifting the Membrane Unit from the water

(1) Preparation

- Detach Unit Slings (4 pcs), Shackles (4 pcs), Carabiners (4 pcs), Leads (4 pcs), and Stoppers (4 pcs) from the Unit Lifting Tool (see Fig. 2-7).
- Attach Hangers (4 pcs) to "Catch" position of the Unit Lifting Tool and hang them down (See Fig. 2-7).

(2) Attaching the Unit Lifting Tool to the Membrane Unit

- Lower the Unit Lifting Tool toward the Membrane Unit. By lowering the Unit Lifting Tool along Guide Poles, make the Unit Lifting Tool approach to the Membrane Unit in the correct direction.
- When the Unit Lifting Tool touches on to the top of the Membrane Unit, the Hangers are automatically fitted inside the Hooks of the Membrane Unit, and the Membrane Unit becomes ready

DRAFT

to be lifted up (see Fig. 2-8).

- Make sure that all of Hangers (4 pcs) are appropriately fitted inside the Hooks (4 pcs) so as to avoid two- or three- point lifting when the Hooks of the Membrane Unit come out of the water surface.

(3) Fall Protection

- Attach the Carabiners (4 pcs), Leads (4 pcs), and Stoppers (4 pcs) to the Membrane Block and the Unit Lifting Tool in order to avoid drop of the Membrane Unit during further lifting work when the Membrane Unit can be reached by hand safely (see Fig. 2-9).

(4) Cautions during the Lifting Work

- Align center of the Unit Lifting Tool to center of the Membrane Unit from both front view and side view.
- Lift the Membrane Unit straight up slowly and safely to avoid any damage on the Membrane Unit or surrounding equipment.
- Be careful not to get a part of your body caught in between the Unit Lifting Tool and the Membrane Unit.
- **Please do not use the Unit Sling for lifting a wet or clogged Membrane Unit.**

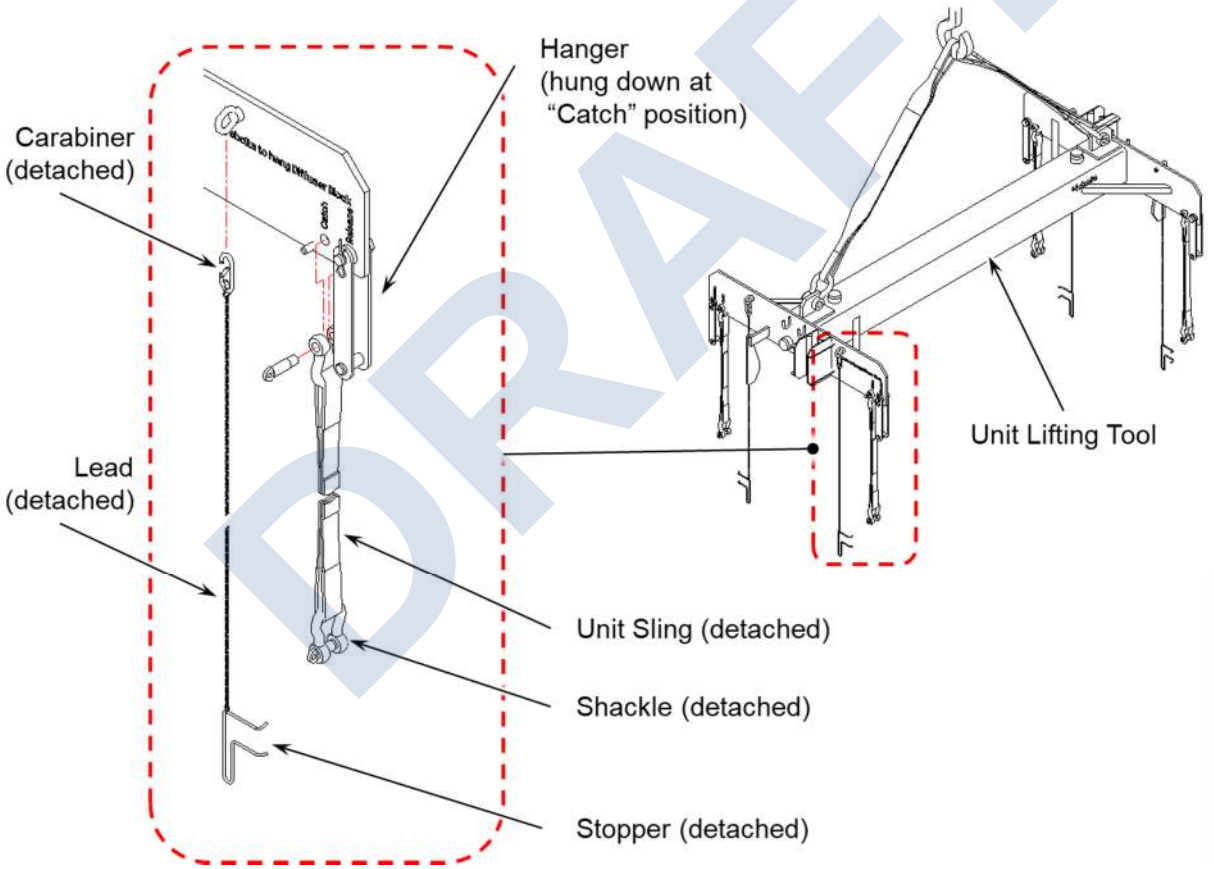

Fig. 2-7 Preparation of the Unit Lifting Tool (when lifting the Membrane Unit from the water)

DRAFT

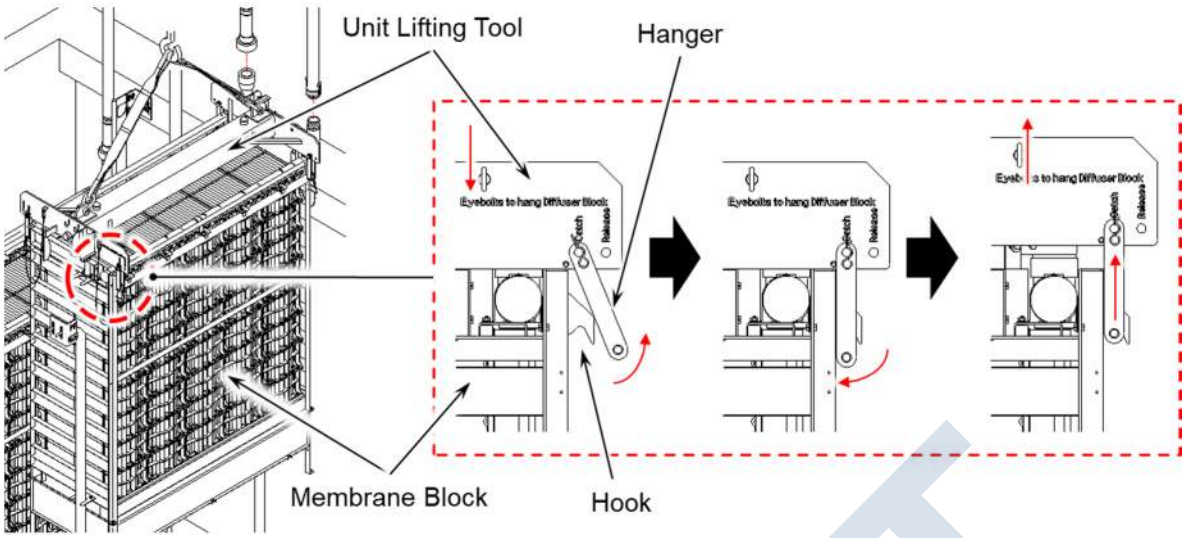

Fig. 2-8 Motion of the Hanger catching the Hook of the Membrane Unit

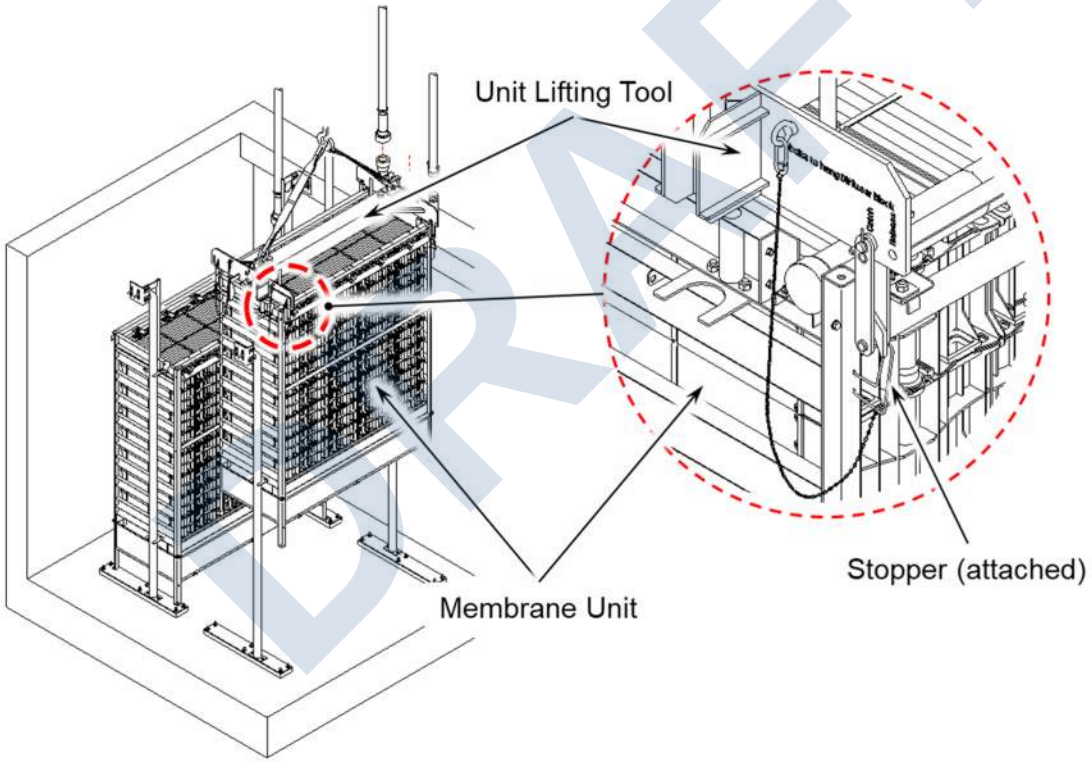

Fig. 2-9 How to use the Unit Lifting Tool when lifting the Membrane Unit from the water

2.3.6 Re-installation of the Membrane Unit into the water

(1) Preparation

- Fill inside of the Unit Lifting Tool with water. See "2.3.7 Filling or draining the water into/from the Unit Lifting Tool" for detailed information.
- Attach the Carabiners (4 pcs), Leads (4 pcs), and Stoppers (4 pcs) to the Unit Lifting Tool (see Fig. 2-10).

- Detach the Unit Slings (4 pcs) and Shackles (4 pcs) from the Unit Lifting Tool (see Fig. 2-10).
- Attach the Hangers (4 pcs) to "Release" position of the Unit Lifting Tool and flip them up (see Fig. 2-10).

(2) Attaching the Unit Lifting Tool to the Membrane Unit

- Attach the Hangers (4 pcs) to the Hooks (4 pcs) of the Membrane Unit (see Fig. 2-11).
- Make sure that all of Hangers (4 pcs) are attached to the Hooks in order to avoid two- or three-point lifting.

(3) Fall Protection

- Attach the Stoppers (4 pcs) to the specified positions in order to avoid a drop of the Membrane Unit due to detachment of the Unit Slings from the Hooks during the lifting work (see Fig. 2-11). See "2.3.8 Attaching/Detaching the Stopper" for detailed information about the way of attaching or detaching the Stopper.

(4) Re-installation of the Membrane Unit

- When lowering the Membrane Unit toward the predetermined position in the Tank, detach the Carabiners (4 pcs), Leads (4 pcs), and Stoppers (4 pcs) while the Membrane Unit can be reached by hand safely.
- The Hangers are automatically detached from the Hooks of the Membrane Unit when the Membrane Unit touches down to the predetermined position and the Unit Lifting Tool touches down to the top surface of the Membrane Unit, and the Unit Lifting Tool becomes ready to be lifted up without accompanying the Membrane Unit (see Fig. 2-12).
- Move the Unit Lifting Tool to a safe space and drain the water inside the Unit Lifting Tool after completing the re-installation work. See "2.3.7 Filling or draining the water into/from the Unit Lifting Tool" for detailed information about the way of draining the water.

(5) Cautions during the Lifting Work

- Align center of the Unit Lifting Tool to center of the Membrane Block from both front view and side view.
- Lift the Membrane Unit straight up slowly and safely to avoid any damage on the Membrane Unit or surrounding equipment.
- Be careful not to get a part of your body caught in between the Unit Lifting Tool and the Membrane Unit.
- **Please do not use the Unit Sling for lifting a wet or clogged Membrane Unit.**

DRAFT

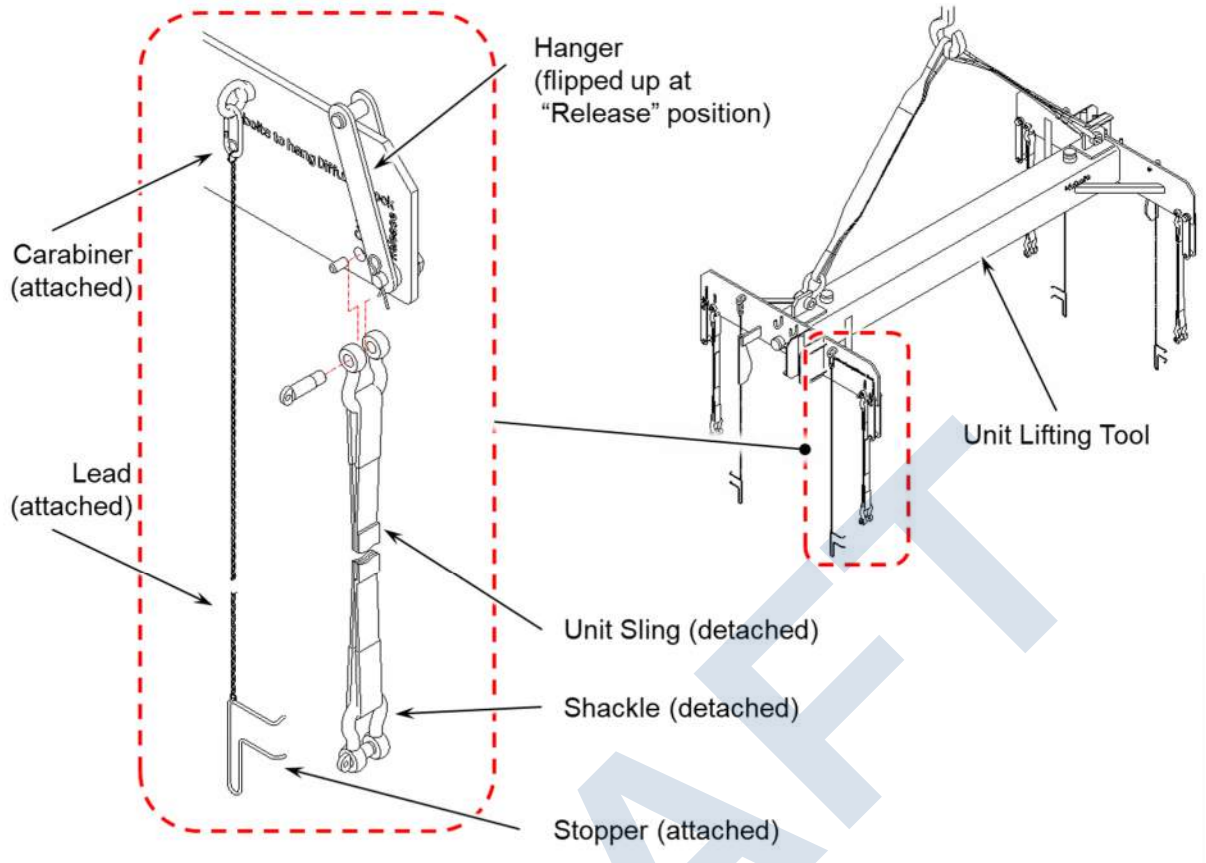

Fig. 2-10 Preparation of the Unit Lifting Tool (when re-installing the Membrane Unit into the water)

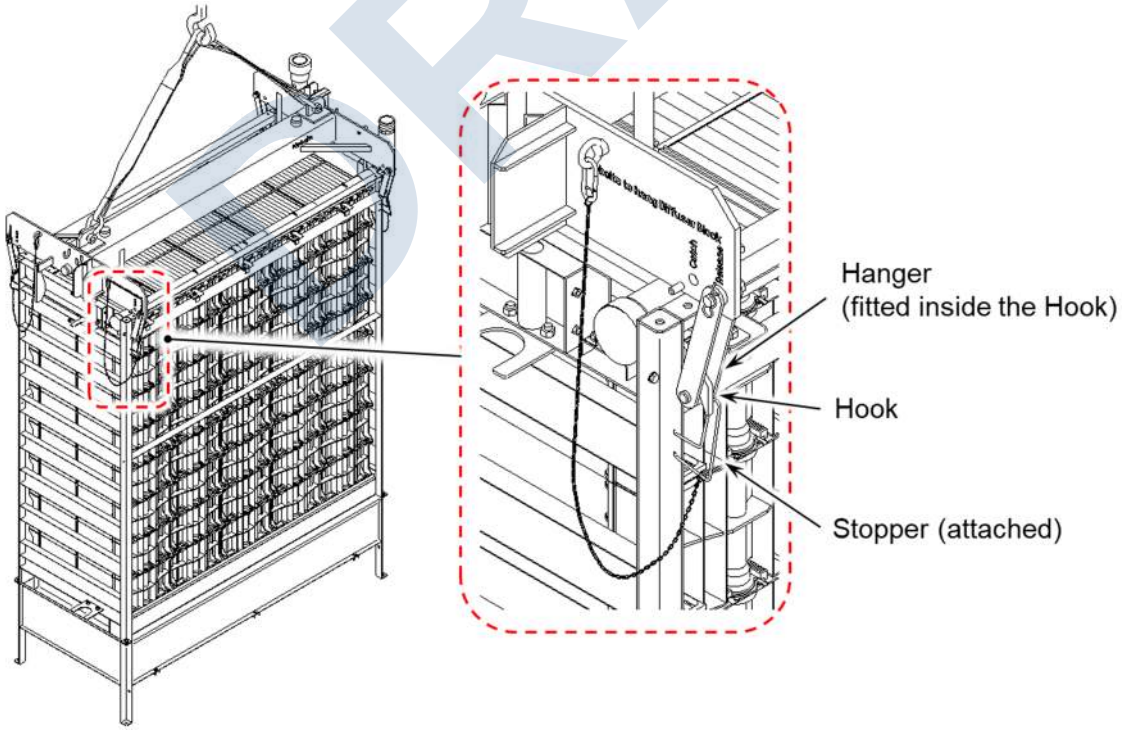

Fig. 2-11 How to use the Unit Lifting Tool when re-installing the Membrane Unit into the water

DRAFT

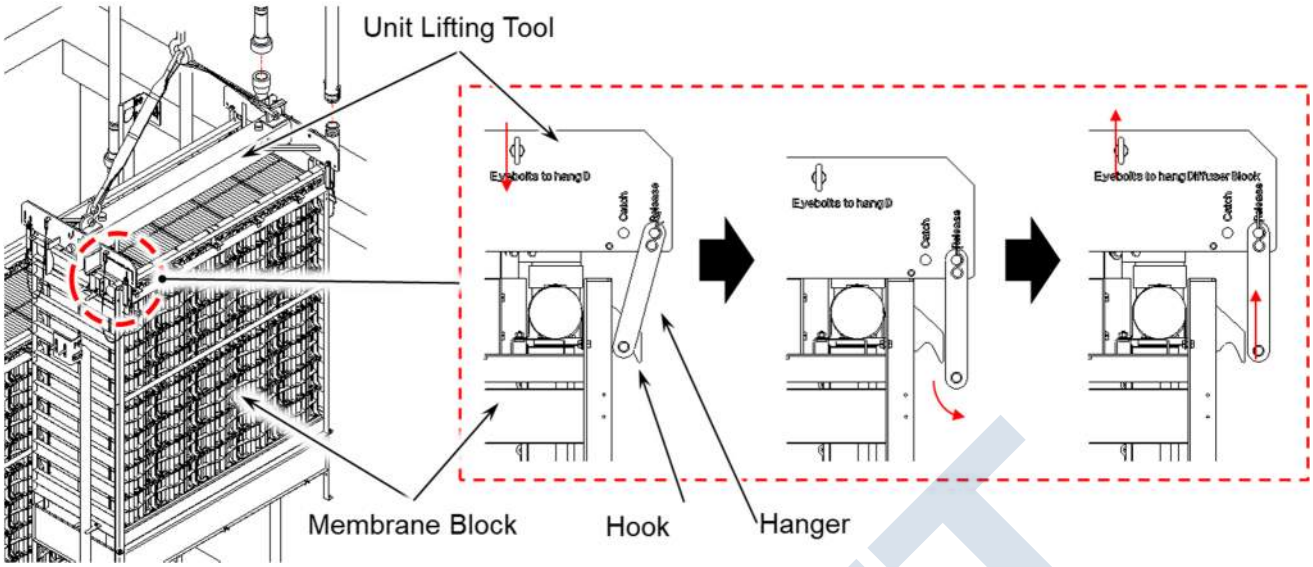

Fig. 2-12 Motion of the Hanger releasing the Hook of the Membrane Unit

2.3.7 Filling or draining the water into/from the Unit Lifting Tool

2.3.7.1 Filling the water

(1) Remove Plugs (2 pcs) on the top of the Unit Lifting Tool (see Fig. 2-13).
(2) Attach Plugs (2 pcs) on the side of the Unit Lifting Tool (see Fig. 2-13).
(3) Fill the water into the Unit Lifting Tool from the water filler on the top of the Unit Lifting Tool.
(4) Attach the Plugs (2 pcs) to the water filler on the top of the Unit Lifting Tool after completing the filling work.

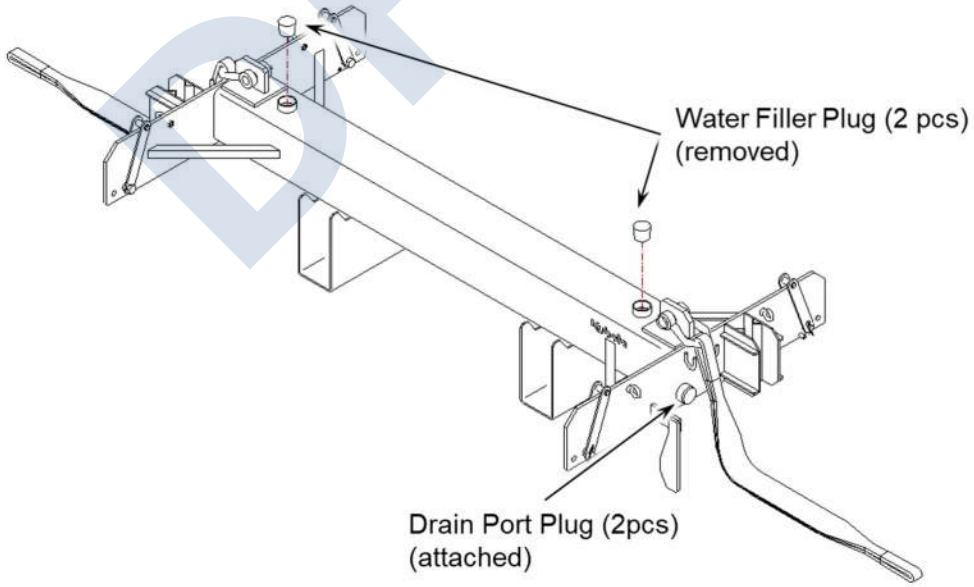

Fig. 2-13 Filling the water to the Unit Lifting Tool

DRAFT

2.3.7.2 Draining the water

(1) Remove the Plugs (2 pcs) on the top of the Unit Lifting Tool (see Fig. 2-14).
(2) Remove the Plugs (2 pcs) on the side of the Unit Lifting Tool (see Fig. 2-14). Then draining will be started.
(3) After completing the draining work, dry inside of the Unit Lifting Tool well and attach the Plugs.

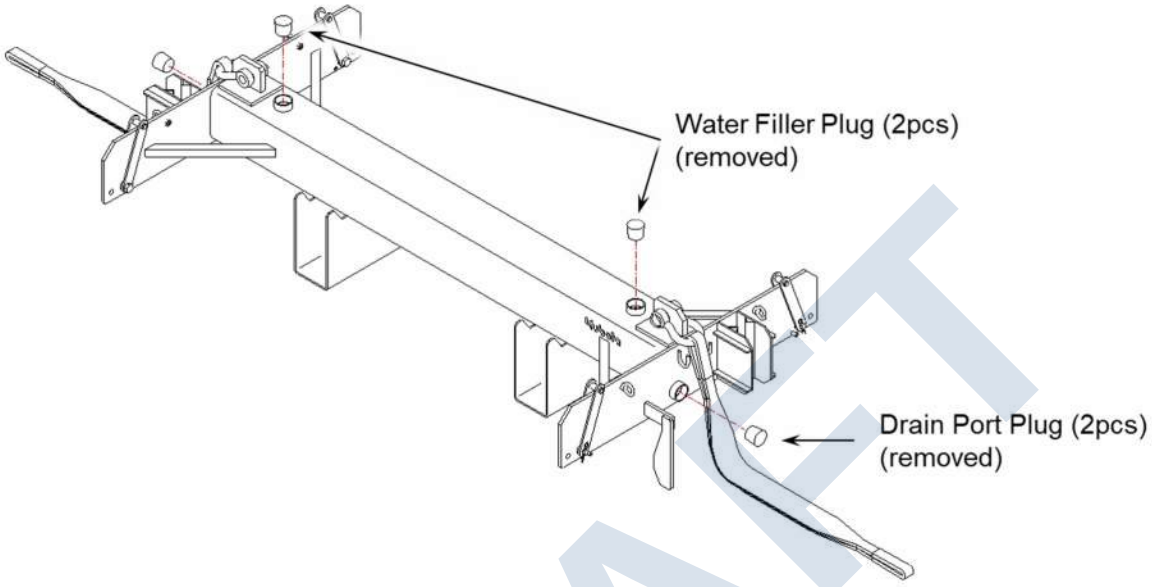

Fig. 2-14 Draining the water from the Unit Lifting Tool

2.3.8 Attaching/Detaching the Stopper

There are totally four (4) Stoppers, two (2) types (mirrored) and two (2) pcs per each type (see Fig. 2-15).

2.3.8.1 Attaching the Stopper

(1) Insert two (2) ends of the Stoppers into two (2) holes beneath the Hooks of the Membrane Unit (see Fig. 2-15 "(b) Inserting the Edges"). Adjusting pitch between the two (2) ends of the Stopper by grabbing near those ends of the Stopper makes the insertion work be easier.
(2) Lean the bend section of the Stopper toward the back side of the Hook by warping overall of the Stopper (see Fig. 2-15 "(c) Leaning the bend section" and "(d) The Bend Section being caught at the Hook ").
(3) Be careful not to install the Stopper in the opposite way because the Stopper installed in the opposite way may not achieve its function (see Fig. 2-15 "(e) Bad example").

2.3.8.2 Detaching the Stopper

(1) Follow reverse procedure mentioned (a) above when detaching the Stopper. It is necessary to remove the Carabiners and the Leads when the Unit Lifting Tool is submerged into water because the Leads are interfered with the work (see Fig. 2-15 "(f) Detaching from the Unit Lifting Tool").

DRAFT

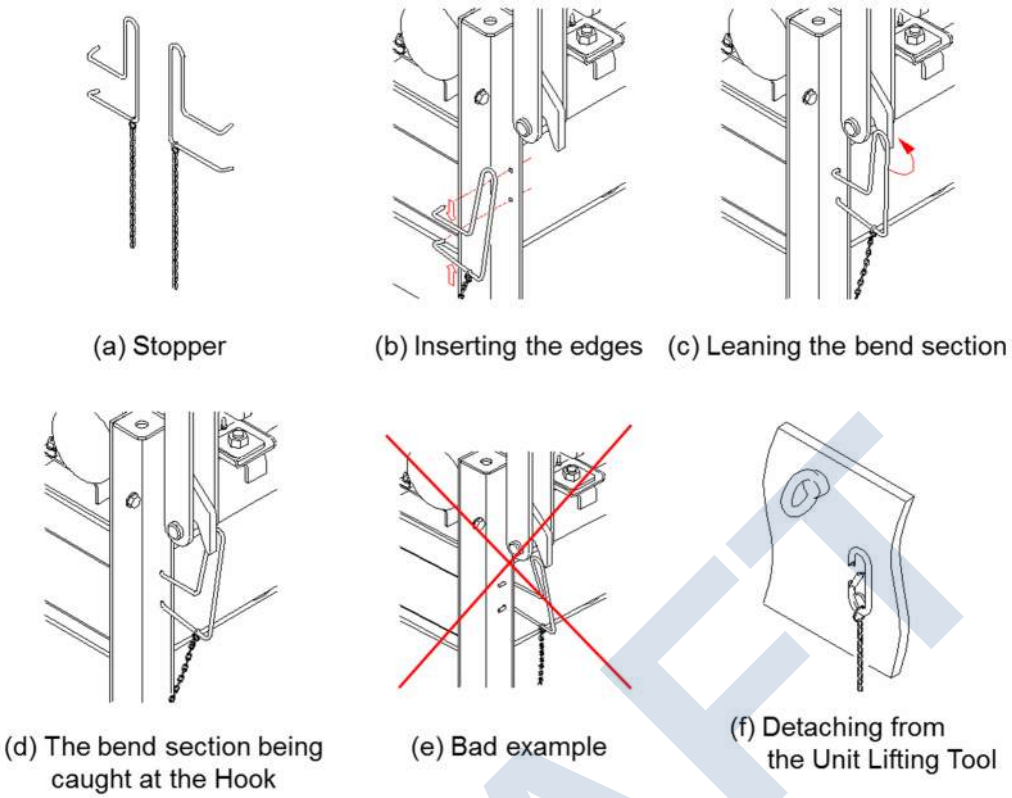

Fig. 2-15 How to attach/detach the Stopper

Warning	**Never go beneath a lifted Membrane Block, Diffuser Block, or Membrane Unit** If they fall down, fatal accident may occur.

Caution	**Before using Lifting Tools, make sure that they have no abnormality** Before using Tools supporting load, check if crack, corrosion, rust, abrasion, and deformation. Check Slings for abnormalities such as a cut, abrasion, scratch, broken, stitch, discoloration, coloration, fusion, and melting. Immediately replace the tools with abnormality. Continued use of them may cause human accident by product dropping.

Caution	**Conduct the lifting work by two or more persons.** If a crane or chain block operator conducts all the work alone, his risk prediction ability will significantly decrease due to increased blind spots.

Caution	**Do not place your hand or head between a Lifting Tool and a Membrane Block or others.** Do not place any part of your body between the Lifting Tool and the Membrane Block, the Diffuser Block, Membrane Unit, or the Membrane Module. It may cause a fatal accident under unsafe operation or during an unexpected drop accident.

DRAFT

Caution	**Be sure to check that there are no slacks of shackles or eyebolts** If they drop off, a Membrane Block, a Diffuser Block, a Membrane Unit, or Membrane Modules may fall to cause human injury or equipment damage.

Caution	**Lifting Tool should be used by four point lifting** when lifting up a Membrane Block, a Diffuser Block, a Membrane Unit, or Membrane Modules, always hang it at four points. If lifted at three or two points, it may drop or swing and result in a fatal accident.

Caution	**Always use Eye bolts when lifting up a Diffuser Block** Eyebolts accompany at the Lifting Tool. If lifted unbalancedly, it may drop or swing and result in a fatal accident.

Prohibited	**Never use the Lifting Tool for lifting other thing or for other purpose.** The Unit Lifting Tool is for lifting up a Membrane Block, a Diffuser Block, or a Membrane Unit safely. Do not lift other things or use for other purpose.

Important	**Always use the Lifting Tool** When lifting a Membrane Block, a Diffuser Block, or a Membrane Unit, always use the Unit Lifting Tool, it serves to lift them safely without excess load.

2.4 Temporary Placing of the Unit Lifting Tool

Be sure to place the Unit Lifting Tool onto the Stands which are furnished with the Unit Lifting Tool when the Unit Lifting Tool is temporarily placed (see Fig. 2-16). Placing the Unit Lifting Tool onto the ground without using the Stands may lead deformation or damage of the Unit Lifting Tool. Deformed or damaged Unit Lifting Tool can cause failure in the lifting work.

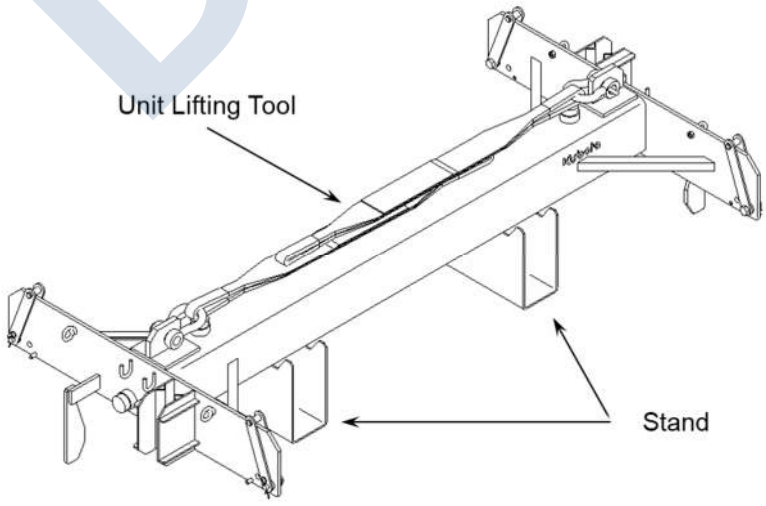

Fig. 2-16 How to temporarily place the Unit Lifting Tool

DRAFT

Important	**Be sure to place the Unit Lifting Tool onto the Stand when placing the Unit Lifting Tool** The Unit Lifting Tool may be deformed or damaged if the Unit Lifting Tool is placed onto the ground directly. Deformed or damaged Unit Lifting Tool can cause failure in the lifting work.

2.5 Storage of the Unit Lifting Tool

- Wash the Unit Lifting Tool to remove the sludge if the Unit Lifting Tool is submerged in to the sludge, drain the water inside the Unit Lifting Tool, and dry the Unit Lifting Tool well.
- Be sure to put the Unit Lifting Tool onto the Stands for storage (see Fig. 2-16).
- Store the Unit Lifting Tool indoor to protect it from rain or other kinds of wetness or corrosive gas. Corrosion decreases the strength of the Unit Lifting Tool.
- Avoid direct sunlight in storage of the Unit Lifting Tool to slow down aging deterioration.

Caution	**Store the Lifting Tool and Shackle without exposure to wetness or corrosive gas** Exposure to water or corrosive gas may cause corrosion of Lifting Tool and Shackle, resulting in decreased strength and drop accident.

Important	**Be sure to place the Unit Lifting Tool onto the Stand when placing the Unit Lifting Tool** The Unit Lifting Tool may be deformed or damaged if the Unit Lifting Tool is placed onto the ground directly. Deformed or damaged Unit Lifting Tool can cause failure in the lifting work.

Important	**Prevent use of Unit Lifting Tool by an outsider without permission or by mistake.** In selection of the storage place of Unit Lifting Tool, pay attention not to be used by an outsider without permission or by mistake

DRAFT

3. Module Lifting Tool

3.1 Overview off the Module Lifting Tool

3.1.1 Purpose

- To lift Membrane Modules when replacing the Membrane Modules.

3.1.2 Specification

- Material: Rolled Steels for General Structure (SS400 in JIS G3101) etc.
- Components: Body of the Module Lifting Tool, Module Slings, Hooks, and Shackles

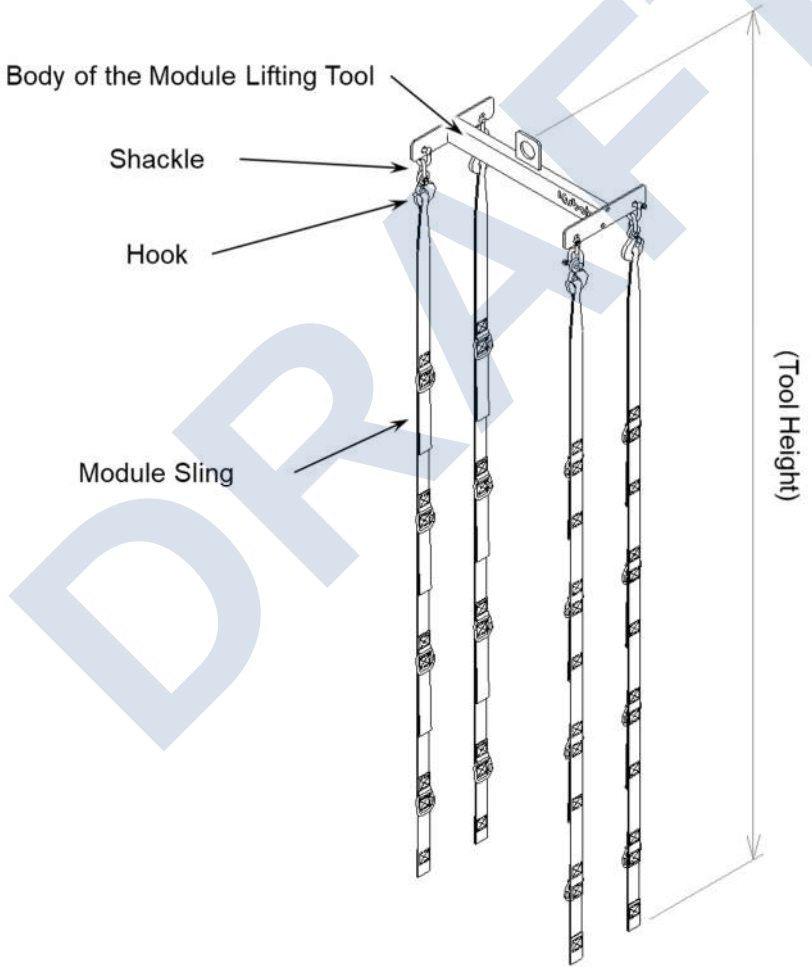

Fig. 3-1 Module Lifting Tool

DRAFT

Table 3-1 Components of the Module Lifting Tool and their Purposes

Components	Purpose
Module Sling	The Module Sling is used for connecting the Body of the Module Lifting Tool to Membrane Modules.
Hook	The Hook is used for connecting the Module Sling to the Body of the Module Lifting Tool.
Shackle	The Shackle is used for attaching the hook to the Body of the Module Lifting Tool.

Table 3-2 Specification of the Module Lifting Tool

Model	Applicable Membrane Unit	Weight*1 (kg)	Lifting Height (mm)	Allowable Maximum Load*2 (kg)
TGSPM004	SPC200 SP200 / 225-A	12	1,803	600
TGSPM006	SPC300 / 600 SP/300 / 600 / 338-A / 675-A	13	2,331	600
TGSPM008	SPC400 SP400 / 800 / 450-A / 900-A	15	2,859	600

*1 The "Weight" includes the weight of the Body of the Module Lifting Tool, Module Slings, Hooks, and Shackles.

*2 The "Allowable Maximum Load" is considered to endure the maximum weight when all the modules are clogged up by sludge.

3.1.3 Structure and Function

- Module Sling consists of Sub-Slings and Catch Rings as shown in Fig. 3-2. Attaching the Sub-Slings to handles of the Membrane Modules (see Pic. 3-1) enables to lift the maximum eight Membrane Modules at a time as shown in Fig. 3-3.
- Up to two (2) Membrane Modules can be hold by one (1) set of Sub-Slings. In that case, two (2) Membrane Modules will be lifted together as a pair as shown in Fig. 3-4.

DRAFT

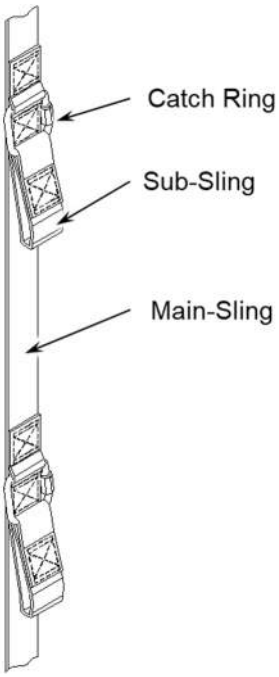

Fig. 3-2 Structure of the Module Sling

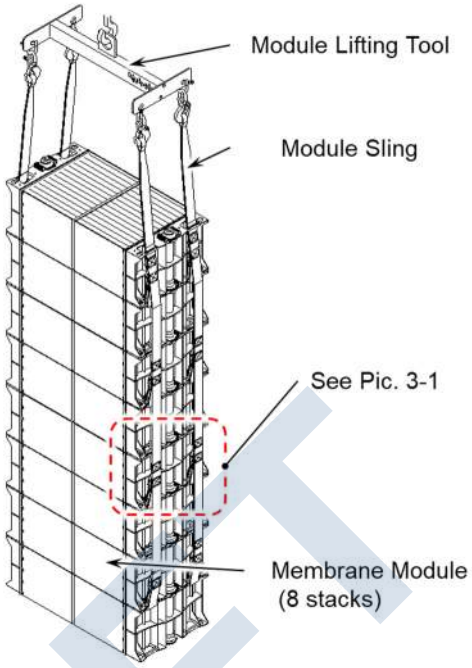

Fig. 3-3 Lifted Membrane Modules

Pic. 3-1 Sub-Slings attached onto handles of the Membrane Modules

DRAFT

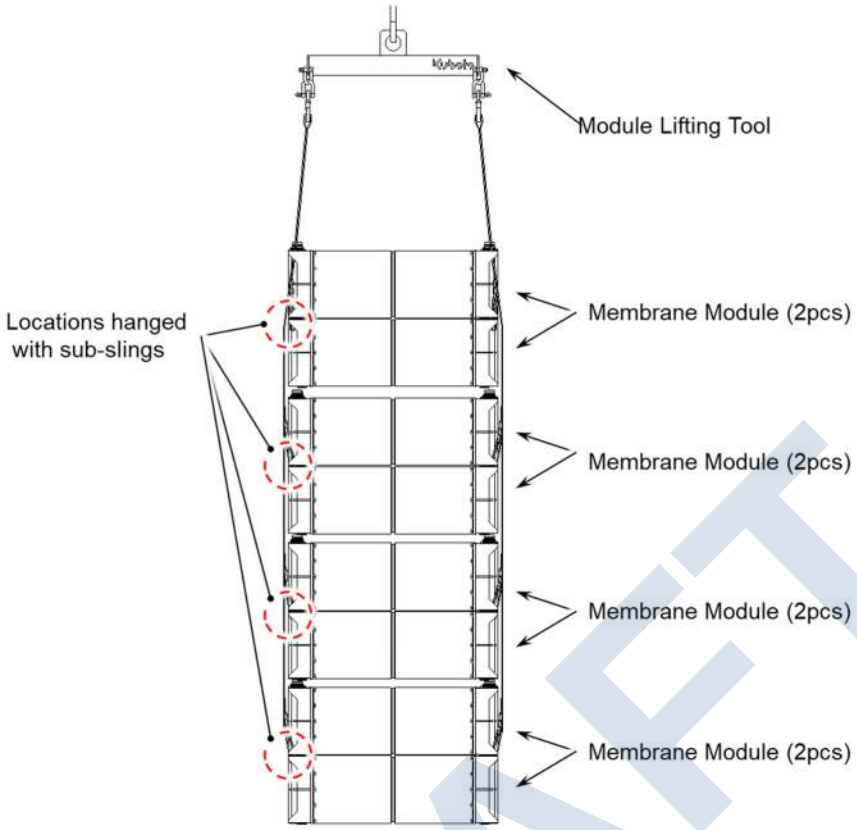

Fig. 3-4 Pairs of Membrane Modules Lifted Together

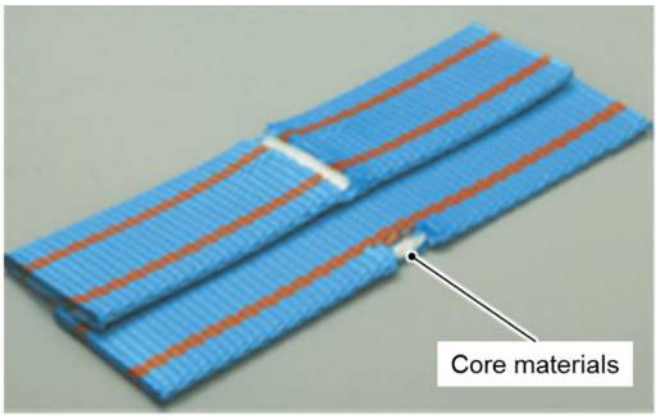
3.2 Before using the Module Lifting Tool

3.2.1 Compliance



Observe the applicable law and rules of each country and region. Particularly, works that require qualification or permission such as crane operation and slinging have to be conducted by a qualified person. Be sure to take safety measures such as scaffolding, safety belt, helmet, etc.

3.2.2 Prior-to-Use Inspection

Be sure to make inspection before using the Module Lifting Tool to check for abnormalities.

- Check the Body of the Module Lifting Tool, Shackles, Hooks, Module Slings, and Catch Rings connecting them for deterioration such as abrasion, crack, and/or corrosion etc.
- Check the Body of the Module Lifting Tool for coming-off of plating.
- Check the Shackles for looseness.
- Check the Body of the Module Lifting Tool for abrasion and deformity.
- Check the Module Slings for deterioration such as a cut, abrasion, scratch, broken stitch, discoloration, coloration, and melting.
- Do not use and immediately replace a sling belt if its core material is exposed as Pic. 3-2.

DRAFT

(The colors of the sling and the core material can differ depending on the model.)

Pic. 3-2 Sign of Replacement of the Sling Belt

Caution	**Before using Lifting Tools, make sure that they have no abnormality** Before using Tools supporting load, check if crack, corrosion, rust, abrasion, and deformation. Check Slings for abnormalities such as a cut, abrasion, scratch, broken, stitch, discoloration, coloration, fusion, and melting. Immediately replace the tools with abnormality. Continued use of them may cause human accident by product dropping.

3.2.3 Prior-to-Use Preparation

- Before mounting the Module Lifting Tool, ensure safety of workers by using scaffolds and safety equipment such as helmets and safety belts to prevent a falling accident. Do not climb on a Membrane Unit.
- When working in a tank, keep the working environment safe by measuring the required items including oxygen and hydrogen sulfide contents in observance of local regulations/standards of each country/region.

Danger	**Keep safe working environment in tanks** When working in a tank, keep the working environment safe by measuring the required items including oxygen and hydrogen sulfide in observance of local regulations/standards of each coutry/region. Failure to follow the procedure could result in a fatal accident such as anoxia.

Warning	**Take safety measures not to cause fall accident** Ensure safety of workers by installing handrails, scaffolds and safety equipment such as helmets, gloves, and safety belts to prevent a fall accident when installing or lifting Membrane Modules. Pay particular attention near the tank opening because the floor may be slippery by wetness. Do not climb on a SMU. Neglecting the safety measures may cause falling

DRAFT

Caution	**Wear adequate clothing and gloves such as cotton work gloves during work** Working in improper clothing or with bare hands may result in a caught-in accident or other unexpected injuries.

3.3 How to use the Module Lifting Tool

Ways of preparing and ways of using the Module Lifting Tool are explained here when Membrane Modules are pulled out of the Membrane Block. See "Instruction Manual for KUBOTA Submerged Membrane Unit™ (SP Type)" or "Instruction Manual for KUBOTA Submerged Membrane Unit™ (SPC Type)" for overall procedures including the steps where the Module Lifting Tool is not used (such as disassembling the Membrane Block) and the cautions when the Membrane Modules are temporarily placed on the ground.

3.3.1 Attaching the Module Lifting Tool to Hook of Crane

Directly attach the Hook of the Crane to lifting lug of the Module Lifting Tool.

3.3.2 Attaching the Module Slings to the Membrane Modules

The Module Slings can be attached to the Membrane Modules by attaching the Sub-Slings which are sewn on the Module Slings to Handles of the Membrane Modules.

(1) Preparation

- Detach the Module Sling from the Module Lifting Tool.

(2) Attaching the Module Slings to the Membrane Modules

- Reeve Eye of the Sub-Sling through the Handle of the Membrane Module from bottom to top*1, 2, 3.
- Open the Catch Ring which is located above the Sub-Sling and attach the Eye of the Sub-Sling to the Catch Ring.
- Close the Catch Ring.

*1 Start attaching the Sub-Sling from top Membrane Module.

*2 Attach one (1) Sub-Sling to both lower handle of the upper Membrane Module and upper handle of the lower Membrane Module together with when two (2) Membrane Modules are stacked (see Fig. 3-5).

*3 Attach one (1) Sub-Sling to upper handle of the Membrane Module if only one (1) Membrane Module is left over (see Fig. 3-6).

(3) Fall Protection

- Avoid drop of the Membrane Module during the lifting work by making sure that there are no slacks of the Catch Rings.

DRAFT

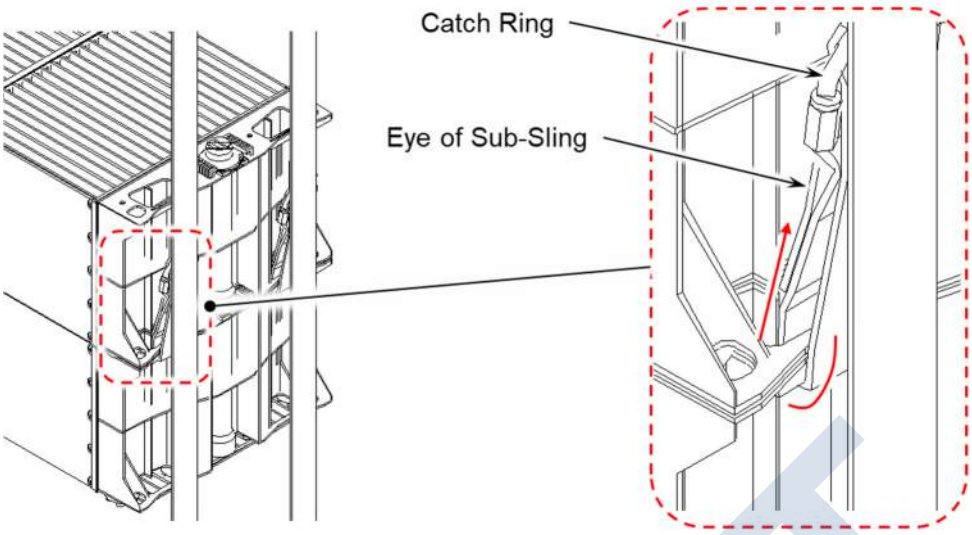


Fig. 3-5 How to attach the Sub-Sling (for two (2) Membrane Modules)

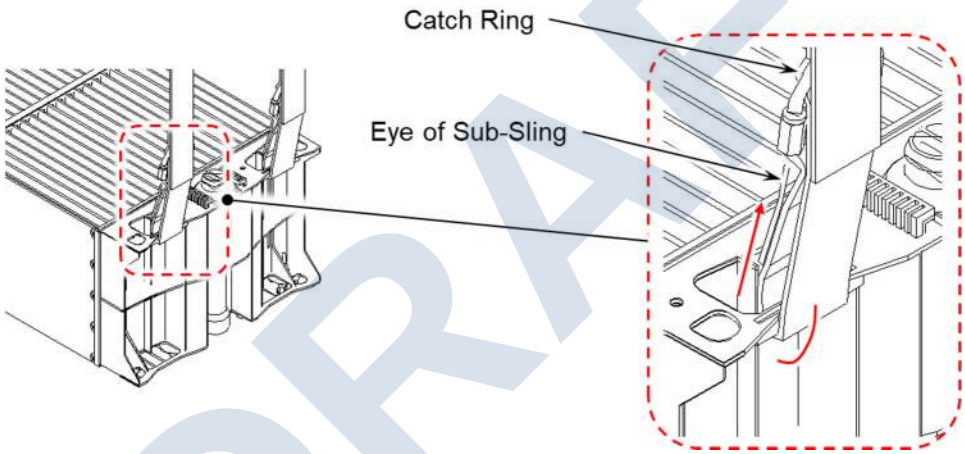

Fig. 3-6 How to attach the Sub-Sling (for one (1) Membrane Module)

3.3.3 Attaching the Module Slings to the Module Lifting Tool

(1) Attaching the Module Slings to the Module Lifting Tool

- Attach Eyes (4 pcs) at upper end of the Module Slings to Hooks (4 pcs) of the Module Lifting Tool (see Fig. 3-7).
- Be sure to attach all of four (4) Eyes to the Hooks in order to avoid two- or three-point lifting.

(2) Fall Protection

- Avoid a drop of the Membrane Modules during the lifting work by securely hooking the Eyes into the Hooks and latching the Hooks (see Fig. 3-7).

(3) Cautions

- Have all the Module Slings pass through inside the Frame of the Membrane Block when pulling Membrane Modules out of the Membrane Block. The Membrane Modules cannot be pulled out if a part of the Module Sling is passed through outside of the Frame.

DRAFT

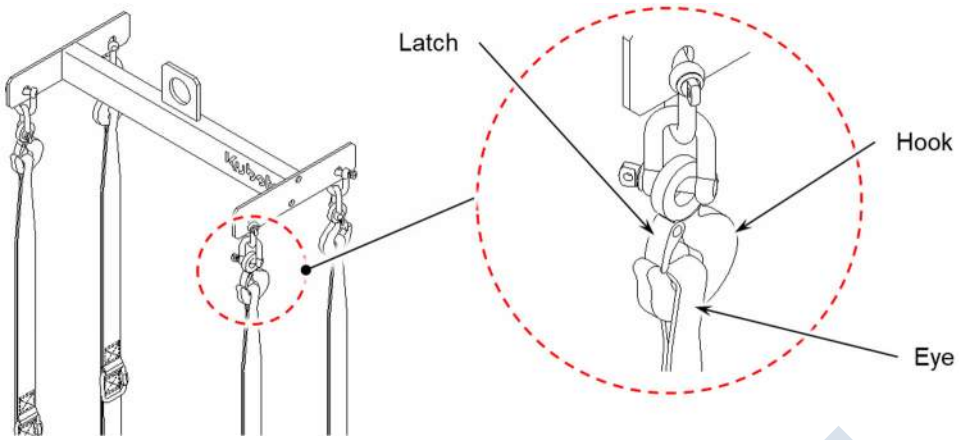

Fig. 3-7 How to attach the Module Slings to the Module Lifting Tool

Warning	**Never go beneath lifted Membrane Modules** If they fall down, fatal accident may occur.

Caution	**Before using Lifting Tools, make sure that they have no abnormality** Before using Tools supporting load, check if crack, corrosion, rust, abrasion, and deformation. Check Slings for abnormalities such as a cut, abrasion, scratch, broken, stitch, discoloration, coloration, fusion, and melting. Immediately replace the tools with abnormality. Continued use of them may cause human accident by product dropping.

Caution	**Conduct the lifting work by two or more persons** If a crane or chain block operator conducts all the work alone, his risk prediction ability will significantly decrease due to increased blind spots.

Caution	**Do not place your hand or head between a Lifting Tool and Membrane Modules** Do not place any part of your body between the Lifting Tool and the Membrane Modules. It may cause a fatal accident under unsafe operation or during an unexpected drop

Caution	**Be sure to check that there are no slacks of shackles or Catch Rings** If they drop off, Membrane Module may fall to cause human injury or equipment damage.

Caution	**Lifting Tool should be used by four point lifting** When lifting up Membrane Modules, always hang it at four points. If lifted at three or two points, it may drop or sing and result in a fatal accident.

DRAFT

Prohibited	**Never use the Module Lifting Tool for lifting other thing or for other purpose.** The Module Lifting Tool is for lifting up Membrane Modules safely. Do not lift other things or use for other purpose.

Important	**Select a level, flat floor to place Membrane Modules temporarily.** Before temporal placement of Membrane Modules, check the floor to be level, flat, and clear of intrusions or obstacles. If a Membrane sheet is broken by intrusion, trash or a stone, it cannot be used yet.

Important	**Always use the Lifting Tool** When lifting Membrane Modules, always use the Module Lifting Tool, it serves to lift them safely without excess load.

3.4 Temporary Placing of the Module Lifting Tool

Be sure to place the Module Lifting Tool on a flat level surface when placing the Module Lifting Tool temporarily.

3.5 Storage of the Module Lifting Tool

- Store the Unit Lifting Tool indoor to protect it from rain or other kinds of wetness or corrosive gas. Corrosion decreases the strength of the Unit Lifting Tool.
- Avoid direct sunlight in storage of the Unit Lifting Tool to slow down aging deterioration.

Caution	**Store the Lifting Tool without exposure to wetness or corrosive gas** Exposure to water or corrosive gas may cause corrosion of Lifting Tool, resulting in decreased strength and drop accident.

Important	**Prevent use of Module Lifting Tool by an outsider without permission or by mistake.** In selection of the storage place of Module Lifting Tool, pay attention not to be used by an outsider without permission or by mistake

DRAFT

CRITICAL INFORMATION / NOTES

1 PRIOR TO SHIPMENT - AERZEN DOES THE FOLLOWING
Removes V-Belts from the motor sheave and wraps them around the blower sheave
Locks the motor hinge plate
Always refer to the operations manual for determining the most suitable lubricant.
Operating and ambient conditions may impact which lubricant to use.

2 UPON ARRIVAL
Immediately remove stretch wrap from package when stored outdoors

3 LIFTING PACKAGE
Without Sound Enclosure: lifting eye holes in the corner of the base frame
With Sound Enclosure: lifting through slots in base with fork lift

4 READ OPERATION MANUAL FOR INSTALLATION INSTRUCTIONS
Call Aerzen After-Sales / Service if you have any questions

5 AT COMMISSIONING - CUSTOMER / CONTRACTOR IS TO
Check oil level (refer to operations manual) - and adjust if necessary
Anchor the base or sound enclosure
Make grounding connections
Connect motor cable per Aerzen Drawing IA-004545
Verify correct rotation of motor (counter-clockwise, looking at drive shaft)
Remove locking device from motor pivot plate
Reinstall V-belts
Apply the oil sight glass Sticker

6 **ALL CUSTOMER PIPING TO BE INDEPENDENTLY SUPPORTED**

7 Recommended MINIMUM clearance at front and rear of package for "normal"
(i.e. inspect machine, change oil, replace belts, etc.) maintenance is 32 inches.

Explanation and Summary
Lines 1), 2), 3). 4) above show required performance data (what was ordered).
Lines 5) through 11) show data that resulted from the performance test on the actual blower.
Line 9) shows a variance of 3.62% in the flow capacity of this unit.
Line 11) shows a variance of 0.08% in the power consumption of this unit.

Standard accepted tolerance is +/- 5%. The unit would be acceptable if the flow was no more than 5% below the expected flow and the power was no more than 5% of expected power.

For this specific case the flow is -3.62% **less than expected.**
For this specific case the power is -0.08% **less than expected.**

Serial number 1619621 **Model number GM 90S** **meets and exceeds the standard tolerance.**

EC Declaration of Conformity

according to the Machinery Directive 2006/42/EC, Annex II, No.1 A

Company Name : Aerzener Maschinenfabrik GmbH
Reherweg 28
31855 Aerzen
Germany

Product Details :

The Declaration of Conformity for this piston engine is supplemented by the technical details in the chapter entitled "Performance Data".
The details provided therein identify the product and must be applied together with this Declaration of Conformity.

Appointed agent for the compilation of the technical documentation : Mr. Irtel, Managing Director
Aerzener Maschinenfabrik GmbH
Reherweg 28
31855 Aerzen
Germany

We hereby declare that the aforementioned product complies with all relevant provisions of Machinery Directive 2006/42/EC for the conveyance and compression of gaseous media.

The aforementioned product also fulfils all provisions of the following relevant EC-directives:

- EMC / Electromagnetic Compatibility 2004/108/EC
- Pressure Equipment Directive 97/23/EC
- The protection targets of the Low Voltage Directive 2006/95/EC have been fulfilled in accordance with Annex I, No. 1.5.1 of the Machinery Directive.

The following harmonised standards were applied:

• DIN EN ISO 12100	03-2011	Safety of Machines - General Design Principles Risk Assessment and Risk Reduction
• DIN EN 1012-1	02-2011	Compressors and Vacuum Pumps - Safety Requirements - Part 1: Compressors

This Declaration of Conformity applies to the product in its original state as placed on the market by the manufacturer. Any retrospective changes and/or retrospective work undertaken shall void this Declaration of Conformity.

POSITIVE DISPLACEMENT BLOWERS

DELTA BLOWER GENERATION 5

Volume flows from 18 cfm to 8830 cfm

DRAFT

AERZEN

DELTA BLOWER.
A TOUGH ENDURANCE RUNNER IN COUNTLESS COMPRESSION PROCESSES.

DRAFT

Delta Blower Generation 5

Positive displacement blowers of the Delta Blower Generation 5 act as the driving force behind many processes, and are the beating heart of a strong machine combination. This generation of assemblies from AERZEN compresses more than 150 years of experience as a world market leader in blower development. And it is more innovative than ever. AERZEN has introduced many innovations with this young series.

They provide a large volume-flow range from 18 cfm to 8830 cfm. With reduced life-cycle costs and quieter operation. But one thing remains the same: This blower class remains highly robust, thoroughly reliable and has an extremely long service life. No wonder customers choose it for continuous, long-term applications - over years and decades.

AERZEN
Delta Blower

Applications
- Water and Waste water treatment
- Aeration
- Backwash of filters
- Pneumatic conveying of bulk materials
- Gas conveying
- Degassing
- Dedusting
- Generation of negative pressure
- Biogas treatment
- Vehicle operation
- Ship unloading
- Tunnel boring

and much more

Industries
- Wastewater treatment plants
- Chemistry and process engineering
- Power plant
- Cement and lime
- Foodstuff technology
- Paper industry
- Pharmacy and many more

Goods conveyed
- Granules
- Sugar
- Cement
- Cereals
- Carbon

and much more

VERSATILE
FOR EACH APPLICATION.

The versatile compact power packages of the Delta Blower series can be used in all climate zones of the world. Just as safe under the most difficult environmental conditions as in indoor installation. They work stand-alone or in a machine combination.

Versatility in figures.
Delta Blowers are strong all-rounders: The smallest assemblies are mounted on silo trucks. The largest machines operate in lifting systems. They unload transport vessels. With an hourly performance of up to 1,000 tons.

Control range between
25 % and 100 %

Volume flows from
approx. 18 cfm to 8830 cfm

Pressures up to 14.5 Psi
Negative pressures down to
-7.25 Psi

Nominal diameters
DN 50 to DN 400

DRAFT

Indispensable for power plant technology

Conveying of powdery goods

Powerful for ship loading and unloading

MACHINES AND SERVICES FROM AERZEN. IN USE WORLDWIDE AND HIGHLY AVAILABLE.

The extremely high load capacity of Delta Blower packages is legendary. Just like their proverbial reliability, their durability or their intelligent operating and maintenance concept. Why are the services of AERZEN an issue at all? Because service is a must. And because our worldwide wellpositioned service teams are an important decision criterion for plant operators: for blowers made by AERZEN.

It's the inner values that matter: the AERZEN blower stage

Made in Germany

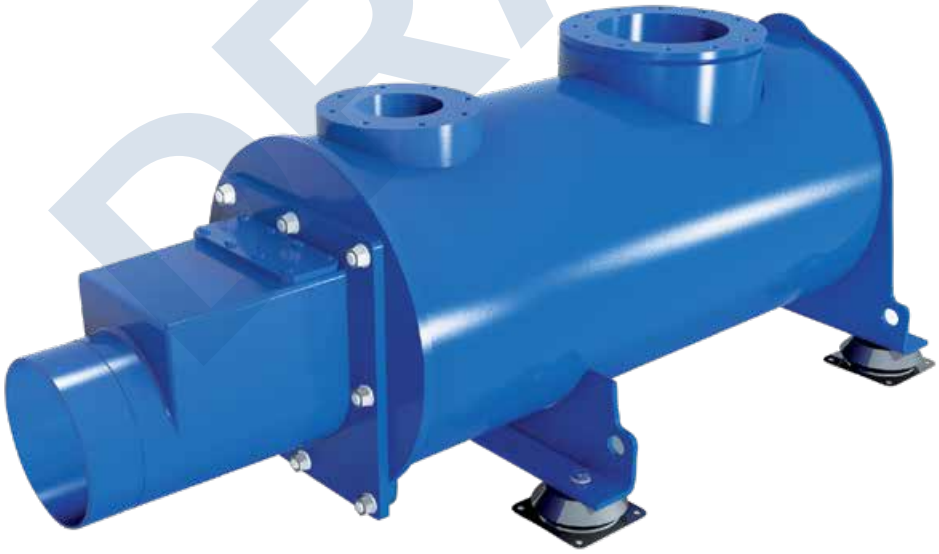
High availability.
The best blower packages are those that you do not notice. Because they are steadfast in their work. For years and decades. The Delta Blowers from AERZEN are such assemblies. AERZEN manufactures all core components itself.

From the assembly to the control system. From the idea to engineering and configuration. And thus ensures the high productivity of its machines. Our value contribution to the quality standard made in Germany.

On site worldwide.

Typical for AERZEN: The reliable availability of its solutions. This refers to our machines. And to our services. The fact that our service teams look after your systems over their entire life cycle protects the value of your investment. The fact that we have a dense network of 50 subsidiaries and agencies in more than 100 countries around the globe guarantees short distances. So we are quickly there for you - in case we are needed.

Safely AERZEN.



- Commissioning by qualified personnel
- Individual training of your specialist personnel
- Customer-specific service and maintenance contracts
- Machine repair also directly on site

Intelligently designed.

What does compact, easy handling or ease of maintenance mean? The value of these promises only becomes apparent in everyday practice. Just like these tangible benefits:

- Small footprint
- Flexible machinery mountings
- Easy to transport with forklift/lift truck
- Space-saving side-by-side installation
- Plug&play installation and commissioning
- Easy access to all wearing parts
- Oil level check from the outside while the machine is running
- Maintenance work such as oil and filter change from the front
- Low sound pressure level
- Belt drive for optimum volume flow design, subsequent power adjustment is quick and easy

Intelligent silencing: the AERZEN discharge silencer without absorption material

100 % clean.

How do we offer food suitability, avoid expensive cleaning or even production restrictions? We do not use absorption material for sound absorption. “Therefore, AERZEN made the base support a discharge silencer and reduces the noise exclusively by means of air deflections.

100 % free of absorption material, because this could wear out and contaminate the downstream system. By the way, the AERZEN base support is patented and certified as spark arrester for ATEX applications.

DRAFT

ROBUST BLOWER PACKAGE
READY TO PERFORM.

AERZEN belongs to the most innovative companies worldwide in the field of compressor technology. In 1868, we started manufacturing positive displacement blowers. By the way, we were the company that manufactured the first positive displacement blower in Europe. Since then, we have taken the performance features of this technology to the peak with every generation. Let yourself be surprised. Discover these special blowers: Delta Blower Generation 5.

Extremely robust blower package
- For a wide range of applications within a high control range from 25 to 100%
- Various modifications are possible

Compact design
- Space-saving side-by-side installation
- Small dimensioning of machine rooms

Easy operation and low-maintenance design
- Highly available at continuous operation even under toughest environmental conditions
- The front side is used for operation and maintenance

Plug&play Solution
- Completely configured, parameterized and ready for connection
- Integrated service kit with first oil fill

Oil-free as per class 0
- According to ISO 8573-1, certified by the TÜV (German technical inspection association)

Free from absorption material
- Suitability for use with foodstuffs in the pneumatic conveying of bulk materials (no impurities)
- Safety for energy-efficient productivity in the Water treatment (no sedimentation of absorption material in the aeration plates, no clogging of the aeration plugs, no pressure loss)

Integrated power supply panel (optional)
- Frequency converter, star-delta, direct, softstarter
- Intelligent AERZEN AERtronic control system

Smart oil system
- Oil level check while machine is running
- It can be read from the outside
- Oil instead of grease: Oil-lubricated bearings increase the service life

DRAFT

Advantages for the life cycle assessment
- Standard use of premium efficiency motors
- Suction on the cold side of the assembly
- Belt drive for optimal volume flow design
- Subsequent power adaptations are easily and quickly possible

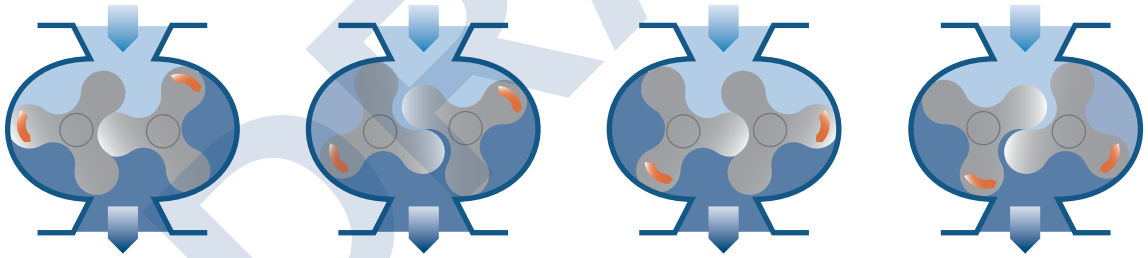
Belt tensioning hinged motor mounting plate
- Fully automatic and maintenance-free belt tension
- Inspection of V-belt tension no longer necessary
- Easy assembly or replacement of V-belts

Multifunctional hoist for hinged motor mounting plate
- Transport safety lock
- Easy and safe installation of V-belts
- Mobile installation of assemblies (e.g. ship installation/earthquake design)
- Hinged motor mounting plate support for heavy motors

Low noise level
- Safe control of the sound values, close to building areas and production areas
- Lowest sound values by optimised acoustic hood
- Integrated method for reducing pulsation (Patented AERZEN blower stage)

PED pressure-vessel guidelines approval (pressure safety valve)
- for overpressure operation

ATEX-compliant
- AERZEN base supports certified as spark suppressor for ATEX applications



TÜV-certified zone separation filter (optional)

DRAFT

INTERESTED IN THE INNER VALUES? CONSTRUCTION AND DESIGN.

It is good to know what is in the assemblies of the Delta Blower line from AERZEN: The wealth of experience of the world market leader. The quality standard of the traditional German family business. The innovation goal "Best solution provider for our customers". In addition first-class material selection. And a principle that has proven itself in tens of thousands of applications: Roots.

Innovation pulsation reduction.
Especially for its Delta Blower stages AERZEN has developed a unique process and integrated it into all sizes: the pulsation reduction. The patented AERZEN process prevents pulsations and noise already at the origin within the blower stage. For this purpose the AERZEN blowers equipped with 3-lobe pistons have two special channels cast in the cylinder. These control the backflow of the medium into the conveying chamber in such a way that the typical backstroke and squeezing pulses (typical for 2-lobe blowers) are eliminated. The end for pulsations due to patented interference method.

Conveying process in the AERZEN blower

Intelligent technical details ensure that the Delta Blower packages retain their value. One example of many: the patented pulsation reduction, an AERZEN innovation for longer bearing life.

DRAFT

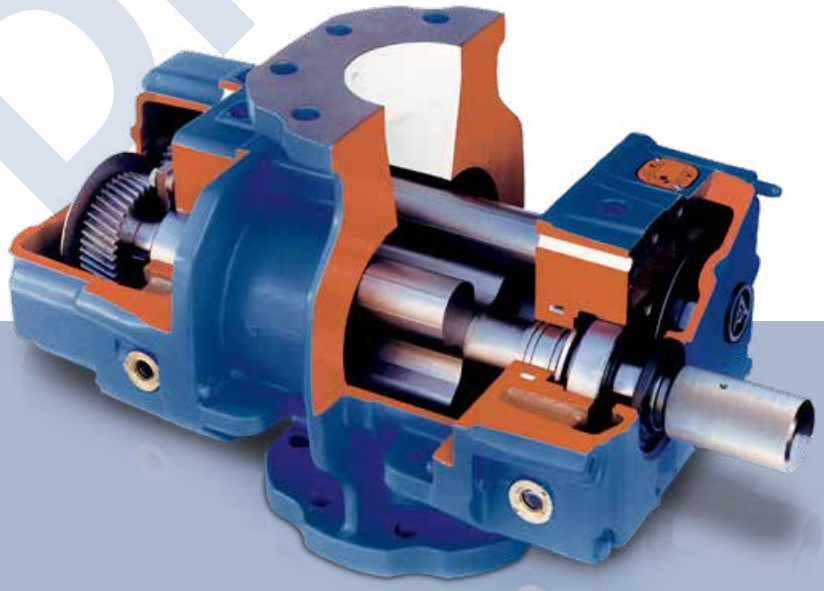
Blower stage
- AERZEN Blowers with 3-lobe pistons and integrated pulsation reduction
- Housing consisting of: Cylinder (with two cylinder with cast-in pre-inlet channels at discharge side to minimise the sound by pulsation reduction), wheel housing, housing cover and side plates
- Material EN-GJL-200
- Ribbed surfaces

Pistons

Sizes GM 3 S to GM 130 L:
- Pistons and shafts in one piece

Sizes GM 150 S to GM 240 S:
- Pistons made of nodular cast iron, shafts made of tempered steel

Drive type
- Overhung via narrow V-belt
- Direct drive



Cooling
- Convection cooling

Lubrication
- Oil splash lubrication for bearings and timing gears

Oil-free conveying
- The oil-free design according to ISO 8573-1 class 0 is guaranteed by the piston ring labyrinth seal, which has proven itself over decades, in combination with neutral chambers (open to the atmosphere)

Timing gears
- Hardened and ground, helically geared and made of case-hardened steel
- They are fitted to the shafts by taper interference fit
- maximum running smoothness and service life

DRAFT

It's the inner values that matter: the AERZEN blower stage

ALREADY IN THE STANDARD VERSION EXTRAORDINARY.

THE DELIVERY CONCEPT OF AERZEN.

Some call it comfortable. The others efficient. We call it all-in: the delivery concept of AERZEN. When the Delta Blower package comes to you, it is already completely configured, parameterized and mounted ready for connection at the factory. Naturally, this is tailored to your processes. Including all standardised accessory components for trouble-free operation at the touch of a button.

All in: The scope of supply in the normal version.

Assembly design: Overpressure

1 **3-lobe blower stage**
- With integrated pulsation reduction (see page 10/11)

2 **Base supports with integrated discharge silencer**
- Certified as spark arrester
- Absorbent-free silencing through patented discharge silencer

3 **Intake silencer with integrated air filter or strainer**
- Standard suction from the atmosphere (overpressure)
- Suction via piping optional (standard for negative pressure)
- Suction via filter element for negative pressure optional

Overpressure

Negative pressure

4 **Flexible rubber sleeve**
- with clamps

5 **Flexible machinery mountings**
- For the decoupling of structure-borne noise

6 **Pressure valve or suction valve**
- For machine protection

7 **Drive**
- Via high-performance narrow V-belt drive by means of three-phase motor
- Standard use of premium efficiency motors (up to motor size 447/9T)

8 **Hinged motor mounting plate**
- Automatic tensioning device for the belt drive
- Multifunctional hoist for hinged motor mounting plate

9 **Connecting housing**
- integrated check valve

10 **Integrated blow-off silencer**
- Horizontal version (up to DN 125)

11 **Standard instrumentation**
- Pressure gauge for indication of the conveying pressure (overpressure)
- Maintenance indicator for monitoring the intake filter (overpressure)
- Vacuum meter for indication of the conveying pressure (negative pressure)

Assembly design: Negative pressure

DRAFT

MODIFICATIONS AND ACCESSORIES.
THE BEST FOR EVERY APPLICATION.

Added value: The accessory components.

- Acoustic hood for indoor and outdoor installation, forced ventilation via mechanical fan
- Start unloading device, required for star-delta starting of the motor (overpressure),
- Vertical blow-off silencer with base plate (negative pressure)
- discharge side expansion joint instead of flexible rubber sleeve
- Power cabinet Star-delta, frequency converter, soft starter
- AERZEN AERtronic blower control
- AERZEN original spare parts
- Other accessories on request

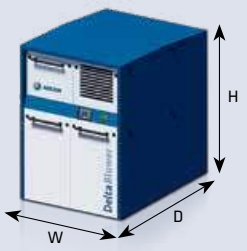
AERZEN Start unloading device

Modifications.

- Special motors
- Special varnish
- ATEX compliant design
- Acoustic hood for desert installation with special sand collector
- Acoustic hood for low temperatures down to negative 104°F with heating and gravity louvers
- Acoustic hood for earthquake resistance and increased wind loads
- Ship installation and vehicle deployment
- Use for special gases through the use of special materials
- Customised documentation
- Compliance with legal requirements for delivery e.g. in Eurasian customs union

Always the safe choice: ATEX compliant design from AERZEN

The new AERtronic - the way into the digital future.
The new edition of the AERtronic control system offers a user-friendly and clear possibility for the analysis and processing of relevant process parameters and thus provides more transparency, safety and efficiency. All measured values converge in the new control system and can be transferred to the production control system via common interfaces in order to always operate the plant at the optimum operating point. The AERtronic is available in three versions:



Basic: As a fully digital display instrument
Advanced: For active process control
Premium: As an intelligent interface with cloud compatibility.

MATURED TO PERFECTION IN 150 YEARS: THE SERVICE WORLD OF AERZEN.

The best kind of service is the kind you don't need. But every technology involves wear and tear. Our machines are designed to do their job for as long and efficiently as possible. If necessary, for decades. The goal of AERZEN Services is to extend service life and availability – simple added value for your investment!

Benefit from AERZEN OEM competence - at any time and anywhere

With your OEM's best recommendations.
We have been manufacturing quality products for over 150 years. At the same time, we also developed a corresponding service world. With tailor-made offers for every phase of your machine's lifespan. With OEM original parts, reliable logistics and excellent service at its core. And with decentralised service centres in your vicinity, which guarantee fast provision of spare parts and competent service - worldwide.

AERZEN on-site service.
Our service teams work where our machines are. All over the world. Onshore or offshore. Often under extreme conditions. How do we do it? With short distances. AERZEN has a dense network of service centres and decentralised parts warehouses around the globe. More than 200 excellently trained service technicians can come to your aid from there. Any time and anywhere you need us.

Contact worldwide

2,500 employees work for AERZEN. On every continent. With six sales offices in Germany alone, we're there for you. And with 50 subsidiaries in over 100 countries around the world. Hence we're never far away – should you ever need us. Give us a call:

+49 5154 81 0

Service-Infoline

Our German Service Centre is available for customers and operators. We are happy to help you. We look forward to your call:

+49 700 49318551

Customer Net

Where you can learn more about the company and the leading compressor technologies from Aerzen? It's simple: In our Customer Net on our website, where we have stored everything that is worth knowing for you:

DRAFT

AERZEN. Compression - the key to our success.

AERZEN was founded in 1864 as Aerzener Maschinenfabrik. In 1868, we built Europe's first positive displacement blower. The first turbo blowers followed in 1911, the first screw compressors in 1943, and in 2010 the world's first rotary lobe compressor package. Innovations "made by AERZEN" keep driving forward the development of compressor technology. Today, AERZEN is among the world's longest established and most significant manufacturers of positive displacement blowers, rotary lobe compressors, screw compressors and turbo blowers. AERZEN is among the undisputed market leaders in many areas of application.

At our 50 subsidiaries around the world, more than 2,500 experienced employees are working hard to shape the future of compressor technology. Their technological expertise, our international network of experts, and the constant feedback we get from our customers provide the basis for our success. AERZEN products and services set the standard in terms of reliability, stability of value and efficiency. Go ahead – challenge us!

Delta Blower (G1-068-10)_Aerzen USA
12|2022

AERZEN DELTA BLOWER GENERATION 5
North American Standard
Positive Pressure

Standard range

Blower sizes: ..... GM 3S to GM 150S

Package nominal sizes: ..... 2” (DN 50) to 12” (DN 300)

Medium: ..... Air

Flow range: ..... 35 to 5297 icfm (1.0 to 150 m^3/min)

Differential pressure: ..... 15 psi (1000 mbar) for “S” and 10 psi (700 mbar) for “L” machines

Maximum operating temperature: 285ºF (140ºC)

Drive: ..... V-belt drive with totally automatic belt tension adjustment

Introduction

The Aerzen Blower is renowned for its performance and its reliability. There is no secret: From the blower-stage through the accessories, Aerzen enhances key features of each component by applying sound engineering, precision machining, and superior workmanship.

The Delta Blower Generation 5 (G5 for short) is the synthesis of four previous Aerzen blower package generations combined with an array of new technical innovations to provide five key advantages to our customers:

- The machinery noise level has been lowered yet another 6-8dBa[1] on average compared to the previous Delta Blower
- The blower package is even more user friendly especially in transport, installation, operation, and maintenance
- The oil level is visible from the outside of the package, so the blower does not need to be shut down
- No absorption material is used in the discharge combination silencer; this eliminates the possibility of foreign objects contaminating the air or gas stream
- Use of a shaft mounted cooling fan, which reduces installation and operating costs by eliminating extra wiring, motor starters, and its interlocking with the main blower motor
- The compact footprint allows units equipped with sound enclosure to be mounted side-by-side since there is only one main maintenance access side

[1] Measured in 1m free-field conditions

DRAFT

Aerzen Delta Blower Generation 5 are pre-engineered modular compact packages, which offer a wide range of options from proven and standardized components at reasonable costs and short delivery times.

Shipped completely assembled, the Aerzen Delta Blower Generation 5 is indoor and outdoor rated. There is no extensive installation work - neither grouting nor special anchoring is required, just simply level it and bolt it to any standard industrial flooring or surface.

Scope of supply: basic configuration

- Aerzen Rotary Lobe Blower stage
- Combination Base Frame / Silencer combined with hinged motor plate for automatic belt tensioning – with 2 ½" diameter discharge pressure gauge
- Making belt changes as easy as possible a motor hinge plate lifting and locking mechanism is included with DN100-300 units and a hydraulic bottle jack is supplied with DN50 and 80 units.
- Set of vibration isolating mounts under the entire blower package
- Inlet silencer – filter with filter maintenance indicator
- Narrow V-belt drive and protection guard
- Pressure safety valve
- Discharge manifold with integral check valve and flexible pipe connector
- Standard paint system
- NEMA electric motor TEFC, Premium efficiency, VFD duty, with conduit box on top
- First oil fill and "Service kit"
- Packaging for domestic trucking
- Standard documentation in electronic format: English language, drawings with US-customary and metric units of measure

Standard options include (not limited to)

- Inlet pipe connection kit
- Sound enclosure with skid / oil-drip pan and forced ventilation
- Start-unloading valve Aeromat, with or without solenoid valve
- Pressure modulating valve Aeropress or Aeropress10S, pilot operated
- Other motors, e.g. misc vendors Premium Efficiency with conduit box on top
- Instrumentation & controls, e.g. AERtronic Aerzen blower controller

DRAFT

Description of the main components

The combination of key components marked with a * in the description below significantly contribute to the reliability and performance of the Aerzen Blower:

At the heart of the package: The Aerzen Rotary Lobe Blower

Low vibration and low pulsations - a key feature:

* Internal pulsation interference channels in conjunction with 3-lobe rotors reduce the pulse in the discharge air stream by as much as 90% or 20 dB at the lobe-passing frequency. This significant attenuation contributes strongly to reducing vibrations in the entire package and lowering the noise emitted by the downstream piping.

Positive displacement characteristic:

- The blower moves a fixed volume of gas with each shaft rotation, nearly independently from the operating pressure.
- At constant differential pressure, the load torque remains constant.
- For a given pressure, the power is directly proportional to the speed.

Flow across the blower stage:

- Vertical from top to bottom

Drive shaft location:

- On the left when facing the blower shaft

Rotation:

- Counterclockwise when facing the blower shaft

Housing:

- The central section, “the cylinder” and the two side-plates house the rotors, while a gear case and a drive end cover contain the lubricating oil for bearings and gears. Individual side plates allow for optimal setting of the radial rotor clearances: a valuable feature on blowers with the gas flowing perpendicular to the rotors.
- Connections: full-size, flat-faced flanges
- * Maintaining internal alignment under all operating conditions is paramount for the reliability of any rotating equipment. The housing is, for this purpose, designed to support the entire blower stage on its outlet flange only; no need to worry about a “soft foot” or uneven base support
- Materials: Gray cast iron EN-GJL-200 equivalent to ASTM A48 Cl.30 AISI A278 Cl. 30

DRAFT

Rotors:

- Up to and including the model GM 80L, rotors and shafts are made of a single, drop forged steel piece made from C45 steel equivalent to AISI Type 1045. Models GM35S, 50L, 90S, and 130L are made from a single piece of EN-GJS-500-7 nodular cast iron equivalent to ASTM A 536. Model GM150S rotors are comprised of a through shaft made from C45 steel equivalent to AISI Type 1045 and a rotor made from EN-GJS-400-15 nodular cast iron equivalent to ASTM A536 Gr. 60-40-18. Solid or dust-tight rotors do not have any open cavities that can trap contaminants. This is particularly important in food applications and applications requiring high purity. Moreover, rotor balance is maintained, and vibration is therefore minimized.
- Stiff rotor design: the rotors' first critical speed is always at least 10% above the maximum operating speed.
- The rotors meet or exceed the ISO 1940 / ANSI S2.19 G6.3 criteria of dynamic balancing

Timing gears:

- Helical gears with hardened and ground teeth to meet AGMA 12 quality standard with an AGMA service factor of 1.70.
- To maintain the advantage of high-quality gears, the gear wheels are secured onto the shafts by means of a tapered interference fit. Optimum concentricity is achieved and neither gear hub nor shaft keys are used. To prevent damaging the seats, gear installation and removal are carried out using hydraulic pressure to expand the gear wheels within their elastic limit.

Bearings:

- The rotors are supported by anti-friction bearings
- The bearings are housed in the side-plates and are sized for an expected 5 years between overhauls.
- The drive-shaft bearing is a cylindrical roller bearing whereas the other bearings are selected to achieve the proper clearances between rotors and housing, axial loads from the helical bearings: smaller machines up to GM 50L feature double angular ball bearings.

Lubrication:

- Oil splash lubrication of all bearings and gears through oil spray disks on both blower ends
- An oil sight glass is provided on each oil sump.
- An oil drain valve is provided on each oil sump (units without sound enclosure). The oil drain valves are directly mounted to the oil sump covers for clean, easy and fast oil change.
- Units with sound enclosure are plumbed together to an oil reservoir that serves as oil fill and drain device, and its oil sight glass is visibly mounted to the maintenance side of the enclosure.
- Aerzen USA provides the first oil fill with a lubricant as recommended in the operating manual as well as a service-kit containing oil fill funnel, and oil drain hose.

Seals at the rotor chamber:

- The rotor chamber is sealed from the oil chambers by four, all metal, non-rubbing seals, each consisting of the following components and in that sequence:
  - Oil slinger ring
  - Two restrictive piston-rings in a labyrinth
  - "Neutral chamber" located between the piston rings used for venting the seal
  - Two restrictive piston-rings in a grooved labyrinth bushing

Seal at the drive shaft:

- Double, permanently lubricated Viton seal ring
- Shaft sleeve: replaceable, hardened steel

DRAFT

Testing

- Each blower stage is subject to a full-load test to verify the volumetric flow and power values.
- Acceptance criteria are +5% on power and –5% on flow for all machine sizes.
- Orifice flow measurement and conversion of results to the operating conditions in accordance with ISO 1217, simplified

The package component Aerzen Rotary Lobe Blower

Intake air silencer & filter

- Absorption-type silencer upstream of the air filter element. For reasons of cleanliness, there is no silencing material between the filter and the inlet blower flange.
- The carbon steel housing is powder coated. Quick-release latches for quick access to the filter element
- Filter performance: G4 per EN 779 (greater than 90% of synthetic dust particles), equivalent to ASHRAE 52.2 MERV 7 (50-70% @3-10 microns)
- Progressively compressed, thermally bound polyester fibers, free of PVC, smoothened and compressed on the clean airside for highest dust separation and retention capacity. The filter media is made of a single, 30 mm thick continuous mat that is white in color and is food safe. Filter element mounts with a quick release turn and lock arrangement.
- Included is a filter maintenance indicator. If the sound enclosure option is selected, the filter maintenance indicator is mounted to the enclosure wall.

Base with integral discharge silencer:

- In addition to the blower's internal pulsation cancellation feature, the combination discharge, three-chamber reactive silencer is used to further reduce the noise and residual pulsation in the air stream across a wide range of operating speeds. The residual pulsation downstream of the silencer meets or exceeds the API 619 recommended 2% peak-to-peak of the absolute line pressure.
- The discharge silencer is combined with the support base into one compact rugged unit. It is made from pressure vessel steel it forms a torsion resistant cylindrical vessel supporting the blower stage and other components.
- The mounting surface for the blower is a full-size steel flange machined and continuously welded to the base with the full number of tapped holes for the studs to fasten the blower to the base - no need to align blower feet or to worry about a soft-foot condition. A surface sealant is used instead of a gasket.
- Maximum operating pressure: 1.1 bar gauge (16 psig) and 150ºC (300ºF), built and certified to the latest European Pressure Vessel Code, PED. Test pressure: 1.9 bar g. (27.6 psig)
- The base is mounted on a set of vibration-isolating mounts

DRAFT

Belt drive

- Narrow, anti-static V-belts
- Selected for a minimum service factor of 1.4 times operating power (BHP), or 1.1 times the motor nominal power (nameplate HP), whichever is greater.[2]
- * The Aerzen Delta Blower Generation 5 package provides entirely automatic tensioning of the belts. Thanks to the package configuration, the drive geometry is such that the motor hinges parallel to the motor shaft centerline, using only the motor mass to maintain this tension without need for adjustments or springs. This not only reduces maintenance; it also reduces the potential for operating with too little (slipping belts) or excessive belt tension (excessive bearing and shaft load).
- DN100-300 blower packages feature a multipurpose lifting device for the motor swing plate. In its most basic function, it serves as shipping locking device preventing the motor from unwanted movement. It also serves as the lifting mechanism for changing out the drive belts. Another additional purpose is limiting the belt tension when oversized motors are used. Finally, the device can be configured to aid limited movement for seismic or mobile blower package service. The maintenance kit provided by Aerzen USA also includes a ratchet wrench used for lifting the motor to change V belts.
- DN50 & DN80 blower packages have a simple to use bracket and hydraulic jack included in the maintenance kit to lift the motor and change or install the belts.
- Sheaves and bushings are dynamically balanced to ISO 1940 / ANSI S2.19 G6.3. For linear tip speeds > 6500 ft/min (33 m/s), nodular cast-iron, ventilated sheaves are used.

Belt guard

- OSHA compliant personnel guard, made of galvanized steel: either perforated steel or solid sheets with vents, depending upon the model.
- Units with sound enclosure feature hand protection fan and belt guards, and the enclosure itself serves as the ultimate protection device. The removable maintenance panels comprise lockable latches that help facilitate OSHA prescribed tag-out-lock-out procedures.

Vibration isolating mounts

- A set of vibration isolating mounts are located under the blower package to hinder the transmission of structure borne noise from the blower and the discharge silencer into any structure the package is installed on, such as a mounting skid if supplied with acoustic enclosure.

Discharge manifold

- Flange-mounted to the discharge silencer, the discharge manifold serves for mounting the pressure safety valve, an optional start-unloading valve and for connecting the blower package to the discharge piping.
- Materials of construction: Gray Cast Iron EN-GJL-250 equivalent to ASTM A48 (Aluminum stub pipe for DN50)
- The discharge manifold houses the discharge check-valve

Pressure safety valve

- DN100-300 blower packages have a vertically mounted, spring loaded, safety pressure valve sized for the full flow of the blower. DN50 and DN80 blower packages feature horizontally mounted safety relief valves.

[2] Higher values are not necessarily better as they could lead to belt slippage due to excessive stiffness, and also shaft damage (deflection) caused by higher tension values required by over sized v-belt drives.

DRAFT

- The valve's characteristic is nearly proportional. It not only opens, but also closes at the set pressure
- The valve has a built-in dampener that allows the valve to actuate smoothly, which prevents the "pop-off" effect commercially available valves exhibit.
- Pressure rise up to 10% at full flow. Certification of conformity to PED
- Being an all-metal valve, it is not suitable as a pressure modulating valve. If this function is needed use an Aerzen pilot operated Aeropress or Aeropress10S pressure modulating valve.
- Materials: seat of gray cast iron and, depending on the size, a brass or anodized aluminum bell and piston, galvanized spring, steel spring rod, and an aluminum or fabricated external steel cylinder.
- Standard set points are 15.2 psig (1050 mbar) for "S" model blowers operating above 10 psi (700 mbar), and 10.9 psig (750 mbar) for all machines operating under 10 psi (700 mbar), including all "L" model blowers[3].
- The valve protects the blower stage against line surges, and spikes. It does not protect against prolonged overloads or excessive discharge temperature. Therefore, it is not an absolute protection device, nor is it "bubble tight".

Discharge check valve

- A full-bore check valve that can be easily removed for inspection and maintenance without disconnecting the discharge piping[4]
- With its horizontal top-located steel shaft[5], the check valve naturally closes by gravity at no-flow.
- Without any springs, the check valve will not chatter, even at low flow conditions (for example in adjustable speed applications)
- Flap material: EPDM on steel for operating temperatures up to the blower limit
- Optional check valve flap material: Silicone rubber

Discharge flexible connector

- A reinforced silicone-rubber discharge flexible connector with heavy-duty clamps connects to the discharge piping.
- It prevents the transmission of structure-borne noise from the blower and its discharge silencer to the discharge piping.
- Located downstream of the silencer and with only a small gap (~1/2") between the package and the pipe, the noise sent to the outside is maintained at a minimum.
- The sleeves are sized for standard, schedule 40 pipe diameters.

Discharge pressure gauge

- Liquid filled, 2 ½ "dial. Units: mbar and psi
- If the sound enclosure option is selected, the discharge pressure gauge is mounted to the sound enclosure wall.

DRAFT

[3] The valves are adjustable, and different springs are available for other set points depending upon operating conditions, motor limitations, or customer's requests.

[4] Except DN50

[5] Except DN50

Optional sound enclosure

- — Covering the entire blower package with the drive motor, the enclosure provides suitable protection for outdoor installation up to 50 mph winds and 25 lb/ft^2 snow load and rain at a 45º angle
- * — The enclosure and the blower package are both mounted on a skid / oil-drip pan, designed for meeting environmental protection standards as well as for easy transportation and installation.
- * — The unique Aerzen package design makes it possible to mount multiple blowers side-by-side without hindering access to the maintenance side (front). All pipe and wiring connections are made from the backside. This offers the best use of available floor space.
- * — All maintenance activities can be carried out from the front of the package, e.g. air filter, belts, and oil maintenance. The oil level is visible from the outside and eliminates any guesswork. Oil can be filled and drained from a common reservoir that also houses the oil level gauge.[6] The oil level check can be done with the blower in operation.
- — The enclosure reduces the package noise level to less than 80 dB(A) – 75dB(A) in most cases- at 1 m, free field, per DIN 45635.
- — Quick release panels, each less than 50 lb (as mandated by MSHA) provide quick and easy access to the blower and the package components for routine maintenance.
- * — Blower packages are fitted with a shaft-mounted cooling fan for sufficient heat removal. There is no need for a separate electric driven fan and required interlock and controls.
- — Aerzen mounts the blower package in the sound enclosure at our factory prior to shipment.
- * — Panels are made of galvanized steel sheet, with self-extinguishing, non-dripping high-density polyester foam as absorption material.
- — The enclosure is powder coated in a UV resistant Aerzen Royal Blue color, accented with light gray maintenance panels

1. General notes

- This description serves as guide for the operation of the hinged motor lifting device.
- Usage requires special knowledge in using and handling this kind of machine.
- For correct operation of the hinged motor in the Delta unit, qualified and trained specialists are required.
- Only use envisaged and suitable tools for adjusting the hinged motor.

Every person involved in the adjustment of the hinged motor should read and understand this description and the corresponding operating instructions and especially the safety instructions!

WARNING!
Danger of injury if insufficiently qualified!
Incorrect use can lead to considerable personal injury and property damage.

- All actions should therefore only be carried out by adequately qualified specialists.

Specialists
are due to their technical training, knowledge and experience as well as knowledge of the relevant provisions able to carry out all work assigned to them and to recognise and avoid possible dangers.

Only personnel are allowed to work whom it can be expected to carry out the work in a reliable manner.

Persons whose responsiveness is influenced due to drugs, alcohol or medication are not allowed.

Age and job-specific regulations should be taken into consideration with the choice of personnel.

DRAFT

Typ / *type*		
Delta Hybrid Delta Blower Generation 5 Delta Screw Generation 5		

2. Safety information

The hinged motor should only be set or adjusted when the machine is not in operation and secured against reactivation!

Securing against reactivation

The machine should be secured against reactivation for all actions that require the machine to be in a non moving condition (e.g. work or fault rectification).

WARNING!
Lethal danger due to unauthorised, uncontrolled or impermissible reactivation!
Unauthorised or uncontrolled reactivation of the machine can lead to serious injuries or death!
Persons could be in the hazardous area.

Applying power can lethally injure these persons.
- Secure the main switch and lock.
- Signs should be placed on the main switch and users informed of the possible dangers.
- Before reactivation ensure that all safety equipment is assembled and fully functional and that there are no dangers existing to persons.
- Always adhere to the following procedure for securing against reactivation.

1. Switch off energy supply.
2. Secure the main switch using a lock which should be locked and a relevant sign should be placed on the main switch.
3. The key should be kept safe with a responsible person.
4. If the main switch cannot be secured, relevant signs should be placed indicating the dangers.
5. After all work is completed check that there are no persons in the hazardous area.
6. Make sure that all protection devices are installed and fully functional.
7. Unlock the main switch and remove the signs.

DRAFT

Typ / *type*

Delta Blower Generation 5
Delta Screw Generation 5

CAUTION!
Danger of injury due to sharp edges and pointed corners!
Sharp edges and pointed corners can cause abrasions and cuts to the skin.
- Proceed carefully when working near sharp edges and pointed corners.
- If in doubt wear protection gloves.

WARNING!
Danger of injury due to moving and rotating components!
Moving and rotating components can cause serious injuries.
- Correctly take the machine out of operation and secure against reactivation before adjusting the hinged motor.
- During the adjustment of the hinged motor do not touch or grasp any moving components.
- Wear close fitting protective clothing with a low tear resistance when in the hazardous area.

WARNING!
Shear and crushing danger due to moving parts!
Moving components can cause shear and crushing injuries.
- Do not grasp between any moving components when working on the hinged motor.
- Never enter the swivel range of the hinged motor.

DRAFT

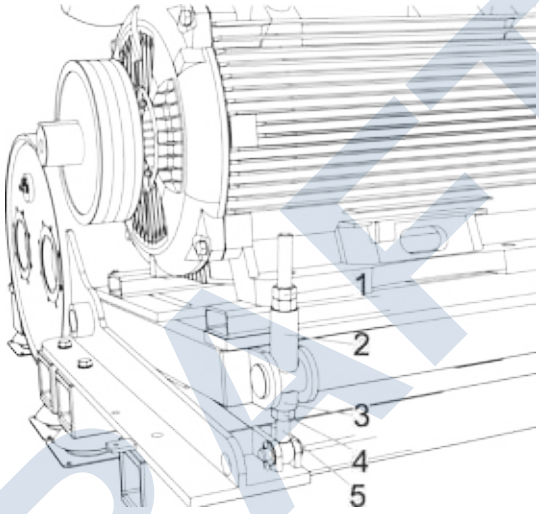
- Only use the ratchet spanner and the original mounting material that were delivered to adjust the hinged motor!

- The hinged motor should not rest on the guide bushing when in the operating position.
  Exception: Hinged motor support for motors with increased weight.

  Otherwise the belts slip and wear out sooner.
  Danger of property damage!

  The hinged motor should also have sufficient space to place the guide bushing after the belt has stretched.

Design with acoustic hood



- After adjusting the hinged motor correctly close the acoustic hood.

DRAFT

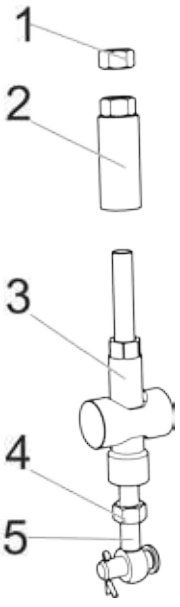
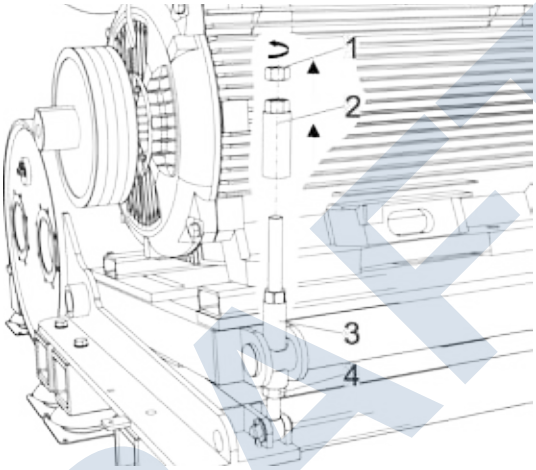
3. Delivery condition



Factory delivery condition / without drive belts.

Fixed hinged motor / transportation lock



4. Assembly overview

Pos.	designation
1	Locking nut 1
2	Locking sleeve
3	Guide bushing
4	Locking nut 2
5	Eyebolt

DRAFT

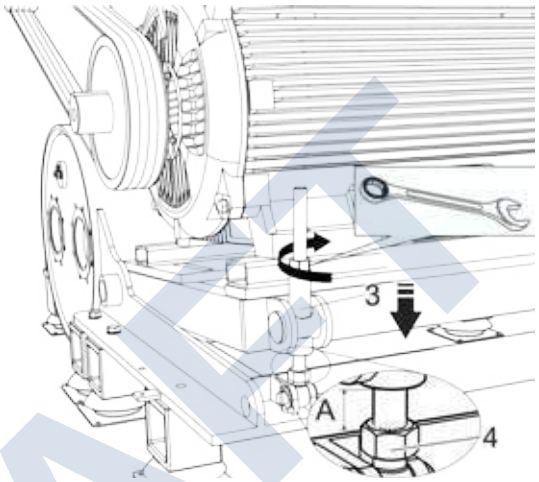
5. Adjusting the hinged motor before commissioning

- Disassemble locking nut (1) and locking sleeve (2).



Check to direction of rotation
Observe the red direction of rotation label on the unit.
Briefly start the drive motor. (approx. 1 - 2 seconds)

Important: WITHOUT belt on the motor disc!

Incorrect direction will destroy the unit!
Direction of the drive motor and the unit must be the same.

- Mount the belt.

DRAFT

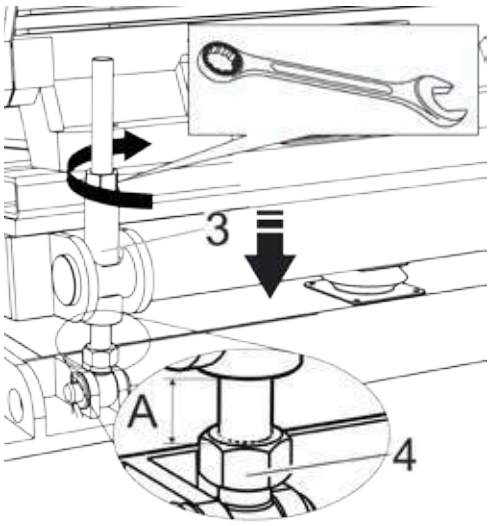
Pre tension the belt



- Screw down the guide bushing (3) with the ratchet spanner.
- The hinged motor is still slightly on the guide bushing (3).

Adjust dimension A

- Adjust the locking nut (4) to dimension A.
- Turn the guide bushing (3) onto the locking nut (4) with the ratchet spanner.

8. Operating condition
Truck, ship and earthquake preparation

DRAFT

9. Adjustment of the hinged motor for rocker support

Prepare the lifting device as with normal use.

Lower the hinged motor until the belt is tensioned.

- Check the belt tension.
- If the belt tension is incorrect, lock the guide bushing (3) and the locking nut (2).
- Check the belt tension after the following intervals and adjust if necessary:
  after 24 op. hrs. after 500 op. hrs after 4000 opt. hrs

DRAFT

Belt tensioning

1. Set the testing force via the profile type.
2. Determine the disc diameter **dk** on the drive and derive from this the indentation depth **E.**
3. Calculate the indentation depth**Ea** with the existing axial distance **e.**
4. The testing force **f** is to be asserted in the middle of the axial distance **e** on the drive belt. The testing force should be exerted vertically on the strand! Pretension the drive to the calculated indentation depth **Ea.**

Pretension example: **Profile** = SPZ; **dk** = 100 mm; **e** = 380 mm; **f** = 2.5 daN; **E** = 2.00 mm; **Ea** = 7.6 mm

The drive belts should be re-tensioned after 30 min. of operation and be checked if possible after 24 hours.

e = axial distance
E = indentation depth every 100 mm axial distance
E_a = indentation depth of the strand
f = testing force

$$E_a = \frac{E \cdot e}{100}$$

Profile	Testing force f for each drive belt (daN)	Diameter d_k (mm)	indentation depth E (mm) each 100 mm Strand length with initial assembly	indentation depth E (mm) each 100 mm Strand length in operation after running in.

G-5 Combination Base - Discharge Silencer

Description: Combination base - discharge silencer

Base/discharge silencer includes three-chamber reactive silencer built as a pressure vessel, blower mounting-flange with studs, discharge connection with integrated check valve, hinged motor plate, entirely supported on vibration isolating feet.

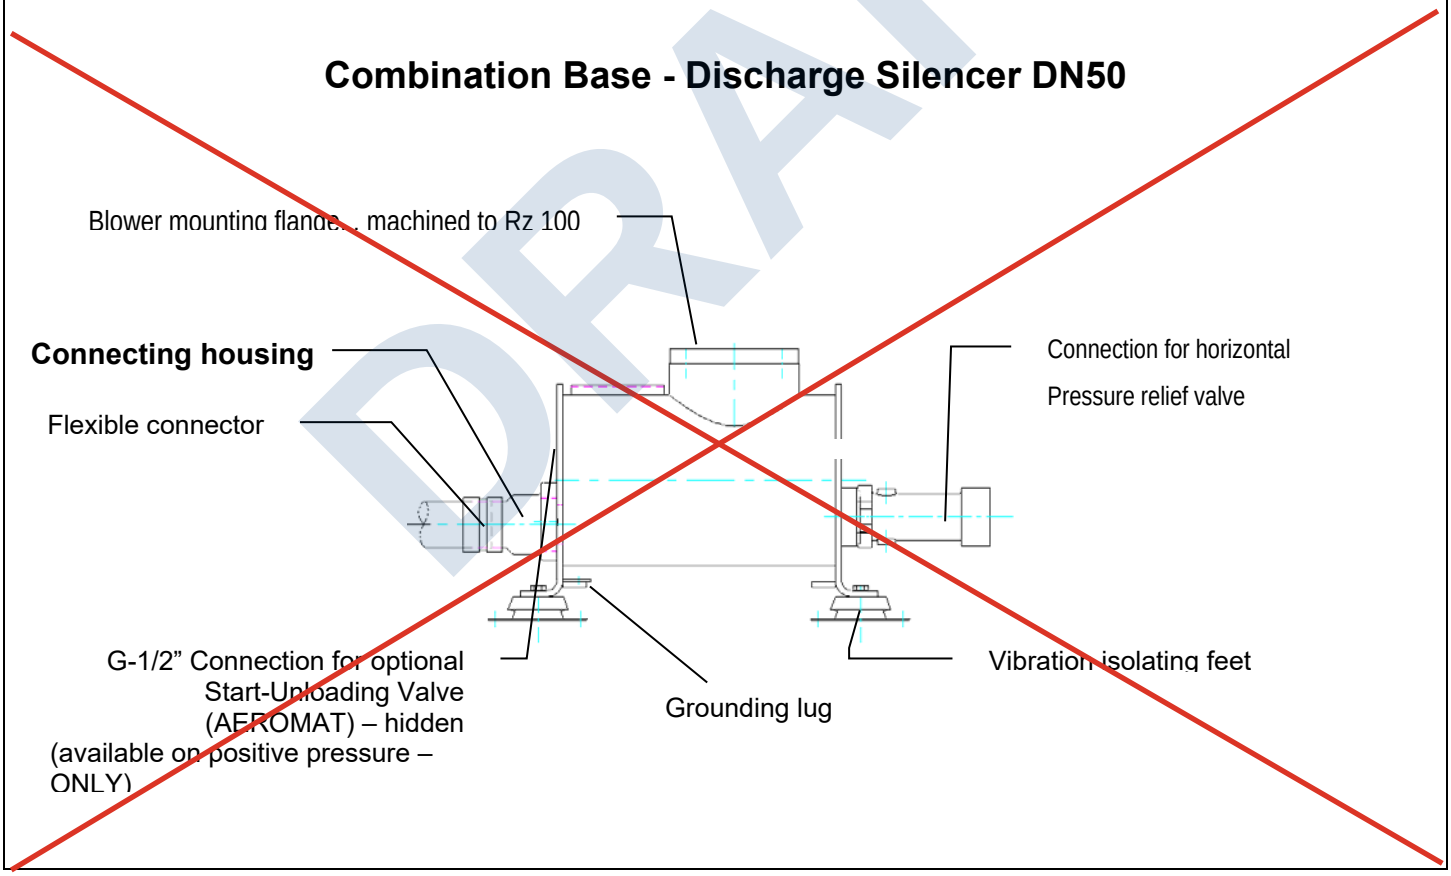
Materials of construction:

Silencer: Pressure vessel quality carbon steel S 235 JR (St 37-2) equivalent to ASTM A 283 Grade B

Pressure vessel code: PED (European directive) PED – AD 2000, DGRL 97/23/EG with consideration given to static and dynamic stress (fatigue resistance)

Maximum operating data: 150 ºC (300 ºF) and 1.1 bar gauge (16 psig)

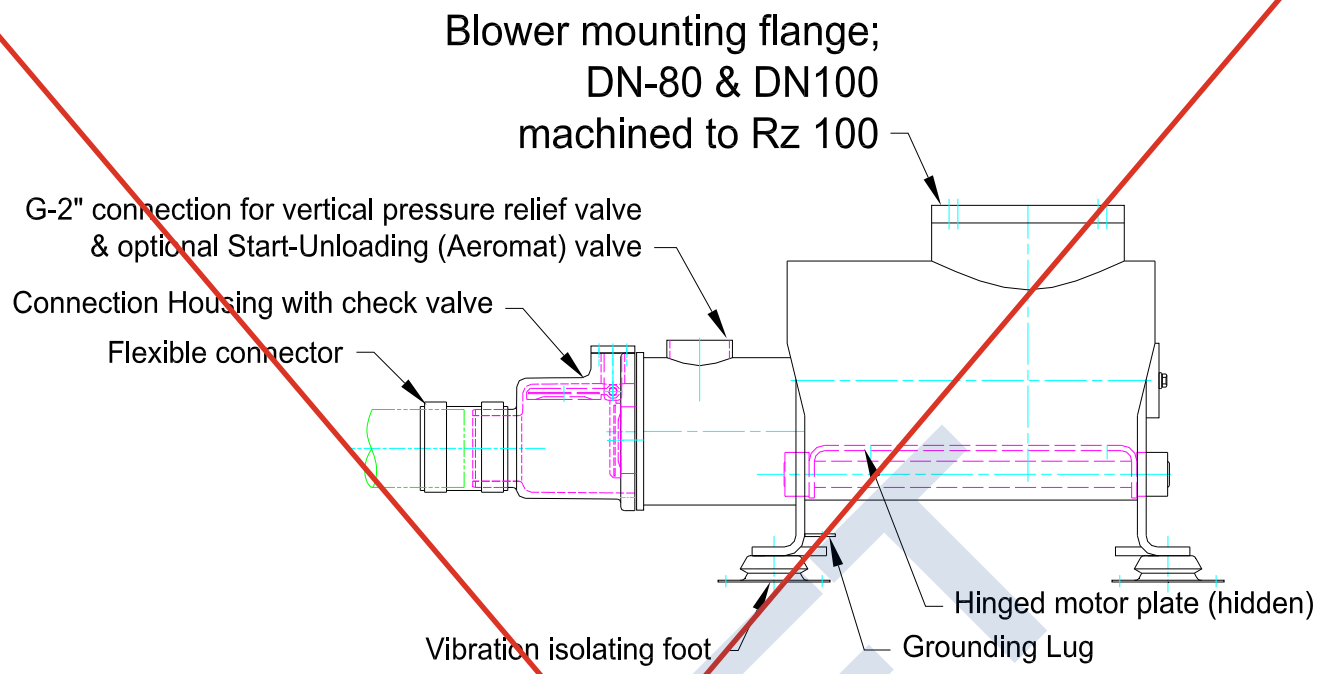
Test pressure: 1.9 bar gauge (27.5 psig)



Shell wall thickness: depending on size: 6mm (1/4") for DN-50 → 15mm (5/8") for DN-300

Performance:

Pulsations in the air stream are reduced below the API 619 standard of 2% peak-to-peak of the mean line pressure.



Pressure drop of the entire Base-Silencer with connecting housing and check valve, at the maximum allowable flow: 35 mbar (0.5 psi); included in the power calculations of the Delta Blower package

DRAFT

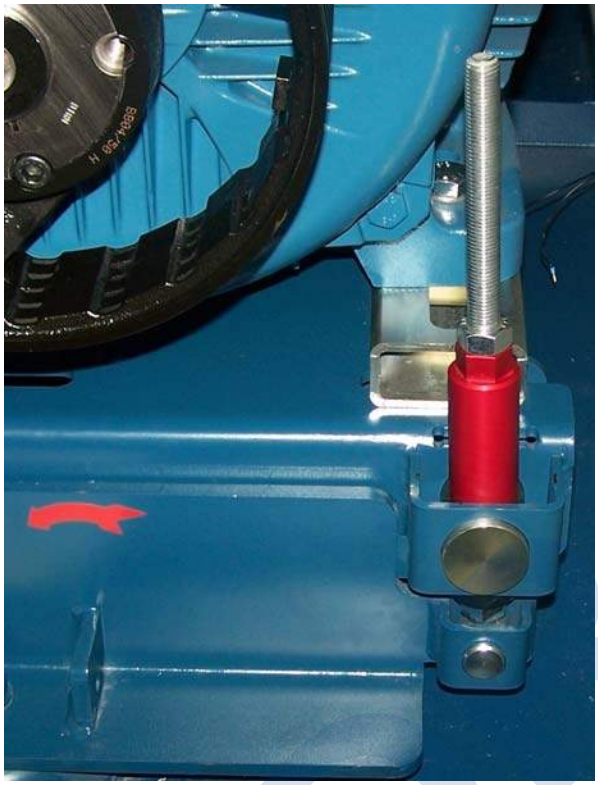
Combination Base - Discharge Silencer

Hinged Motor Plate DN50 –DN80

The hinged motor plate of the base frame in sizes DN50 and DN80 allows the motor mass to properly tension the drive belts during normal operation. The motor is mounted and aligned before leaving the factory. The hinged motor plate is then locked in place for shipment. (see photo on the left below) Remove the red locking bar and use the Aerzen supplied bracket and hydraulic jack to raise the hinged motor plate for installation or maintenance of the drive belts. (see photo on the right below) Refer to the Operations Manual for commissioning and maintenance of the blower.

Hinge Plate with Locking Pin on Arrival

The red locking pin serves to keep the motor swing plate stable during shipping. Remove before attempting to raise the motor hinge plate.



Raising the Hinged Motor Plate

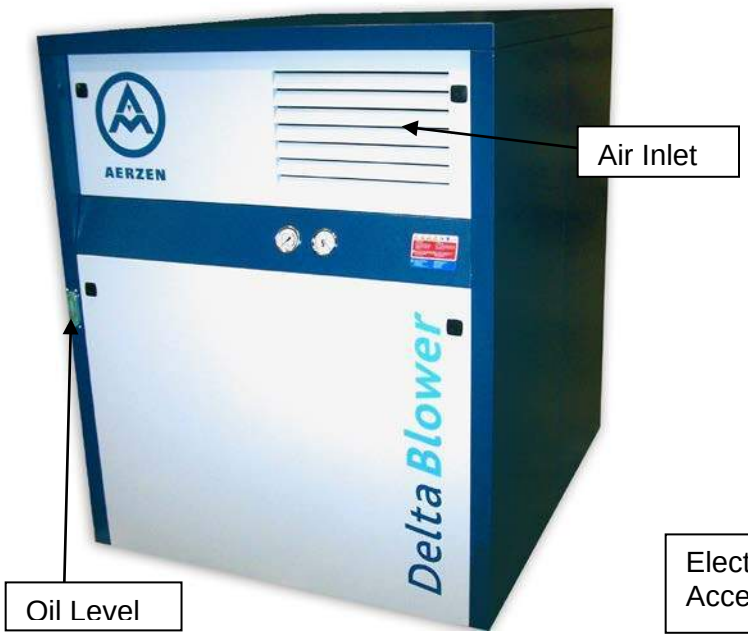
Use the Aerzen supplied bracket and jack to raise the hinged motor plate when installing or maintaining the belts.

Combination Base - Discharge Silencer

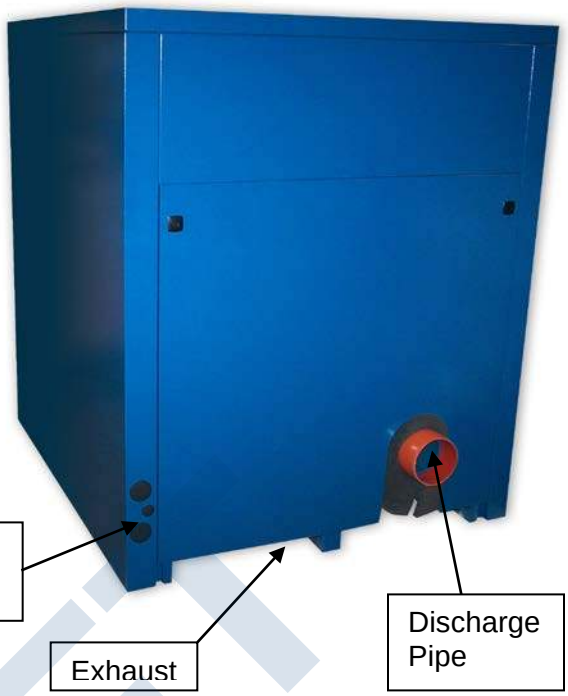
Hinged Motor Plate DN50 –DN300

The hinged motor plate for sizes DN100 through DN250 features a multipurpose lifting device. In its most basic function it serves as shipping locking device (red part) preventing the motor from unwanted movement. It also serves as the lifting mechanism (black part) for changing the drive belts. During normal operation the motor mass tensions the drive belts in the tried and true Aerzen way. The motor swing plate does not rest on the lifting mechanism (see photo on the right below). No speciaı adjustments are necessary during normal operation of the blower package. Another additional purpose is limiting the belt tension when oversized motors are used. Finally, the device can be configured to aid limited movement for seismic or mobile blower package service. Refer to G4-079 B XT for operation of Multipurpose Lifting Device. Depending on motor weight, DN300 units can have (1) or (2) lifting devices.

Lifting Device on Arrival



The red locking sleeve serves to keep the motor swing plate stable during shipping. It may also be used in seismic and mobile applications as a motor swing stop



Lifting Device in Normal Operation

The black guide bushing serves as a belt installation aid. Using an Aerzen supplied ratchet wrench, it helps lift the motor swing plate during belt installation and maintenance. Once new belts are installed it is backed down to the lock nut. **The motor hinge plate does not rest on the guide bushing during normal operation**. The guide bushing may also be used as tension limiter for use with overweight motors.

DRAFT

Shown is a DN-125 Sound Enclosure

Rear View of the Enclosure

DRAFT

Description: The sound enclosure surrounds the entire blower package to reduce noise and protect the machine from the weather while allowing easy access for maintenance. The base of the enclosure supports the entire blower package and contains an oil drip pan for environmental protection. Aerzen mounts the entire blower package within the sound enclosure at the factory prior to shipment. Transportation and installation are simplified by having the entire package supported and contained within the enclosure. The unit may be moved with a pallet jack or forklift.

The sound enclosure is designed with strategic consideration for airflow through the unit. A fan is mounted on the end of the blower shaft, so there is no need for a separate electric motor driven fan. From the cool, front side of the blower, air is drawn in through a sound trap. The air then passes over the motor and blower housings and finally is exhausted through the floor at the rear of the unit.

Quick release panels, each less than 45 lbs., provide access for routine maintenance of the blower and the package components. All maintenance and connections are located in the front and rear, allowing multiple machines to be placed side-by-side.

The oil level gauge is visible from the outside of the sound enclosure in sizes GM 4S DN-80 through GM 150 S DN-300 with the oil fill port and drain mounted to the enclosure just inside a removable panel.

The smallest size, GM 3S DN-50, has an easily removable roof to facilitate maintenance.

Materials:

Base pan – Polyester based powder coated steel weldment, 3 to 5 mm thick

Exterior panels - Polyester based powder coated galvanized steel

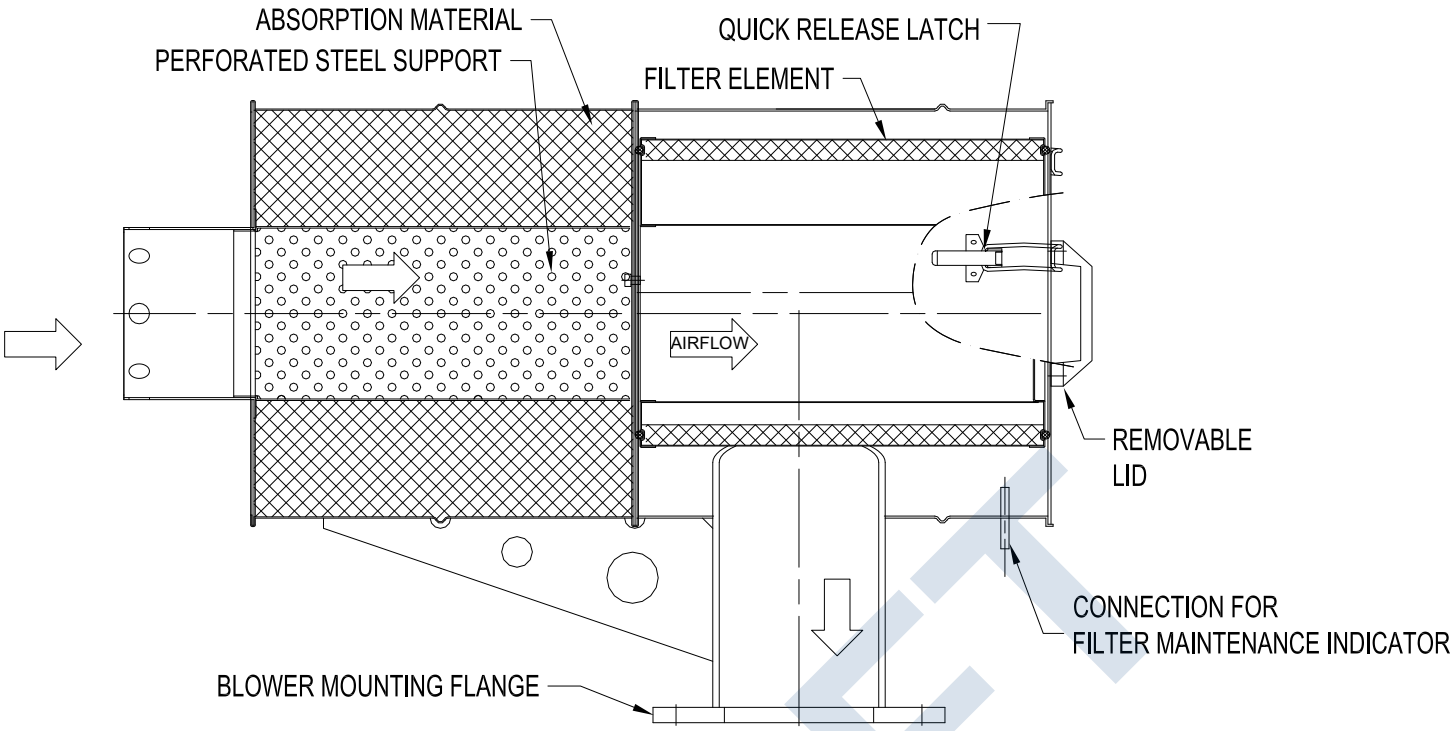
Sound insulation -Self-extinguishing, non-dripping high-density polyester foam

Technical:

Package noise level reduced to 80 dB, or less, at 1 m, free field, per DIN 45635.

Snow Load – 122 kg / m^2 (25 lbs / ft^2)

Wind Load – 80.4 km / hr (50 mph)



Suitable for indoor or outdoor installation

DRAFT

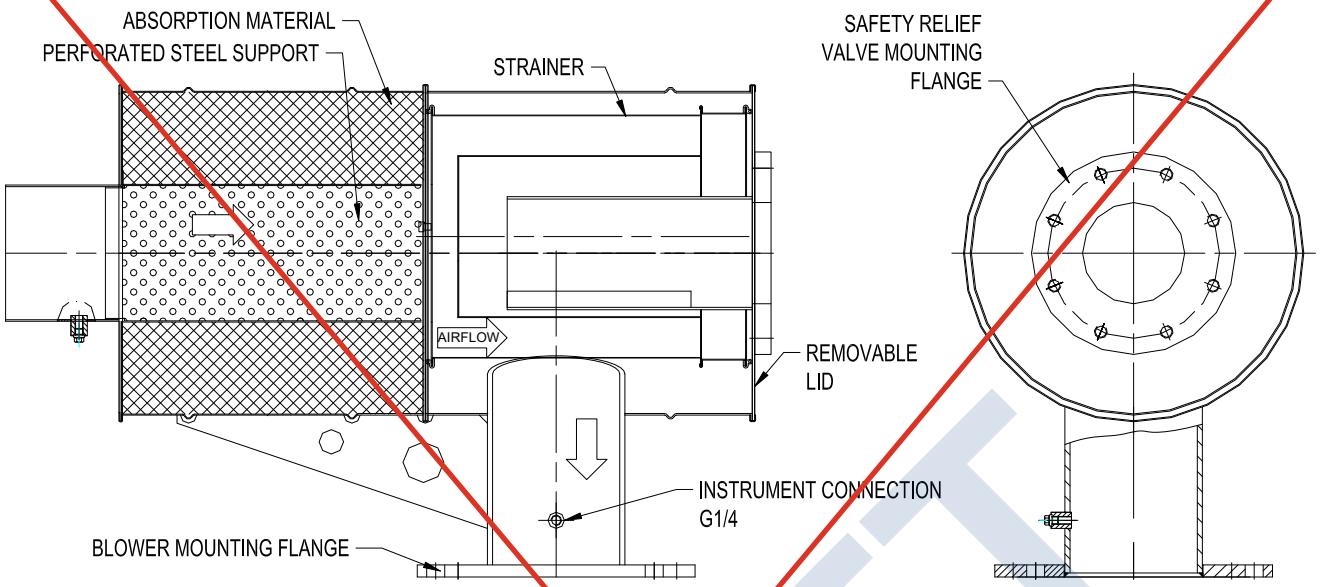
G5 Pressure Inlet Filter/ Silencer
DN 50 - DN 300

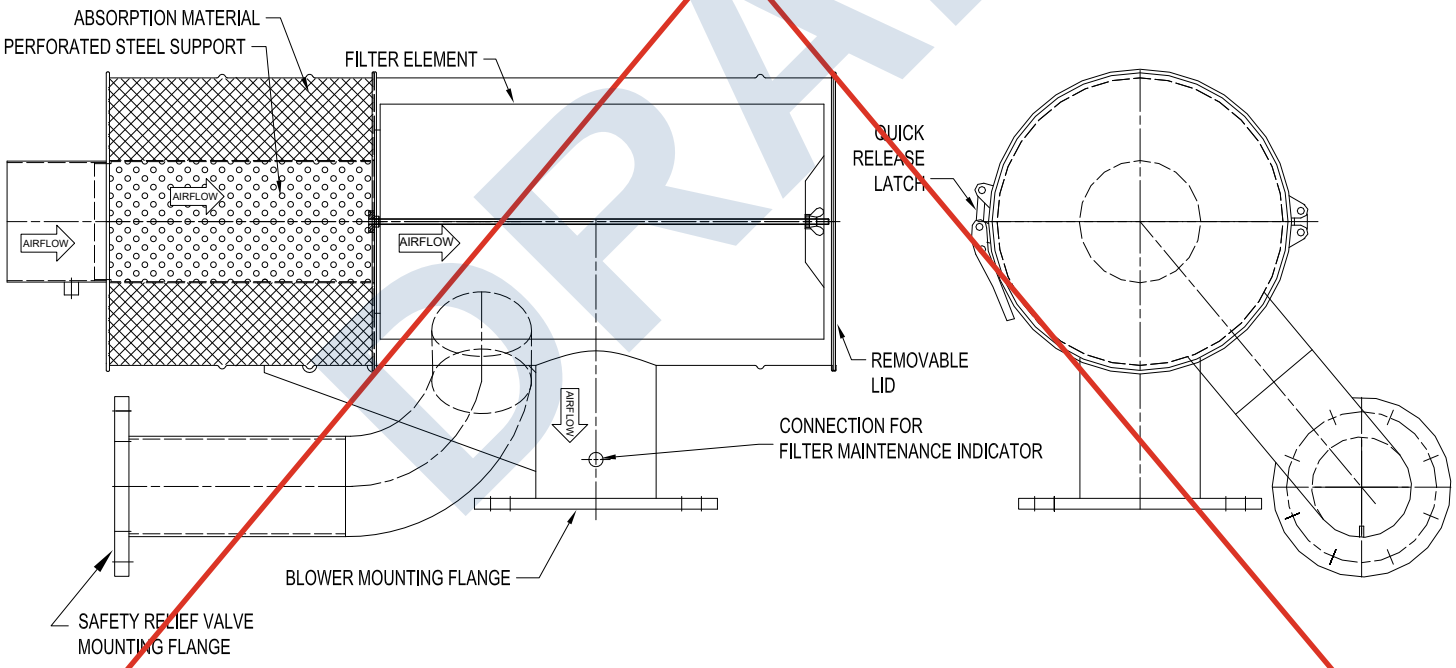
Description: Combination dry air intake filter and absorption type silencer with filter (or strainer) element located downstream from the silencer chamber

Materials of construction:



Casing:	Powder coated (RAL# 5001) Carbon Steel
	Maximum operating data: 60 °C (140 °F) and – 70 mbar (-2.07"Hg)
	Removable maintenance lid is held in place with quick release clamps
Absorption material:	Flame retardant, polyester based urethane foam, grey in color,
	secured in place with perforated steel
Filter element:	Thermally bound, food safe, polyester fibers, free of PVC, white in color
	Filter element mounts with a quick release turn and lock arrangement.

Performance:



Filtration class: G4 per EN 779 (greater than 90% of synthetic dust particles),
equivalent to ASHRAE 52.2 MERV 7 (50-70% @3-10 microns)
Pressure-drop of the entire silencer and clean filter at the maximum allowable flow: 10 mbar (0.15 psi)
Pressure drop filter element: 5 mbar (2" WC) clean, or replace at 45 mbar max. (18" WC)
Noise reduction: 10-15 dB mean noise reduction across audible octave bands

DRAFT

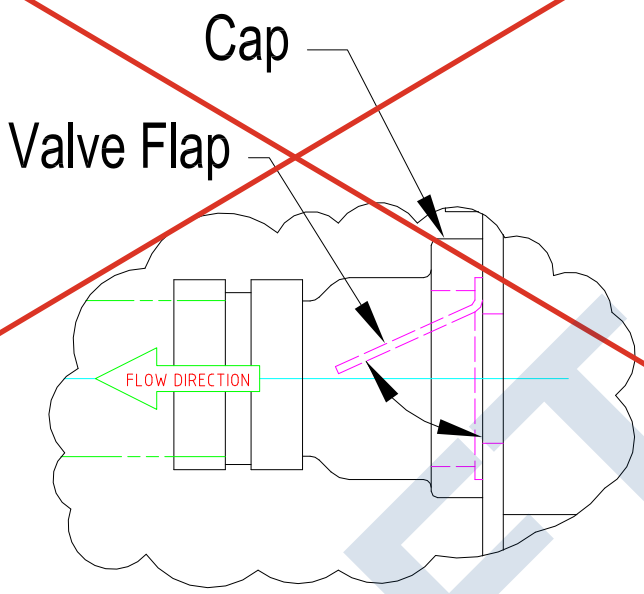
Aerzen Delta Blower + G5

The drive configuration of the Aerzen Delta Blower is such that any change in the belt length (due to belt stretching) results in a nearly proportional displacement of the motor. Therefore, the motor weight alone can be used reliably for automatic belt tension adjustment.

This, however, is not achievable with a different geometry, such as shown below: In such cases, a slight change in the belt length requires a much greater displacement of the motor making a manual adjustment necessary. Improper adjustment leads to belt failure and other, more significant damages can follow.

Our belt tensioning principle offer two more benefits to the user, which are superior to any other system offered: We do not need any other tensioning mechanisms to tension the belts. This eliminates further wear and tear items that the user does not have to maintain or even check up on. Secondly, we have eliminated the need for re-aligning the motor upon changing belts. The motor stays put and is merely pivoted up and down during a belt change.



Others

DRAFT

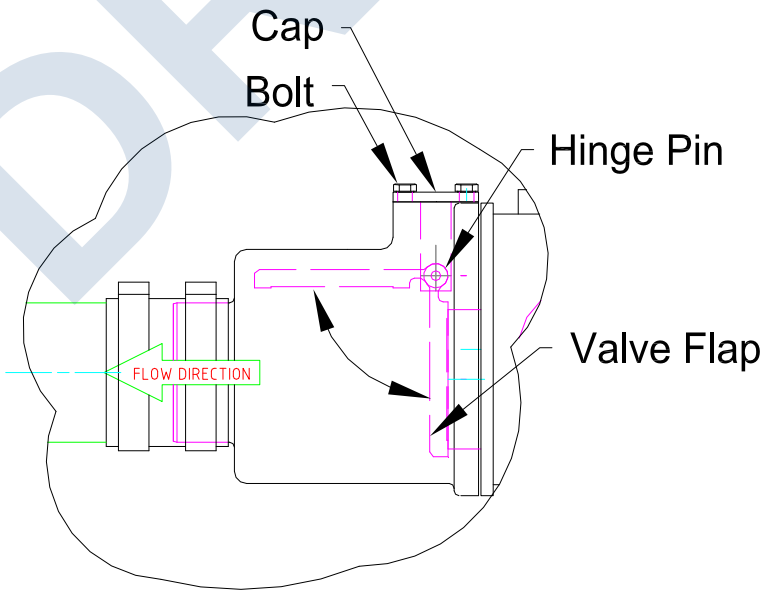
DN-50 Check Valve



Description: The DN-50 check valve is a full-bore, cast aluminum housing with an embedded Viton flap sandwiched between the connection housing and the baseframe. The hinge is integrated to the rubber and closes naturally by gravity without use of a spring. Operating range is up to 150°C or 302°F.

Check Valve Assembly w/ Viton flap P/N: **146756**

Check Valve – DN-80 Through DN-300

Description: Housed in the connecting housing is a full-bore, steel embedded in rubber check-valve that closes naturally by gravity without use of spring. The check-valve flap can easily be pulled out for inspection, maintenance or replacement without disconnecting the piping: removing the bolts and lifting the cap.

Technical Data

Maximum operating pressure: 1.2 bar g (17.4 psig)

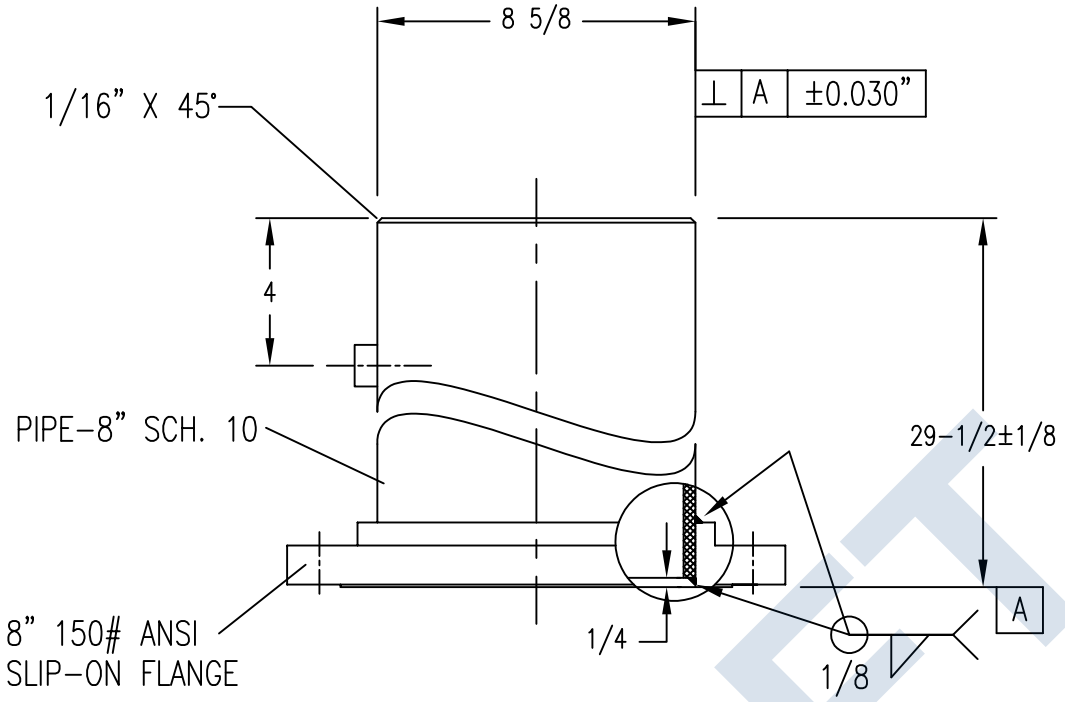
Test pressure: 2.4 bar (34.8 psig)

Operating temperature –40 to 180° C (-40 to 356° F)

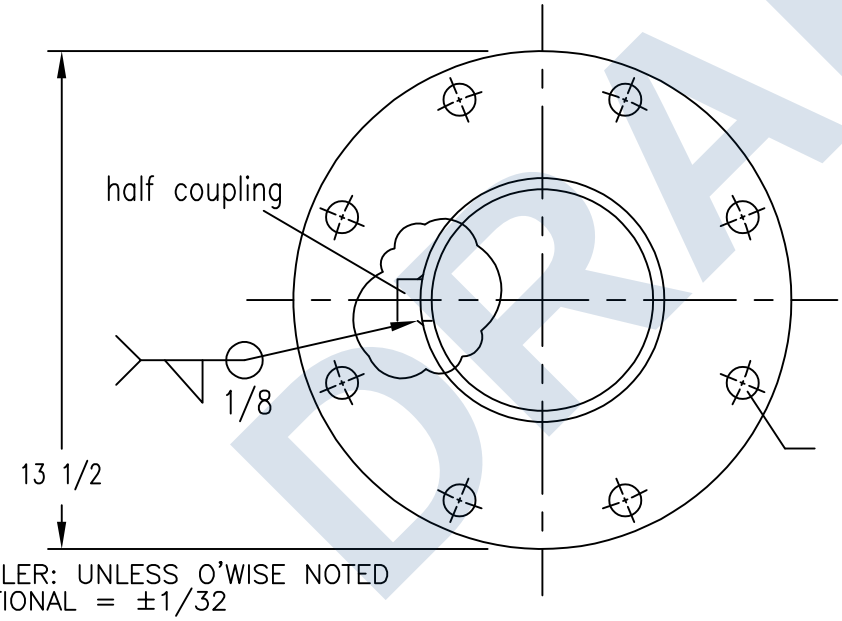
Materials

Silicone Rubber with embedded woven fiber reinforcement up to DN-300

Perbunan rubber in DN-400



60 +/- 5 Shore A



Shelf-life: up to 20 years, under clean, cool & dry conditions

CAUTION:

- Pipe misalignment could cause leaks and premature failure of the sleeve.
- It is imperative to maintain the recommended pipe-end clearance for the pipe connection to retain its flexibility and reduce the transmission of noise and vibrations from the blower package to the process piping.

8" PIPE X 8" FLANGE X 17–1/4" LONG

SCALE	DATE	DRAWN BY	CHECKED BY
MODEL SPACE 1:1	08/27/2009	J. P. SHIELDS	D.L.M.

Description:

The Pressure Relief Valve is designed for use with air or inert gases to protect the blower and its accessories from damage in the event of excessive pressure. It is not to be used as a pressure regulating device. It contains a spring-loaded valve guided by a spindle and surrounded by a protective sheath that is capable of venting the entire volume flow of the blower. In positive pressure machines, it is installed downstream from the positive displacement blower and before the check valve or any shut-off valve. In vacuum applications, it is installed on the intake side of the blower.

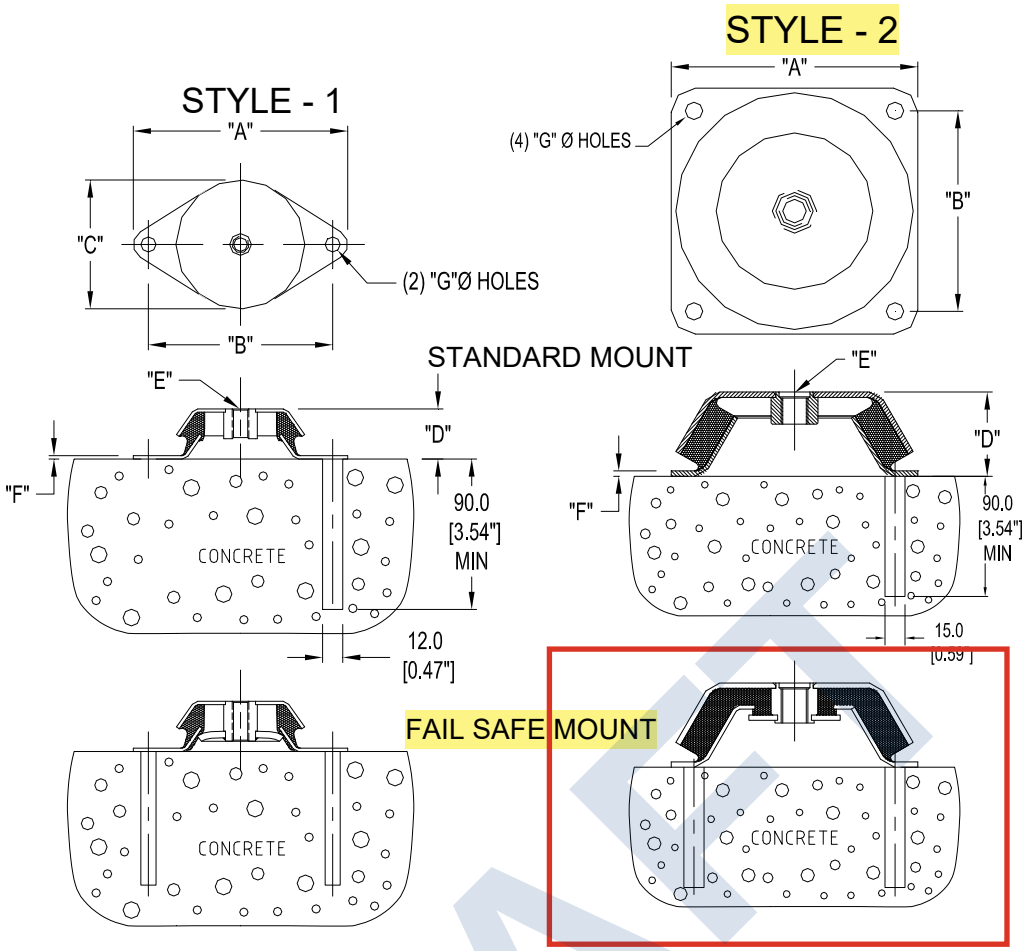
QTY	DESCRIPTION	MATERIAL
1	Connection Flange or Thread with Valve Seat	Grey Cast Iron
1	Valve Spindle	Carbon Steel
1	Bell	Brass
1	Spring End Plate	Carbon Steel
2	Hex Nut	Carbon Steel

QTY	DESCRIPTION	MATERIAL
2	Guide Nut	Carbon Steel
1	Spring	Spring Steel
1	Valve Disc / Piston	Brass
1	Valve Guide / Bushing	Brass
1	Cover	Aluminum

Technical Data:

Maximum Temperature: 200°C (392°F)	Valve Characteristic: Proportional
Conforms to PED 97 / 23 / EG	Pressure Rise: 10%
Maximum Pressure: 1.1 Bar (15.9 PSIG)	

Maintenance:



Periodically inspect for free movement of the valve. While the machine is stopped and the motor locked out, insert flat blade screwdrivers into both maintenance ports and lift the valve. Remove the screwdrivers and visibly ensure the valve is properly seated. When operated in clean environments, inspect valve either every six months or 1000 run hours, whichever occurs sooner. In dusty conditions, inspect every month. Refer to document G4-002 for complete operating instructions.

DRAFT

Only (1) anchor per foot is required for Standard mounts, anchor each hole (“G”) for Fail-safe mounts.

Standard mounts are not recommended for use where negative loads occur, (marine or earthquake zones) use Fail-safe mounts or contact Aerzen for alternates.

All vibrations isolators have a natural frequency that will not interfere with the fundamental blower package frequencies.

SPECIFICATIONS

Construction Materials:

Non Wetted
- Case: 304SS
- Ring: 304SS, Bayonet Twist-Off
- Dial: White Aluminum, Black Letters

Wetted
- Capsule: 316LSS
- Socket: 316SS

Case-to-Socket
- Screw Connection
- Vented Case

Lens
- Tempered Safety Glass (Standard), Plastic, or Laminated Safety Glass

Temperature Limits:

Ambient
-40°F — 150°F

Process
-40°F — 200°F

Process Temperature Limits When Assembled with a Diaphragm Seal

-60°F — 350°F
Direct Mount

-100°F — 750°F
Remote Mount or Cooling Tower

*Exact temperature limits will depend on diaphragm seal & fill fluid.

Accuracy: 2-1.6-2%
Fillable: No
Restrictor Screw: Yes
Weight: 2.5" = 0.5 lbs
4" = 1.1 lbs
6" = 2.1 lbs
Maximum Working Pressure:
Stable = 100%
Momentary = 130% of scale

-NC = NACE Compliance Certificate
-PM = Positive Material Identification Certification
-R5 = 1.5% Full Scale Accuracy (Not Available on Compound Ranges)

*Non-standard configuration

DRAFT

Diaphragm Seal Suitability Guide

Low pressure capsule gauges are very sensitive and require diaphragm seals with high fluid displacement. If a diaphragm seal is required to isolate the process fluid from the pressure gauge, the following seal model types are available for the Series PC.

Diaphragm Seal Model

High Displacement

Total Gauge Span* (in H_2O)

	10"	15"	20"	30"	40"	60"	100"	160"	200"	300"
W6	X	X	X	X	X	X	S	S	T	T
W7	X	X	X	S	S	T	T	T		
V5	X	S	S	T	T	T	T	T		
T6	X	X	X	X	X	S	S	S	S	S

*Total gauge span is additive of negative and positive pressures.

Example: -15 - 0 - 30 psi = 45 psi span

- Assembly will function correctly with minimal accuracy degradation.
- T — Assembly will function correctly given stable temperature.
- S — Assembly is highly sensitive to orientation and temperature variance. REOTEMP cannot guarantee a stated accuracy.
- X — Assembly will not work. The diaphragm does not displace enough fill fluid to drive the pressure gauge.

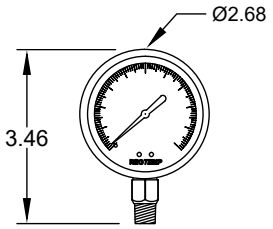
INDUSTRIAL STAINLESS/BRASS GAUGE

REOTEMP's Series PG gauges are an economical choice where ambient corrosion and vibration are of concern. The stainless steel case and ring offer excellent corrosion resistance, and is fillable for applications with vibration. It is suitable for all fluids compatible with copper alloys.

PG25C2

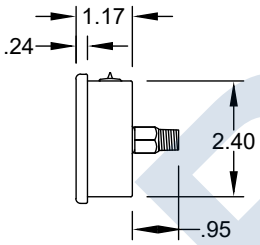
PG40C2

Fillable Custom Logo



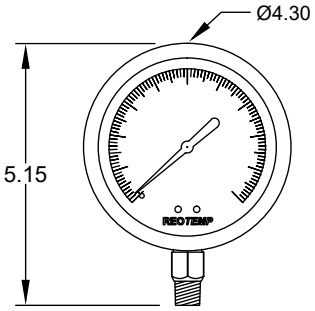
FEATURES / BENEFITS

- Stainless Steel Case
- Copper Alloy Wetted Parts
- Field Fillable Case
- Convenient Panel Mounting Adapters



ASME B40.100

SPECIFICATIONS



Accuracy	2.5" = 3 - 2 - 3%, ASME Grade B 4" = 2 - 1 - 2%, ASME Grade A
Ambient Limits	-40°F/140°F
Process Limits	-40°F/140°F
Process Limits with Diaphragm Seal	Cannot be mounted to a diaphragm seal.
Wetted Materials	Tube: Copper Alloy Socket: Copper Alloy
Lens	Plastic (Standard) or Glass
Other Materials	Case: 304SS Ring: 304SS Dial: White Aluminum, Black Letters Case-to-Socket: Screw Connection
Fillable	Yes
Restrictor Screw	Built-in, Non-Removable
Maximum Working Pressure	Stable = 100% Momentary = 110% of scale
Environmental Protection	NEMA 4X/IP65
Weight	2.5" = 0.25 lbs (0.4 lbs filled) 4" = 0.6 lbs (1.2 lbs filled)

B-Series Switches – Pressure, Differential Pressure & Hydraulic

FEATURES

B-Series switches have proven reliable in such harsh environments as:

- ***Offshore oil rigs***
- ***Chemical and petrochemical plants***
- ***Pulp and paper mills***
- ***Steel mills***
- ***Power plants***
- ***Water and sewage-treatment plants***
- ***Other corrosive environments***

Ashcroft Inc. supplies highly reliable Ashcroft® switches and controls for industrial and process applications. We begin with rock-solid designs, matching the most appropriate technology with the safety and reliability requirements of the applications. The materials of construction are specified to Ashcroft's exacting standards, and product is built to last in the toughest applications. Our modern, responsive manufacturing facility is supported by an extensive network of stocking distributors and factory sales offices located in virtually every part of the world. Special application assistance is always just a telephone call away.

The Ashcroft B-Series switch line is designed to satisfy most switch requirements. Materials of construction have been selected for long life. A wide variety of precision switch elements are available to meet every application requirement, including hermetically sealed contacts for added reliability and safety. The actuators we use have been proven in more than 20 years of service in the world's plants and mills. Special designs are available for fire safety, NACE, limit control and other more stringent requirements. Simplicity and ease of use are stressed to improve reliability of the installation.

Applications include: pumps, compressors, washers, filters, degreasers, evapora-tors, recovery systems, food processing, ground support equipment, reverse osmosis systems, heat exchangers, hydraulic systems, lubrication systems, marine equipment, textile machinery, heating and air conditioning equipment.

B-Series Switches – Pressure, Differential Pressure & Hydraulic

Pressure & Differential Pressure Switches

B-Series pressure, differential pressure and vacuum switches use two different actuators depending on setpoint requirements. For setpoints between 2 and 3000 psi, the simple, rugged diaphragm-sealed piston actuator is used. This design features high reliability and choice of actuator seal materials for virtually every application. An optional welded design is also available for setpoints up to 1000 psi for maximum reliability. This design is available in 316 SS or Monel. Differential pressure models use a unique, dual diaphragm-sealed piston design that features very high static operating pressures and small size.

For setpoints between 4.5 and 150 inches of H_2O, a large diaphragm is used for increased sensitivity in both pressure and differential pressure designs with good choice of materials of construction.

All standard models feature ±1 percent of range setpoint repeatability and a minimum of 400 percent of range proof pressures.

These standard designs perform well in applications where shock and vibration could be a problem and may be used in conjunction with Ashcroft diaphragm seals in extreme services such as slurries or abrasive process fluids.

600 psid	42 0 kg/cm²	4200 kPa	1000	8000	20.0-40.0	80.0-150.0	30.0-115.0	30.0-56.0	112.0-210.0

Values shown are for zero static working pressure.

NOTES:

1 Switches may generally be set between 15% and 100% of nominal range on increasing pressure. Consult factory for applications where setpoints must be lower.

2 All deadbands are given in English units as shown in the nominal range column. Deadbands shown are for switches with Buna N diaphragm. Approximate deadbands for optional diaphragms:

Viton:	Multiply Buna N value by 1.4
Teflon:	Multiply Buna N value by 1.2
Stainless Steel:	Multiply Buna N value by 1.7
Monel:	Multiply Buna N value by 1.7
Dual Switch Element:	Multiply single switch element value by 1.6 for approximate deadband.

DRAFT

B-Series Switches – Pressure, Differential Pressure & Hydraulic

B-SERIES PRESSURE AND DIFFERENTIAL PRESSURE SWITCH MODEL NUMBER:

To specify the exact switch desired, select entries from appropriate tables as shown in example below.

1		2		3	4			5
B	4	2	0	B	X	P	K	600 PSI

1 – ENCLOSURE	
B4	Pressure switch, Type 400, watertight enclosure meets NEMA 3, 4, 4X, 13 and IP66 requirements.
B7	Pressure switch, Type 700, explosion-proof enclosure meets Div. 1 & 2, NEMA 7, 9 and IP66 requirements.
D4	Differential pressure switch, Type 400, water-tight enclosure meets NEMA 3, 4, 4X, 13 and IP66 requirements.
D7	Differential pressure switch, Type 700, explosion-proof enclosure meets Div. 1 & 2, NEMA 7, 9 and IP66 requirements.

3 – ACTUATOR SEAL					
		Range			
Code and Material	**Process Temperature Limits °F(9)**	**Vac. ˝ H_2O**	**0-600 psi**	**1000 psi**	**3000 psi**
B – Buna-N	0 to 150	•	•	•	•
V – Viton	20 to 300	•	•	•	
T – Teflon	0 to 150	•	•	•	•
S – 316L(8)	0 to 300		•	•	
P – Monel(8)	0 to 300		•	•	

4 – OPTIONS	5 – RANGE
Use table from page 5	Select from table on page 2

NOTES:

1 Standard switch.
2 Not available with psid ranges.
3 Dual switches are 2 SPDT snap-action switches, not independently adjustable.
4 Wires cannot be terminated inside B400 switch enclosure.
5 Not available with type 700 enclosure.
6 Estimated dc. rating, 2.5A, 28 Vdc (not UL listed).
7 Estimated dc rating, 0.4A, 120 Vdc (not UL listed).
8 Available on pressure only.
9 Ambient operating temperature limits –20 to 150°F, all styles, setpoint shift of ±1% of range per 50°F temperature change is normal. Switches are calibrated at 70°F reference.

2 – SWITCH ELEMENT SELECTION		
Order Code	**Switch Elements UL/CSA Listed SPDT**	
20(7)	Narrow deadband ac	15A, 125/250 Vac
21	Ammonia service	5A, 125/250 Vac
22(6)	Hermetically sealed switch, narrow deadband	5A, 125/250 Vac
23	Heavy duty ac	22A, 125/250 Vac
24(1)	General purpose	15A, 125/250/480 Vac ½A, 125 Vdc ¼A, 250 Vdc; 6A, 30 Vdc
25(2)	Heavy duty dc	10A, 125 Vac or dc, ⅛ HP, 125 Vac or dc
26(7)	Sealed environment proof	15A, 125/250 Vac
27	High temperature 300°F	15A, 125/250 Vac
28(5)	Manual reset trip on increasing	15A, 125/250 Vac
29(5)	Manual reset trip on decreasing	15A, 125/250 Vac
31	Low level (gold) contacts	1A, 125 Vac
32	Hermetically sealed switch, general purpose	11A, 125/250 Vac 5A, 30 Vdc
42	Hermetically sealed switch, gold contacts	1A, 125 Vac
50	Variable deadband	15A, 125/250 Vac
UL/CSA Listed Dual (2 SPDT)		
61(7)	Dual narrow deadband	15A, 125/250 Vac
62(7)	Dual sealed environment proof	15A, 125/250 Vac
63	Dual high temp. 300°F	15A, 125/250 Vac
64	Dual general purpose	15A, 125/250/480 Vac ½A, 125 Vdc ¼A, 250 Vdc
65	Dual ammonia service	5A, 125/250 Vac
67(4,6)	Dual hermetically sealed switch, narrow deadband	5A, 125/250 Vac
68(4)	Dual hermetically sealed switch, general purpose	11A, 125/250 Vac 5A, 30 Vdc
70	Dual low level gold contacts	1A, 125 Vac
71(4)	Dual hermetically sealed switch, gold contacts	1A, 125 Vac

Contact dial thermometer

Particularities

- Temperature controller with actual value display as panel-mounting or add-on device
- Stainless steel case with bayonet lock
- Class 1.5
- Protection class IP 53
- Case sizes ∅: 60 mm, 80 mm and 100 mm
  Front frame: 72x72 mm and 96x96 mm

Type 608520/2380

Type 608550/1080

Brief description

Contact dial thermometer are devices with actual value display for temperature measurement, control and monitoring and can be used universally.

The temperature depending volume change in a measuring system filled with liquid or the temperature depending pressure change in a measuring system filled with gas is converted to a rotational movement of the actual value indicator by a bourdon tube, no transmission gear is required. The microswitch is actuated by the rotational movement of the indicator shaft via a tap system.

DRAFT

Technical Data

Case and front frame	Stainless steel (1.4301)
Cover cap	Plastic (PA6), gray, UV stabilized
Protection type	IP 51 as per DIN EN 60529 (IP 53 with extra code 401)
Front pane	Acryl glass (PMMA)
Chassis	Aluminum (3.2582.05)
Scale	white, labeled in black
Display	Class 1.5 similar to DIN EN 13190
Anti-kink spring	for devices with capillary on the case and the temperature probe
Set point value setting	by set point controller in the front window
Display correction	on the rear
Limit value temperatures	for transport and storage -30°C...+70°C (for display range -40...+40°C up to max. 50°C; -30...+50°C up to max. 60°C)
Rated position	any

Technical Data

Display range (AB)	Display range in °C	Measuring range in °C	Tolerance in °C
469	-40...+40	-30...+30	1.5
643	-20...+120	-20...+120	3.0
807	0...+60	+10...+50	1.5
814	0...+100	+10...+90	1.5
818	0...+120	+20...+100	3.0
832	0...+200	+20...+180	3.0
840	0...+300	+30...+270	6.0
848	0...+400	+50...+350	6.0
854	0...+500	+50...+450	8.0
848	0...+600	+100...+500	10.0

	Liquid filling	**Gas filling**
Measuring system	Display range (AB) ≤ 350°C	Display range (AB) ÷ 400°C
Time behavior	approx. 12 s, measured in water, with a probe Ø of 6 mm made of Cu.	approx. 4 s, measured in oil, with a probe Ø of 10 mm made of stainless steel.
Ambient temperature influence effect	In % of the display range (referring to the deviation from the reference value +23°C)	
on case	0.15% of the display range per K ambient temperature change	0.05% of the display range per K ambient temperature change
on capillary (per m)	0.03% of the display range per K ambient temperature change	no influence
	Higher ambient temperature – higher temperature display – lower switching point	
Anti-kink spring	for devices with capillary on the case and the temperature probe	
Set point value setting	by set point controller in the front window	
Display correction	on the rear	
Limit value temperatures	for transport and storage -30°C...+70°C (for display range -40...+40°C up to max. 50°C; -30...+50°C up to max. 60°C)	
Rated position	any	

	standard	**Extra code (TZ) 650**
Electric contact		
Type of contact	Single-pole microswitch with mechanically actuate change-over contact	
Contact rating	AC 230V, +10/-15%, 48...63Hz, cos φ = 1 (0.6)	
	5 (1.5) A	10 (3) A
Hysteresis	approx. 1.5% of the display range	1.5 to 3% of the display range
Switching point accuracy	± 0.5% of the display range referring to the switch-off point with rising temperature	
Switching reliability	To ensure a high switching reliability, we recommend a minimum voltage of 24 V and a minimum current of 100 mA	

	standard	Design 02 and 22	**Design 10, 23 and TZ 426**	**Case Ø 60 mm**
Electrical connection	Screw-type terminals, connection cross section up to 2.5 mm^2	Connection cable 0.5 m with screw-type terminals	Cover cap with cable screw-connection, suitable for cable Ø from 6.5 to 13 mm	Cover cap with cable screw-connection, suitable for cable Ø from 8 to 10 mm

Note:

Physical and toxic features of the expansion means, which could emerge in the event of a measuring system break.

Control range with scale limit value	Hazardous reactions	Fire and explosion hazard		hazardous to waters	Information about toxicology		
		Ignition temperature	Explosion limit		irritant	dangerous to health	toxic
< +200 °C	no	+ 355 °C	0.6 - 8 V%	yes	yes	[a]	no
≥ 200 °C ≤ +350 °C		+ 490 °C	- -	yes	yes	[a]	
> 350 °C ≤ +500 °C		no	no	no	no	no	

[a] There is currently no statement by the health authority concerning hazards to health in the event of short-term exposure and low concentration, e.g. measuring system break.

DRAFT

SECTION 5

DRAFT

Severe Duty is **Standard** with **WEG W22** motors.

You do not need a special motor for severe duty. Severe Duty is standard with WEG W22 motors.

DRAFT

You do not need a special motor for severe duty. Severe Duty is standard with WEG.

Features that make a difference:

- All NEMA Premium ratings have a 1.25 service factor (up to 100 HP) resulting in cooler operation and extended life of the motor
- All Cast Iron Construction, including Terminal Box and Fan Cover (*)
- Solid feet for reduced vibration levels and impact absorption
- Optimized ventilation system for cooler operation and extended life
- High Grade FC200 cast iron provides superior mechanical strength and heat dissipation
- All WEG W22 motors are Totally Enclosed Fan Cooled with a true IP55 rating against dust and moisture. (IPW56, IPW65 and IPW66 available as optional)
- Exclusive W-Seal 364T and larger provides superior bearing protection
- Taconite Labyrinth seal 586 Frame and larger
- Exclusive WEG painting system exceed 200hrs ASTM 117 corrosion test (Exceeds IEEE841 standard)
- Balanced to 0.08 inches per second vibration limits (Meets IEEE841 standard)
- Four Bolt Conduit Cover with glued Neoprene Gasket
- Impregnation Resin and magnet wire are insulation class H
- Stainless Steel Nameplate - Laser edged with high contrast background
- Corrosion Proof Drains
- Inverter Duty per NEMA MG1, Part 31
- Certified Class I Div 2, Groups A, B, C & D; Class II, Div 2, Groups F & G

**cast iron fan cover available as an option on 143-215T frames*

New Cooling System

Fan Cover
- Aerodynamic design
- Noise level reduction
- Better air flow distribution over frame
- Increased mechanical strength

Fan
- Reinforced fan hub structure
- Noise level reduction
- Increased air flow
- Fan with higher stiffness

Terminal Box
- Better connection quality
- Easier cable handling during installation
- More space available for accessory installation
- Easier Maintenance
- Mounting F1/F2/F3
- Rotation on 90° stages

Bearing Caps

External
- Finned surface for improved bearing heat dissipation

Internal
- Change of grease path for positive lubrication
- Bearing lubrication quality improvement
- Reduced bearing temperature

Seal Subsystem
- Increased dust and moisture protection
- Increased protection to high-pressure cleaning

Frame
- Reduced temperature on windings and bearings
- Noise level reduction
- Terminal box position outlet on top

Pad for vibration sensor
- Displaced 90º from each other

Enhanced Lifting Provisions
- Easier handling - horizontal & vertical
- Higher mechanical strength and handling safety

Solid feet
- More impact resistance
- Ideal for high vibration level applications

Endshields Subsystem

DE (Drive Endshield)
- New fin design
- Bearing moved outwards for better load support
- Improved bearing heat dissipation for reduced bearing temperature
- Reinforced endshield structure

NDE (Non-Drive Endshield)
- New design with smooth exterior surface
- Improved air flow
- Noise level reduction
- Improved structural rigidity for low vibration

AEGIS SGR™

BEARING PROTECTION RING

Sustainable Technology for True Inverter Duty Motors

WEG uses the standard SGR from the AEGIS catalog that is sized based on the motor min/max shaft diameter. They use the type with the mounting brackets which are designed to fit over the shaft shoulder on the motor end-shield.

Bearing Protection For Life!

2009

DRAFT

BEARING PROTECTION RING™

"The only bearing protection system guaranteed to eliminate harmful shaft currents preventing premature motor failure - for life."

Guarantee

Electro Static Technology guarantees any new motor up to 100hp/75kW will not fail from electrical bearing fluting damage for the life of the motor when the AEGIS SGR™ Bearing Protection Ring™ is installed in accordance with manufacturer's installation instructions. If electrically induced fluting damage occurs, Electro Static Technology will replace motor bearings. Guarantee is subject to the terms and conditions of the AEGIS SGR™ Guarantee Program.

For program details, visit: www.est-aegis.com

Don't let this happen to your bearings!

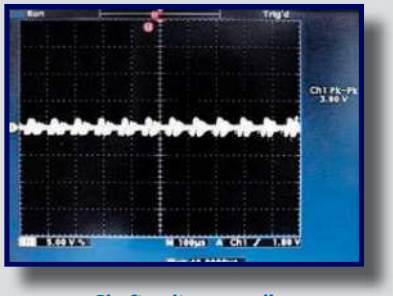
Sustainable Motor Design - Prevent Bearing Failure

AEGIS Bearing Protection Ring™- protects motor bearings for life. Variable frequency drives (VFD) induce electrical voltages onto the shaft of AC and DC motors. With AEGIS SGR Bearing Protection Ring installed on the motor, you benefit from sustainability, system up-time, production improvement, and higher reliability.

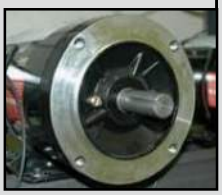
PROBLEM:

VFD Induced Shaft Voltages Damage Bearings



Shaft voltage reading with no protection

Variable frequency drives (VFD) on AC and DC motors induce harmful electrical voltages on the motor shaft. Once these voltages exceed the resistance of the bearing lubricant, they discharge through the motor's bearings causing fusion craters, severe pitting, fluting damage, excessive bearing noise and eventually bearing failure.



SOLUTION:

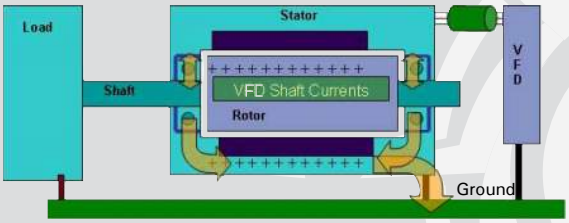
AEGIS SGR™ - Electrical Bearing Damage Protection

The new AEGIS SGR™ Bearing Protection Ring™ prevents electrical bearing damage by safely channeling harmful shaft voltages away from the bearings to ground. Using proprietary Electron Transport Technology™, the conductive micro fibers inside the AEGIS SGR™ provide the path of least resistance and dramatically extend motor life.

Shaft voltage reading with AEGIS SGR

No bearing protection

VFD



AEGIS SGR™ Bearing Protection Ring™

DRAFT

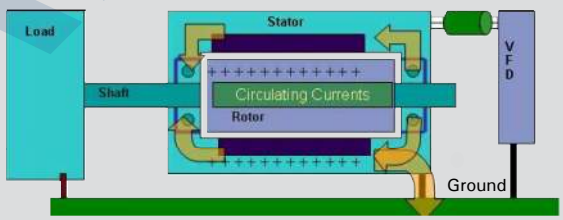
About Shaft Voltages and Bearing Currents

VFD Induced Shaft Voltages - All Motors

Damaging voltages are induced on the shafts of AC and DC motors controlled by variable frequency drives (VFD). The extremely high on/off switching speeds of the pulse width modulation (PWM), generated by the insulated gate bipolar transistors (IGBT), induce damaging voltages onto the motor shaft through parasitic capacitive coupling between the stator and rotor. This common mode shaft voltage seeks a path to ground, usually through the motor's bearings.

EDM Currents Damage Bearings



Bearing fluting, "washboard" pattern on bearing race

Electrical Damage in the Bearings (EDM) - Pitting, Fluting, Failure

Damaging currents arc through the dielectric oil film between the rolling elements and the bearing race. This is known as electrical discharge machining (EDM) effect. EDM causes fusion craters, severe pitting, and eventually bearing fluting (a washboard-like pattern in the bearing race) which results in premature bearing failure.

High Frequency Circulating Currents in Large AC and DC Motors

In addition to potential bearing failures in motors from VFD induced EDM currents, AC and DC motors above 100 hp (75 kW) may also experience bearing failures caused by high frequency circulating currents. VFD induced high frequency circulating currents are in the kilohertz or even megahertz range and circulate through the motor's bearings because of magnetic flux imbalances in the stator. This type of VFD induced current becomes the more dominant destructive current in higher hp/kW motors.

High Frequency Currents Damage Bearings

AEGIS SGR™ Bearing Protection Ring™ is the most effective solution to protect bearings in motors and attached equipment from EDM currents and VFD induced shaft voltages.

DRAFT

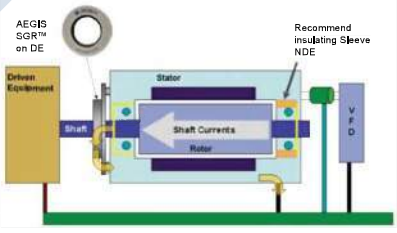
Application Notes for AEGIS Bearing Protection Ring™

Improve System Reliability and Production with Sustainable Motor Design

Motors up to 100 HP (75 kW)

Any motor controlled by a variable frequency drive (VFD) requires bearing protection. Motors of 100 hp down to fractional hp motors will experience bearing failures when operated on a PWM drive. AEGIS SGR™ Bearing Protection Ring™ guarantees that bearings will not fail in these motors from fluting damage for the service life of the motor.

Install one AEGIS SGR™ Bearing Protection Ring™ on either the drive end or the non-drive end of the motor. The simplest installation is to slide the AEGIS SGR™ over the drive end and fasten it to the motor end bell with the easy to install mounting hardware included with each AEGIS SGR™



★ Recommend Colloidal Silver Shaft Coating PN CS015

Motors 100 HP to 1000 HP (75 kW to 750 kW)

Large motors above 100 hp may have VFD induced EDM currents as well as high frequency circulating currents when they are controlled by VFDs. To protect the bearings, insulate the bearing on one end and install an AEGIS SGR™ on the other end.

Insulation on one end (usually NDE) and AEGIS SGR™ on opposite end

- This method offers the most reliable protection
- Motor frame must be well grounded
- Non-Drive End: Bearing journal should be insulated or Insulated/ Ceramic Bearing installed to disrupt circulating currents
- Install AEGIS SGR™ Bearing Protection Ring™ on opposite end of insulation and Insulated/Ceramic Bearing (usually DE)
- Protects bearings in attached equipment (gear box, pillow block, encoder etc.)

★ Recommend Colloidal Silver Shaft Coating PN CS015

BEARING PROTECTION FACTS:

Bearing protection for motors and attached equipment: Only AEGIS SGR™ will protect both motor bearings and the bearings in attached equipment. VFD induced currents on the shaft can discharge through motor bearings or coupled equipment like gear boxes, pumps, fan bearings, pillow blocks, encoders, brake motors, etc. AEGIS SGR™ addresses the root of the problem and channels harmful currents to ground.

Maintenance free bearing protection for life: Hundreds of thousands of conductive micro fibers have virtually zero wear during operation, even at high RPM and high surface rates. Unlike carbon block brushes, there is no spring pressure on fibers. AEGIS SGR™ Bearing Protection Ring™ will last for the service life of the motor.

AEGIS SGR™ is effective in grease, oil, dirt or dust: Lab and field tested. The conductive micro fibers "sweep" away contaminants from the shaft surface and maintain a conductive path even when oil, grease, dirt or dust get on the shaft.

Operation in harsh environments where fibers are exposed to excessive debris: To prevent particles from damaging the fibers, install a slinger or O-ring against the AEGIS SGR™.

★ COLLOIDAL SILVER SHAFT COATING: NEW TECHNOLOGY

Improving the conductivity of the steel shaft surface enhances the shaft voltage discharge capability in AEGIS shaft grounding applications. Maintaining a highly conductive shaft surface is especially important in critical applications or in applications where the conductive shaft surface of steel could become compromised. Environmental elements could create a potential for decreased conductivity on the shaft of the motor.

Apply AEGIS CS015 Colloidal Silver Shaft Coating to any VFD driven motor shaft prior to installing AEGIS Bearing Protection Ring™.

DRAFT

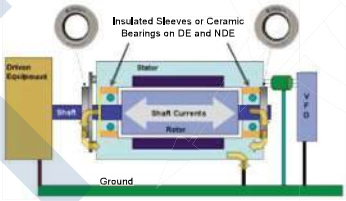
BEARING PROTECTION FACTS:

AEGIS SGR™ Bearing Protection Ring™ current handling capability: AEGIS SGR™ is rated to discharge high frequency current. Variable frequency drives (VFD) induce high frequency EDM currents of up to 2 amps in 50 billionths of a second. AEGIS SGR™ protects the bearing by safely channeling the energy away from the motor bearings to ground.

AEGIS Bearing Protection Ring™ - the most reliable bearing protection: Production up-time and reliability improve when AEGIS SGR™ is installed. The patented ring of hundreds of thousands of conductive micro fibers provide protection for the service life of the motor. The fibers will always surround the shaft with a conductive path for destructive shaft currents while the motor is running.

Vertical Motors: Insulate top bearing or shaft with non conductive coating. For bottom bearing, coat shaft with Colloidal Silver Shaft Coating and install AEGIS Bearing Protection Ring.

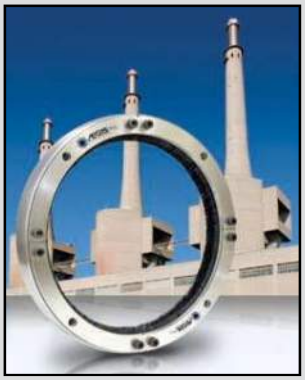


If insulation is not possible, the next best protection is to install AEGIS SGR™ on both ends of the motor

- Motor frame must be well grounded
- Install AEGIS SGR™ Bearing Protection Ring™ on drive and non-drive end to provide path of least resistance for circulating currents and to channel VFD currents to ground.
- Protects bearings in attached equipment
- **NOT SUITABLE FOR CYLINDRICAL ROLLER BEARING**

★ Coat shaft with Colloidal Silver Shaft Coating

Critical Applications: Insulate both ends and add AEGIS SGR™ Bearing Protection Ring™ on both ends



- Motor frame must be well grounded
- Drive and Non-Drive end: Bearing journals should be insulated or Insulated/Ceramic Bearing installed to disrupt circulating currents
- Install AEGIS SGR™ Bearing Protection Ring™ on drive and non-drive end to provide path of least resistance for shaft voltages and to channel VFD induced currents to ground.
- AEGIS SGR™ required to protect bearings in attached equipment (gear box, pillow block, encoder, etc.)

★ Coat shaft with Colloidal Silver Shaft Coating

Medium Voltage Motors
Large Motors and Generators over 1000 HP (750 kW)
Power Generators over 750kW

AEGIS iPRO™ Bearing Protection Ring™

Large motors and generators often have much higher induced shaft voltages and bearing currents which require a high current capable Bearing Protection Ring™. High frequency circulating currents induced by variable frequency drives (VFD) will cause bearing fluting and catastrophic failure in these motors. Generators experience current surges which can cause electrical arcing in bearings and equipment.

AEGIS iPRO™ High Current Bearing Protection Ring™

- One end of the motor should be insulated. Install AEGIS iPRO™ on opposite end of insulation to protect the non-insulated bearing.
- Install AEGIS iPRO™ on both ends of motor or generator if bearing cannot be insulated.

★ Coat shaft with Colloidal Silver Shaft Coating

MOTORS WITH CERAMIC BEARINGS

Insulating both bearing journals or using ceramic coated bearings in the motor **does not prevent VFD induced currents** from discharging through the bearings on attached equipment and may present a voltage hazard.

Whenever ceramic bearings are used in a motor, *AEGIS SGR™ is required* to protect attached equipment and reduce potentially dangerous shaft voltages.

DRAFT

Purpose of Application Notes: Application notes are intended as general guidance to assist with proper application of AEGIS SGR™ Bearing Protection Ring™ to protect motor bearings. All statements and technical information contained in the application notes are rendered in good faith. User must assume responsibility to determine suitability of the product for its intended use.

AEGIS SVP™ Shaft Voltage Probe

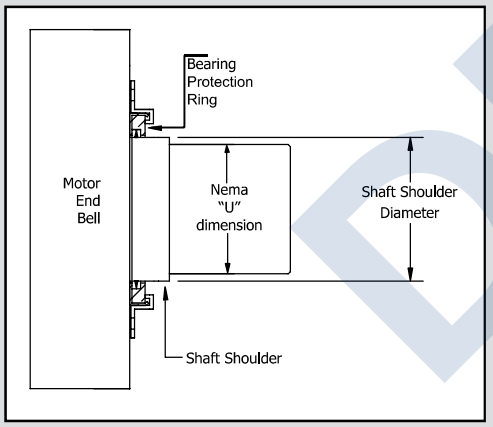
Conductive Microfiber Probe for use with Fluke 199C ScopeMeter

Measuring VFD Induced Shaft Voltages

For the first time you can easily and more accurately measure the voltage on a rotating shaft. The AEGIS SVP™ Shaft Voltage Probe's unique design of high density conductive microfibers ensures continuous contact with the rotating shaft. Used with the Fluke 199C ScopeMeter, you can determine if your motor is subject to potentially damaging bearing currents.

Catalog Number	Includes:
SVP-KIT-F199C	3 SVP tips, probe holder with two piece extension rod (fits 3/8" magnetic base)
SVP-TIP-F199C	3 SVP tips

Selecting The Right Size Bearing Protection Ring For Your Motor

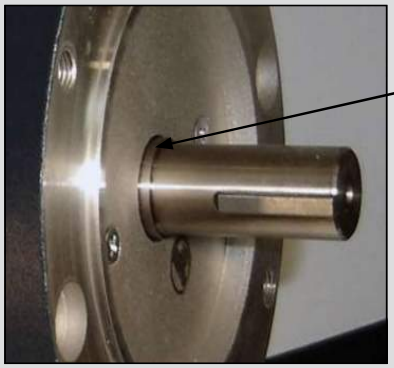


Front View

Side View

Back View

Mounting Options shown on page 8



1. Measure shaft diameter at a point 0.125" from motor end bell.
2. Refer to the part lists to locate the correct SGR part number.

Note: If you have a slinger or a shaft shoulder that is less than 0.375", you will need the NEMA/IEC kit. See page 13 for more information.

Example shaft measurement
0.425"

Catalog Number	Min.shaft diameter	Max.shaft diameter	Outside diameter	Thickness Max
SGR-6.9-1	0.311	0.355	1.60	0.295
SGR-8.0-1	0.356	0.395	1.60	0.295
SGR-9.0-1	0.396	0.435	1.60	0.295
SGR-10.1-1	0.436	0.480	1.60	0.295
SGR-11.2-1	0.481	0.520	1.60	0.295

Shaft shoulder: The SGR can be mounted to the shaft shoulder but the shoulder should be at least 0.375" in length so that all of the fibers are in contact with the rotating shaft. Measure the diameter of the shaft shoulder then locate the correct SGR on the part lists.

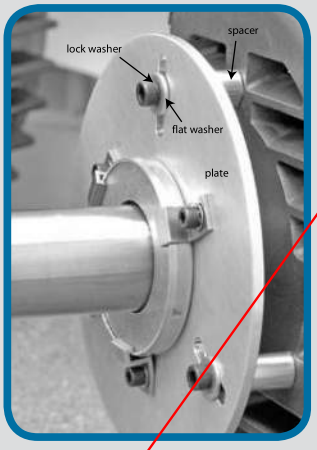
Custom Kits available for shaft diameters not shown above

NEMA/IEC Bearing Protection Ring™ Kit

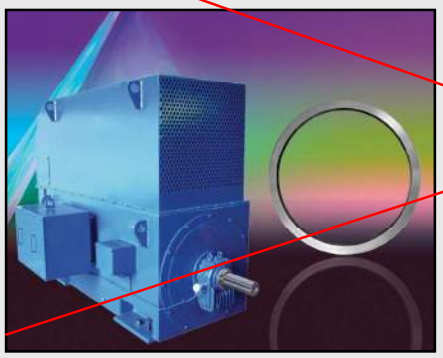
SOLID



1 AEGIS SGR™
1 mounting plate
3 screws (inches or metric)
3 washers
3 lock washers
3 spacers*

SPLIT

1 AEGIS Split Ring SGR™
1 split mounting plate
3 screws (inches or metric)
3 washers
3 lock washers
3 spacers*



* each kit includes 3 spacer lengths: 1/4", 1/2", and 1" for NEMA kits and 7mm, 17mm, and 27mm for IEC kits.

- Easy to order and install for any NEMA or IEC frame size
- Clears any slinger, shaft shoulder or protrusion
- Adjustable slots adapt to most end bells
- Rigid mounting plate ensures alignment
- Split Ring kit allows for installation without decoupling equipment

DRAFT

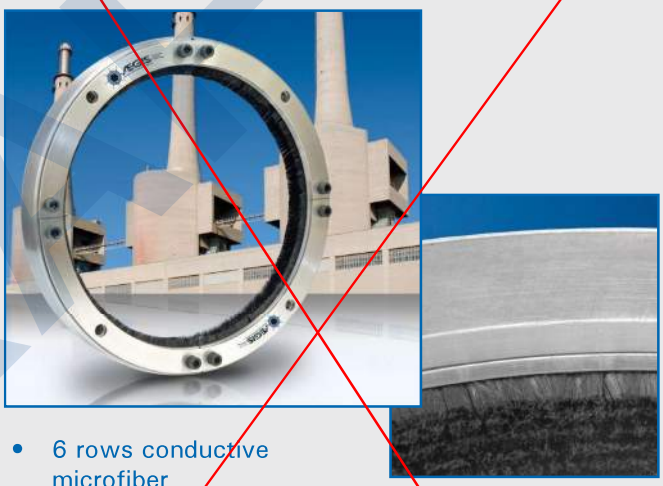
Custom Applications

AEGIS SGR™ Bearing Protection Ring™ for Large Shaft Diameters



- For shaft diameters greater than 6" (152.4mm)
- Long term reliable performance
- Maintenance free system
- Available in solid or split ring design

AEGIS WTG™ Wind Turbine Bearing Protection

- 6 rows conductive microfiber
- High current capable
- AEGIS WTG™ shaft current monitoring compatible
- Long term reliable performance
- Maintenance free system
- Up-tower retrofit capable split ring configuration

AEGIS iPRO™ High Current Bearing Protection for Large Motors and Generators

- 6 rows conductive microfiber
- High current capable
- AEGIS iPRO shaft current monitoring compatible
- Long term reliable performance
- Maintenance free system
- Available in sizes up to 30" (762mm) shaft diameter

WARRANTY: Units are guaranteed for one year from date of purchase against defective materials and workmanship. Replacement will be made except for defects caused by abnormal use or mishandling. All statements and technical information contained herein, or presented by the manufacturer or his representative are rendered in good faith. User must assume responsibility to determine suitability of the product for intended use. The manufacturer shall not be liable for any injury, loss or damage, direct or consequential arising out of the use, or attempt to use the product.

Patent Numbers: 7,136,271: 7,193,836: and other patents pending

Engineering Specification:

All motors driven by a variable frequency PWM drive shall include a maintenance free, circumferential, conductive micro fiber shaft grounding ring (AEGIS SGR) to discharge shaft currents to ground.
Recommended part: AEGIS SGR™ Bearing Protection Ring

Low Voltage Motors - Technical Bulletin - LVTB 04052024-1

Topic:	Insulated Bearings and Brackets
Issue Date:	April 5, 2024
Issued by	Dale Basso
Distribution List:	LV AEs, Inside Sales, Outside sales Service & Warranty

Preface: Shaft currents have become an increasing issue with modern Variable Frequency Drives and Higher switching frequencies? This creates a need to protect bearings from electrical damage.

The Basics:

Practical experience and international standards show that bearing insulation is an effective solution to prevent bearing damages due to electric currents flowing through the bearings. These currents can be caused by electromagnetic unbalances, by electrostatic effects, or by the high frequency common mode voltage from frequency converters. Bearing insulation can be made in different effective ways, as shown in IEC 60034-25 – Clause 8.4.2 (Figure 1), as well as NEMA ICS 7.2-2021 -5.2.10.

There are three components of shaft/bearing currents

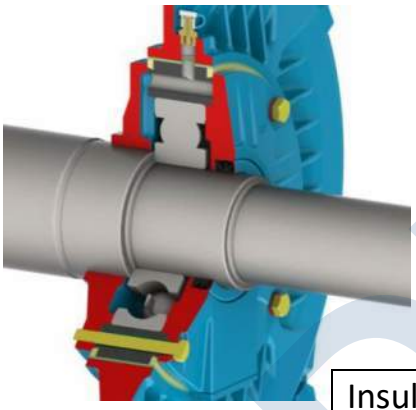
- **Stator to Frame capacitive currents**
  - Higher frequencies caused by switching
  - Standard ground is not the desire return path to the drive
  - May take path through bearings, shaft and driven load
  - Best solution excellent low impedance return path back to the VFD (VFD Cable & Ground straps)

- **Stator to Rotor capacitive currents**
  - Created in rotor looking for path to source (VFD)
  - Path of least resistance may be:
    - Through driven equipment bearings
    - Through motor bearings
    - Best solution is motor drive end shaft ground brush plus Excellent Low impedance return path to VFD

- **Motor circulating currents** - Typically motors above 400T Frames (>100HP)
  - Caused by asymmetry in Magnetic field axially along the rotor
  - Typically, low frequencies on Sine wave- Higher frequencies on VFD
  - Best solution – Insulated ODE bearing (or bearing housing) and DE Shaft Ground brush plus Excellent low impedance return path to VFD

What is the difference between an insulated bearing housing and an insulated bearing?

Both provide the same benefit, as referenced in IEC 60034-25 and EASA AR100. That is to provide a layer of insulation to break the High frequency capacitive current across the bearing.



The effectiveness is measured in Ohms at high frequency not DC. According to IEC 60034-25 and EASA AR100 standards; in order to assure effective protection against bearing currents, the bearing impedance should be ≥ 100 Ω at 1 MHz.

DRAFT

- Popular **ceramic coated Insulated bearings** exceed 50-100 Ohms @1MHZ

- **WEG Insulated End Bracket** – 100+ Ohms @1MHZ
  The advantage of the Insulated bearing housing is that it is more effective than the ceramic coated bearings at a comparable cost, and allows future bearing replacements to utilize standard readily available bearings which cost less than the special insulated bearings.

Insulating layer separating shaft and bearing from ground

- **Ceramic Ball bearings** – >200 Ohms @1MHz

DRAFT

BEST PRACTICES FOR VARIABLE FREQUENCY DRIVE (VFD) APPLICATIONS

VFD-induced shaft voltage can exist in every VFD driven motor application. It is not specific to the air movement industry, nor is it specific to any particular manufacturer's motors, drives or equipment. However, shaft voltage only becomes a problem when it leads to bearing current and consequential damage to the motor bearings.

NOTICE!

Risk of serious machine damage!
Appropriate measures must be implemented by the installation contractor to limit the shaft induced voltage to 1V – 2V as per IEEE 112.

Figure 1 Bearing damage caused by EDM

Frequency converters (also known as variable frequency drives or VFD's) can induce a voltage on the shafts of drive motors and stages due to the high switching frequencies used in these drives. Shaft voltage can become a problem when it reaches a high enough level to discharge across the bearings, causing electrical discharge machining (EDM) and creating small grooves called fluting which can lead to premature bearing failure. The potential for this induced shaft voltage exists in every VFD driven motor application and must be addressed on an installation specific basis.

VFD induced voltage is a phenomenon that is somewhat rare and unpredictable. As additional protection, Aerzen USA offers options for mitigating induced shaft currents such as grounding rings and isolated motor non drive end bearings. Even with these options installed, there is no guarantee that this phenomenon will be entirely eliminated. Damage to the motor bearings from shaft / bearing currents is not covered by warranty from Aerzen, the motor manufacturer or VFD manufacturer.

GENERAL RECOMMENDATIONS:

Motors up to and including 100HP (75kW) – Low Voltage

For induction motors either foot mounted, c-face or d-flange mounted motors with single row radial ball bearings on both ends of the motors

- Install one AEGIS SGR Bearing Protection Ring on either the drive end or the non-drive end of the motor to discharge capacitive induced shaft voltage.

Motors Greater than 100HP (75kW)

For horizontally mounted motors with single row radial ball bearings on both ends of the motor:

- Non-Drive End (Opposite Drive End): Bearing housing must be isolated with insulated sleeve or coating or use insulated ceramic or hybrid bearing to disrupt circulating currents.
- Drive End: Install one AEGIS Bearing Protection Ring.

Motors in Hazardous Areas

Grounding rings are permitted. Consult Aerzen USA or your motor supplier for specific recommendations.

Vent Silencer	Carbon Steel	Powder Coated	QH-00552	SikaCor Zinc R	A-6-450

*If made in the USA, Protection Method goes from Painted Externally to Powder Coated (A-6-450)

General Painting Information

The machine castings are fettled, cleaned and primed; the primer used is specially developed for machinery parts and is particularly notable for its excellent bonding characteristic and elasticity. Its base is a quick drying synthetic resin binder possessing a high degree of water resistance. The proportion of pigment to binder is such to ensure the best protection for the machines.
Total dry Film Thickness: 70 µm (2.75 mil)

Surface Preparation	Sand blasting, mechanical cleaning to near white surfaces per SA 2,5 acc. to DIN ISO 8501 or SSPC10	
Primer	Alkyd Resin: RAL 6006	Manufacturer: Relius Coatings
Final Coat	Alkyd Resin: RAL 5001 (Blue)	Manufacturer: Relius Coatings (BASF) or Dr. Demuth GmbH

General Powder Coating Information

SP Polyester Powder Paint, RAL 5001, structure, glossy
Relius No.: I536-5401
Total dry film thickness: 80 - 110µm

General Upgraded Protection Information

Surface Preparation	Sa 2 ½
Priming Coat	SikaCorEG4 (80µm max)
Intermediate Coat	SikaCorEG1 (80µm max)
Finishing Coat	SikaCorEG5 (80µm max)

Pre-Commissioning Checklist

	Document #	A-7-0288 rev "4"

The purpose of this pre-commissioning checklist is to ensure readiness to successfully commission your Aerzen packages. We will need some information from you in order to better prepare for the commissioning. We ask that your on-site representative complete and return this checklist to Aerzen USA at your earliest convenience.

We will also need to know if you have a target date in mind for our service technician to be on-site, and if the plant maintenance personnel will be on-site at that time to receive maintenance training. This training is normally hands-on in nature and should not take more than 1-2 hours. In addition to the pre-commissioning checklist, we will need an on-site contact and phone number for our service technician.

We will make every effort to meet your target date for commissioning. Please keep in mind that our start-up/commissioning schedule can run three to five weeks out. The earlier we know your target date the better chance we have of reserving your request on our schedule.

Please be aware that should the commissioning prerequisites not be completed prior to our arrival, Aerzen USA reserves the right to charge any and all responsible parties for additional time and travel expenses required to complete the commissioning service.

Below is a checklist of items requiring attention prior to our arrival. Please verify your understanding and completion of the prerequisites by initialing the check the boxes corresponding to each requirement. Please send this checklist to the Aerzen Service Coordinator once all the prerequisites have been verified

DRAFT

1	The Aerzen package has not been damaged during shipping and/or while on-site	☐
2	The Aerzen package is installed in permanent position, is level, properly grounded and anchored.	☐
3	The process pipework for the Aerzen package inlet and discharge is connected in its final position and independently supported (temporary supports are not acceptable	☐
4	Electrical connections have been completed for the motor using flexible conduit to allow the motor to be raised into its operational position.	☐
4A	The package safety switches (if applicable) are wired to the PLC or MCC (as applicable).	☐
4B	The Aerzen control panel (if applicable) is wired to the PLC or MCC (as applicable).	☐
4C	The correct voltage is fed to the control panel. Refer to the project specific wiring diagram for the voltage required	☐
4D	If there is a VFD or Soft-Starter and supplied by others, it has been configured with the following motor settings:	☐
4D-1	Horsepower (kilowatt)	☐
4D-2	Voltage	☐
4D-3	Maximum Frequency	☐

4D Continued

4D-4	Minimum Frequency - based on minimum speed of the blower or compressor in conjunction with the sheave combination	☐
4D-5	Full Load Amps	☐
4D-6	Time to Minimum Speed (3-5 seconds)	☐
4D-7	Coast to Stop (do not brake)	☐
4D-8	**CONSTANT TORQUE (VERY IMPORTANT!!!)**	☐
4D-9	Restart - only when the machine has come to a complete stop.	☐

5	Belts or coupling bolts removed for rotation test	☐
6	Verification that machine is filled to proper oil level with correct oil (if delivered without oil)	☐
7	Required personnel scheduled to attend startup (electrician, operators, maintenance personnel, etc)	☐
8	Proper paperwork completed to allow Aerzen technician on site	☐
9	If required, on-site safety training requirements for Aerzen personnel must be scheduled in advance. Please advise type, length and place of training).	☐

Tolerance on Power & Flow is +/- 5%

DRAFT

CRITICAL INFORMATION / NOTES

1 PRIOR TO SHIPMENT - AERZEN DOES THE FOLLOWING
Removes V-Belts from the motor sheave and wraps them around the blower sheave
Locks the motor hinge plate
Always refer to the operations manual for determining the most suitable lubricant.
Operating and ambient conditions may impact which lubricant to use.

2 UPON ARRIVAL
Immediately remove stretch wrap from package when stored outdoors

3 LIFTING PACKAGE
Without Sound Enclosure: lifting eye holes in the corner of the base frame
With Sound Enclosure: lifting through slots in base with fork lift

4 READ OPERATION MANUAL FOR INSTALLATION INSTRUCTIONS
Call Aerzen After-Sales / Service if you have any questions

5 AT COMMISSIONING - CUSTOMER / CONTRACTOR IS TO
Check oil level (refer to operations manual) - and adjust if necessary
Anchor the base or sound enclosure
Make grounding connections
Connect motor cable per Aerzen Drawing IA-004545
Verify correct rotation of motor (counter-clockwise, looking at drive shaft)
Remove locking device from motor pivot plate
Reinstall V-belts
Apply the oil sight glass Sticker

6 **ALL CUSTOMER PIPING TO BE INDEPENDENTLY SUPPORTED**

7 Recommended MINIMUM clearance at front and rear of package for "normal"
(i.e. inspect machine, change oil, replace belts, etc.) maintenance is 32 inches.

Explanation and Summary
Lines 1), 2), 3). 4) above show required performance data (what was ordered).
Lines 5) through 11) show data that resulted from the performance test on the actual blower.
Line 9) shows a variance of 3.62% in the flow capacity of this unit.
Line 11) shows a variance of 0.08% in the power consumption of this unit.

Standard accepted tolerance is +/- 5%. The unit would be acceptable if the flow was no more than 5% below the expected flow and the power was no more than 5% of expected power.

For this specific case the flow is -3.62% **less than expected.**
For this specific case the power is -0.08% **less than expected.**

Serial number 1619621 **Model number GM 90S** **meets and exceeds the standard tolerance.**

EC Declaration of Conformity

according to the Machinery Directive 2006/42/EC, Annex II, No.1 A

Company Name : Aerzener Maschinenfabrik GmbH
Reherweg 28
31855 Aerzen
Germany

Product Details :

The Declaration of Conformity for this piston engine is supplemented by the technical details in the chapter entitled "Performance Data".
The details provided therein identify the product and must be applied together with this Declaration of Conformity.

Appointed agent for the compilation of the technical documentation : Mr. Irtel, Managing Director
Aerzener Maschinenfabrik GmbH
Reherweg 28
31855 Aerzen
Germany

We hereby declare that the aforementioned product complies with all relevant provisions of Machinery Directive 2006/42/EC for the conveyance and compression of gaseous media.

The aforementioned product also fulfils all provisions of the following relevant EC-directives:

- EMC / Electromagnetic Compatibility 2004/108/EC
- Pressure Equipment Directive 97/23/EC
- The protection targets of the Low Voltage Directive 2006/95/EC have been fulfilled in accordance with Annex I, No. 1.5.1 of the Machinery Directive.

The following harmonised standards were applied:

• DIN EN ISO 12100	03-2011	Safety of Machines - General Design Principles Risk Assessment and Risk Reduction
• DIN EN 1012-1	02-2011	Compressors and Vacuum Pumps - Safety Requirements - Part 1: Compressors

This Declaration of Conformity applies to the product in its original state as placed on the market by the manufacturer. Any retrospective changes and/or retrospective work undertaken shall void this Declaration of Conformity.

Aerzen, 09-01-2012

POSITIVE DISPLACEMENT BLOWERS

DELTA BLOWER GENERATION 5

Volume flows from 18 cfm to 8830 cfm

DRAFT

AERZEN

DELTA BLOWER.
A TOUGH ENDURANCE RUNNER IN COUNTLESS COMPRESSION PROCESSES.

DRAFT

Delta Blower Generation 5

Positive displacement blowers of the Delta Blower Generation 5 act as the driving force behind many processes, and are the beating heart of a strong machine combination. This generation of assemblies from AERZEN compresses more than 150 years of experience as a world market leader in blower development. And it is more innovative than ever. AERZEN has introduced many innovations with this young series.

They provide a large volume-flow range from 18 cfm to 8830 cfm. With reduced life-cycle costs and quieter operation. But one thing remains the same: This blower class remains highly robust, thoroughly reliable and has an extremely long service life. No wonder customers choose it for continuous, long-term applications - over years and decades.

AERZEN
Delta Blower

Applications
- Water and Waste water treatment
- Aeration
- Backwash of filters
- Pneumatic conveying of bulk materials
- Gas conveying
- Degassing
- Dedusting
- Generation of negative pressure
- Biogas treatment
- Vehicle operation
- Ship unloading
- Tunnel boring

and much more

Industries
- Wastewater treatment plants
- Chemistry and process engineering
- Power plant
- Cement and lime
- Foodstuff technology
- Paper industry
- Pharmacy and many more

Goods conveyed
- Granules
- Sugar
- Cement
- Cereals
- Carbon

and much more

VERSATILE
FOR EACH APPLICATION.

The versatile compact power packages of the Delta Blower series can be used in all climate zones of the world. Just as safe under the most difficult environmental conditions as in indoor installation. They work stand-alone or in a machine combination.

Versatility in figures.
Delta Blowers are strong all-rounders: The smallest assemblies are mounted on silo trucks. The largest machines operate in lifting systems. They unload transport vessels. With an hourly performance of up to 1,000 tons.

Control range between
25 % and 100 %

Volume flows from
approx. 18 cfm to 8830 cfm

Pressures up to 14.5 Psi
Negative pressures down to
-7.25 Psi

Nominal diameters
DN 50 to DN 400

DRAFT

Indispensable for power plant technology

Conveying of powdery goods

Powerful for ship loading and unloading

MACHINES AND SERVICES FROM AERZEN. IN USE WORLDWIDE AND HIGHLY AVAILABLE.

The extremely high load capacity of Delta Blower packages is legendary. Just like their proverbial reliability, their durability or their intelligent operating and maintenance concept. Why are the services of AERZEN an issue at all? Because service is a must. And because our worldwide wellpositioned service teams are an important decision criterion for plant operators: for blowers made by AERZEN.

It's the inner values that matter: the AERZEN blower stage

Made in Germany

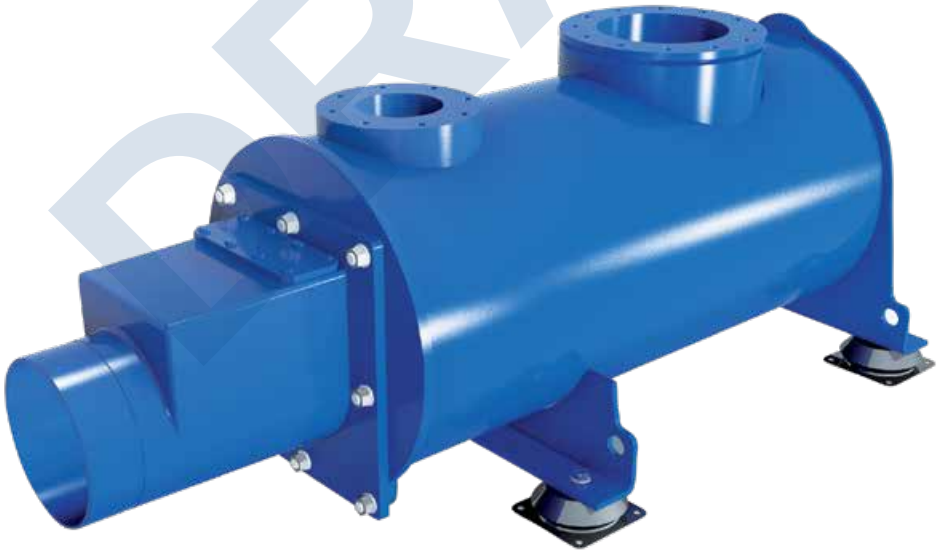
High availability.
The best blower packages are those that you do not notice. Because they are steadfast in their work. For years and decades. The Delta Blowers from AERZEN are such assemblies. AERZEN manufactures all core components itself.

From the assembly to the control system. From the idea to engineering and configuration. And thus ensures the high productivity of its machines. Our value contribution to the quality standard made in Germany.

On site worldwide.

Typical for AERZEN: The reliable availability of its solutions. This refers to our machines. And to our services. The fact that our service teams look after your systems over their entire life cycle protects the value of your investment. The fact that we have a dense network of 50 subsidiaries and agencies in more than 100 countries around the globe guarantees short distances. So we are quickly there for you - in case we are needed.

Safely AERZEN.



- Commissioning by qualified personnel
- Individual training of your specialist personnel
- Customer-specific service and maintenance contracts
- Machine repair also directly on site

Intelligently designed.

What does compact, easy handling or ease of maintenance mean? The value of these promises only becomes apparent in everyday practice. Just like these tangible benefits:

- Small footprint
- Flexible machinery mountings
- Easy to transport with forklift/lift truck
- Space-saving side-by-side installation
- Plug&play installation and commissioning
- Easy access to all wearing parts
- Oil level check from the outside while the machine is running
- Maintenance work such as oil and filter change from the front
- Low sound pressure level
- Belt drive for optimum volume flow design, subsequent power adjustment is quick and easy

Intelligent silencing: the AERZEN discharge silencer without absorption material

100 % clean.

How do we offer food suitability, avoid expensive cleaning or even production restrictions? We do not use absorption material for sound absorption. “Therefore, AERZEN made the base support a discharge silencer and reduces the noise exclusively by means of air deflections.

100 % free of absorption material, because this could wear out and contaminate the downstream system. By the way, the AERZEN base support is patented and certified as spark arrester for ATEX applications.

DRAFT

ROBUST BLOWER PACKAGE
READY TO PERFORM.

AERZEN belongs to the most innovative companies worldwide in the field of compressor technology. In 1868, we started manufacturing positive displacement blowers. By the way, we were the company that manufactured the first positive displacement blower in Europe. Since then, we have taken the performance features of this technology to the peak with every generation. Let yourself be surprised. Discover these special blowers: Delta Blower Generation 5.

Extremely robust blower package
- For a wide range of applications within a high control range from 25 to 100%
- Various modifications are possible

Compact design
- Space-saving side-by-side installation
- Small dimensioning of machine rooms

Easy operation and low-maintenance design
- Highly available at continuous operation even under toughest environmental conditions
- The front side is used for operation and maintenance

Plug&play Solution
- Completely configured, parameterized and ready for connection
- Integrated service kit with first oil fill

Oil-free as per class 0
- According to ISO 8573-1, certified by the TÜV (German technical inspection association)

Free from absorption material
- Suitability for use with foodstuffs in the pneumatic conveying of bulk materials (no impurities)
- Safety for energy-efficient productivity in the Water treatment (no sedimentation of absorption material in the aeration plates, no clogging of the aeration plugs, no pressure loss)

Integrated power supply panel (optional)
- Frequency converter, star-delta, direct, softstarter
- Intelligent AERZEN AERtronic control system

Smart oil system
- Oil level check while machine is running
- It can be read from the outside
- Oil instead of grease: Oil-lubricated bearings increase the service life

DRAFT

Advantages for the life cycle assessment
- Standard use of premium efficiency motors
- Suction on the cold side of the assembly
- Belt drive for optimal volume flow design
- Subsequent power adaptations are easily and quickly possible

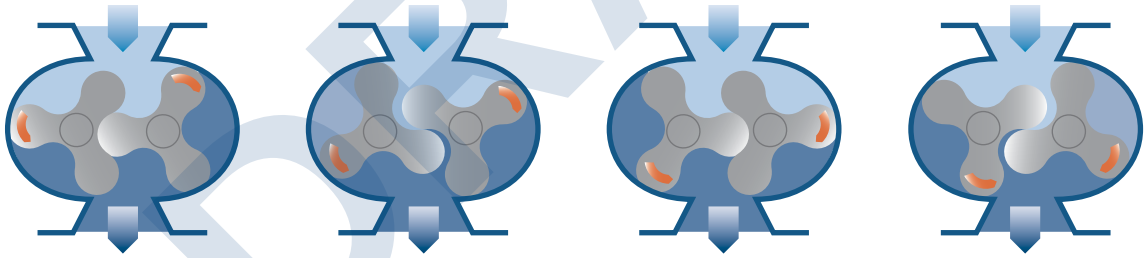
Belt tensioning hinged motor mounting plate
- Fully automatic and maintenance-free belt tension
- Inspection of V-belt tension no longer necessary
- Easy assembly or replacement of V-belts

Multifunctional hoist for hinged motor mounting plate
- Transport safety lock
- Easy and safe installation of V-belts
- Mobile installation of assemblies (e.g. ship installation/earthquake design)
- Hinged motor mounting plate support for heavy motors

Low noise level
- Safe control of the sound values, close to building areas and production areas
- Lowest sound values by optimised acoustic hood
- Integrated method for reducing pulsation (Patented AERZEN blower stage)

PED pressure-vessel guidelines approval (pressure safety valve)
- for overpressure operation

ATEX-compliant
- AERZEN base supports certified as spark suppressor for ATEX applications



TÜV-certified zone separation filter (optional)

DRAFT

INTERESTED IN THE INNER VALUES? CONSTRUCTION AND DESIGN.

It is good to know what is in the assemblies of the Delta Blower line from AERZEN: The wealth of experience of the world market leader. The quality standard of the traditional German family business. The innovation goal "Best solution provider for our customers". In addition first-class material selection. And a principle that has proven itself in tens of thousands of applications: Roots.

Innovation pulsation reduction.
Especially for its Delta Blower stages AERZEN has developed a unique process and integrated it into all sizes: the pulsation reduction. The patented AERZEN process prevents pulsations and noise already at the origin within the blower stage. For this purpose the AERZEN blowers equipped with 3-lobe pistons have two special channels cast in the cylinder. These control the backflow of the medium into the conveying chamber in such a way that the typical backstroke and squeezing pulses (typical for 2-lobe blowers) are eliminated. The end for pulsations due to patented interference method.

Conveying process in the AERZEN blower

Intelligent technical details ensure that the Delta Blower packages retain their value. One example of many: the patented pulsation reduction, an AERZEN innovation for longer bearing life.

DRAFT

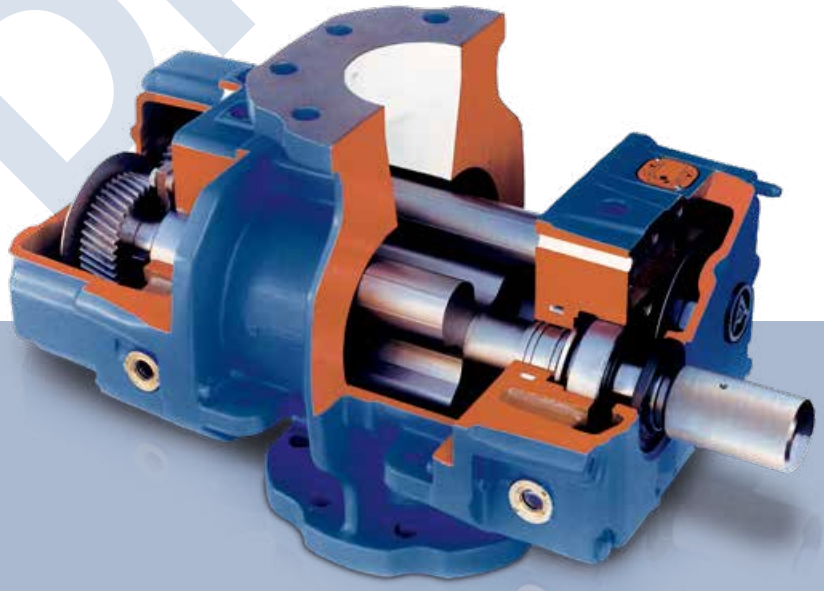
Blower stage
- AERZEN Blowers with 3-lobe pistons and integrated pulsation reduction
- Housing consisting of: Cylinder (with two cylinder with cast-in pre-inlet channels at discharge side to minimise the sound by pulsation reduction), wheel housing, housing cover and side plates
- Material EN-GJL-200
- Ribbed surfaces

Pistons

Sizes GM 3 S to GM 130 L:
- Pistons and shafts in one piece

Sizes GM 150 S to GM 240 S:
- Pistons made of nodular cast iron, shafts made of tempered steel

Drive type
- Overhung via narrow V-belt
- Direct drive



Cooling
- Convection cooling

Lubrication
- Oil splash lubrication for bearings and timing gears

Oil-free conveying
- The oil-free design according to ISO 8573-1 class 0 is guaranteed by the piston ring labyrinth seal, which has proven itself over decades, in combination with neutral chambers (open to the atmosphere)

Timing gears
- Hardened and ground, helically geared and made of case-hardened steel
- They are fitted to the shafts by taper interference fit
- maximum running smoothness and service life

DRAFT

It's the inner values that matter: the AERZEN blower stage

ALREADY IN THE STANDARD VERSION EXTRAORDINARY.

THE DELIVERY CONCEPT OF AERZEN.

Some call it comfortable. The others efficient. We call it all-in: the delivery concept of AERZEN. When the Delta Blower package comes to you, it is already completely configured, parameterized and mounted ready for connection at the factory. Naturally, this is tailored to your processes. Including all standardised accessory components for trouble-free operation at the touch of a button.

All in: The scope of supply in the normal version.

Assembly design: Overpressure

1 **3-lobe blower stage**
- With integrated pulsation reduction (see page 10/11)

2 **Base supports with integrated discharge silencer**
- Certified as spark arrester
- Absorbent-free silencing through patented discharge silencer

3 **Intake silencer with integrated air filter or strainer**
- Standard suction from the atmosphere (overpressure)
- Suction via piping optional (standard for negative pressure)
- Suction via filter element for negative pressure optional

Overpressure

Negative pressure

4 **Flexible rubber sleeve**
- with clamps

5 **Flexible machinery mountings**
- For the decoupling of structure-borne noise

6 **Pressure valve or suction valve**
- For machine protection

7 **Drive**
- Via high-performance narrow V-belt drive by means of three-phase motor
- Standard use of premium efficiency motors (up to motor size 447/9T)

8 **Hinged motor mounting plate**
- Automatic tensioning device for the belt drive
- Multifunctional hoist for hinged motor mounting plate

9 **Connecting housing**
- integrated check valve

10 **Integrated blow-off silencer**
- Horizontal version (up to DN 125)

11 **Standard instrumentation**
- Pressure gauge for indication of the conveying pressure (overpressure)
- Maintenance indicator for monitoring the intake filter (overpressure)
- Vacuum meter for indication of the conveying pressure (negative pressure)

Assembly design: Negative pressure

DRAFT

MODIFICATIONS AND ACCESSORIES.
THE BEST FOR EVERY APPLICATION.

Added value: The accessory components.

- Acoustic hood for indoor and outdoor installation, forced ventilation via mechanical fan
- Start unloading device, required for star-delta starting of the motor (overpressure),
- Vertical blow-off silencer with base plate (negative pressure)
- discharge side expansion joint instead of flexible rubber sleeve
- Power cabinet Star-delta, frequency converter, soft starter
- AERZEN AERtronic blower control
- AERZEN original spare parts
- Other accessories on request

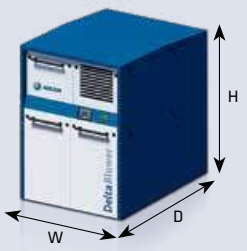
AERZEN Start unloading device

Modifications.

- Special motors
- Special varnish
- ATEX compliant design
- Acoustic hood for desert installation with special sand collector
- Acoustic hood for low temperatures down to negative 104°F with heating and gravity louvers
- Acoustic hood for earthquake resistance and increased wind loads
- Ship installation and vehicle deployment
- Use for special gases through the use of special materials
- Customised documentation
- Compliance with legal requirements for delivery e.g. in Eurasian customs union

Always the safe choice: ATEX compliant design from AERZEN

The new AERtronic - the way into the digital future.
The new edition of the AERtronic control system offers a user-friendly and clear possibility for the analysis and processing of relevant process parameters and thus provides more transparency, safety and efficiency. All measured values converge in the new control system and can be transferred to the production control system via common interfaces in order to always operate the plant at the optimum operating point. The AERtronic is available in three versions:



Basic: As a fully digital display instrument
Advanced: For active process control
Premium: As an intelligent interface with cloud compatibility.

MATURED TO PERFECTION IN 150 YEARS: THE SERVICE WORLD OF AERZEN.

The best kind of service is the kind you don't need. But every technology involves wear and tear. Our machines are designed to do their job for as long and efficiently as possible. If necessary, for decades. The goal of AERZEN Services is to extend service life and availability – simple added value for your investment!

Benefit from AERZEN OEM competence - at any time and anywhere

With your OEM's best recommendations.
We have been manufacturing quality products for over 150 years. At the same time, we also developed a corresponding service world. With tailor-made offers for every phase of your machine's lifespan. With OEM original parts, reliable logistics and excellent service at its core. And with decentralised service centres in your vicinity, which guarantee fast provision of spare parts and competent service - worldwide.

AERZEN on-site service.
Our service teams work where our machines are. All over the world. Onshore or offshore. Often under extreme conditions. How do we do it? With short distances. AERZEN has a dense network of service centres and decentralised parts warehouses around the globe. More than 200 excellently trained service technicians can come to your aid from there. Any time and anywhere you need us.

Contact worldwide

2,500 employees work for AERZEN. On every continent. With six sales offices in Germany alone, we're there for you. And with 50 subsidiaries in over 100 countries around the world. Hence we're never far away – should you ever need us. Give us a call:

+49 5154 81 0

Service-Infoline

Our German Service Centre is available for customers and operators. We are happy to help you. We look forward to your call:

+49 700 49318551

Customer Net

Where you can learn more about the company and the leading compressor technologies from Aerzen? It's simple: In our Customer Net on our website, where we have stored everything that is worth knowing for you:

DRAFT

AERZEN. Compression - the key to our success.

AERZEN was founded in 1864 as Aerzener Maschinenfabrik. In 1868, we built Europe's first positive displacement blower. The first turbo blowers followed in 1911, the first screw compressors in 1943, and in 2010 the world's first rotary lobe compressor package. Innovations "made by AERZEN" keep driving forward the development of compressor technology. Today, AERZEN is among the world's longest established and most significant manufacturers of positive displacement blowers, rotary lobe compressors, screw compressors and turbo blowers. AERZEN is among the undisputed market leaders in many areas of application.

At our 50 subsidiaries around the world, more than 2,500 experienced employees are working hard to shape the future of compressor technology. Their technological expertise, our international network of experts, and the constant feedback we get from our customers provide the basis for our success. AERZEN products and services set the standard in terms of reliability, stability of value and efficiency. Go ahead – challenge us!

EXPECT PERFORMANCE

Delta Blower (G1-068-10)_Aerzen USA
12|2022

AERZEN DELTA BLOWER GENERATION 5
North American Standard
Positive Pressure

Standard range

Blower sizes: ..... GM 3S to GM 150S

Package nominal sizes: ..... 2” (DN 50) to 12” (DN 300)

Medium: ..... Air

Flow range: ..... 35 to 5297 icfm (1.0 to 150 m^3/min)

Differential pressure: ..... 15 psi (1000 mbar) for “S” and 10 psi (700 mbar) for “L” machines

Maximum operating temperature: 285ºF (140ºC)

Drive: ..... V-belt drive with totally automatic belt tension adjustment

Introduction

The Aerzen Blower is renowned for its performance and its reliability. There is no secret: From the blower-stage through the accessories, Aerzen enhances key features of each component by applying sound engineering, precision machining, and superior workmanship.

The Delta Blower Generation 5 (G5 for short) is the synthesis of four previous Aerzen blower package generations combined with an array of new technical innovations to provide five key advantages to our customers:

- The machinery noise level has been lowered yet another 6-8dBa[1] on average compared to the previous Delta Blower
- The blower package is even more user friendly especially in transport, installation, operation, and maintenance
- The oil level is visible from the outside of the package, so the blower does not need to be shut down
- No absorption material is used in the discharge combination silencer; this eliminates the possibility of foreign objects contaminating the air or gas stream
- Use of a shaft mounted cooling fan, which reduces installation and operating costs by eliminating extra wiring, motor starters, and its interlocking with the main blower motor
- The compact footprint allows units equipped with sound enclosure to be mounted side-by-side since there is only one main maintenance access side

[1] Measured in 1m free-field conditions

DRAFT

Aerzen Delta Blower Generation 5 are pre-engineered modular compact packages, which offer a wide range of options from proven and standardized components at reasonable costs and short delivery times.

Shipped completely assembled, the Aerzen Delta Blower Generation 5 is indoor and outdoor rated. There is no extensive installation work - neither grouting nor special anchoring is required, just simply level it and bolt it to any standard industrial flooring or surface.

Scope of supply: basic configuration

- Aerzen Rotary Lobe Blower stage
- Combination Base Frame / Silencer combined with hinged motor plate for automatic belt tensioning – with 2 ½" diameter discharge pressure gauge
- Making belt changes as easy as possible a motor hinge plate lifting and locking mechanism is included with DN100-300 units and a hydraulic bottle jack is supplied with DN50 and 80 units.
- Set of vibration isolating mounts under the entire blower package
- Inlet silencer – filter with filter maintenance indicator
- Narrow V-belt drive and protection guard
- Pressure safety valve
- Discharge manifold with integral check valve and flexible pipe connector
- Standard paint system
- NEMA electric motor TEFC, Premium efficiency, VFD duty, with conduit box on top
- First oil fill and "Service kit"
- Packaging for domestic trucking
- Standard documentation in electronic format: English language, drawings with US-customary and metric units of measure

Standard options include (not limited to)

- Inlet pipe connection kit
- Sound enclosure with skid / oil-drip pan and forced ventilation
- Start-unloading valve Aeromat, with or without solenoid valve
- Pressure modulating valve Aeropress or Aeropress10S, pilot operated
- Other motors, e.g. misc vendors Premium Efficiency with conduit box on top
- Instrumentation & controls, e.g. AERtronic Aerzen blower controller

DRAFT

Description of the main components

The combination of key components marked with a * in the description below significantly contribute to the reliability and performance of the Aerzen Blower:

At the heart of the package: The Aerzen Rotary Lobe Blower

Low vibration and low pulsations - a key feature:

* Internal pulsation interference channels in conjunction with 3-lobe rotors reduce the pulse in the discharge air stream by as much as 90% or 20 dB at the lobe-passing frequency. This significant attenuation contributes strongly to reducing vibrations in the entire package and lowering the noise emitted by the downstream piping.

Positive displacement characteristic:

- The blower moves a fixed volume of gas with each shaft rotation, nearly independently from the operating pressure.
- At constant differential pressure, the load torque remains constant.
- For a given pressure, the power is directly proportional to the speed.

Flow across the blower stage:

- Vertical from top to bottom

Drive shaft location:

- On the left when facing the blower shaft

Rotation:

- Counterclockwise when facing the blower shaft

Housing:

- The central section, “the cylinder” and the two side-plates house the rotors, while a gear case and a drive end cover contain the lubricating oil for bearings and gears. Individual side plates allow for optimal setting of the radial rotor clearances: a valuable feature on blowers with the gas flowing perpendicular to the rotors.
- Connections: full-size, flat-faced flanges
- * Maintaining internal alignment under all operating conditions is paramount for the reliability of any rotating equipment. The housing is, for this purpose, designed to support the entire blower stage on its outlet flange only; no need to worry about a “soft foot” or uneven base support
- Materials: Gray cast iron EN-GJL-200 equivalent to ASTM A48 Cl.30 AISI A278 Cl. 30

DRAFT

Rotors:

- Up to and including the model GM 80L, rotors and shafts are made of a single, drop forged steel piece made from C45 steel equivalent to AISI Type 1045. Models GM35S, 50L, 90S, and 130L are made from a single piece of EN-GJS-500-7 nodular cast iron equivalent to ASTM A 536. Model GM150S rotors are comprised of a through shaft made from C45 steel equivalent to AISI Type 1045 and a rotor made from EN-GJS-400-15 nodular cast iron equivalent to ASTM A536 Gr. 60-40-18. Solid or dust-tight rotors do not have any open cavities that can trap contaminants. This is particularly important in food applications and applications requiring high purity. Moreover, rotor balance is maintained, and vibration is therefore minimized.
- Stiff rotor design: the rotors' first critical speed is always at least 10% above the maximum operating speed.
- The rotors meet or exceed the ISO 1940 / ANSI S2.19 G6.3 criteria of dynamic balancing

Timing gears:

- Helical gears with hardened and ground teeth to meet AGMA 12 quality standard with an AGMA service factor of 1.70.
- To maintain the advantage of high-quality gears, the gear wheels are secured onto the shafts by means of a tapered interference fit. Optimum concentricity is achieved and neither gear hub nor shaft keys are used. To prevent damaging the seats, gear installation and removal are carried out using hydraulic pressure to expand the gear wheels within their elastic limit.

Bearings:

- The rotors are supported by anti-friction bearings
- The bearings are housed in the side-plates and are sized for an expected 5 years between overhauls.
- The drive-shaft bearing is a cylindrical roller bearing whereas the other bearings are selected to achieve the proper clearances between rotors and housing, axial loads from the helical bearings: smaller machines up to GM 50L feature double angular ball bearings.

Lubrication:

- Oil splash lubrication of all bearings and gears through oil spray disks on both blower ends
- An oil sight glass is provided on each oil sump.
- An oil drain valve is provided on each oil sump (units without sound enclosure). The oil drain valves are directly mounted to the oil sump covers for clean, easy and fast oil change.
- Units with sound enclosure are plumbed together to an oil reservoir that serves as oil fill and drain device, and its oil sight glass is visibly mounted to the maintenance side of the enclosure.
- Aerzen USA provides the first oil fill with a lubricant as recommended in the operating manual as well as a service-kit containing oil fill funnel, and oil drain hose.

Seals at the rotor chamber:

- The rotor chamber is sealed from the oil chambers by four, all metal, non-rubbing seals, each consisting of the following components and in that sequence:
  - Oil slinger ring
  - Two restrictive piston-rings in a labyrinth
  - "Neutral chamber" located between the piston rings used for venting the seal
  - Two restrictive piston-rings in a grooved labyrinth bushing

Seal at the drive shaft:

- Double, permanently lubricated Viton seal ring
- Shaft sleeve: replaceable, hardened steel

DRAFT

Testing

- Each blower stage is subject to a full-load test to verify the volumetric flow and power values.
- Acceptance criteria are +5% on power and –5% on flow for all machine sizes.
- Orifice flow measurement and conversion of results to the operating conditions in accordance with ISO 1217, simplified

The package component Aerzen Rotary Lobe Blower

Intake air silencer & filter

- Absorption-type silencer upstream of the air filter element. For reasons of cleanliness, there is no silencing material between the filter and the inlet blower flange.
- The carbon steel housing is powder coated. Quick-release latches for quick access to the filter element
- Filter performance: G4 per EN 779 (greater than 90% of synthetic dust particles), equivalent to ASHRAE 52.2 MERV 7 (50-70% @3-10 microns)
- Progressively compressed, thermally bound polyester fibers, free of PVC, smoothened and compressed on the clean airside for highest dust separation and retention capacity. The filter media is made of a single, 30 mm thick continuous mat that is white in color and is food safe. Filter element mounts with a quick release turn and lock arrangement.
- Included is a filter maintenance indicator. If the sound enclosure option is selected, the filter maintenance indicator is mounted to the enclosure wall.

Base with integral discharge silencer:

- In addition to the blower's internal pulsation cancellation feature, the combination discharge, three-chamber reactive silencer is used to further reduce the noise and residual pulsation in the air stream across a wide range of operating speeds. The residual pulsation downstream of the silencer meets or exceeds the API 619 recommended 2% peak-to-peak of the absolute line pressure.
- The discharge silencer is combined with the support base into one compact rugged unit. It is made from pressure vessel steel it forms a torsion resistant cylindrical vessel supporting the blower stage and other components.
- The mounting surface for the blower is a full-size steel flange machined and continuously welded to the base with the full number of tapped holes for the studs to fasten the blower to the base - no need to align blower feet or to worry about a soft-foot condition. A surface sealant is used instead of a gasket.
- Maximum operating pressure: 1.1 bar gauge (16 psig) and 150ºC (300ºF), built and certified to the latest European Pressure Vessel Code, PED. Test pressure: 1.9 bar g. (27.6 psig)
- The base is mounted on a set of vibration-isolating mounts

DRAFT

Belt drive

- Narrow, anti-static V-belts
- Selected for a minimum service factor of 1.4 times operating power (BHP), or 1.1 times the motor nominal power (nameplate HP), whichever is greater.[2]
- * The Aerzen Delta Blower Generation 5 package provides entirely automatic tensioning of the belts. Thanks to the package configuration, the drive geometry is such that the motor hinges parallel to the motor shaft centerline, using only the motor mass to maintain this tension without need for adjustments or springs. This not only reduces maintenance; it also reduces the potential for operating with too little (slipping belts) or excessive belt tension (excessive bearing and shaft load).
- DN100-300 blower packages feature a multipurpose lifting device for the motor swing plate. In its most basic function, it serves as shipping locking device preventing the motor from unwanted movement. It also serves as the lifting mechanism for changing out the drive belts. Another additional purpose is limiting the belt tension when oversized motors are used. Finally, the device can be configured to aid limited movement for seismic or mobile blower package service. The maintenance kit provided by Aerzen USA also includes a ratchet wrench used for lifting the motor to change V belts.
- DN50 & DN80 blower packages have a simple to use bracket and hydraulic jack included in the maintenance kit to lift the motor and change or install the belts.
- Sheaves and bushings are dynamically balanced to ISO 1940 / ANSI S2.19 G6.3. For linear tip speeds > 6500 ft/min (33 m/s), nodular cast-iron, ventilated sheaves are used.

Belt guard

- OSHA compliant personnel guard, made of galvanized steel: either perforated steel or solid sheets with vents, depending upon the model.
- Units with sound enclosure feature hand protection fan and belt guards, and the enclosure itself serves as the ultimate protection device. The removable maintenance panels comprise lockable latches that help facilitate OSHA prescribed tag-out-lock-out procedures.

Vibration isolating mounts

- A set of vibration isolating mounts are located under the blower package to hinder the transmission of structure borne noise from the blower and the discharge silencer into any structure the package is installed on, such as a mounting skid if supplied with acoustic enclosure.

Discharge manifold

- Flange-mounted to the discharge silencer, the discharge manifold serves for mounting the pressure safety valve, an optional start-unloading valve and for connecting the blower package to the discharge piping.
- Materials of construction: Gray Cast Iron EN-GJL-250 equivalent to ASTM A48 (Aluminum stub pipe for DN50)
- The discharge manifold houses the discharge check-valve

Pressure safety valve

- DN100-300 blower packages have a vertically mounted, spring loaded, safety pressure valve sized for the full flow of the blower. DN50 and DN80 blower packages feature horizontally mounted safety relief valves.

[2] Higher values are not necessarily better as they could lead to belt slippage due to excessive stiffness, and also shaft damage (deflection) caused by higher tension values required by over sized v-belt drives.

DRAFT

- The valve's characteristic is nearly proportional. It not only opens, but also closes at the set pressure
- The valve has a built-in dampener that allows the valve to actuate smoothly, which prevents the "pop-off" effect commercially available valves exhibit.
- Pressure rise up to 10% at full flow. Certification of conformity to PED
- Being an all-metal valve, it is not suitable as a pressure modulating valve. If this function is needed use an Aerzen pilot operated Aeropress or Aeropress10S pressure modulating valve.
- Materials: seat of gray cast iron and, depending on the size, a brass or anodized aluminum bell and piston, galvanized spring, steel spring rod, and an aluminum or fabricated external steel cylinder.
- Standard set points are 15.2 psig (1050 mbar) for "S" model blowers operating above 10 psi (700 mbar), and 10.9 psig (750 mbar) for all machines operating under 10 psi (700 mbar), including all "L" model blowers[3].
- The valve protects the blower stage against line surges, and spikes. It does not protect against prolonged overloads or excessive discharge temperature. Therefore, it is not an absolute protection device, nor is it "bubble tight".

Discharge check valve

- A full-bore check valve that can be easily removed for inspection and maintenance without disconnecting the discharge piping[4]
- With its horizontal top-located steel shaft[5], the check valve naturally closes by gravity at no-flow.
- Without any springs, the check valve will not chatter, even at low flow conditions (for example in adjustable speed applications)
- Flap material: EPDM on steel for operating temperatures up to the blower limit
- Optional check valve flap material: Silicone rubber

Discharge flexible connector

- A reinforced silicone-rubber discharge flexible connector with heavy-duty clamps connects to the discharge piping.
- It prevents the transmission of structure-borne noise from the blower and its discharge silencer to the discharge piping.
- Located downstream of the silencer and with only a small gap (~1/2") between the package and the pipe, the noise sent to the outside is maintained at a minimum.
- The sleeves are sized for standard, schedule 40 pipe diameters.

Discharge pressure gauge

- Liquid filled, 2 ½ "dial. Units: mbar and psi
- If the sound enclosure option is selected, the discharge pressure gauge is mounted to the sound enclosure wall.

DRAFT

[3] The valves are adjustable, and different springs are available for other set points depending upon operating conditions, motor limitations, or customer's requests.

[4] Except DN50

[5] Except DN50

Optional sound enclosure

- — Covering the entire blower package with the drive motor, the enclosure provides suitable protection for outdoor installation up to 50 mph winds and 25 lb/ft^2 snow load and rain at a 45º angle
- * — The enclosure and the blower package are both mounted on a skid / oil-drip pan, designed for meeting environmental protection standards as well as for easy transportation and installation.
- * — The unique Aerzen package design makes it possible to mount multiple blowers side-by-side without hindering access to the maintenance side (front). All pipe and wiring connections are made from the backside. This offers the best use of available floor space.
- * — All maintenance activities can be carried out from the front of the package, e.g. air filter, belts, and oil maintenance. The oil level is visible from the outside and eliminates any guesswork. Oil can be filled and drained from a common reservoir that also houses the oil level gauge.[6] The oil level check can be done with the blower in operation.
- — The enclosure reduces the package noise level to less than 80 dB(A) – 75dB(A) in most cases- at 1 m, free field, per DIN 45635.
- — Quick release panels, each less than 50 lb (as mandated by MSHA) provide quick and easy access to the blower and the package components for routine maintenance.
- * — Blower packages are fitted with a shaft-mounted cooling fan for sufficient heat removal. There is no need for a separate electric driven fan and required interlock and controls.
- — Aerzen mounts the blower package in the sound enclosure at our factory prior to shipment.
- * — Panels are made of galvanized steel sheet, with self-extinguishing, non-dripping high-density polyester foam as absorption material.
- — The enclosure is powder coated in a UV resistant Aerzen Royal Blue color, accented with light gray maintenance panels

1. General notes

- This description serves as guide for the operation of the hinged motor lifting device.
- Usage requires special knowledge in using and handling this kind of machine.
- For correct operation of the hinged motor in the Delta unit, qualified and trained specialists are required.
- Only use envisaged and suitable tools for adjusting the hinged motor.

Every person involved in the adjustment of the hinged motor should read and understand this description and the corresponding operating instructions and especially the safety instructions!

WARNING!
Danger of injury if insufficiently qualified!
Incorrect use can lead to considerable personal injury and property damage.

- All actions should therefore only be carried out by adequately qualified specialists.

Specialists
are due to their technical training, knowledge and experience as well as knowledge of the relevant provisions able to carry out all work assigned to them and to recognise and avoid possible dangers.

Only personnel are allowed to work whom it can be expected to carry out the work in a reliable manner.

Persons whose responsiveness is influenced due to drugs, alcohol or medication are not allowed.

Age and job-specific regulations should be taken into consideration with the choice of personnel.

DRAFT

Typ / *type*		
Delta Hybrid Delta Blower Generation 5 Delta Screw Generation 5		

2. Safety information

The hinged motor should only be set or adjusted when the machine is not in operation and secured against reactivation!

Securing against reactivation

The machine should be secured against reactivation for all actions that require the machine to be in a non moving condition (e.g. work or fault rectification).

WARNING!
Lethal danger due to unauthorised, uncontrolled or impermissible reactivation!
Unauthorised or uncontrolled reactivation of the machine can lead to serious injuries or death!
Persons could be in the hazardous area.

Applying power can lethally injure these persons.
- Secure the main switch and lock.
- Signs should be placed on the main switch and users informed of the possible dangers.
- Before reactivation ensure that all safety equipment is assembled and fully functional and that there are no dangers existing to persons.
- Always adhere to the following procedure for securing against reactivation.

1. Switch off energy supply.
2. Secure the main switch using a lock which should be locked and a relevant sign should be placed on the main switch.
3. The key should be kept safe with a responsible person.
4. If the main switch cannot be secured, relevant signs should be placed indicating the dangers.
5. After all work is completed check that there are no persons in the hazardous area.
6. Make sure that all protection devices are installed and fully functional.
7. Unlock the main switch and remove the signs.

DRAFT

Typ / *type*

Delta Screw Generation 5

CAUTION!
Danger of injury due to sharp edges and pointed corners!
Sharp edges and pointed corners can cause abrasions and cuts to the skin.
- Proceed carefully when working near sharp edges and pointed corners.
- If in doubt wear protection gloves.

WARNING!
Danger of injury due to moving and rotating components!
Moving and rotating components can cause serious injuries.
- Correctly take the machine out of operation and secure against reactivation before adjusting the hinged motor.
- During the adjustment of the hinged motor do not touch or grasp any moving components.
- Wear close fitting protective clothing with a low tear resistance when in the hazardous area.

WARNING!
Shear and crushing danger due to moving parts!
Moving components can cause shear and crushing injuries.
- Do not grasp between any moving components when working on the hinged motor.
- Never enter the swivel range of the hinged motor.

DRAFT

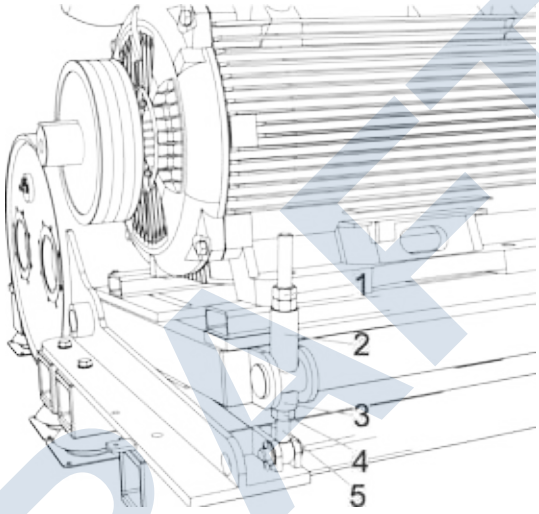
- Only use the ratchet spanner and the original mounting material that were delivered to adjust the hinged motor!

- The hinged motor should not rest on the guide bushing when in the operating position.
  Exception: Hinged motor support for motors with increased weight.

  Otherwise the belts slip and wear out sooner.
  Danger of property damage!

  The hinged motor should also have sufficient space to place the guide bushing after the belt has stretched.

Design with acoustic hood



- After adjusting the hinged motor correctly close the acoustic hood.

DRAFT

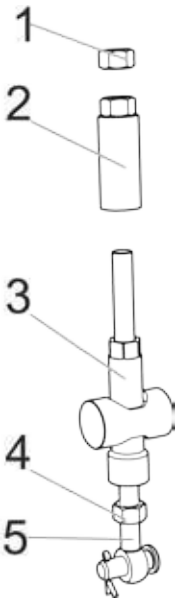
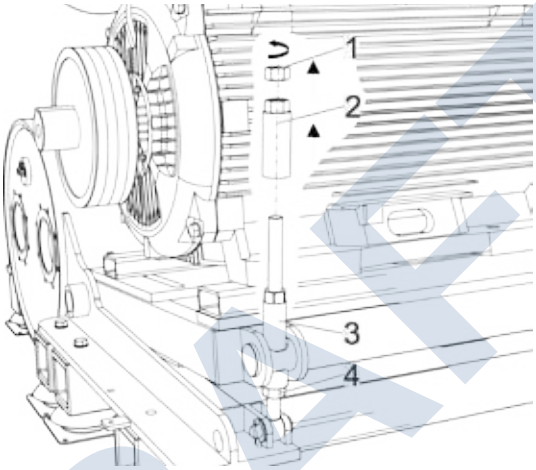
3. Delivery condition



Factory delivery condition / without drive belts.

Fixed hinged motor / transportation lock



4. Assembly overview

Pos.	designation
1	Locking nut 1
2	Locking sleeve
3	Guide bushing
4	Locking nut 2
5	Eyebolt

DRAFT

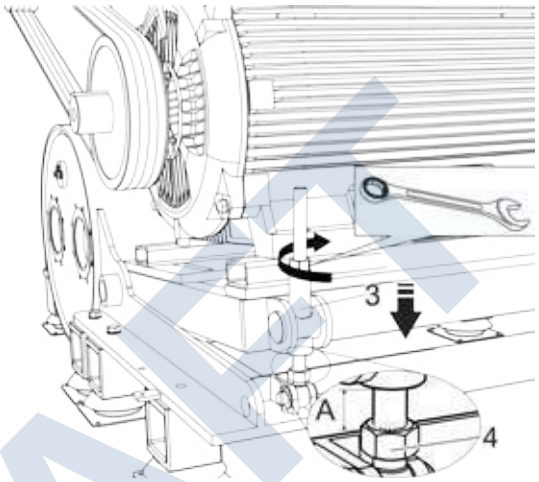
5. Adjusting the hinged motor before commissioning

- Disassemble locking nut (1) and locking sleeve (2).



Check to direction of rotation
Observe the red direction of rotation label on the unit.
Briefly start the drive motor. (approx. 1 - 2 seconds)

Important: WITHOUT belt on the motor disc!

Incorrect direction will destroy the unit!
Direction of the drive motor and the unit must be the same.

- Mount the belt.

DRAFT

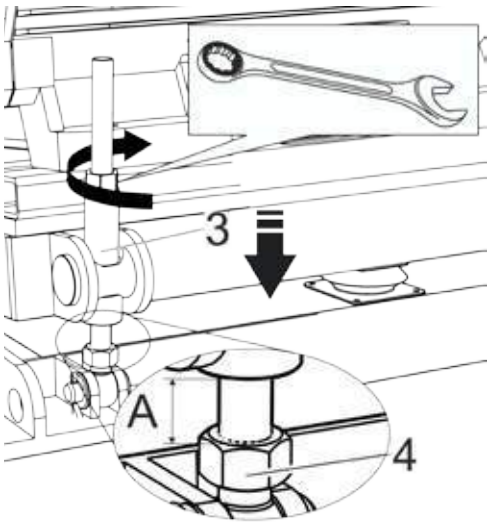
Pre tension the belt



- Screw down the guide bushing (3) with the ratchet spanner.
- The hinged motor is still slightly on the guide bushing (3).

Adjust dimension A

- Adjust the locking nut (4) to dimension A.
- Turn the guide bushing (3) onto the locking nut (4) with the ratchet spanner.

Lower the hinged motor until the belt is tensioned.

- Check the belt tension.
- If the belt tension is incorrect, lock the guide bushing (3) and the locking nut (2).
- Check the belt tension after the following intervals and adjust if necessary:
  after 24 op. hrs. after 500 op. hrs after 4000 opt. hrs

DRAFT

Belt tensioning

1. Set the testing force via the profile type.
2. Determine the disc diameter **dk** on the drive and derive from this the indentation depth **E.**
3. Calculate the indentation depth**Ea** with the existing axial distance **e.**
4. The testing force **f** is to be asserted in the middle of the axial distance **e** on the drive belt. The testing force should be exerted vertically on the strand! Pretension the drive to the calculated indentation depth **Ea.**

Pretension example: **Profile** = SPZ; **dk** = 100 mm; **e** = 380 mm; **f** = 2.5 daN; **E** = 2.00 mm; **Ea** = 7.6 mm

The drive belts should be re-tensioned after 30 min. of operation and be checked if possible after 24 hours.

e = axial distance
E = indentation depth every 100 mm axial distance
E_a = indentation depth of the strand
f = testing force

$$E_a = \frac{E \cdot e}{100}$$

Profile	Testing force f for each drive belt (daN)	Diameter d_k (mm)	indentation depth E (mm) each 100 mm Strand length with initial assembly	indentation depth E (mm) each 100 mm Strand length in operation after running in.

G-5 Combination Base - Discharge Silencer

Description: Combination base - discharge silencer

Base/discharge silencer includes three-chamber reactive silencer built as a pressure vessel, blower mounting-flange with studs, discharge connection with integrated check valve, hinged motor plate, entirely supported on vibration isolating feet.

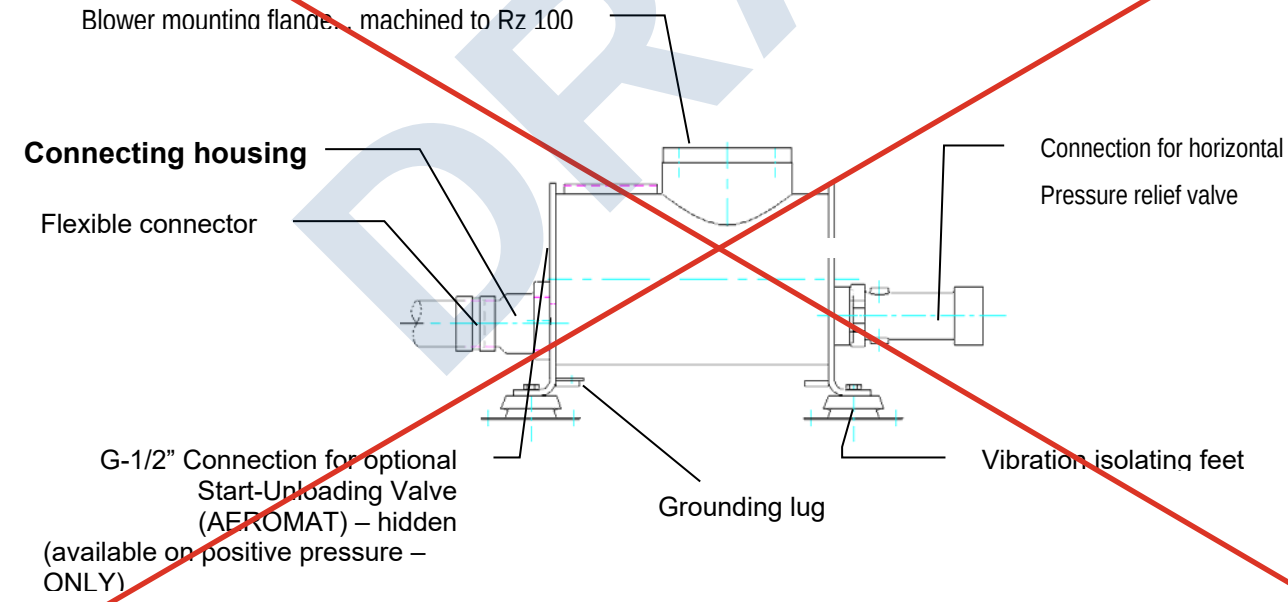
Materials of construction:

Silencer: Pressure vessel quality carbon steel S 235 JR (St 37-2) equivalent to ASTM A 283 Grade B

Pressure vessel code: PED (European directive) PED – AD 2000, DGRL 97/23/EG with consideration given to static and dynamic stress (fatigue resistance)

Maximum operating data: 150 ºC (300 ºF) and 1.1 bar gauge (16 psig)

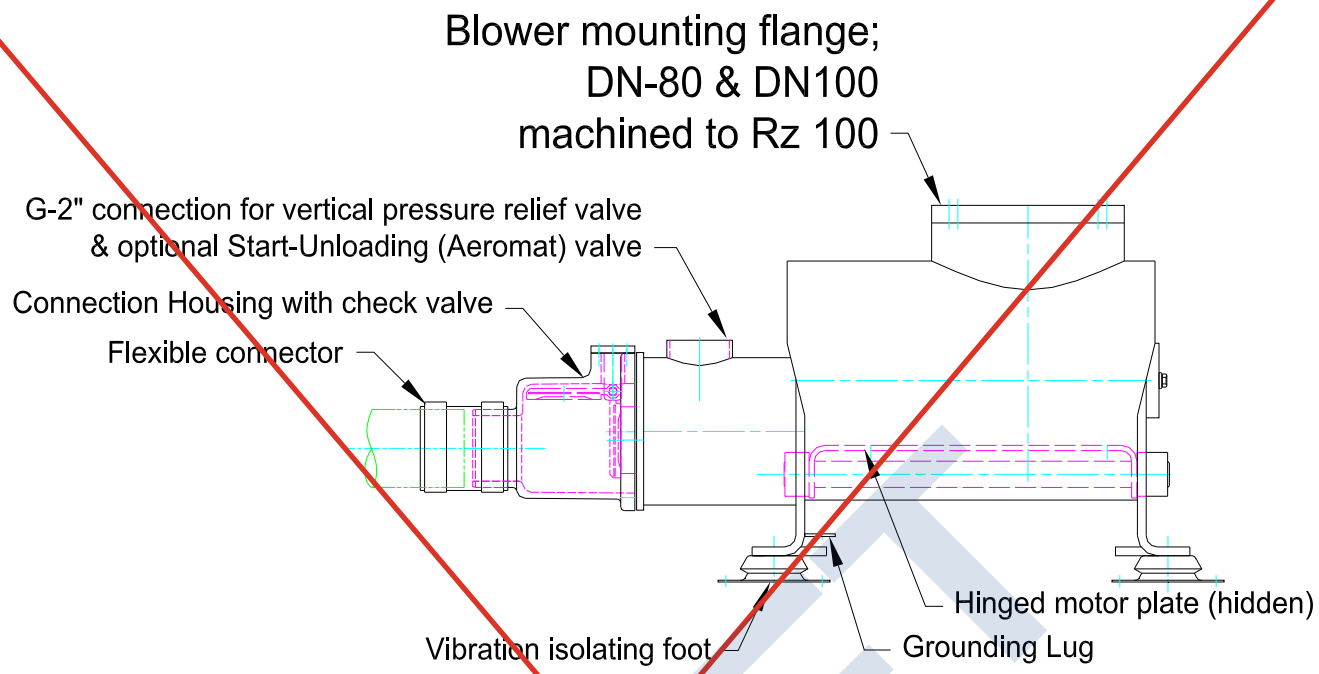
Test pressure: 1.9 bar gauge (27.5 psig)



Shell wall thickness: depending on size: 6mm (1/4") for DN-50 → 15mm (5/8") for DN-300

Performance:

Pulsations in the air stream are reduced below the API 619 standard of 2% peak-to-peak of the mean line pressure.



Pressure drop of the entire Base-Silencer with connecting housing and check valve, at the maximum allowable flow: 35 mbar (0.5 psi); included in the power calculations of the Delta Blower package

Combination Base-Discharge Silencer DN-250

Combination Base-Discharge Silencer DN-300

DRAFT

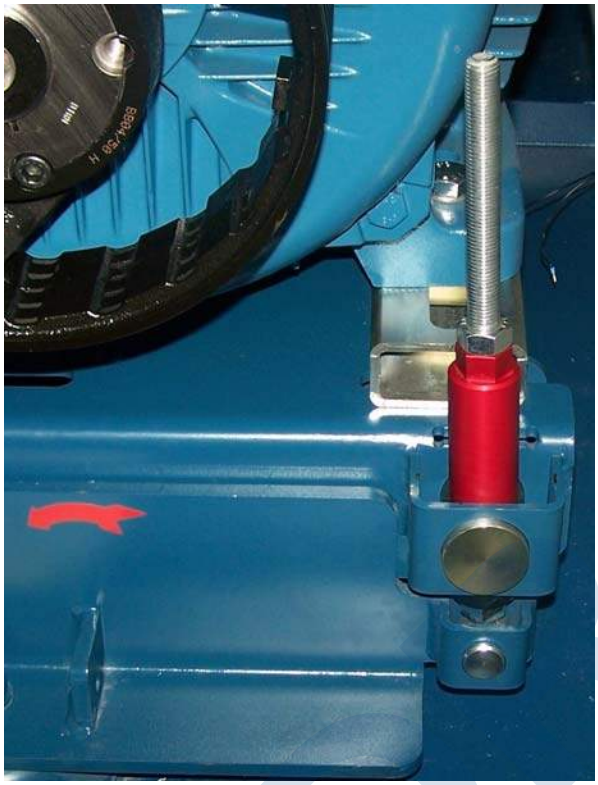
Combination Base - Discharge Silencer

Hinged Motor Plate DN50 –DN80

The hinged motor plate of the base frame in sizes DN50 and DN80 allows the motor mass to properly tension the drive belts during normal operation. The motor is mounted and aligned before leaving the factory. The hinged motor plate is then locked in place for shipment. (see photo on the left below) Remove the red locking bar and use the Aerzen supplied bracket and hydraulic jack to raise the hinged motor plate for installation or maintenance of the drive belts. (see photo on the right below) Refer to the Operations Manual for commissioning and maintenance of the blower.

Hinge Plate with Locking Pin on Arrival

The red locking pin serves to keep the motor swing plate stable during shipping. Remove before attempting to raise the motor hinge plate.



Raising the Hinged Motor Plate

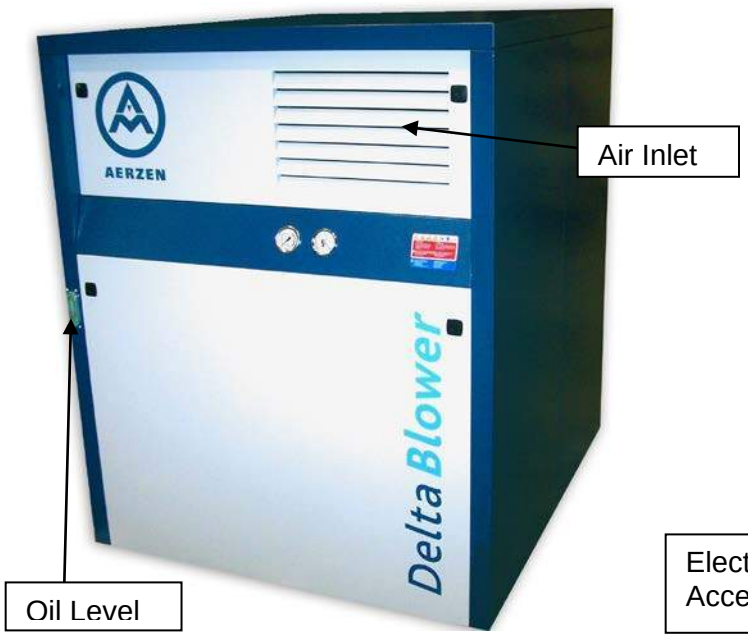
Use the Aerzen supplied bracket and jack to raise the hinged motor plate when installing or maintaining the belts.

Combination Base - Discharge Silencer

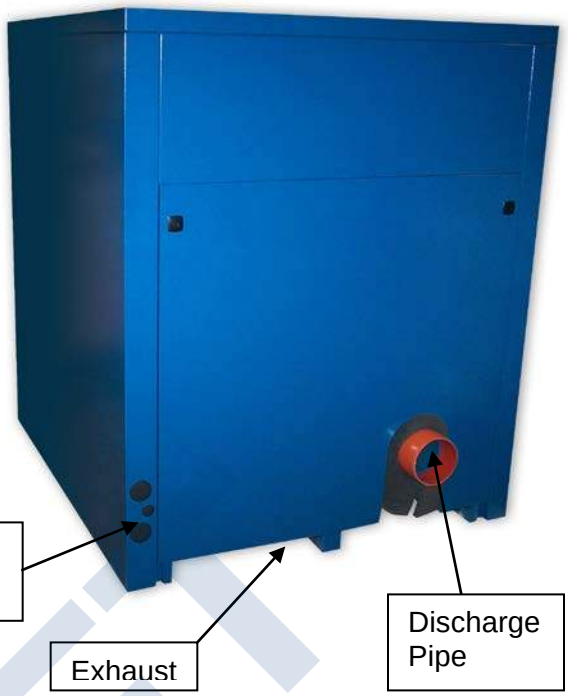
Hinged Motor Plate DN50 –DN300

The hinged motor plate for sizes DN100 through DN250 features a multipurpose lifting device. In its most basic function it serves as shipping locking device (red part) preventing the motor from unwanted movement. It also serves as the lifting mechanism (black part) for changing the drive belts. During normal operation the motor mass tensions the drive belts in the tried and true Aerzen way. The motor swing plate does not rest on the lifting mechanism (see photo on the right below). No speciaı adjustments are necessary during normal operation of the blower package. Another additional purpose is limiting the belt tension when oversized motors are used. Finally, the device can be configured to aid limited movement for seismic or mobile blower package service. Refer to G4-079 B XT for operation of Multipurpose Lifting Device. Depending on motor weight, DN300 units can have (1) or (2) lifting devices.

Lifting Device on Arrival



The red locking sleeve serves to keep the motor swing plate stable during shipping. It may also be used in seismic and mobile applications as a motor swing stop



Lifting Device in Normal Operation

The black guide bushing serves as a belt installation aid. Using an Aerzen supplied ratchet wrench, it helps lift the motor swing plate during belt installation and maintenance. Once new belts are installed it is backed down to the lock nut. **The motor hinge plate does not rest on the guide bushing during normal operation**. The guide bushing may also be used as tension limiter for use with overweight motors.

DRAFT

Shown is a DN-125 Sound Enclosure

Rear View of the Enclosure

DRAFT

Description: The sound enclosure surrounds the entire blower package to reduce noise and protect the machine from the weather while allowing easy access for maintenance. The base of the enclosure supports the entire blower package and contains an oil drip pan for environmental protection. Aerzen mounts the entire blower package within the sound enclosure at the factory prior to shipment. Transportation and installation are simplified by having the entire package supported and contained within the enclosure. The unit may be moved with a pallet jack or forklift.

The sound enclosure is designed with strategic consideration for airflow through the unit. A fan is mounted on the end of the blower shaft, so there is no need for a separate electric motor driven fan. From the cool, front side of the blower, air is drawn in through a sound trap. The air then passes over the motor and blower housings and finally is exhausted through the floor at the rear of the unit.

Quick release panels, each less than 45 lbs., provide access for routine maintenance of the blower and the package components. All maintenance and connections are located in the front and rear, allowing multiple machines to be placed side-by-side.

The oil level gauge is visible from the outside of the sound enclosure in sizes GM 4S DN-80 through GM 150 S DN-300 with the oil fill port and drain mounted to the enclosure just inside a removable panel.

The smallest size, GM 3S DN-50, has an easily removable roof to facilitate maintenance.

Materials:

Base pan – Polyester based powder coated steel weldment, 3 to 5 mm thick

Exterior panels - Polyester based powder coated galvanized steel

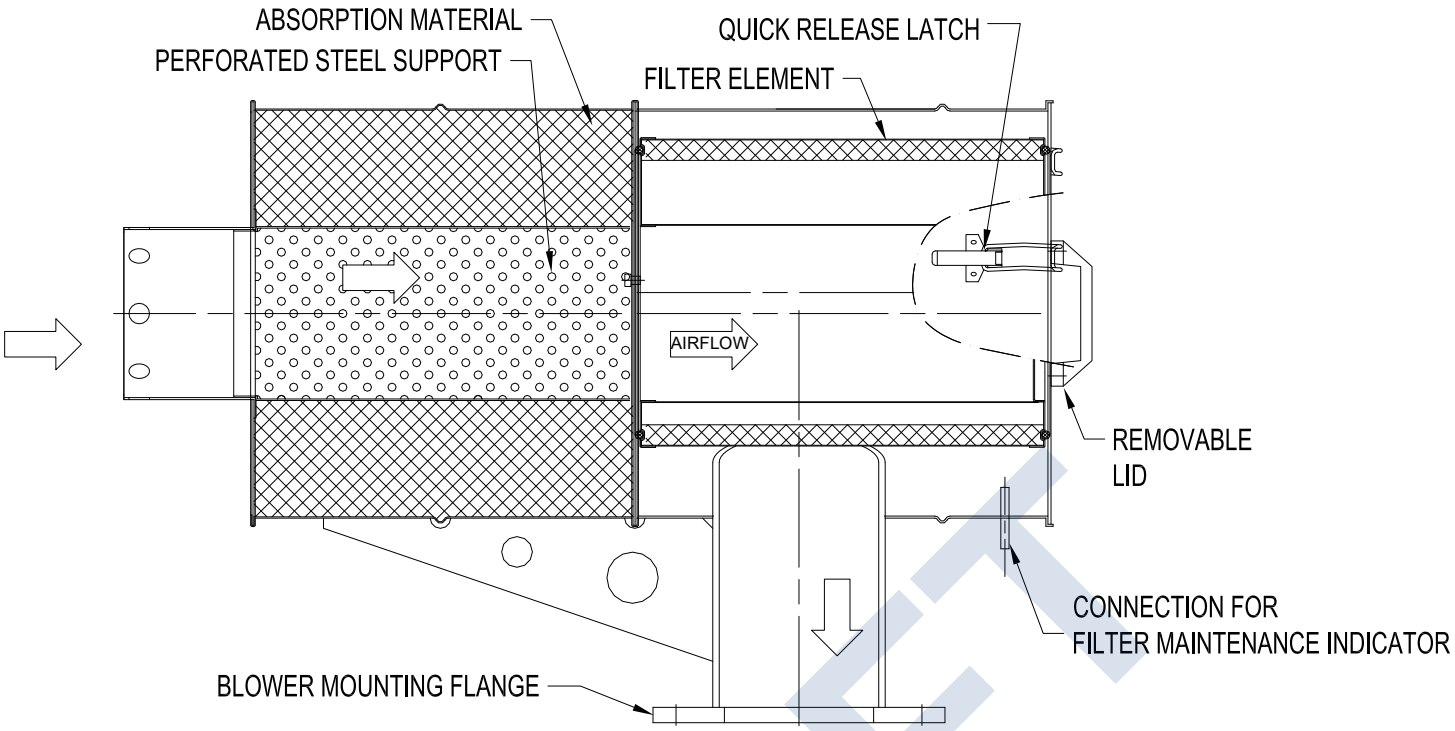
Sound insulation -Self-extinguishing, non-dripping high-density polyester foam

Technical:

Package noise level reduced to 80 dB, or less, at 1 m, free field, per DIN 45635.

Snow Load – 122 kg / m^2 (25 lbs / ft^2)

Wind Load – 80.4 km / hr (50 mph)



Suitable for indoor or outdoor installation

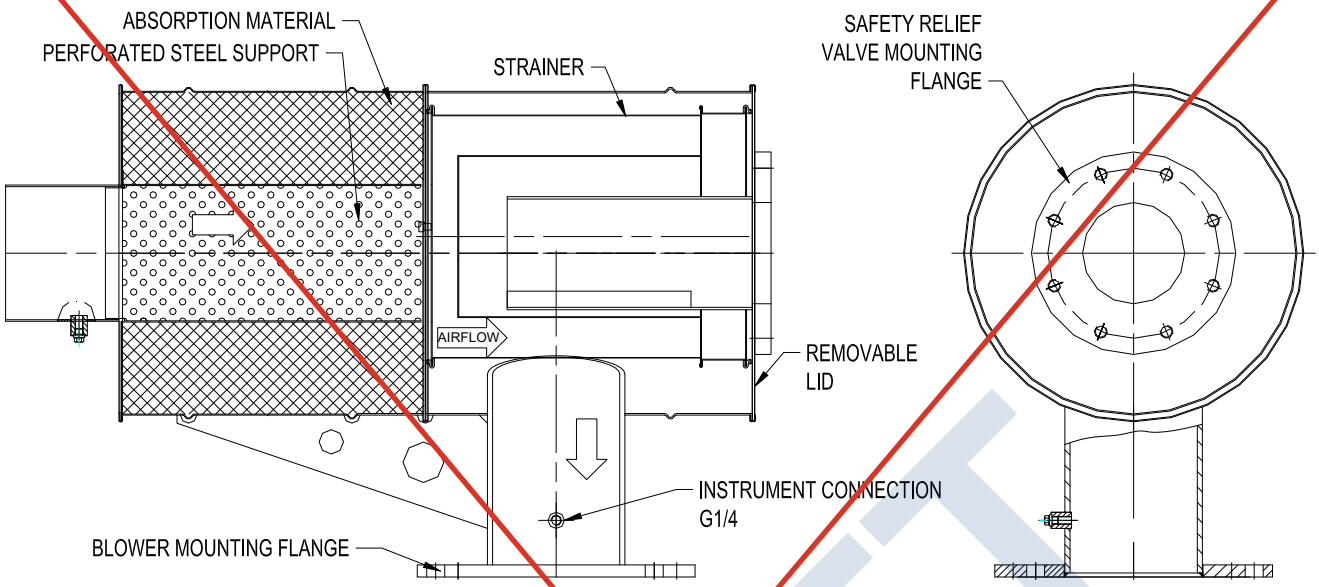
G5 Pressure Inlet Filter/ Silencer
DN 50 - DN 300

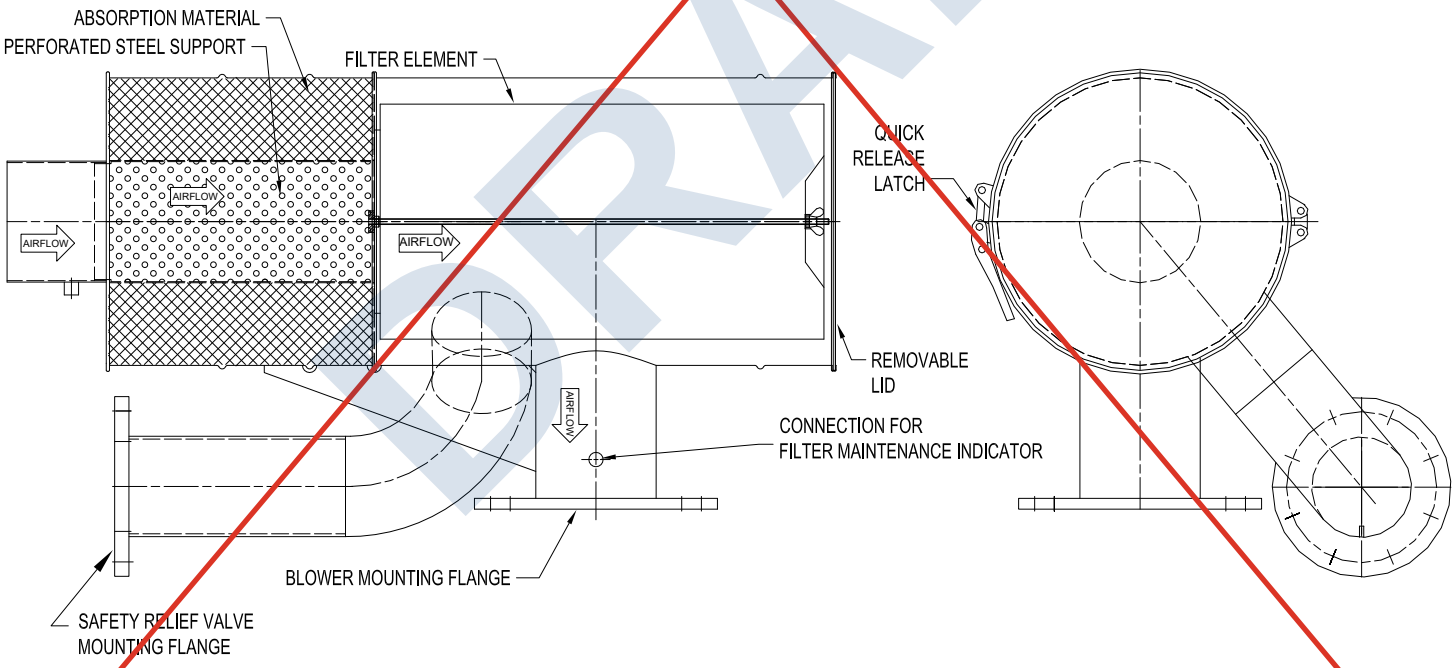
Description: Combination dry air intake filter and absorption type silencer with filter (or strainer) element located downstream from the silencer chamber

Materials of construction:



Casing:	Powder coated (RAL# 5001) Carbon Steel
	Maximum operating data: 60 °C (140 °F) and – 70 mbar (-2.07"Hg)
	Removable maintenance lid is held in place with quick release clamps
Absorption material:	Flame retardant, polyester based urethane foam, grey in color,
	secured in place with perforated steel
Filter element:	Thermally bound, food safe, polyester fibers, free of PVC, white in color
	Filter element mounts with a quick release turn and lock arrangement.

Performance:



Filtration class: G4 per EN 779 (greater than 90% of synthetic dust particles),
equivalent to ASHRAE 52.2 MERV 7 (50-70% @3-10 microns)
Pressure-drop of the entire silencer and clean filter at the maximum allowable flow: 10 mbar (0.15 psi)
Pressure drop filter element: 5 mbar (2" WC) clean, or replace at 45 mbar max. (18" WC)
Noise reduction: 10-15 dB mean noise reduction across audible octave bands

DRAFT

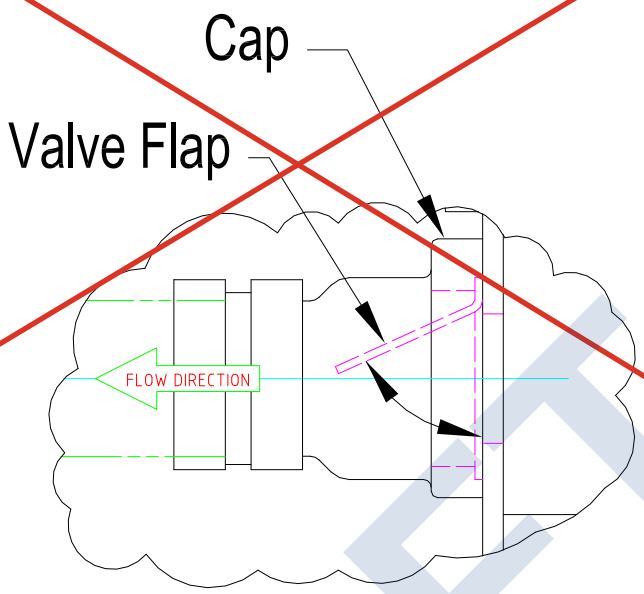
Aerzen Delta Blower + G5

The drive configuration of the Aerzen Delta Blower is such that any change in the belt length (due to belt stretching) results in a nearly proportional displacement of the motor. Therefore, the motor weight alone can be used reliably for automatic belt tension adjustment.

This, however, is not achievable with a different geometry, such as shown below: In such cases, a slight change in the belt length requires a much greater displacement of the motor making a manual adjustment necessary. Improper adjustment leads to belt failure and other, more significant damages can follow.

Our belt tensioning principle offer two more benefits to the user, which are superior to any other system offered: We do not need any other tensioning mechanisms to tension the belts. This eliminates further wear and tear items that the user does not have to maintain or even check up on. Secondly, we have eliminated the need for re-aligning the motor upon changing belts. The motor stays put and is merely pivoted up and down during a belt change.



Others

DRAFT

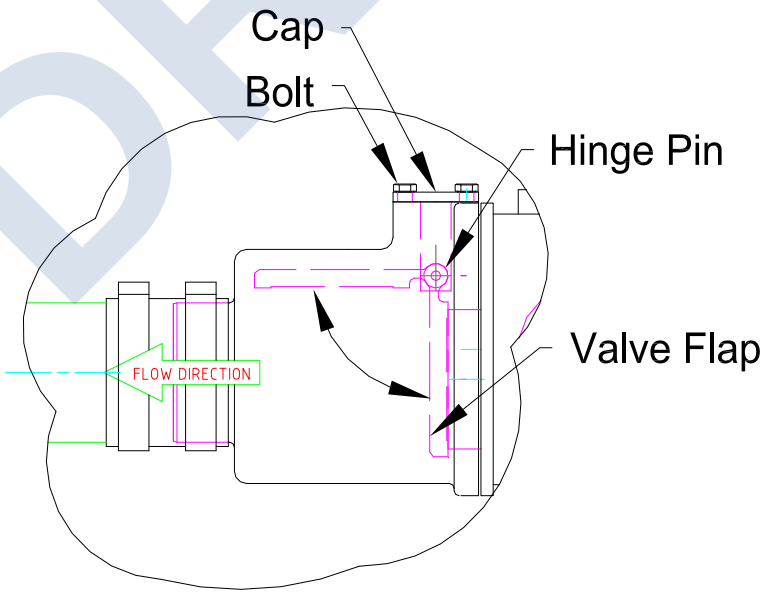
DN-50 Check Valve



Description: The DN-50 check valve is a full-bore, cast aluminum housing with an embedded Viton flap sandwiched between the connection housing and the baseframe. The hinge is integrated to the rubber and closes naturally by gravity without use of a spring. Operating range is up to 150°C or 302°F.

Check Valve Assembly w/ Viton flap P/N: **146756**

Check Valve – DN-80 Through DN-300

Description: Housed in the connecting housing is a full-bore, steel embedded in rubber check-valve that closes naturally by gravity without use of spring. The check-valve flap can easily be pulled out for inspection, maintenance or replacement without disconnecting the piping: removing the bolts and lifting the cap.

Technical Data

Maximum operating pressure: 1.2 bar g (17.4 psig)

Test pressure: 2.4 bar (34.8 psig)

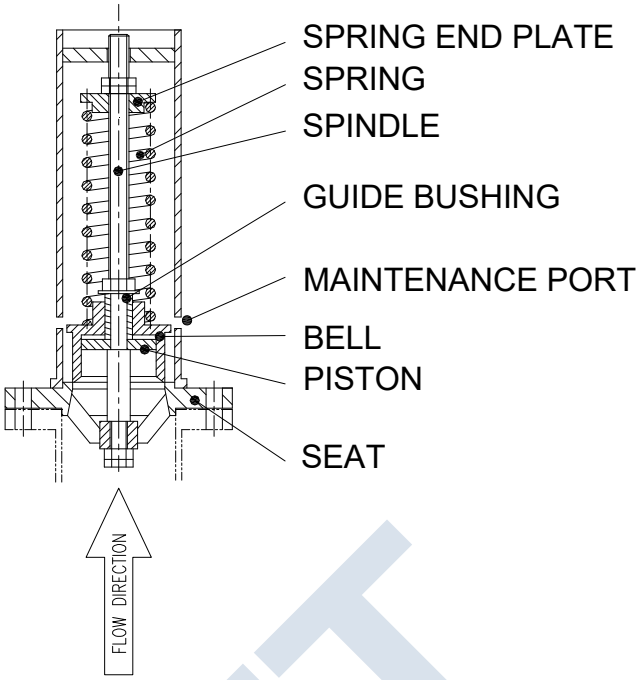
Operating temperature –40 to 180° C (-40 to 356° F)

Materials

Silicone Rubber with embedded woven fiber reinforcement up to DN-300

Perbunan rubber in DN-400

60 +/- 5 Shore A



Shelf-life: up to 20 years, under clean, cool & dry conditions

CAUTION:

- Pipe misalignment could cause leaks and premature failure of the sleeve.
- It is imperative to maintain the recommended pipe-end clearance for the pipe connection to retain its flexibility and reduce the transmission of noise and vibrations from the blower package to the process piping.

Description:

The Pressure Relief Valve is designed for use with air or inert gases to protect the blower and its accessories from damage in the event of excessive pressure. It is not to be used as a pressure regulating device. It contains a spring-loaded valve guided by a spindle and surrounded by a protective sheath that is capable of venting the entire volume flow of the blower. In positive pressure machines, it is installed downstream from the positive displacement blower and before the check valve or any shut-off valve. In vacuum applications, it is installed on the intake side of the blower.

QTY	DESCRIPTION	MATERIAL
1	Connection Flange or Thread with Valve Seat	Grey Cast Iron
1	Valve Spindle	Carbon Steel
1	Bell	Brass
1	Spring End Plate	Carbon Steel
2	Hex Nut	Carbon Steel

QTY	DESCRIPTION	MATERIAL
2	Guide Nut	Carbon Steel
1	Spring	Spring Steel
1	Valve Disc / Piston	Brass
1	Valve Guide / Bushing	Brass
1	Cover	Aluminum

Technical Data:

Maximum Temperature: 200°C (392°F)	Valve Characteristic: Proportional
Conforms to PED 97 / 23 / EG	Pressure Rise: 10%
Maximum Pressure: 1.1 Bar (15.9 PSIG)	

Maintenance:

Periodically inspect for free movement of the valve. While the machine is stopped and the motor locked out, insert flat blade screwdrivers into both maintenance ports and lift the valve. Remove the screwdrivers and visibly ensure the valve is properly seated. When operated in clean environments, inspect valve either every six months or 1000 run hours, whichever occurs sooner. In dusty conditions, inspect every month. Refer to document G4-002 for complete operating instructions.

Only (1) anchor per foot is required for Standard mounts, anchor each hole ("G") for Fail-safe mounts.

Standard mounts are not recommended for use where negative loads occur, (marine or earthquake zones) use Fail-safe mounts or contact Aerzen for alternates.

All vibrations isolators have a natural frequency that will not interfere with the fundamental blower package frequencies.

-C3 = 3 pt. Calibration Certificate
-TS = Stainless Steel Tag
-NC = NACE Compliance Certificate
-PM = Positive Material Identification Certification
-R5 = 1.5% Full Scale Accuracy (Not Available on Compound Ranges)

*Non-standard configuration

DRAFT

Diaphragm Seal Suitability Guide

Low pressure capsule gauges are very sensitive and require diaphragm seals with high fluid displacement. If a diaphragm seal is required to isolate the process fluid from the pressure gauge, the following seal model types are available for the Series PC.

Diaphragm Seal Model

High Displacement

Total Gauge Span* (in H_2O)

	10"	15"	20"	30"	40"	60"	100"	160"	200"	300"
W6	X	X	X	X	X	X	S	S	T	T
W7	X	X	X	S	S	T	T	T		
V5	X	S	S	T	T	T	T	T		
T6	X	X	X	X	X	S	S	S	S	S

*Total gauge span is additive of negative and positive pressures.

Example: -15 - 0 - 30 psi = 45 psi span

- Assembly will function correctly with minimal accuracy degradation.
- T — Assembly will function correctly given stable temperature.
- S — Assembly is highly sensitive to orientation and temperature variance. REOTEMP cannot guarantee a stated accuracy.
- X — Assembly will not work. The diaphragm does not displace enough fill fluid to drive the pressure gauge.

INDUSTRIAL STAINLESS/BRASS GAUGE

REOTEMP's Series PG gauges are an economical choice where ambient corrosion and vibration are of concern. The stainless steel case and ring offer excellent corrosion resistance, and is fillable for applications with vibration. It is suitable for all fluids compatible with copper alloys.

B-Series Switches – Pressure, Differential Pressure & Hydraulic

FEATURES

B-Series switches have proven reliable in such harsh environments as:

- ***Offshore oil rigs***
- ***Chemical and petrochemical plants***
- ***Pulp and paper mills***
- ***Steel mills***
- ***Power plants***
- ***Water and sewage-treatment plants***
- ***Other corrosive environments***

Ashcroft Inc. supplies highly reliable Ashcroft® switches and controls for industrial and process applications. We begin with rock-solid designs, matching the most appropriate technology with the safety and reliability requirements of the applications. The materials of construction are specified to Ashcroft's exacting standards, and product is built to last in the toughest applications. Our modern, responsive manufacturing facility is supported by an extensive network of stocking distributors and factory sales offices located in virtually every part of the world. Special application assistance is always just a telephone call away.

The Ashcroft B-Series switch line is designed to satisfy most switch requirements. Materials of construction have been selected for long life. A wide variety of precision switch elements are available to meet every application requirement, including hermetically sealed contacts for added reliability and safety. The actuators we use have been proven in more than 20 years of service in the world's plants and mills. Special designs are available for fire safety, NACE, limit control and other more stringent requirements. Simplicity and ease of use are stressed to improve reliability of the installation.

Applications include: pumps, compressors, washers, filters, degreasers, evapora-tors, recovery systems, food processing, ground support equipment, reverse osmosis systems, heat exchangers, hydraulic systems, lubrication systems, marine equipment, textile machinery, heating and air conditioning equipment.

B-Series Switches – Pressure, Differential Pressure & Hydraulic

Pressure & Differential Pressure Switches

B-Series pressure, differential pressure and vacuum switches use two different actuators depending on setpoint requirements. For setpoints between 2 and 3000 psi, the simple, rugged diaphragm-sealed piston actuator is used. This design features high reliability and choice of actuator seal materials for virtually every application. An optional welded design is also available for setpoints up to 1000 psi for maximum reliability. This design is available in 316 SS or Monel. Differential pressure models use a unique, dual diaphragm-sealed piston design that features very high static operating pressures and small size.

For setpoints between 4.5 and 150 inches of H_2O, a large diaphragm is used for increased sensitivity in both pressure and differential pressure designs with good choice of materials of construction.

All standard models feature ±1 percent of range setpoint repeatability and a minimum of 400 percent of range proof pressures.

These standard designs perform well in applications where shock and vibration could be a problem and may be used in conjunction with Ashcroft diaphragm seals in extreme services such as slurries or abrasive process fluids.

600 psid	42 0 kg/cm²	4200 kPa	1000	8000	20.0-40.0	80.0-150.0	30.0-115.0	30.0-56.0	112.0-210.0

Values shown are for zero static working pressure.

NOTES:

1 Switches may generally be set between 15% and 100% of nominal range on increasing pressure. Consult factory for applications where setpoints must be lower.

2 All deadbands are given in English units as shown in the nominal range column. Deadbands shown are for switches with Buna N diaphragm. Approximate deadbands for optional diaphragms:

Viton:	Multiply Buna N value by 1.4
Teflon:	Multiply Buna N value by 1.2
Stainless Steel:	Multiply Buna N value by 1.7
Monel:	Multiply Buna N value by 1.7
Dual Switch Element:	Multiply single switch element value by 1.6 for approximate deadband.

DRAFT

B-Series Switches – Pressure, Differential Pressure & Hydraulic

B-SERIES PRESSURE AND DIFFERENTIAL PRESSURE SWITCH MODEL NUMBER:

To specify the exact switch desired, select entries from appropriate tables as shown in example below.

1		2		3	4			5
B	4	2	0	B	X	P	K	600 PSI

1 – ENCLOSURE	
B4	Pressure switch, Type 400, watertight enclosure meets NEMA 3, 4, 4X, 13 and IP66 requirements.
B7	Pressure switch, Type 700, explosion-proof enclosure meets Div. 1 & 2, NEMA 7, 9 and IP66 requirements.
D4	Differential pressure switch, Type 400, water-tight enclosure meets NEMA 3, 4, 4X, 13 and IP66 requirements.
D7	Differential pressure switch, Type 700, explosion-proof enclosure meets Div. 1 & 2, NEMA 7, 9 and IP66 requirements.

3 – ACTUATOR SEAL					
		Range			
Code and Material	**Process Temperature Limits °F(9)**	**Vac. ˝ H_2O**	**0-600 psi**	**1000 psi**	**3000 psi**
B – Buna-N	0 to 150	•	•	•	•
V – Viton	20 to 300	•	•	•	
T – Teflon	0 to 150	•	•	•	•
S – 316L(8)	0 to 300		•	•	
P – Monel(8)	0 to 300		•	•	

4 – OPTIONS	5 – RANGE
Use table from page 5	Select from table on page 2

NOTES:

1 Standard switch.
2 Not available with psid ranges.
3 Dual switches are 2 SPDT snap-action switches, not independently adjustable.
4 Wires cannot be terminated inside B400 switch enclosure.
5 Not available with type 700 enclosure.
6 Estimated dc. rating, 2.5A, 28 Vdc (not UL listed).
7 Estimated dc rating, 0.4A, 120 Vdc (not UL listed).
8 Available on pressure only.
9 Ambient operating temperature limits –20 to 150°F, all styles, setpoint shift of ±1% of range per 50°F temperature change is normal. Switches are calibrated at 70°F reference.

2 – SWITCH ELEMENT SELECTION		
Order Code	**Switch Elements UL/CSA Listed SPDT**	
20(7)	Narrow deadband ac	15A, 125/250 Vac
21	Ammonia service	5A, 125/250 Vac

Contact dial thermometer

Particularities

- Temperature controller with actual value display as panel-mounting or add-on device
- Stainless steel case with bayonet lock
- Class 1.5
- Protection class IP 53
- Case sizes ∅: 60 mm, 80 mm and 100 mm
  Front frame: 72x72 mm and 96x96 mm

Type 608520/2380

Type 608550/1080

Brief description

Contact dial thermometer are devices with actual value display for temperature measurement, control and monitoring and can be used universally.

The temperature depending volume change in a measuring system filled with liquid or the temperature depending pressure change in a measuring system filled with gas is converted to a rotational movement of the actual value indicator by a bourdon tube, no transmission gear is required. The microswitch is actuated by the rotational movement of the indicator shaft via a tap system.

DRAFT

Technical Data

Case and front frame	Stainless steel (1.4301)
Cover cap	Plastic (PA6), gray, UV stabilized
Protection type	IP 51 as per DIN EN 60529 (IP 53 with extra code 401)
Front pane	Acryl glass (PMMA)
Chassis	Aluminum (3.2582.05)
Scale	white, labeled in black
Display	Class 1.5 similar to DIN EN 13190
Anti-kink spring	for devices with capillary on the case and the temperature probe
Set point value setting	by set point controller in the front window
Display correction	on the rear
Limit value temperatures	for transport and storage -30°C...+70°C (for display range -40...+40°C up to max. 50°C; -30...+50°C up to max. 60°C)
Rated position	any

Hysteresis	approx. 1.5% of the display range	1.5 to 3% of the display range
Switching point accuracy	± 0.5% of the display range referring to the switch-off point with rising temperature	
Switching reliability	To ensure a high switching reliability, we recommend a minimum voltage of 24 V and a minimum current of 100 mA	

	standard	Design 02 and 22	**Design 10, 23 and TZ 426**	**Case Ø 60 mm**
Electrical connection	Screw-type terminals, connection cross section up to 2.5 mm^2	Connection cable 0.5 m with screw-type terminals	Cover cap with cable screw-connection, suitable for cable Ø from 6.5 to 13 mm	Cover cap with cable screw-connection, suitable for cable Ø from 8 to 10 mm

Note:

Physical and toxic features of the expansion means, which could emerge in the event of a measuring system break.

Control range with scale limit value	Hazardous reactions	Fire and explosion hazard		hazardous to waters	Information about toxicology		
		Ignition temperature	Explosion limit		irritant	dangerous to health	toxic
< +200 °C	no	+ 355 °C	0.6 - 8 V%	yes	yes	[a]	no
≥ 200 °C ≤ +350 °C		+ 490 °C	- -	yes	yes	[a]	
> 350 °C ≤ +500 °C		no	no	no	no	no	

[a] There is currently no statement by the health authority concerning hazards to health in the event of short-term exposure and low concentration, e.g. measuring system break.

DRAFT

SECTION 5

DRAFT

Severe Duty is **Standard** with **WEG W22** motors.

You do not need a special motor for severe duty. Severe Duty is standard with WEG W22 motors.

DRAFT

You do not need a special motor for severe duty. Severe Duty is standard with WEG.

Features that make a difference:

- All NEMA Premium ratings have a 1.25 service factor (up to 100 HP) resulting in cooler operation and extended life of the motor
- All Cast Iron Construction, including Terminal Box and Fan Cover (*)
- Solid feet for reduced vibration levels and impact absorption
- Optimized ventilation system for cooler operation and extended life
- High Grade FC200 cast iron provides superior mechanical strength and heat dissipation
- All WEG W22 motors are Totally Enclosed Fan Cooled with a true IP55 rating against dust and moisture. (IPW56, IPW65 and IPW66 available as optional)
- Exclusive W-Seal 364T and larger provides superior bearing protection
- Taconite Labyrinth seal 586 Frame and larger
- Exclusive WEG painting system exceed 200hrs ASTM 117 corrosion test (Exceeds IEEE841 standard)
- Balanced to 0.08 inches per second vibration limits (Meets IEEE841 standard)
- Four Bolt Conduit Cover with glued Neoprene Gasket
- Impregnation Resin and magnet wire are insulation class H
- Stainless Steel Nameplate - Laser edged with high contrast background
- Corrosion Proof Drains
- Inverter Duty per NEMA MG1, Part 31
- Certified Class I Div 2, Groups A, B, C & D; Class II, Div 2, Groups F & G

**cast iron fan cover available as an option on 143-215T frames*

New Cooling System

Fan Cover
- Aerodynamic design
- Noise level reduction
- Better air flow distribution over frame
- Increased mechanical strength

Fan
- Reinforced fan hub structure
- Noise level reduction
- Increased air flow
- Fan with higher stiffness

Terminal Box
- Better connection quality
- Easier cable handling during installation
- More space available for accessory installation
- Easier Maintenance
- Mounting F1/F2/F3
- Rotation on 90° stages

Bearing Caps

External
- Finned surface for improved bearing heat dissipation

Internal
- Change of grease path for positive lubrication
- Bearing lubrication quality improvement
- Reduced bearing temperature

Seal Subsystem
- Increased dust and moisture protection
- Increased protection to high-pressure cleaning

Frame
- Reduced temperature on windings and bearings
- Noise level reduction
- Terminal box position outlet on top

Pad for vibration sensor
- Displaced 90º from each other

Enhanced Lifting Provisions
- Easier handling - horizontal & vertical
- Higher mechanical strength and handling safety

Solid feet
- More impact resistance
- Ideal for high vibration level applications

Endshields Subsystem

DE (Drive Endshield)
- New fin design
- Bearing moved outwards for better load support
- Improved bearing heat dissipation for reduced bearing temperature
- Reinforced endshield structure

NDE (Non-Drive Endshield)
- New design with smooth exterior surface
- Improved air flow
- Noise level reduction
- Improved structural rigidity for low vibration

DRAFT

DATA SHEET

Three Phase Induction Motor - Squirrel Cage

Customer	:

Product line	: W22 NEMA Premium Efficiency Three-Phase	Product code :	11431291
		Catalog # :	20018ET3G447T-W22

Frame	: 445/7T	Locked rotor time	: 28s (cold) 16s (hot)
Output	: 200 HP (150 kW)	Temperature rise	: 80 K
Poles	: 4	Duty cycle	: Cont.(S1)
Frequency	: 60 Hz	Ambient temperature	: -20°C to +40°C
Rated voltage	: 460 V	Altitude	: 1000 m.a.s.l.
Rated current	: 230 A	Protection degree	: IP55
L. R. Amperes	: 1564 A	Cooling method	: IC411 - TEFC
LRC	: 6.8x(Code G)	Mounting	: F-3
No load current	: 70.0 A	Rotation[1]	: Both (CW and CCW)
Rated speed	: 1785 rpm	Noise level[2]	: 73.0 dB(A)
Slip	: 0.83 %	Starting method	: ~~Direct On Line~~
Rated torque	: 81.3 kgfm	Approx. weight[3]	: 1038 kg /2288 lbs
Locked rotor torque	: 229 %		
Breakdown torque	: 250 %		
Insulation class	: F		
Service factor	: 1.15		
Moment of inertia (J)	: 3.21 kgm²		
Design	: B		

Output	25%	50%	75%	100%
Efficiency (%)	95.7	95.8	96.2	96.2
Power Factor	0.50	0.73	0.82	0.85

Foundation loads	
Max. traction	: 1540 kgf
Max. compression	: 2578 kgf

		Drive end	Non drive end

AEGIS SGR™

BEARING PROTECTION RING

Sustainable Technology for True Inverter Duty Motors

WEG uses the standard SGR from the AEGIS catalog that is sized based on the motor min/max shaft diameter. They use the type with the mounting brackets which are designed to fit over the shaft shoulder on the motor end-shield.

Bearing Protection For Life!

2009

DRAFT

BEARING PROTECTION RING™

"The only bearing protection system guaranteed to eliminate harmful shaft currents preventing premature motor failure - for life."

Guarantee

Electro Static Technology guarantees any new motor up to 100hp/75kW will not fail from electrical bearing fluting damage for the life of the motor when the AEGIS SGR™ Bearing Protection Ring™ is installed in accordance with manufacturer's installation instructions. If electrically induced fluting damage occurs, Electro Static Technology will replace motor bearings. Guarantee is subject to the terms and conditions of the AEGIS SGR™ Guarantee Program.

For program details, visit: www.est-aegis.com

Don't let this happen to your bearings!

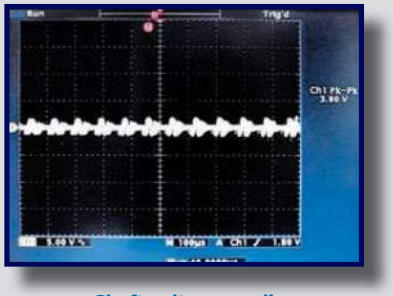
Sustainable Motor Design - Prevent Bearing Failure

AEGIS Bearing Protection Ring™- protects motor bearings for life. Variable frequency drives (VFD) induce electrical voltages onto the shaft of AC and DC motors. With AEGIS SGR Bearing Protection Ring installed on the motor, you benefit from sustainability, system up-time, production improvement, and higher reliability.

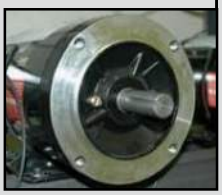
PROBLEM:

VFD Induced Shaft Voltages Damage Bearings



Shaft voltage reading with no protection

Variable frequency drives (VFD) on AC and DC motors induce harmful electrical voltages on the motor shaft. Once these voltages exceed the resistance of the bearing lubricant, they discharge through the motor's bearings causing fusion craters, severe pitting, fluting damage, excessive bearing noise and eventually bearing failure.



SOLUTION:

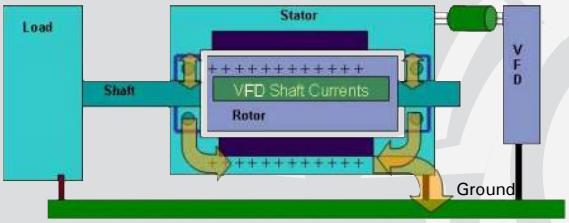
AEGIS SGR™ - Electrical Bearing Damage Protection

The new AEGIS SGR™ Bearing Protection Ring™ prevents electrical bearing damage by safely channeling harmful shaft voltages away from the bearings to ground. Using proprietary Electron Transport Technology™, the conductive micro fibers inside the AEGIS SGR™ provide the path of least resistance and dramatically extend motor life.

Shaft voltage reading with AEGIS SGR

No bearing protection

VFD



AEGIS SGR™ Bearing Protection Ring™

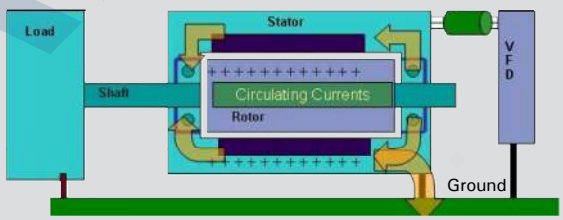
DRAFT

About Shaft Voltages and Bearing Currents

VFD Induced Shaft Voltages - All Motors

Damaging voltages are induced on the shafts of AC and DC motors controlled by variable frequency drives (VFD). The extremely high on/off switching speeds of the pulse width modulation (PWM), generated by the insulated gate bipolar transistors (IGBT), induce damaging voltages onto the motor shaft through parasitic capacitive coupling between the stator and rotor. This common mode shaft voltage seeks a path to ground, usually through the motor's bearings.

EDM Currents Damage Bearings



Bearing fluting, "washboard" pattern on bearing race

Electrical Damage in the Bearings (EDM) - Pitting, Fluting, Failure

Damaging currents arc through the dielectric oil film between the rolling elements and the bearing race. This is known as electrical discharge machining (EDM) effect. EDM causes fusion craters, severe pitting, and eventually bearing fluting (a washboard-like pattern in the bearing race) which results in premature bearing failure.

High Frequency Circulating Currents in Large AC and DC Motors

In addition to potential bearing failures in motors from VFD induced EDM currents, AC and DC motors above 100 hp (75 kW) may also experience bearing failures caused by high frequency circulating currents. VFD induced high frequency circulating currents are in the kilohertz or even megahertz range and circulate through the motor's bearings because of magnetic flux imbalances in the stator. This type of VFD induced current becomes the more dominant destructive current in higher hp/kW motors.

High Frequency Currents Damage Bearings

AEGIS SGR™ Bearing Protection Ring™ is the most effective solution to protect bearings in motors and attached equipment from EDM currents and VFD induced shaft voltages.

DRAFT

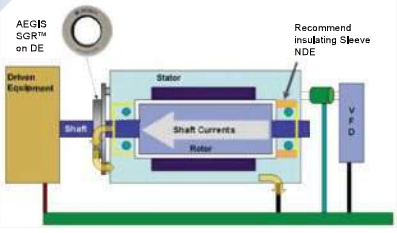
Application Notes for AEGIS Bearing Protection Ring™

Improve System Reliability and Production with Sustainable Motor Design

Motors up to 100 HP (75 kW)

Any motor controlled by a variable frequency drive (VFD) requires bearing protection. Motors of 100 hp down to fractional hp motors will experience bearing failures when operated on a PWM drive. AEGIS SGR™ Bearing Protection Ring™ guarantees that bearings will not fail in these motors from fluting damage for the service life of the motor.

Install one AEGIS SGR™ Bearing Protection Ring™ on either the drive end or the non-drive end of the motor. The simplest installation is to slide the AEGIS SGR™ over the drive end and fasten it to the motor end bell with the easy to install mounting hardware included with each AEGIS SGR™



★ Recommend Colloidal Silver Shaft Coating PN CS015

Motors 100 HP to 1000 HP (75 kW to 750 kW)

Large motors above 100 hp may have VFD induced EDM currents as well as high frequency circulating currents when they are controlled by VFDs. To protect the bearings, insulate the bearing on one end and install an AEGIS SGR™ on the other end.

Insulation on one end (usually NDE) and AEGIS SGR™ on opposite end

- This method offers the most reliable protection
- Motor frame must be well grounded
- Non-Drive End: Bearing journal should be insulated or Insulated/ Ceramic Bearing installed to disrupt circulating currents
- Install AEGIS SGR™ Bearing Protection Ring™ on opposite end of insulation and Insulated/Ceramic Bearing (usually DE)
- Protects bearings in attached equipment (gear box, pillow block, encoder etc.)

★ Recommend Colloidal Silver Shaft Coating PN CS015

BEARING PROTECTION FACTS:

Bearing protection for motors and attached equipment: Only AEGIS SGR™ will protect both motor bearings and the bearings in attached equipment. VFD induced currents on the shaft can discharge through motor bearings or coupled equipment like gear boxes, pumps, fan bearings, pillow blocks, encoders, brake motors, etc. AEGIS SGR™ addresses the root of the problem and channels harmful currents to ground.

Maintenance free bearing protection for life: Hundreds of thousands of conductive micro fibers have virtually zero wear during operation, even at high RPM and high surface rates. Unlike carbon block brushes, there is no spring pressure on fibers. AEGIS SGR™ Bearing Protection Ring™ will last for the service life of the motor.

AEGIS SGR™ is effective in grease, oil, dirt or dust: Lab and field tested. The conductive micro fibers "sweep" away contaminants from the shaft surface and maintain a conductive path even when oil, grease, dirt or dust get on the shaft.

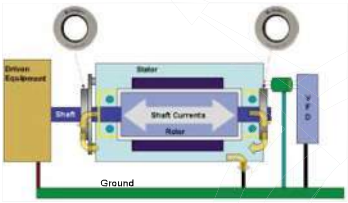
Operation in harsh environments where fibers are exposed to excessive debris: To prevent particles from damaging the fibers, install a slinger or O-ring against the AEGIS SGR™.

★ COLLOIDAL SILVER SHAFT COATING: NEW TECHNOLOGY

Improving the conductivity of the steel shaft surface enhances the shaft voltage discharge capability in AEGIS shaft grounding applications. Maintaining a highly conductive shaft surface is especially important in critical applications or in applications where the conductive shaft surface of steel could become compromised. Environmental elements could create a potential for decreased conductivity on the shaft of the motor.

Apply AEGIS CS015 Colloidal Silver Shaft Coating to any VFD driven motor shaft prior to installing AEGIS Bearing Protection Ring™.

DRAFT

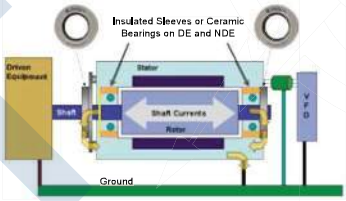


BEARING PROTECTION FACTS:

AEGIS SGR™ Bearing Protection Ring™ current handling capability: AEGIS SGR™ is rated to discharge high frequency current. Variable frequency drives (VFD) induce high frequency EDM currents of up to 2 amps in 50 billionths of a second. AEGIS SGR™ protects the bearing by safely channeling the energy away from the motor bearings to ground.

AEGIS Bearing Protection Ring™ - the most reliable bearing protection: Production up-time and reliability improve when AEGIS SGR™ is installed. The patented ring of hundreds of thousands of conductive micro fibers provide protection for the service life of the motor. The fibers will always surround the shaft with a conductive path for destructive shaft currents while the motor is running.

Vertical Motors: Insulate top bearing or shaft with non conductive coating. For bottom bearing, coat shaft with Colloidal Silver Shaft Coating and install AEGIS Bearing Protection Ring.

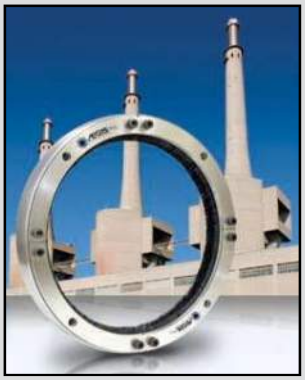


If insulation is not possible, the next best protection is to install AEGIS SGR™ on both ends of the motor

- Motor frame must be well grounded
- Install AEGIS SGR™ Bearing Protection Ring™ on drive and non-drive end to provide path of least resistance for circulating currents and to channel VFD currents to ground.
- Protects bearings in attached equipment
- **NOT SUITABLE FOR CYLINDRICAL ROLLER BEARING**

★ Coat shaft with Colloidal Silver Shaft Coating

Critical Applications: Insulate both ends and add AEGIS SGR™ Bearing Protection Ring™ on both ends



- Motor frame must be well grounded
- Drive and Non-Drive end: Bearing journals should be insulated or Insulated/Ceramic Bearing installed to disrupt circulating currents
- Install AEGIS SGR™ Bearing Protection Ring™ on drive and non-drive end to provide path of least resistance for shaft voltages and to channel VFD induced currents to ground.
- AEGIS SGR™ required to protect bearings in attached equipment (gear box, pillow block, encoder, etc.)

★ Coat shaft with Colloidal Silver Shaft Coating

Medium Voltage Motors
Large Motors and Generators over 1000 HP (750 kW)
Power Generators over 750kW

AEGIS iPRO™ Bearing Protection Ring™

Large motors and generators often have much higher induced shaft voltages and bearing currents which require a high current capable Bearing Protection Ring™. High frequency circulating currents induced by variable frequency drives (VFD) will cause bearing fluting and catastrophic failure in these motors. Generators experience current surges which can cause electrical arcing in bearings and equipment.

AEGIS iPRO™ High Current Bearing Protection Ring™

- One end of the motor should be insulated. Install AEGIS iPRO™ on opposite end of insulation to protect the non-insulated bearing.
- Install AEGIS iPRO™ on both ends of motor or generator if bearing cannot be insulated.

★ Coat shaft with Colloidal Silver Shaft Coating

MOTORS WITH CERAMIC BEARINGS

Insulating both bearing journals or using ceramic coated bearings in the motor **does not prevent VFD induced currents** from discharging through the bearings on attached equipment and may present a voltage hazard.

Whenever ceramic bearings are used in a motor, *AEGIS SGR™ is required* to protect attached equipment and reduce potentially dangerous shaft voltages.

DRAFT

Purpose of Application Notes: Application notes are intended as general guidance to assist with proper application of AEGIS SGR™ Bearing Protection Ring™ to protect motor bearings. All statements and technical information contained in the application notes are rendered in good faith. User must assume responsibility to determine suitability of the product for its intended use.

AEGIS SVP™ Shaft Voltage Probe

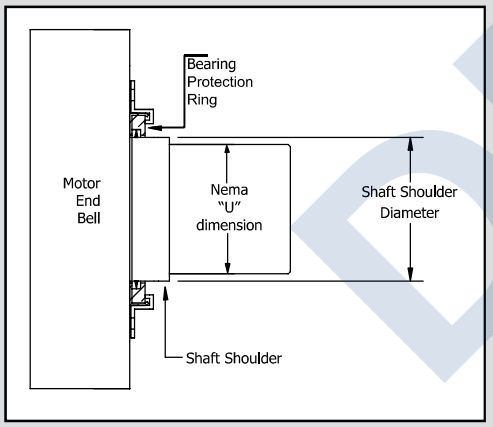
Conductive Microfiber Probe for use with Fluke 199C ScopeMeter

Measuring VFD Induced Shaft Voltages

For the first time you can easily and more accurately measure the voltage on a rotating shaft. The AEGIS SVP™ Shaft Voltage Probe's unique design of high density conductive microfibers ensures continuous contact with the rotating shaft. Used with the Fluke 199C ScopeMeter, you can determine if your motor is subject to potentially damaging bearing currents.

Catalog Number	Includes:
SVP-KIT-F199C	3 SVP tips, probe holder with two piece extension rod (fits 3/8" magnetic base)
SVP-TIP-F199C	3 SVP tips

Selecting The Right Size Bearing Protection Ring For Your Motor

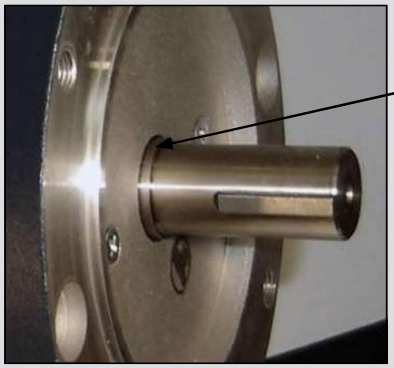


Front View

Side View

Back View

Mounting Options shown on page 8



1. Measure shaft diameter at a point 0.125" from motor end bell.
2. Refer to the part lists to locate the correct SGR part number.

Note: If you have a slinger or a shaft shoulder that is less than 0.375", you will need the NEMA/IEC kit. See page 13 for more information.

Example shaft measurement
0.425"

Catalog Number	Min.shaft diameter	Max.shaft diameter	Outside diameter	Thickness Max
SGR-6.9-1	0.311	0.355	1.60	0.295
SGR-8.0-1	0.356	0.395	1.60	0.295
SGR-9.0-1	0.396	0.435	1.60	0.295
SGR-10.1-1	0.436	0.480	1.60	0.295
SGR-11.2-1	0.481	0.520	1.60	0.295

Shaft shoulder: The SGR can be mounted to the shaft shoulder but the shoulder should be at least 0.375" in length so that all of the fibers are in contact with the rotating shaft. Measure the diameter of the shaft shoulder then locate the correct SGR on the part lists.

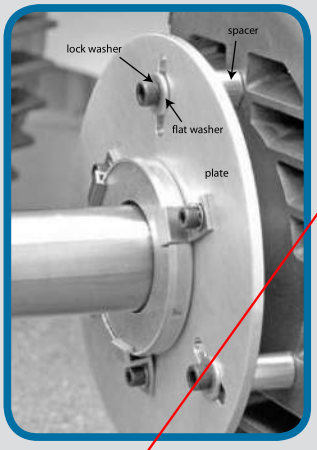
Custom Kits available for shaft diameters not shown above

NEMA/IEC Bearing Protection Ring™ Kit

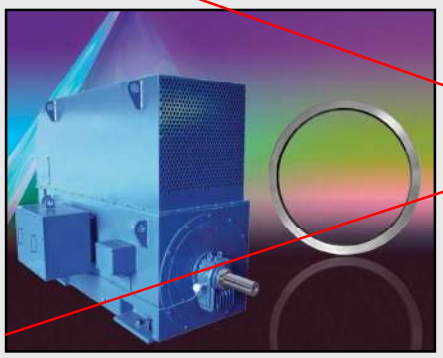
SOLID



1 AEGIS SGR™
1 mounting plate
3 screws (inches or metric)
3 washers
3 lock washers
3 spacers*

SPLIT

1 AEGIS Split Ring SGR™
1 split mounting plate
3 screws (inches or metric)
3 washers
3 lock washers
3 spacers*



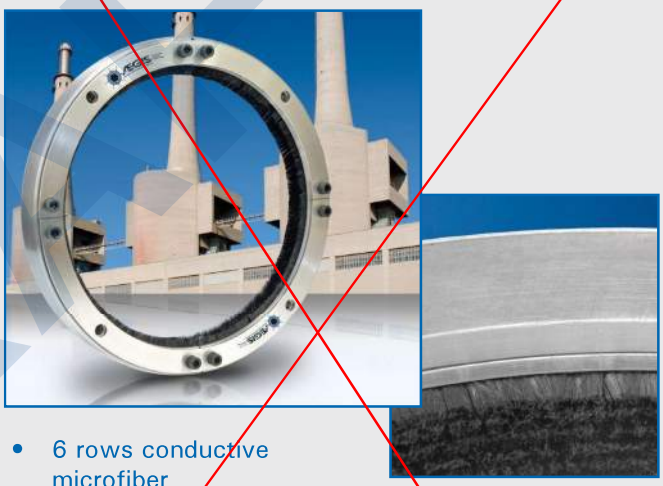
* each kit includes 3 spacer lengths: 1/4", 1/2", and 1" for NEMA kits and 7mm, 17mm, and 27mm for IEC kits.

- Easy to order and install for any NEMA or IEC frame size
- Clears any slinger, shaft shoulder or protrusion
- Adjustable slots adapt to most end bells
- Rigid mounting plate ensures alignment
- Split Ring kit allows for installation without decoupling equipment

DRAFT

Custom Applications

AEGIS SGR™ Bearing Protection Ring™ for Large Shaft Diameters



- For shaft diameters greater than 6" (152.4mm)
- Long term reliable performance
- Maintenance free system
- Available in solid or split ring design

AEGIS WTG™ Wind Turbine Bearing Protection

- 6 rows conductive microfiber
- High current capable
- AEGIS WTG™ shaft current monitoring compatible
- Long term reliable performance
- Maintenance free system
- Up-tower retrofit capable split ring configuration

AEGIS iPRO™ High Current Bearing Protection for Large Motors and Generators

- 6 rows conductive microfiber
- High current capable
- AEGIS iPRO shaft current monitoring compatible
- Long term reliable performance
- Maintenance free system
- Available in sizes up to 30" (762mm) shaft diameter

WARRANTY: Units are guaranteed for one year from date of purchase against defective materials and workmanship. Replacement will be made except for defects caused by abnormal use or mishandling. All statements and technical information contained herein, or presented by the manufacturer or his representative are rendered in good faith. User must assume responsibility to determine suitability of the product for intended use. The manufacturer shall not be liable for any injury, loss or damage, direct or consequential arising out of the use, or attempt to use the product.

Patent Numbers: 7,136,271: 7,193,836: and other patents pending

Engineering Specification:

All motors driven by a variable frequency PWM drive shall include a maintenance free, circumferential, conductive micro fiber shaft grounding ring (AEGIS SGR) to discharge shaft currents to ground.
Recommended part: AEGIS SGR™ Bearing Protection Ring

Low Voltage Motors - Technical Bulletin - LVTB 04052024-1

Topic:	Insulated Bearings and Brackets
Issue Date:	April 5, 2024
Issued by	Dale Basso
Distribution List:	LV AEs, Inside Sales, Outside sales Service & Warranty

Preface: Shaft currents have become an increasing issue with modern Variable Frequency Drives and Higher switching frequencies? This creates a need to protect bearings from electrical damage.

The Basics:

Practical experience and international standards show that bearing insulation is an effective solution to prevent bearing damages due to electric currents flowing through the bearings. These currents can be caused by electromagnetic unbalances, by electrostatic effects, or by the high frequency common mode voltage from frequency converters. Bearing insulation can be made in different effective ways, as shown in IEC 60034-25 – Clause 8.4.2 (Figure 1), as well as NEMA ICS 7.2-2021 -5.2.10.

There are three components of shaft/bearing currents

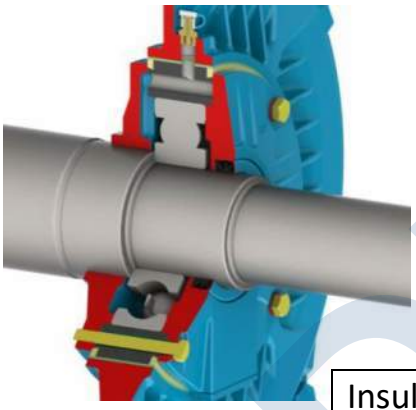
- **Stator to Frame capacitive currents**
  - Higher frequencies caused by switching
  - Standard ground is not the desire return path to the drive
  - May take path through bearings, shaft and driven load
  - Best solution excellent low impedance return path back to the VFD (VFD Cable & Ground straps)

- **Stator to Rotor capacitive currents**
  - Created in rotor looking for path to source (VFD)
  - Path of least resistance may be:
    - Through driven equipment bearings
    - Through motor bearings
    - Best solution is motor drive end shaft ground brush plus Excellent Low impedance return path to VFD

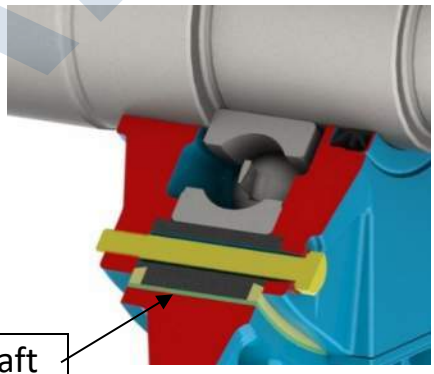
- **Motor circulating currents** - Typically motors above 400T Frames (>100HP)
  - Caused by asymmetry in Magnetic field axially along the rotor
  - Typically, low frequencies on Sine wave- Higher frequencies on VFD
  - Best solution – Insulated ODE bearing (or bearing housing) and DE Shaft Ground brush plus Excellent low impedance return path to VFD

What is the difference between an insulated bearing housing and an insulated bearing?

Both provide the same benefit, as referenced in IEC 60034-25 and EASA AR100. That is to provide a layer of insulation to break the High frequency capacitive current across the bearing.



The effectiveness is measured in Ohms at high frequency not DC. According to IEC 60034-25 and EASA AR100 standards; in order to assure effective protection against bearing currents, the bearing impedance should be ≥ 100 Ω at 1 MHz.



DRAFT

- Popular **ceramic coated Insulated bearings** exceed 50-100 Ohms @1MHZ

- **WEG Insulated End Bracket** – 100+ Ohms @1MHZ
  The advantage of the Insulated bearing housing is that it is more effective than the ceramic coated bearings at a comparable cost, and allows future bearing replacements to utilize standard readily available bearings which cost less than the special insulated bearings.

Insulating layer separating shaft and bearing from ground

- **Ceramic Ball bearings** – >200 Ohms @1MHz

DRAFT

BEST PRACTICES FOR VARIABLE FREQUENCY DRIVE (VFD) APPLICATIONS

VFD-induced shaft voltage can exist in every VFD driven motor application. It is not specific to the air movement industry, nor is it specific to any particular manufacturer's motors, drives or equipment. However, shaft voltage only becomes a problem when it leads to bearing current and consequential damage to the motor bearings.

NOTICE!

Risk of serious machine damage!
Appropriate measures must be implemented by the installation contractor to limit the shaft induced voltage to 1V – 2V as per IEEE 112.

Figure 1 Bearing damage caused by EDM

Frequency converters (also known as variable frequency drives or VFD's) can induce a voltage on the shafts of drive motors and stages due to the high switching frequencies used in these drives. Shaft voltage can become a problem when it reaches a high enough level to discharge across the bearings, causing electrical discharge machining (EDM) and creating small grooves called fluting which can lead to premature bearing failure. The potential for this induced shaft voltage exists in every VFD driven motor application and must be addressed on an installation specific basis.

VFD induced voltage is a phenomenon that is somewhat rare and unpredictable. As additional protection, Aerzen USA offers options for mitigating induced shaft currents such as grounding rings and isolated motor non drive end bearings. Even with these options installed, there is no guarantee that this phenomenon will be entirely eliminated. Damage to the motor bearings from shaft / bearing currents is not covered by warranty from Aerzen, the motor manufacturer or VFD manufacturer.

GENERAL RECOMMENDATIONS:

Motors up to and including 100HP (75kW) – Low Voltage

For induction motors either foot mounted, c-face or d-flange mounted motors with single row radial ball bearings on both ends of the motors

- Install one AEGIS SGR Bearing Protection Ring on either the drive end or the non-drive end of the motor to discharge capacitive induced shaft voltage.

Motors Greater than 100HP (75kW)

For horizontally mounted motors with single row radial ball bearings on both ends of the motor:

- Non-Drive End (Opposite Drive End): Bearing housing must be isolated with insulated sleeve or coating or use insulated ceramic or hybrid bearing to disrupt circulating currents.
- Drive End: Install one AEGIS Bearing Protection Ring.

Motors in Hazardous Areas

Grounding rings are permitted. Consult Aerzen USA or your motor supplier for specific recommendations.

*If made in the USA, Protection Method goes from Painted Externally to Powder Coated (A-6-450)

General Painting Information

The machine castings are fettled, cleaned and primed; the primer used is specially developed for machinery parts and is particularly notable for its excellent bonding characteristic and elasticity. Its base is a quick drying synthetic resin binder possessing a high degree of water resistance. The proportion of pigment to binder is such to ensure the best protection for the machines.
Total dry Film Thickness: 70 µm (2.75 mil)

Surface Preparation	Sand blasting, mechanical cleaning to near white surfaces per SA 2,5 acc. to DIN ISO 8501 or SSPC10	
Primer	Alkyd Resin: RAL 6006	Manufacturer: Relius Coatings
Final Coat	Alkyd Resin: RAL 5001 (Blue)	Manufacturer: Relius Coatings (BASF) or Dr. Demuth GmbH

General Powder Coating Information

SP Polyester Powder Paint, RAL 5001, structure, glossy
Relius No.: I536-5401
Total dry film thickness: 80 - 110µm

General Upgraded Protection Information

Surface Preparation	Sa 2 ½
Priming Coat	SikaCorEG4 (80µm max)
Intermediate Coat	SikaCorEG1 (80µm max)
Finishing Coat	SikaCorEG5 (80µm max)

Pre-Commissioning Checklist

	Document #	A-7-0288 rev "4"

The purpose of this pre-commissioning checklist is to ensure readiness to successfully commission your Aerzen packages. We will need some information from you in order to better prepare for the commissioning. We ask that your on-site representative complete and return this checklist to Aerzen USA at your earliest convenience.

We will also need to know if you have a target date in mind for our service technician to be on-site, and if the plant maintenance personnel will be on-site at that time to receive maintenance training. This training is normally hands-on in nature and should not take more than 1-2 hours. In addition to the pre-commissioning checklist, we will need an on-site contact and phone number for our service technician.

We will make every effort to meet your target date for commissioning. Please keep in mind that our start-up/commissioning schedule can run three to five weeks out. The earlier we know your target date the better chance we have of reserving your request on our schedule.

Please be aware that should the commissioning prerequisites not be completed prior to our arrival, Aerzen USA reserves the right to charge any and all responsible parties for additional time and travel expenses required to complete the commissioning service.

Below is a checklist of items requiring attention prior to our arrival. Please verify your understanding and completion of the prerequisites by initialing the check the boxes corresponding to each requirement. Please send this checklist to the Aerzen Service Coordinator once all the prerequisites have been verified

DRAFT

1	The Aerzen package has not been damaged during shipping and/or while on-site	☐
2	The Aerzen package is installed in permanent position, is level, properly grounded and anchored.	☐
3	The process pipework for the Aerzen package inlet and discharge is connected in its final position and independently supported (temporary supports are not acceptable	☐
4	Electrical connections have been completed for the motor using flexible conduit to allow the motor to be raised into its operational position.	☐
4A	The package safety switches (if applicable) are wired to the PLC or MCC (as applicable).	☐
4B	The Aerzen control panel (if applicable) is wired to the PLC or MCC (as applicable).	☐
4C	The correct voltage is fed to the control panel. Refer to the project specific wiring diagram for the voltage required	☐
4D	If there is a VFD or Soft-Starter and supplied by others, it has been configured with the following motor settings:	☐
4D-1	Horsepower (kilowatt)	☐
4D-2	Voltage	☐
4D-3	Maximum Frequency	☐

4D Continued

4D-4	Minimum Frequency - based on minimum speed of the blower or compressor in conjunction with the sheave combination	☐
4D-5	Full Load Amps	☐
4D-6	Time to Minimum Speed (3-5 seconds)	☐
4D-7	Coast to Stop (do not brake)	☐
4D-8	**CONSTANT TORQUE (VERY IMPORTANT!!!)**	☐
4D-9	Restart - only when the machine has come to a complete stop.	☐

5	Belts or coupling bolts removed for rotation test	☐
6	Verification that machine is filled to proper oil level with correct oil (if delivered without oil)	☐
7	Required personnel scheduled to attend startup (electrician, operators, maintenance personnel, etc)	☐
8	Proper paperwork completed to allow Aerzen technician on site	☐
9	If required, on-site safety training requirements for Aerzen personnel must be scheduled in advance. Please advise type, length and place of training).	☐

DRAFT

FLYGT SUBMERSIBLE AXIAL FLOW PUMP PP-4640

Performance Specification

SCOPE
Furnish and install 3 submersible horizontal propeller pump(s). Each pump shall be equipped with 4.0 HP, submersible electric motor connected for operation on a 460Volt, 3 Phase, 60 Hertz, service, with 50 Ft. of 7 conductor with #14 AWG size Subcab cable. All cables shall be neoprene or CPE jacketed.

MANUFACTURER REQUIREMENTS
The pumping equipment specified herein shall be the design and fabrication of a single manufacturer which shall have sole source responsibility for said equipment.

PUMP DESIGN
The pump(s) shall be capable of handling raw, screened sewage. The pump, with its appurtenances and cable, shall be capable of continuous submergence under water without loss of watertight integrity to a depth of 100 Ft.

PUMP CONSTRUCTION
Each pump shall be of the integral design, close coupled, submersible type. All components of the pump, including motor shall be capable of continuous underwater operation. In addition, all components of the pump shall be capable of continuous operation completely un-submerged, for two (2) hours.

Motor casing shall be 304SS construction. Other major pump components shall be epoxy coated steel. The oil housing cover plate shall be of corrosion resistant plastic. All exposed nuts and bolts shall be of stainless steel.

MOTOR
The multi-pole motor shall be directly connected to the propeller (gearbox designs are not acceptable) to produce a propeller speed of 875 RPM. The pump motor shall be squirrel cage, induction, shell type design, housed in an air filled, watertight chamber. The stator winding shall be insulated with moisture resistant Class F insulation which will resist a temperature of 155°C (311°F). The stator shall be dipped and baked three times in Class F varnish. The motor shall be designed for continuous duty, capable of sustaining a maximum of at least thirty (30) evenly spaced starts per hour. The rotor bars and short circuit rings shall be made of aluminum.

ELASTOMERS
All mating surfaces where watertight sealing is required shall be machined and fitted with Nitrile rubber O-rings. Fitting shall be such that sealing is accomplished by metal-to-metal contact between machined surfaces. This will result in controlled compression of the O-rings without requiring a specific torque limit. No secondary sealing compounds, rectangular gaskets, elliptical O-rings, grease or other devices shall be used.

PROPELLER
The propeller shall be of 316 stainless steel dynamically balanced, non-clogging backward curved design. Each blade shall be laser cut and welded to the hub and tested to ensure that the propeller is properly balanced. The propeller shall be capable of handling solids, fibrous materials, heavy sludge and other matter found in normal sewage applications. The propeller shall be 14-7/16 inches in diameter and have three blades, each at a blade angle of 9 degrees.

CABLE ENTRY
The cable entry housing shall be an integral part of the back plate. The cable entry shall have a double set of elastomer grommets in order to ensure a redundant system in the event of a cable entry seal failure. Single sealing systems will not be deemed acceptable. The cable entry shall be comprised of two

DRAFT

cylindrical elastomer grommets, each flanked by washers and a ferrule designed with close tolerance fit against the cable outside diameter and the entry inside diameter. This will provide a leak proof, torque-free seal at the cable entrance. The assembly shall bear against a shoulder in the stator casing opening and be compressed by a gland nut threaded into it. Interaction between the gland nut and the ferrule should move the grommet along the cable axially instead of with a rotary motion. The junction chamber and motor compartment shall be separated by a terminal board which shall protect the motor interior from foreign material gaining access into the pump top. Connection between the threaded compressed type binding posts permanently affixed to the terminal board and thus perfectly leak proof. Epoxies, silicones, or other secondary sealing systems shall not be considered acceptable.

BEARINGS
All bearings shall have a minimum rated life of 100,000 Hrs. The outboard propeller bearing shall be an angular contact bearing. The motor shaft end shall be supported by two bearings. A roller bearing shall take up the radial loads while an angular contact bearing shall take up the axial loads. The bearings shall be pre-loaded by a bearing loading nut located on the motor end of the shaft in order to reduce shaft deflection and increase bearing life and seal life. Pumps without pre-loaded bearings will not be considered acceptable or equal.

THERMAL SENSORS
Thermal sensors shall be used to monitor stator temperatures. The stator shall be equipped with three (3) thermal switches embedded in the end coils of the stator winding. These shall be used in conjunction with, and supplemental to, external motor overload protection, and wired to the control panel.

SHROUD ASSEMBLY
The pump assembly shall incorporate a shroud a full 360 degrees around the propeller.

OIL HOUSING
The oil housing shall contain two compartments consisting of an inner and an outer section with four ports to connect and facilitate oil flow. In the event that the mixed media bypasses the outer seal, this design will allow the outer compartment to collect the heavier (denser) fluids by means of the simple process of gravity.

MECHANICAL SEALS
Each pump shall be provided with two sets of lapped and face type mechanical seals running in oil reservoirs for cooling and lubrication. The mechanical seals shall contain both stationary and positively driven rotary tungsten carbide face rings unless otherwise specified. In order to avoid seal failure from sticking, clogging, and misalignment from elements contained in the mixed media. Only the seal faces of the outer seal assembly and its retaining clips shall be exposed to the mixed media. All other components shall be contained in the oil housing. All seal faces must also be capable of being relapped.

The seals shall require neither maintenance nor adjustment, but shall be easy to check and replace. Shaft seals without positively driven rotating members shall not be considered acceptable or equal.

LUBRICANT
Seal lubricant shall be FDA approved, non toxic.

1 Technical specification

1.1 Product Description

Usage

The PP pump is mainly used in recirculation in Biological Nutrient Removal processes in treatment plants. Other areas of use:

- Emptying of rainwater retention basins
- Creating streams, for example for boat rides
- Pumping sea water to fish, shrimp, and oyster farms
- Pumping water to irrigation ditches
- Pumping cooling water to power plants

Denomination

Standard version	Explosion proof version
4630.412	4630.492
4640.412	4640.492
4650.412	4650.492
4660.412	4660.492
4670.412	4670.492
4680.412	4680.492

Installation

Guide bars, diameter 2 inches (50.8 mm).

Application limits

Feature	Description
Liquid temperature	• Maximum 40°C (104°F) • Warm-liquid version 60°C (140°F), or 90°C (194°F)
Liquid viscosity	Maximum 5000 cp
pH	1 – 12
Depth of immersion	Maximum 20 m (65 ft)

Motor data

Feature	Description
Motor type	Squirrel-cage induction motor
Frequency	60 Hz
Supply	3–phase
Starting method	• Direct on-line • Variable Frequency Drive (VFD)
Maximum starts per hour	30 evenly-spaced starts per hour
Voltage variation	• Continuously running: Maximum ±5% • Intermittently running: Maximum ±10%
Voltage imbalance between the phases	Maximum 2%

DRAFT

Cables

- SUBCAB® heavy-duty submersible cable
- SUBCAB® screened heavy-duty submersible cable
- HCR, heavy-duty heat and chemical resistant submersible cable

Monitoring equipment

- Thermal contacts opening at 140°C, (285°F)
- Leakage sensor in stator housing (FLS), optional

Dimensions and weight

See the dimensional drawing.

Installation equipment

The available installation equipment depends on product version and type of installation.

- Discharge connection
- Lifting equipment

Accessories

- Electrical equipment: ~~Starter~~, monitoring relay, ~~controller, variable frequency drive, and control panel~~
- ~~Zinc anodes~~
- ~~Cable protection hose~~

Materials

Item	Material
Motor casing	Stainless steel ASTM 316L
Stator housing	Cast iron
Shaft	Stainless steel, ASTM/AISI 431
Oil housing	Vinyl ester based SMC
Lifting device	Stainless steel ASTM 316L
Inlet cone	Stainless steel ASTM 304, optional: ASTM 316L
Fixing plate	Stainless steel ASTM 304, optional: ASTM 316L
Oil	Paraffin oil ISO VG32

Surface treatment

Stainless steel parts are blasted to a dull grey surface.

O-rings

Nitrile rubber as standard, fluorinated rubber for warm liquid versions.

Hydraulic unit

Three-blade high efficiency clog-free propeller, stainless steel ASTM 316L.

Propeller diameter	• 4630–4640: 368 mm (14.5 in) • 4650–4660: 580 mm (22.8 in) • 4670–4680: 766 mm (30.2 in)

Mechanical face seals

The inner seal uses the patented Active Seal™ technology, which is a zero leakage seal, allowing no liquid to penetrate from the buffer fluid compartment to the stator housing.

	Inner seal	Outer seal
Standard, 4630–4640	Corrosion resistant cemented carbide (WCCR) / Aluminum oxide (Al_2O_3)	WCCR / WCCR

DRAFT

	Inner seal	Outer seal
Standard, 4650–4680	Corrosion resistant cemented carbide (WCCR) / WCCR	WCCR / WCCR
Optional, 4630–4640	WCCR / Al_2O_3	Silicon carbide (RSiC) / RSiC
Optional, 4650–4680	WCCR / WCCR	Silicon carbide (RSiC) / RSiC

Xylem |’zīləm|

1) The tissue in plants that brings water upward from the roots;
2) a leading global water technology company.

We’re a global team unified in a common purpose: creating advanced technology solutions to the world’s water challenges. Developing new technologies that will improve the way water is used, conserved, and re-used in the future is central to our work. Our products and services move, treat, analyze, monitor and return water to the environment, in public utility, industrial, residential and commercial building services settings. Xylem also provides a leading portfolio of smart metering, network technologies and advanced analytics solutions for water, electric and gas utilities. In more than 150 countries, we have strong, long-standing relationships with customers who know us for our powerful combination of leading product brands and applications expertise with a strong focus on developing comprehensive, sustainable solutions.

Description

P 4640

Ultra-Low-Head High-Flow Wastewater Pump

Flygt ultra-low-head high-flow wastewater pumps are engineered for versatility and lean installation, and offer highly efficient and reliable pumping of highly contaminated fluids. Few components, straightforward service routines and simple installation make Flygt ultra-low-head pumps an economical choice for a wide range of applications, including activated sludge treatment, stormwater and other low-head high-flow duties. Pumping efficiency is kept sustained high with backswept propeller blades and wide-hub propeller design.

Flexible and Modular Design

All external parts manufactured for excellent corrosion-resistance. Major parts in stainless steel.

- High efficiency stainless steel propeller with backswept propeller blades for high clog resistance.
- Optional Hard-Iron impeller for abrasive applications.
- Short shaft overhang – reduces shaft deflection and increases seal and bearing life.
- Motor designed for submersible use – heat is concentrated to the stator core for improved cooling properties.
- High performance motor with Class H motor insulation provides thermal overload protection and extra long service life.
- Double mechanical seal system – Two sets of mechanical shaft seals work independently to provide double security. Available in Tungsten carbide (WCCR) or Silicone carbide (SiC) depending on pumped media.
- Plug-in seal with the Active Seal system, offering increased sealing reliability and zero leakage into the motor, thereby reducing the risk of bearing and stator failures.
- Motor cable SUBCAB® - specially developed for submersible use.
- Cable entry with double elastomer seal grommets – for double security.

Product Features

- State of the art ultra-low-head high-flow wastewater pump
- Robust and reliable direct drive
- Sustained high efficiency with fiber-handling hydraulics
- High reliability with Class H insulated motor and Active Seal system Plug-in seal

Flygt Pump Lift™

Pump Lifting System

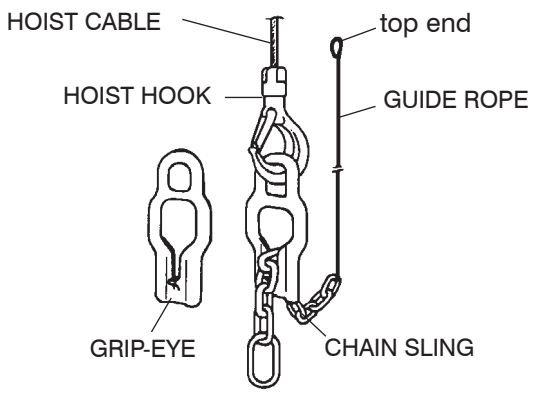
The normal method of lowering and raising a NP/CP pump in and out of a lift station is by use of a chain or cable attached to the pump. The length of the chain or cable is dependent on the depth of the station. The average length would probably be between 18 to 20 ft. and in certain cases may be much longer. In many cases, depending on the lifting device (usually a hoist), the operator may have to take a second or third bite on the pump chain in order to lift the pump clear of the station.

An added accessory to the Flygt line is the patented **Flygt Pump Lift™** System which consists of a Nylon or stainless steel guide rope, a short length of high tensile strength carbon steel or stainless steel chain and a forged "Grip-Eye" of wrought alloy steel.

The pump raising operation using this positive recovery system is accomplished as follows:

1. Connect the small eye of the Grip-Eye to the end of the hoist cable.
2. Slip the top end of the guide rope through the large eye of the Grip-Eye. The guide rope simply acts as a guide for the Grip-Eye on its way down to the short length of the pump lifting chain.
3. While keeping the guide rope taut, proceed to lower the Grip-Eye until it is well positioned over the pump lifting chain.
4. Release the tension on the guide rope. The lifting chain will now take a position to become engaged in the Grip-Eye.
5. Gradually take up tension on the hoist cable and the Grip-Eye will make a positive grip on the pump lifting chain. Continue hoisting until the pump is clear of the station.

Guiding the Grip-Eye to the chain



Hoisting

Caution: The Grip-Eyes may only be used with the corresponding special Flygt Chain Sling Units.

Grip-Eyes are not covered under warranty if other chains are used.

Guide Ropes are not to be used for lifting the pump.

Refer to the following pages for pump models and correct assembly.

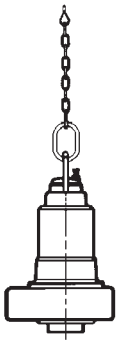


FIG. 1

(Standard) The end ring of the Chain Sling is slipped over the pump lifting handle.

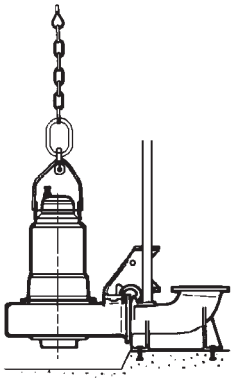

FIG. 2

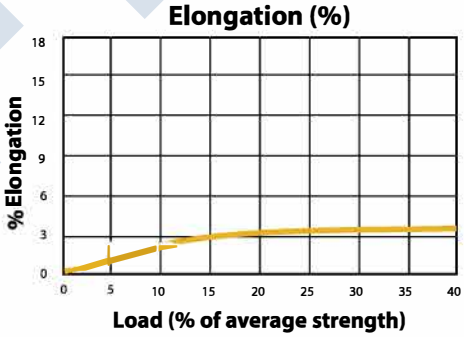
(Customer to supply extra shackle) A shackle of capable strength can be used in conjunction with the standard ring should customer choose not to remove and replace pump handle.

DRAFT

NOVABRAID™

PERFORMANCE BY DESIGN



SPECTEC-12™

SPECTEC-12™ is a hollow braided 12-strand rope using 100% Spectra fiber. It is designed with single ply construction up to 1" nominal size and two ply up to 2". Spectec-12 yields one of the highest strength to weight ratios available in a synthetic rope. It comes standard with a urethane coating that provides additional abrasion resistance while remaining easy to handle and splice.

Lifting the pump

Lowering the pump

DRAFT

August 24, 2020

Mini-CAS Wiring Memo

Background:

Xylem-Flygt has utilized a Mini-CAS (Control And Status) relay for many years to monitor multiple sensors within Flygt pumps. This relay allows for multiple sensors to be wired together and monitored through two sensor wires. The most common sensor scheme is a single FLS (Fluid Leakage Sensor) used for liquid detection in the normally dry motor housing, and a set of three Thermal Sensors, one imbedded within each phase of the motor windings, to monitor when the temperature of the motor winding(s) exceed 284°F .

Requirements:

Xylem Flygt – The use of this relay is required for warranty purposes. It is required that an over temperature alarm disables the motor upon activation and prohibits the motor's operation until the alarm is reset. While not required to disable, it is required that a leakage alarm is annunciated and addressed in a reasonable amount of time to minimize further damage.

NFPA/NEC – The use of this relay is required to meet the pumps explosion-proof certification as defined by FM (Factory Mutual). FM has determined it is necessary to immediately shut down the pump in the event of a motor temperature alarm as the motor skin could exceed the temperature limitation for Class 1, Division 1 locations and could ignite any explosive gasses which can be found in wastewater wet wells.

Interpretation of NFPA/NEC Code:

It is both Xylem-Flygt and Whitney Equipment's interpretation of the code that the over temperature monitoring system is utilized in every circumstance/event. Meaning that in all auto, manual, and emergency operation modes the motor temperature alarm disables the motor's ability to operate.

The disabling of the motor starting equipment is most reliably done by utilizing the "Temperature Interlock" (Normally-Open circuit, terminals 1 & 3). When powered up and the motor temperature in the normal state, this circuit will close providing a run enable signal to a supervisor controller or other motor run circuits. In the event the alarm opens, due to a temperature alarm, Mini-CAS failure, Mini-CAS power failure, or the removal of the Mini-CAS, the control system should not allow the motor to operate.

Ultimately, it is up to the project's engineer, control panel manufacturer, and the electrician to ensure all local and national codes are met.

DRAFT

Warranty:

Whitney Equipment will test this circuit to ensure proper operation for warranty purposes and will confirm if the motor can operate in any mode. We understand the critical nature of this equipment, but require for warranty purposes that the motor is never run with the motor in over-temperature alarm. If the owner of this equipment chooses to have by-pass ability, warranty may not apply to a motor failure caused by excessive heat. Although this failure is uncommon using today's modern motor protection devices, it is easy to identify when these safety features have been by-passed.

If you have any questions or concerns about the sensors, Mini-CAS relay, or how to apply them to your project, please contact our team at (425) 486-9499.

FLYGT
a xylem brand

Issued: 6/13 Supersedes: 4/12

MiniCAS

Features

- 120 VAC, 24 VAC, or 24 VDC Powered
- Durable Plastic Enclosure with Flange for Mounting
- Leakage & Temperature Alarm Indication
- Power Applied Indication
- Temperature Alarm Reset Mode Select Switch
- Temperature Alarm Reset Push-button
- Sensor Input Transient & Short Circuit Protection

c UL us

UL FILE # 222351

MADE IN THE U.S.A.

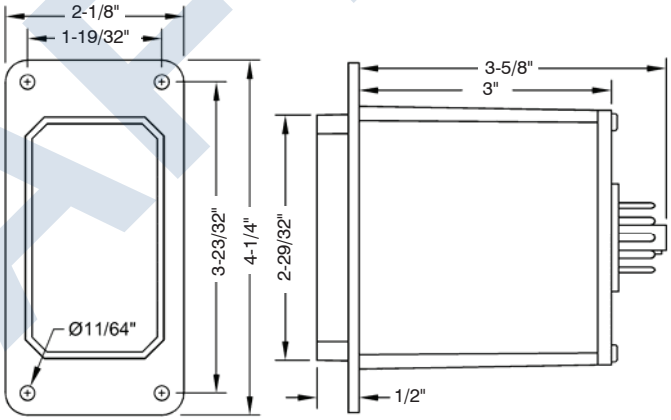
Operation

The MiniCAS provides Motor Over Temperature and Seal Leakage protection for Flygt Submersible Pumps equipped with FLS or CLS sensors. The unit supplies 12 VDC to the sensor and measures the current through the sensor using protected, noise-filtered electronic circuitry. When sensor current is in the normal range, the Temperature Alarm Relay is activated to allow normal pump operation.

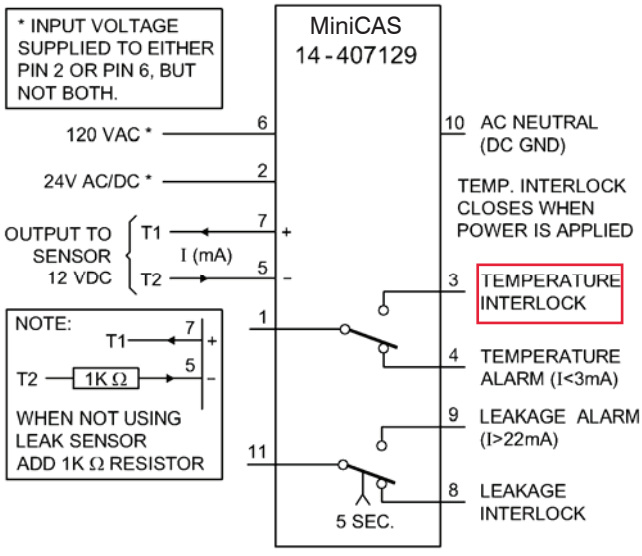
High Temperature Condition

In a motor High Temperature condition, the pump thermal contacts open and the current becomes zero. The Overtemp Indication is turned on and the Temperature Alarm Relay is deactivated, preventing pump operation. When the motor High Temperature condition has cleared, the unit will reset based on the position of the Alarm Reset Mode Select Switch (Auto or Manual). In the Auto position, the Overtemp Alarm resets automatically. In the Manual position, the Overtemp Reset Push-button must be pushed to clear the alarm.

Seal Leakage Condition



In a Seal Leakage condition, the Flygt FLS or CLS sensor decreases its internal resistance. The increased current is sensed, the Leakage Indication is turned on, and the Leakage Alarm Relay is activated.



Shorted Sensor Condition

If the sensor wires are shorted, a Shorted Sensor condition is indicated by activating the Leakage Alarm Relay and alternately flashing both the Leakage and Overtemp LED together with the Power LED. If the short is removed, the fault will automatically reset within 30 seconds.

Cleared Fault Indication

For both Overtemp and Seal Leakage conditions, a cleared fault indication is provided. If either condition has occurred, but has been automatically cleared, then the corresponding Indication will slowly flash. The flashing indication may be manually removed by pressing the Overtemp Reset Push-button.

Specifications

Input Power:	120 VAC ± 10% 3.5 VA max. 24 VAC ± 10% 3.5 VA max. 24 VDC ± 10% 125 mA max.
Output Rating:	NEMA B300 Pilot Duty, 1/6th HP, 3A @ 240 VAC Form C

WARRANTY
Xylem Water Solutions USA, Inc.

For the period defined, Xylem Water Solutions USA, Inc. offers a commercial warranty to the original End Purchaser against defects in workmanship and material on Flygt Products. Warranty covers Flygt parts and labor as outlined in **ADDENDUM – A**.

COVERAGE:
Xylem Water Solutions USA, Inc. will pay the cost of parts and labor during the warranty period, provided that the Flygt product, with cable attached, is returned prepaid to a Xylem Water Solutions USA, Inc. Authorized Service Facility for Flygt Product repairs. Coverage for Flygt parts and labor will be provided for the period shown in **ADDENDUM - A.** The warranty period will begin from date of shipment or date of a valid Start-up (For permanently installed pumps only). In cases where the Start-up date is used as the beginning of the warranty on a permanently installed Flygt pump, a Start-up Report completed by an approved service technician from a Xylem Water Solutions USA, Inc. Authorized Service Facility for Flygt products must be received by the Xylem Water Solutions USA, Inc. Area Service Manager for Flygt Products within thirty (30) days of the initial onset of the unit placed into service. If not received, the beginning of the warranty coverage will default to the Flygt product ship date. A Start-up for a permanently installed Flygt pump must occur within one (1) year from the date of shipment from a Xylem Water Solutions USA, Inc. authorized facility for Flygt Products or warranty will automatically default to ship date as start of warranty. (See **STORAGE** section) When using the start-up date as the beginning of the warranty, a copy of the Start-up Report will be required to support any Warranty Claims. Warranty on Flygt Dewatering pumps will begin with ship date only. No other date on Flygt Dewatering pumps will be considered.

Xylem Water Solutions USA, Inc.'s sole obligation under this Warranty for Flygt Products shall be to replace, repair or grant credit for Flygt Products upon Xylem Water Solutions USA, Inc.'s exclusive determination that the Flygt Product does not conform to the above warranty. In the event that the Flygt product is replaced, warranty on the replacement product will be equal to the balance remaining on the original product or ninety (90) days, whichever is greater.

MISUSE:
This Warranty shall not apply to any Flygt product or part of Flygt product which (i) has been subjected to misuse, misapplication, accident, alteration, neglect, or physical damage (ii) has been installed, operated, used and/or maintained in a manner which is in an application that is contrary to Xylem Water Solutions USA, Inc.'s printed instructions as it pertains to installation, operation and maintenance of Flygt Products, including but without limitation to (iii) operation of equipment without being connected to monitoring devices supplied with specific products for protection; or (iv) damaged due to a defective power supply, improper electrical protection, faulty installation or repair, ordinary wear and tear, corrosion or chemical attack, an act of God, an act of war or by an act of terrorism; or (v) has been damaged resulting from the use of accessory equipment not sold by Xylem Water Solutions USA, Inc. or not approved by Xylem Water Solutions USA, Inc. in connection with Flygt products.

WEAR PARTS:
This warranty does not cover costs for standard and/or scheduled maintenance performed, nor does it cover Flygt parts that, by virtue of their operation, require replacement through normal wear (aka: Wear Parts), unless a defect in material or workmanship can be determined by Xylem Water Solutions USA, Inc.. Wear Parts are defined as Cutters, Cutting Plates, Impellers, Agitators, Diffusers, Wear Rings (Stationary or Rotating), Volutes (when used in an abrasive environment), oil, grease, cooling fluids and/or any items deemed necessary to perform and meet the requirements of normal maintenance on all Flygt equipment.

DRAFT

WARRANTY
Xylem Water Solutions USA, Inc.

DISCLAIMERS:
(i) Xylem Water Solutions USA, Inc.'s warranties are null and void when Flygt Products are exported outside of the United States of America without the knowledge and written consent of Xylem Water Solutions USA, Inc.; (ii) Xylem Water Solutions USA, Inc. makes no independent warranty or representation with respect to parts or products manufactured by others and provided by Xylem Water Solutions USA, Inc. (however, Xylem Water Solutions USA, Inc. will extend to the Purchaser any warranty received from Xylem Water Solutions USA, Inc.'s supplier for such parts or products).

LIMITATIONS:
XYLEM WATER SOLUTIONS USA, INC. NEITHER ASSUMES, NOR AUTHORIZES ANY PERSON OR COMPANY TO ASSUME FOR XYLEM WATER SOLUTIONS USA, INC., ANY OTHER OBLIGATION IN CONNECTION WITH THE SALE OF ITS FLYGT EQUIPMENT. ANY ENLARGEMENT OR MODIFICATION OF THIS WARRANTY BY A FLYGT PRODUCT DISTRIBUTOR, OR OTHER SELLING AGENT SHALL BECOME THE EXCLUSIVE RESPONSIBILITY OF SUCH ENTITY.

THE FOREGOING WARRANTY IS EXCLUSIVE AND IN LIEU OF ANY AND ALL OTHER EXPRESS OR IMPLIED WARRANTIES, GUARANTEES, CONDITIONS OR TERMS OF WHATEVER NATURE RELATING TO FLYGT PRODUCT(S), INCLUDING AND WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE WHICH ARE HEREBY EXPRESSLY DISCLAIMED AND EXCLUDED. PURCHASER'S EXCLUSIVE REMEDY AND XYLEM WATER SOLUTIONS USA, INC.'S AGGREGATE LIABILITY FOR BREACH OF ANY OF THE FOREGOING WARRANTIES IS LIMITED TO REPAIRING OR REPLACING FLYGT PRODUCTS AND SHALL IN ALL CASES BE LIMITED TO THE AMOUNT PAID BY THE PURCHASER HEREUNDER. IN NO EVENT IS XYLEM WATER SOLUTIONS USA, INC. LIABLE FOR ANY OTHER FORM OF DAMAGES, WHETHER DIRECT, INDIRECT, LIQUIDATED, INCIDENTAL, CONSEQUENTIAL, PUNITIVE, EXEMPLARY OR SPECIAL DAMAGES, INCLUDING BUT NOT LIMITED TO LOSS OF USE, LOSS OF PROFIT, LOSS OF ANTICIPATED SAVINGS OR REVENUE, LOSS OF INCOME, LOSS OF BUSINESS, LOSS OF PRODUCTION, LOSS OF OPPORTUNITY OR LOSS OF REPUTATION.

XYLEM WATER SOLUTIONS USA, INC. WILL NOT BE HELD RESPONSIBLE FOR TRAVEL EXPENSES, RENTED EQUIPMENT, OUTSIDE CONTRACTOR'S FEES, OR ANY EXPENSES ASSOCIATED WITH A FLYGT PRODUCT REPAIR SHOP NOT AUTHORIZED BY XYLEM WATER SOLUTIONS USA, INC. U.S.A., INC. REIMBURSEMENT COSTS FOR CRANES AND/OR ANY SPECIAL EQUIPMENT USED IN CONJUNCTION FOR THE REMOVAL AND/OR REINSTALLATION OF ANY FLYGT EQUIPMENT IS NOT COVERED UNDER THIS WARRANTY.

ANY UNAUTHORIZED ALTERATIONS TO SUPPLIED FLYGT EQUIPMENT USED WITHOUT XYLEM WATER SOLUTIONS USA, INC. SUPPLIED FLYGT BRAND CABLE OR CONTROLS WILL NOT BE COVERED UNDER THIS WARRANTY, UNLESS IT CAN BE PROVEN SUCH ANCILLARY EQUIPMENT IS SUITABLE FOR THE PURPOSE AND EQUAL TO XYLEM WATER SOLUTIONS USA, INC. SUPPLIED FLYGT BRAND CABLES OR CONTROLS THAT WOULD ORIGINALLY HAVE BEEN SUPPLIED WITH THE TYPE OF EQUIPMENT IN USE.

REQUIREMENTS:
A copy of Electrical System Schematics of the Control used (including a Control's Bill of Material) could be required to support a Warranty Claim when a non Flygt Brand Control is used. In addition, a written record, hereby known as "the log", will be associated with each unit serial number and must be maintained by the organization having product maintenance responsibility. The log must record each preventative maintenance activity and any repair activity during the life of the warranty or verification that a Xylem Water Solutions USA, Inc. authorized Service Contract for Flygt Products is in force and must be available for review and/or auditing. Failure to meet these conditions could render this warrant null and void. Such logs could be required to determine warranty coverage.

DRAFT

WARRANTY
Xylem Water Solutions USA, Inc.

STORAGE:
Should a delay occur between ship date and the date of start-up, maintenance as outlined in Xylem Water Solutions USA, Inc.'s Care & Maintenance Manual for Flygt Products must be performed by the "CONTRACTOR" and/or "OWNER" during any such period of storage. Documentation providing proof and outlining what maintenance was performed must be provided to Xylem Water Solutions USA, Inc. or its Flygt Products representative within thirty (30) days of said maintenance, or the Xylem Water Solutions USA, Inc. warranty for Flygt Products could be considered void.

CONTROLS:
Warranty coverage for permanently installed controls will start for the end purchaser on the date of shipment. This warranty does not apply to controls that have been damaged due to a defective and/or improper input power supply, improper electrical protection, accidental damage, improper or unauthorized installation and/or repair, unauthorized alteration, negligence, environmental corrosion or chemical attack, improper maintenance or storage of control, any act of God, an act of war, an act of terrorism or damage resulting from the use of accessory equipment not approved by Xylem Water Solutions USA, Inc.. Further, this warranty does not apply in the event an adjustment is found to correct the alleged defect.

Solid state devices will be covered for a period of one (1) year. Electrical control panels containing controllers, PLC's, drives, soft starts, and other computerized equipment will require Transient Voltage Surge Suppression (TVSS) protection in order to satisfy the requirements of this warranty. The protection equipment associated with the control must be kept in working condition during the life of the warranty. Auxiliary equipment supplied with the control (air-conditioners etc.) is limited by the respective original equipment manufacturer's warranty offered. Consumable items such as: light bulbs, fuses, and relays are covered under normal operating conditions. Electrical surges experienced during startups and/or during normal operating use of the control panel will cause the consumable items not to be covered under this warranty policy. Components not supplied by Xylem Water Solutions USA, Inc. will not covered by this warranty.

TOP (The Optimum Pump Station)
Xylem Water Solutions USA, Inc. will warrant the Flygt TOP pre-engineered fiberglass pump station components against defects in material and workmanship for a period of one (1) year from date of start-up or eighteen (18) months from date of shipment and is valid only to the original owner of the station. Warranty shall cover the cost of labor and materials required to correct any warrantable defect, excluding any removal and reinstallation costs, FOB Xylem Water Solutions USA, Inc.'s authorized warranty service location for Flygt's TOP.

Flygt Products contained within a TOP pre-engineered fiberglass pump station will carry the standard Xylem Water Solutions USA, Inc. warranty for Flygt products and/or accessories installed in the TOP pre-engineered fiberglass pump station.

All Flygt Product restrictions and/or limitations as outlined and described within the context of this warranty are germane to all sections of this Xylem Water Solutions USA, Inc. Warranty document.

Any action shown is subjected to the requirements of the drawings and the specifications. Contractor is responsible for correlating and confirming dimensions at the job site, choice of fabrication processes and techniques of construction: coordination of his work with that of other trades; and performing the work in a safe satisfactory manner.

DATE: 7/29/2025 BY: DD / NE

Contractor to Note:

Submittal Comments:

1. Please confirm that the actuator can be installed 180° from the vertical position. Please submit any necessary support details required for this configuration.
2. Please list the quantity of each type of valve and actuator being provided on the cover sheet.
3. Please submit cut sheets for two 6” WAS plug valves and electric actuator.
4. Please call out the 12” permeate valves to be stainless steel.
5. Please change the electric actuator power supply to be 120V/1 phase.

BECK ELECTRIC ACTUATORS

Actuator Specifications

Ref: MSB-25-162918

Line	Qty	Model	Application Description
1	3	11-369	Valve/ Air Scour BABA Compliant Actuator NON-AIS 10" M&H 4700 AWWA flanged butterfly valve supplied as unitized assembly. Power: 480/3/60 Control: 4-20 mA

Actuator Features & Specifications

change to 120V/1 phase

Voltage/Phase / Freq:	480/3/60
Torque (lb-ft):	400
Stroke Timing (seconds):	54
Travel (degrees):	90
Auxiliary Limit Switches:	4X SPDT
Communications Protocol:	HART communications / Local pushbutton interface
Control Signal:	4-20 MA
Feedback Signal:	4-20 mA
Loss of Control Signal Action:	Stay In Place
Loss of Power Action:	Stay in Place
Enclosure Rating:	TYPE 4X, IP66/IP68 (3m / 48 hrs)
Corrosion Protection:	Standard
Position Sensing Device:	Contactless Position Sensor (CPS)
Control Board:	Digital Control Module (DCM)
Wiring Diagram:	17-7000-35

Integral Features:
- Self-Locking, Self-Releasing Gear Train
- Handwheel (manual operation without power)
- Non-coasting Beck control motor with instant magnetic braking
- Dust-Tight Construction
- Over-Travel Limit Switches
- Cast Mechanical Stops
- 5-Position Handswitch (electrical manual operation)
- Temperature Sensing Technology
- Stall Protection Circuitry

Additional Features: Certificate of Inspection
Auxiliary handswitch contact closed in AUTO
Motor Handwheel Label (OPEN direction)
Handswitch Inlay (OPEN / CLOSE)

Valve Info: Beck Mounting with Beck Supplied Mounting Hardware
NON-AIS 10" M&H 4700 AWWA flanged butterfly valve

Valve/Damper Supplier By: BECK

Mounting Type: Direct Couple

Torque Requirements

PLEASE REFER TO MOUNTING LAYOUT DRAWING FOR REQUIRED FASTENER TORQUE SPECIFICATIONS

ADDITONAL FASTENER TORQUE RECOMMENDATIONS:
www.haroldbeck.com/fastenertorque

Special Instructions

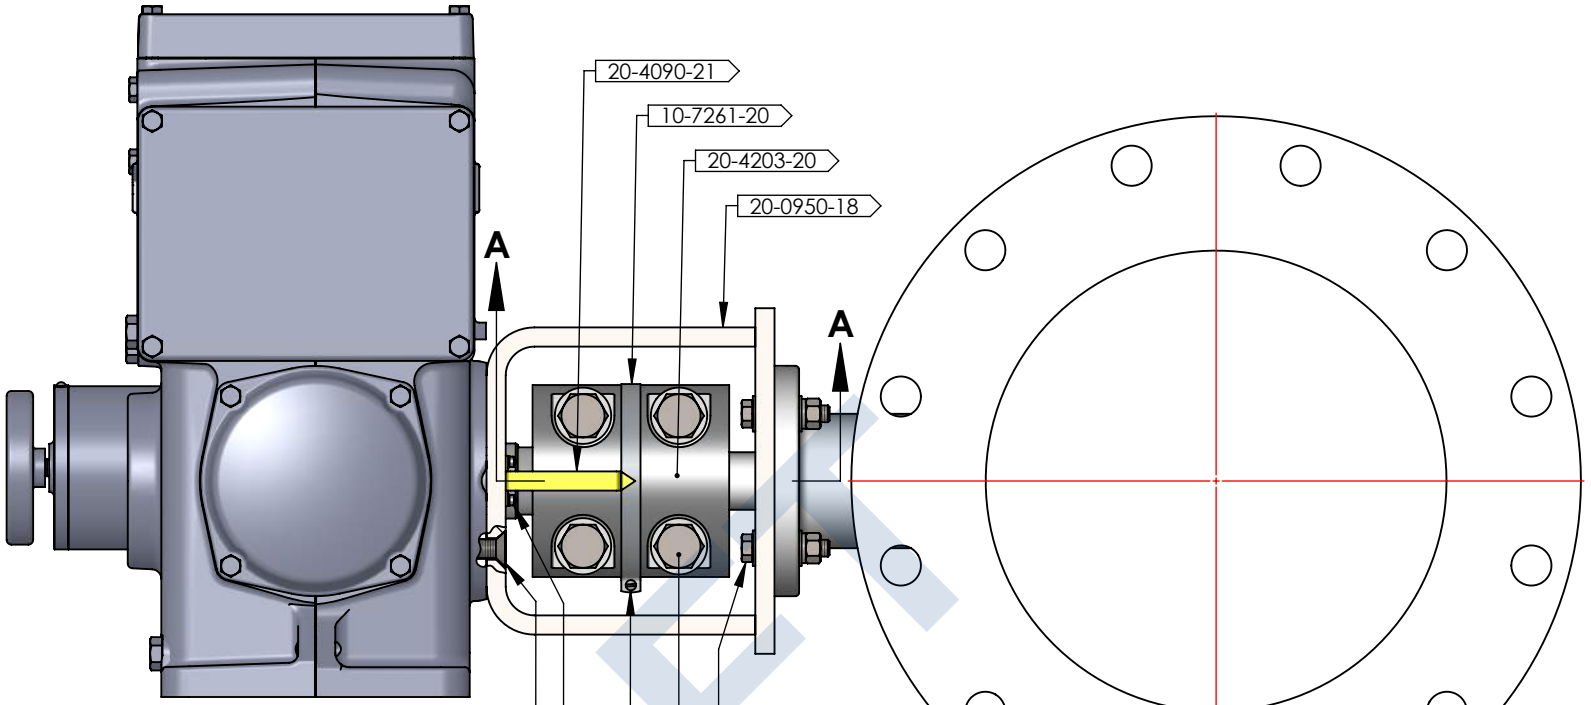
1. This design does not require the valve stem key.

DRAFT

VALVE MOUNTING SPECIFICATION

Made in USA Since 1936

Installation Instructions



1. Identify the mounting hardware supplied with the Beck actuator. See the parts list, installation instructions, and special instructions specific to your mounting, fastener torques, and layout drawing. Note that the special instructions may override the generic installation instructions listed below.
2. Set the valve to its fully closed position.
3. Attach the "U" mounting bracket or base to the valve.
   a. For designs using a U-bracket, hand tighten the fasteners.
   b. For designs using a Yoke and Base, tighten the fasteners to the required torque.
4. One end of the coupling has been designed to fit the valve stem. Loosely assemble the coupling halves and place this end of the coupling over the valve stem.
5. To achieve proper actuator orientation with respect to the valve, the Beck actuator can be attached to the yoke, "U" mounting bracket, or adapter plate in multiple positions.
   a. For designs using a U-bracket, position the actuator as desired and attach it to the bracket, inserting the actuator output shaft into the coupling. Tighten the fasteners to the required torque.
   b. For designs using a Yoke and Base, position the yoke as desired and attach it to the actuator and tighten the fasteners to the recommended torque. Attach the Beck actuator and yoke assembly to the base, inserting the actuator output shaft into the coupling. Hand tighten the fasteners.
   c. For G31 actuator installations, rotate the actuator handwheel until the mechanical stop pin is aligned with the slot in the adapter plate or mounting bracket. Refer to the Group 31 Actuator Instruction Manual Start-up instructions to reset the limit switches to the mechanical stop.
6. Connect power to the actuator per Beck Instruction manual. With the coupling still loose, rotate the Beck actuator output shaft to the closed position.
7. Without rotating the actuator output shaft or the valve stem, position the coupling to ensure that both the actuator shaft and the valve stem are as equally engaged as possible into the coupling. Hand tighten the coupling fasteners.
8. Ensure the actuator shaft and valve shaft are aligned so the coupling will engage both properly, then snug the coupling fasteners. Continue to tighten the coupling fasteners in a crisscross sequence, approximately 1/8 turn per fastener, until the required torque is reached.
9. Tighten all remaining fasteners to the required torque.
10. Place the index around the coupling. Do not tighten index fasteners.
11. Attach the pointer and pointer spacer (if included) or pointer pin to the yoke or "U" mounting bracket, and tighten the fasteners (if included).
12. Rotate the index to align the closed position on the index with the pointer, and tighten the index fasteners.
13. Affix tape to the valve stem and coupling on the side opposite the pointer for use as a match mark.

Threaded Fastener Components Function and Conditions	Product to be Applied
Carbon steel (including SZP) providing clamping for the transmission of torque through friction (caps of crank arms, lever arms, and couplings)	None.
Fasteners through which operating loads are transmitted from operational equipment (actuator, valve, bearing support, etc.) to support structures (bracket, pedestal, support plate, etc.).	Thread Locker, Medium Strength (Loctite 242 or similar)
Threaded connections which are subject to time lapse between initial assembly and the adjustment to the final depth of engagement (linkage assemblies, etc.):	Thread Locker, Med Strength - Wicking (Loctite 290 or similar)
Threaded connections which support accessories that do not transmit operating loads (tag, index, pointer, etc.), especially those with provision for a screw driver rather than a wrench	Thread Locker, Low Strength (Loctite 222 or similar)
Threaded connections in which both the internally AND the externally threaded components are both stainless steel ***and*** • Of nominal diameter larger than 0.25, ***OR*** • Tightened to torque value higher than the SAE Grade 2 seating torque	Anti-Galling Compound (Loctite LB 8150 Anti-seize or similar)

INSTRUCTION MANUAL

For actuators manufactured after March 2019

DRAFT

This manual supports Group 11 actuators using DCM-3 part numbers:

22-5014-58, 22-5014-59

22-5014-78, 22-5014-79

22-5018-59

ELECTRIC ACTUATORS FOR INDUSTRIAL PROCESS CONTROL

INTRODUCTION

This manual contains the information needed to install, operate, and maintain Beck Group 11 actuators equipped with the Digital Control Module (DCM-3), manufactured by Harold Beck & Sons, Inc. of Newtown, Pennsylvania.

The Group 11 actuator is a powerful control package designed to provide precise position control of dampers, valves, fluid couplings and other devices requiring up to 1,800 lb-ft (2 440 N•m) of actuator torque.

IMPORTANT: This manual contains information that will make installation simple, efficient, and trouble-free. Please read and understand the appropriate sections in this manual before attempting to install or operate your actuator.

This manual, along with Beck Manual Supplement 80-1100-14, is provided with applicable Group 11 & Group 11E hazardous location actuators.

The Beck Group 11 is an electric actuator for industrial process control. Exceptionally stable and trouble-free, these rotary actuators are in use throughout the world in valve and damper applications.

Group 75 compact rotary actuators ...
incorporate a very compact design with high temperature resistance and great mounting flexibility; making these actuators ideal for boiler windbox applications as well as all types of rotary valve applications in tight spaces.

Group 42 linear actuators ...
incorporate a long stroke design providing up to 1,000 lbs. (4450 N) of thrust. These actuators are ideally suited for burner air register type applications.

Group 22 digital control actuators ...
are designed for accurate, reliable, modulating digital control of high torque applications. The actuator is ideal for use in large boiler applications, such as ID/FD fan dampers.

Group 29 linear valve actuators ...
are ideally suited for globe valves from 1" to 8" (25 mm to 203 mm) diameter. Beck's unique Tight-Seater™ coupling provides positive seating of valves.

Group 14 linear actuators ...
are ideally suited for globe valves from 1" to 8" (25 to 203 mm) diameter. Beck's unique Tight-Seater™ coupling provides positive seating of valves.

Group 31 compact rotary actuators ...
are particularly suited for coupling to ball, plug, and butterfly valves up to 4" (102 mm) diameter, and small dampers.

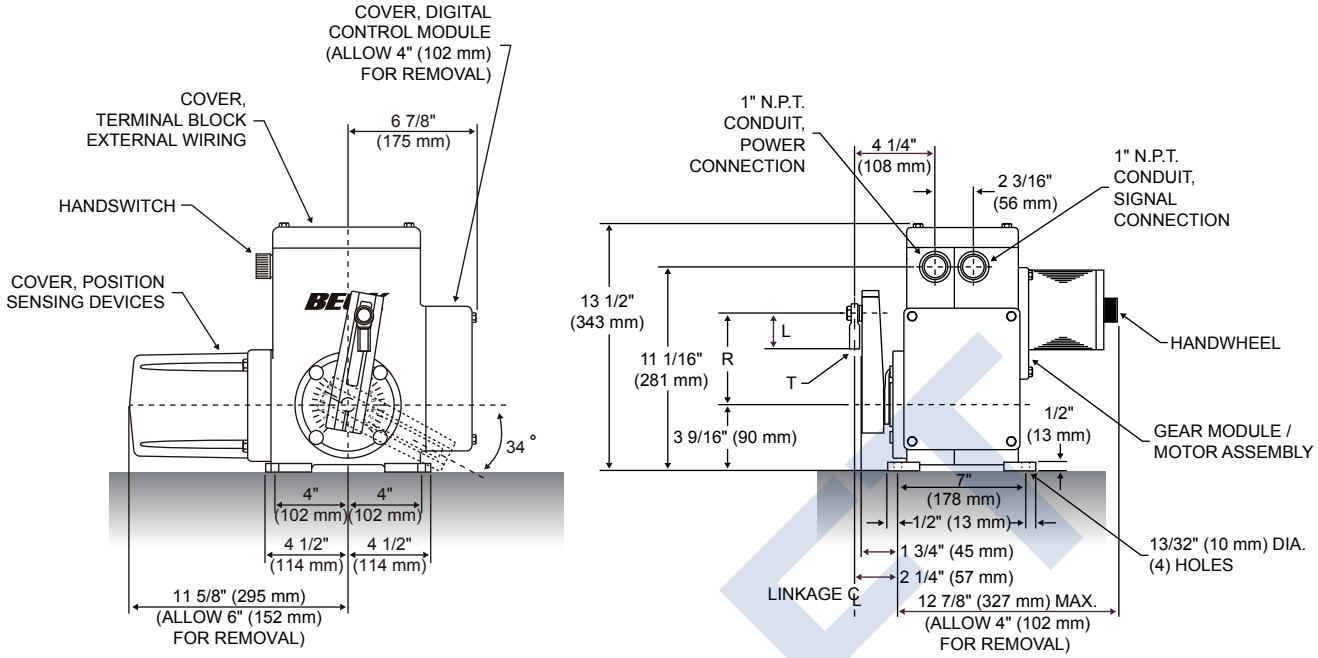
11-209 / 11-269 11-309 / 11-369	110	.88	.51	.44	.28	.25	.22	.18
11-409 / 11-469	400	3.1	1.8	1.6	.98	.89	.78	.65

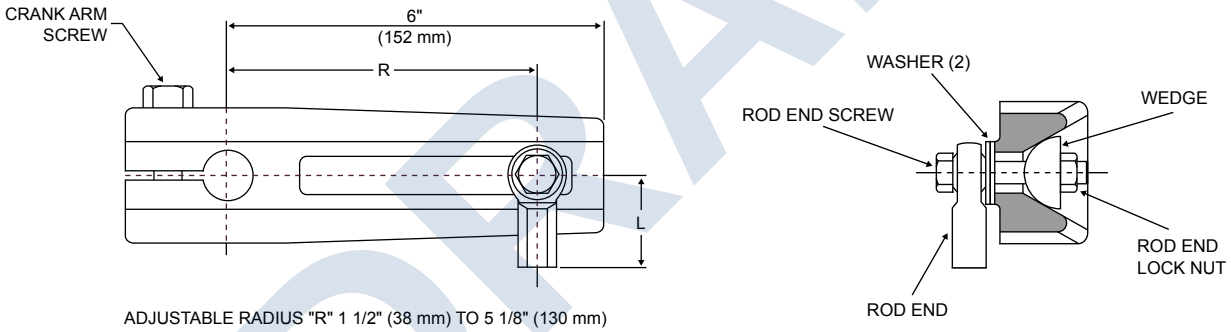
Operating Conditions	-40° to 85°C (-40° to 185°F) ***NOTE: Actuators should be stored between -40° to 85°C (-40° to 185°F)*** 0 to 100% relative humidity, non-condensing
Communication Interface	HART protocol (Rev. 5 -- burst mode is not supported) Pushbutton / LEDs, DB9 Serial commands
Demand Input Signal Options	4–20 mA (1–5 V dc input is possible with the removal of the "R11" resistor located on the DCM-3 board—see page 48)
Adjustability for Split Range Operation	0%: 0.1 V to 4 V dc 100%: 0% + 1 V min. to 5 V max.
Minimum Step Size	0.1% (0.15% typical, configurable from 0.1 to 2.5%)
Linearity	±1% of span, max. independent error
Hysteresis	0.25% of span at any point
Demand input Signal Characterization	**Linear:** Actuator output shaft moves proportionally to the input signal **Square:** Actuator output shaft moves proportionally to the square of the input signal **Square Root:** Actuator output shaft moves proportionally to the square root of the input signal **Custom:** Actuator output shaft moves according to the configurable 20-segment (maximum) response curve. (Not available with all DCM versions)
Position Feedback Signal	4–20 mA
Isolation	Demand input and position Feedback signals are isolated from ground and the AC power line. Signal buffering provides 24 V dc isolation between the Demand and Feedback signals.
Action on Loss of Power	Stays in place
Action on Loss of Input Signal	Stays in place or drives to any preset position (configurable)

DRAFT



Stall Protection	If the motor tries to run in one direction for more than 300 seconds (configurable from 30 to 450 seconds), the DCM-3 will shut off power to the motor (feature can be enabled/disabled) - factory default is enabled.
Overtorque Protection (Optional)	The DCM-3 shuts off power to the motor if the measured output torque of the actuator exceeds 150% (adjustable from 25% to 150%) of the actuator rating (feature can be enabled/disabled)—disabled is the factory default.
Alarm Annunciation	Available at terminal E. Depending on actuator power, the voltage is either 120 V ac (80 mA max.) or 240 V ac (40 mA max.).
Temperature Indication	Measures the internal temperature of the actuator and triggers an alarm when the temperature exceeds the rating.
Over-travel Limit Switches	Two SPDT switches (CW and CCW) provide over-travel protection.
Auxiliary Switches	Up to four 6 A, 120 V ac (0.5 A, 125 V dc) cam-operated switches (S1-S4) are available. An additional two switches may be ordered (S5-S6) with models 11-209, 11-309, and 11-409. Factory default switch settings: S1, S4 and S5 are set to operate just before reaching the CCW travel limit. S2, S3 and S6 are set to operate just before reaching the CW travel limit. See the diagram on page 27.
Handswitch	Permits local electrical operation, independent of controller signal. Standard on all units. An auxiliary contact is available as an option for remote auto indication (rated 2.5 A at 120 V ac).
Handwheel	Provides manual operation without electrical power.
Motor Assembly	120 V ac, single-phase, no-burnout, non-coasting motor has instant magnetic braking. Requires no contacts or moving parts.
Gear Train	High-efficiency, precision-cut, heat-treated alloy steel and ductile iron spur gears. Interchangeable gear modules permit field change of torque/timing.
Mechanical Stops	Prevent overtravel during automatic or manual operation.
Enclosure	Precision-machined, aluminum alloy castings painted with corrosion-resistant polyurethane paint provide a rugged, dust-tight, weatherproof enclosure. Actuators designed for hazardous classified locations are also available. Type 4X; IP68, 3 meters/48 hours*. *NOTE: Internal water damage is not covered by warranty.
Maximum Output Shaft Rotation	100 degrees (Models 11-159, 11-209, 11-309, 11-409) 90 degrees (Models 11-169, 11-269, 11-369, 11-469)
Mounting Orientation	Any orientation—no limitations.
Standards**	CSA Labeled (US & Canada); CE Compliant; UKCA Compliant

**NOTE: May not be available with all options and models. For more information, please call Beck at 215-968-4600.



DRAFT

PRECAUTIONARY INFORMATION

SAFETY PRECAUTIONS

WARNING

Installation and service instructions are for use by qualified personnel only. To avoid injury and electric shock, do not perform any servicing other than that contained in this manual. Please read and understand the appropriate sections in this manual before attempting to install or operate your drive.

STORAGE INFORMATION

Beck actuators should be stored in a clean, dry area where the temperature is between -40° and 85°C (-40° to 185°F).

Damage due to moisture while in storage is not covered by warranty.

INSTALLATION—MECHANICAL

There are many considerations regarding proper mechanical installation—see the instructions beginning on page 14 for details. Refer to the outline dimension drawings for physical dimensions and required clearances.

VALVE ACTUATOR INSTALLATIONS

CAUTION

Working with valves installed in a pipeline can be dangerous. Take appropriate precautions when mounting to installed valves.

INSTALLATION—ELECTRICAL

See the instructions beginning on page 18 for details regarding electrical installation.

CAUTION

For maximum safety, the Beck actuator body should be grounded. Use the green grounding screw in the wiring compartment of the actuator.

CAUTION

Always close covers immediately after installation or service to prevent moisture or other foreign matter from entering the actuator.

CONDUIT ENTRIES

Conduits are provided for power and signal wiring. Temporary plugs are installed in the conduit entrances at the factory for shipping only and are not intended for permanent use. Prior to actuator operation, all conduit entrances must be properly sealed in accordance with National Standards or Regulatory Authorities.

DRAFT

GENERAL OPERATION INFORMATION

MODES OF OPERATION

There are three basic modes of operation:

- **Handwheel—**local mechanical control
- **Handswitch—**local electrical control
- **Automatic—**remote electrical control

Any or all of these modes can be used to test basic operation of your actuator during start-up.

HANDWHEEL

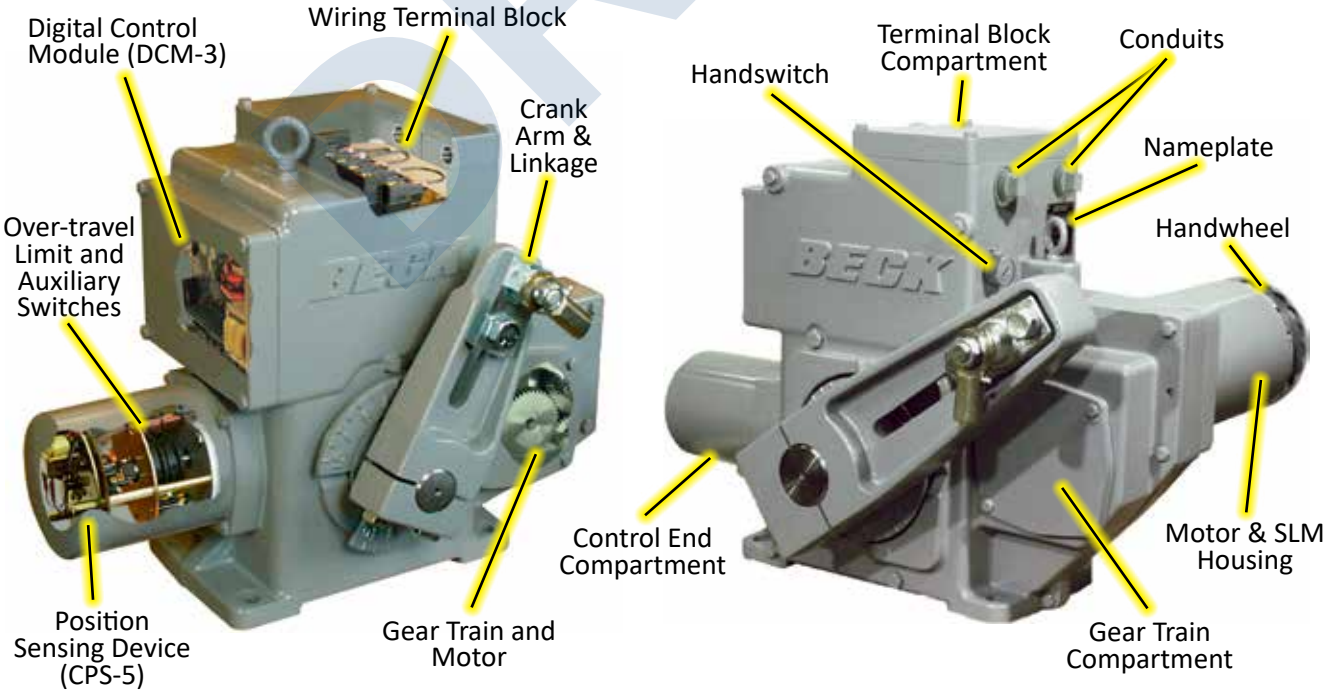
The Handwheel permits manual operation of the actuator without power. The Handwheel is coupled directly to the motor shaft at the rear of the motor housing and it rotates when the motor runs.

The Handwheel is particularly useful during initial installation or when power is not available. If power is available, the Handswitch must be moved to the STOP position before manually operating the Handwheel.

HANDWHEELS

11-1_9 **11-2_9/-3_9** **11-4_9**

HANDSWITCH



A Handswitch allows local electric control at the actuator. In either of the STOP positions, the motor is blocked from running. In the CW or CCW positions, the motor runs to move the output shaft in the corresponding direction. When moving the output shaft using the Handswitch, the motor will stop when the over-travel limit switches are reached.

The Demand signal can position the actuator only when the Handswitch is in the AUTO position.

AUTOMATIC MODE

When the Handswitch is placed in the AUTO position, the actuator is in automatic mode and responds to a Demand signal (also called the setpoint). The Digital Control Module (DCM-3) compares the Demand signal with the output shaft position. When the DCM-3 detects a difference between Demand and Position (called error), the motor will rotate the output shaft until the Position matches the Demand.

MODEL GROUP 11 COMPONENTS

DRAFT

INSTALLATION—MECHANICAL

Beck Group 11 actuators may be installed in any convenient orientation, because the gearing does not require an oil bath. Refer to the outline dimension drawings for physical dimensions and required clearances.

VALVE ACTUATOR INSTALLATIONS

CAUTION

Working with valves installed in a pipeline can be dangerous. Take appropriate precautions when mounting to installed valves.

Whenever an actuator is being mounted on a valve, refer to the valve manufacturer's maintenance manual for specific valve-related instructions. Consult the Beck Valve Mounting Specification sheet shipped with the actuator for specific instructions on assembly of the Beck actuator and mounting hardware to the valve. It is good practice to remove the valve from service if possible.

UNITIZED VALVE/ACTUATOR ASSEMBLY INSTALLATION

Inspect the valve and pipe flanges to ensure they are clean. Be certain that other pipelines in the area are free from pipe scale or welding slag that could damage the gasket surfaces.

Carefully lift the assembly and position the valve in the pipeline. Install and tighten the flange bolts according to the valve and/or gasket manufacturer's instructions.

NOTE: The valve may have undergone temperature variations in shipment. This could result in seepage past the stem seals. Refer to the valve manufacturer's maintenance instructions for packing adjustments, if required.

FOOT MOUNTED ACTUATOR INSTALLATIONS

Actuators may be mounted in any orientation. If mounting near obstructions such as pipes or beams, take into consideration access to the field wiring terminals, enclosure cover clearances, and the output shaft. Refer to the outline dimension drawings for the clearance necessary to remove covers.

Before the actuator is bolted into place, the mounting surface must be shimmed for flatness to within 0.020 inches. Each shim must support at least 75% of the mounting foot surface area (recommended shim size is 4 square inches or larger). Improper shimming or mounting can damage the actuator mounting feet.

If the actuator is to be bolted to a mounting plate, the plate must be rigid and must not yield to the stresses created from operating the actuator. If the mounting plate is not rigid or the mounting bolts are not sufficiently tightened, damage to the actuator housing could result. A rigid, vibration-free surface will generally prolong the life of the actuator's components. The mounting plate should be at least as thick as the diameter of the mounting bolts.

Mounting bolts should be hex head steel, zinc plated (HHSZP) Grade 2 or better and sized as shown in the table below. The bolts should be torqued appropriately for the application.

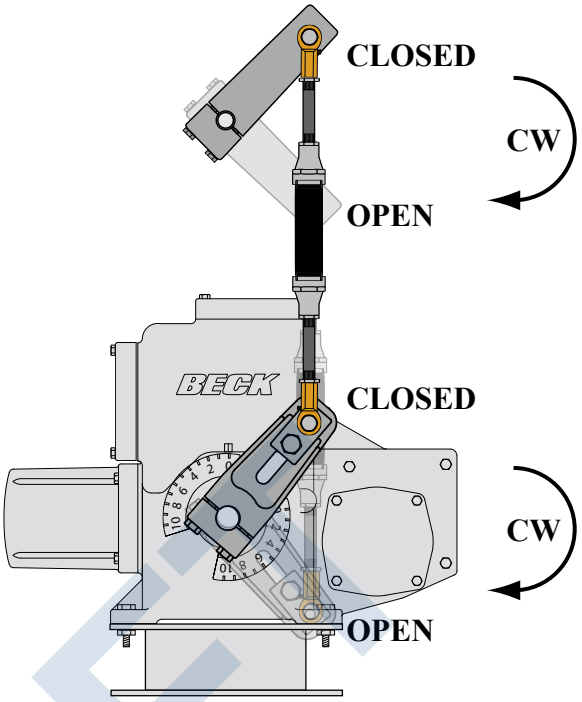
Actuator Model	Bolt Size	Bolt Torque
11-159	3/8"	20 lb-ft (27 N•m)
11-209 / 11-309	5/8"	100 lb-ft (135 N•m)
11-409	3/4"	175 lb-ft (237 N•m)

MOUNTING PEDESTALS

Standard and custom retrofit Beck pedestals are available, including designs for a number of common pneumatic actuators such as the Bailey AC and UP series and Hagan cylinders. A typical generic pedestal is shown here.

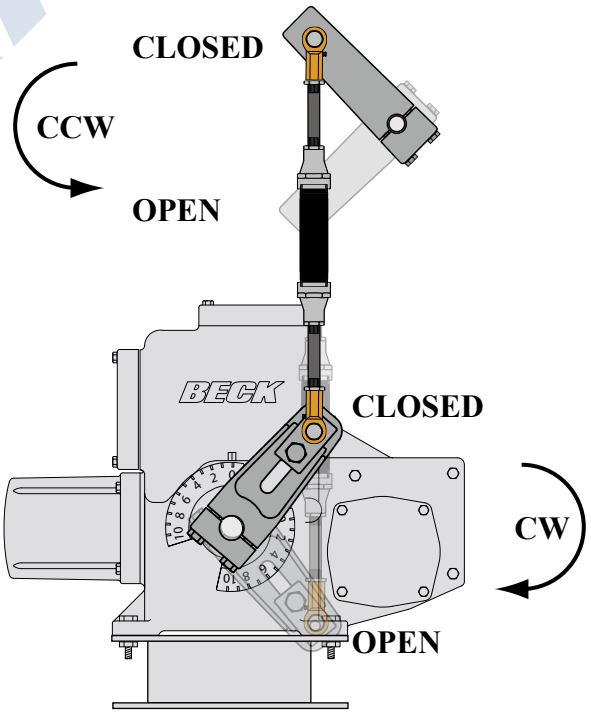
DRAFT

LINKAGE REQUIREMENTS



(IF APPLICABLE)

For best results, the linkage should be designed in advance. In most applications, the best control will result when the linkage is adjusted so that the full 100° travel of the Beck actuator shaft is used, even though the driven lever may travel less than 100°. The general requirements for a good linkage are:



1. It must be rigid enough to carry the link thrust without bending or deforming.
2. It must have a built-in means of adjustment so that the length of the connecting link can be changed a small amount.
3. Rod end bearings, similar to those furnished on the Beck crank arm, should be used at both ends of the connecting link. This type of device permits small angular misalignments and helps prevent binding of the linkage.
4. The Beck crank arm radius must be calculated so that the arm will move through a 100° arc and the driven lever will move through its correct arc.
5. The actuator and driven shafts must be parallel and the linkage should be in a plane perpendicular to the shafts. See the example of a parallel linkage arrangement at right. Z-Linkage arrangements (where linkage ends are on opposite sides of the parallel between the driven shaft and actuator output shaft) are ***not*** recommended.

LINK-ASSIST™ REPORT

The Beck Link-Assist™ computer program optimizes the linkage configuration for the application load. It ensures proper setup and operation of the actuator. Contact your Beck Sales Engineer to take advantage of Beck's Link-Assist™ program. Additional Link-Assist™ information is available on the Beck website: *www.haroldbeck.com*.

Parallel Linkage Design Example
(Recommended)

Z- Linkage Design Example
(Not Recommended)

DRAFT

LINKAGE KITS AVAILABLE

Beck linkage kits are made to accommodate a wide variation in linkage lengths without requiring modification of end fittings. Linkage kits are also available in stainless steel for use in corrosive environments.

Hex Linkage kits are available for applications with linkage length requirements between 9" (229 mm) and 33" (838 mm). Each hex linkage kit comes complete with a rod end, studs, threaded hex bar, and jam nut hardware.

To order hex linkage kits, first obtain the approximate overall linkage length “A” in the hex linkage figure on page 17. Select the kit part number from the corresponding table. For lengths beyond those listed in the table, contact your Beck sales engineer.

Pipe linkage kits are available for longer linkage length requirements and include the essential linkage end connections, rod end, studs, and jam nut hardware. Schedule 40 pipe is not included and must be cut to length and threaded in the field (see the table on page 17 for instructions to calculate pipe length). To simplify installation of the pipe link, the kit accepts NPT right-hand threads on both ends of the pipe. Left-hand threads are internal to the linkage kit assembly, making final length adjustments quick and easy.

To order pipe linkage kits, first obtain the approximate overall linkage length “A” in the figure on page 17. Select the kit part number from the corresponding table. For lengths beyond those listed in the table, contact your Beck sales engineer.

Hex Linkage

DRAFT

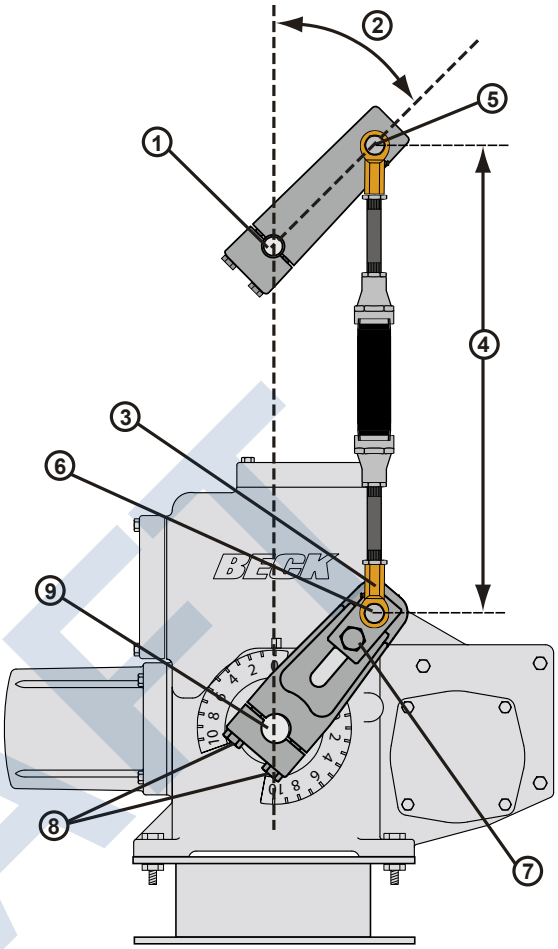
INSTALLATION Mechanical

LINKAGE INSTALLATION

The following procedure is recommended to couple the linkage between the Group 11 actuator and the driven shaft:

1. Position the driven shaft ① to the fully closed position.
2. Set the driven shaft lever to its required starting angle ② (predetermined with Link-Assist™).
3. Remove the rod end ③ from the Beck crank arm. Attach to the connecting link.
4. Adjust the connecting link ④ to the predetermined length.
5. Connect the connecting link to the driven lever at the predetermined radius ⑤.
6. Set the crank pin ⑥(or rod end screw on 11-159, see appropriate outline dimension drawing) on the Beck crank arm to the predetermined radius. This is done by loosening the crank pin screws ⑦ and sliding the crank pin to the predetermined position (none on 11-159). Tighten the crank pin screws to the appropriate torque.
7. Loosen the crank arm clamping screws ⑧.

CAUTION



The crank arm will pop free, allowing adjustment for 360° around the shaft.

8. Position the actuator's output shaft ⑨ to its fully closed limit.
9. Swing the crank arm into position and assemble the connecting link to the crank arm crank pin. Tighten the rod end nut ⑥ to the appropriate torque (see outline dimension tables beginning on page 6).
10. Tighten the crank arm screws ⑧ evenly, in a cross-pattern (if applicable), to the torque shown in the tables beginning on page 6).
11. Lubricate the rod end bearings.

Carefully move the actuator's output shaft to the fully open (maximum input signal) position. Check that no binding occurs between the linkage, crank arm, driven shaft lever, and surrounding obstructions. Also observe that the driven shaft rotates the proper amount. Ensure that the actuator reaches the proper limit and shuts off.

If binding in the linkage occurs due to too much travel of the driven lever, travel can be reduced by shortening the Beck actuator crank arm radius. Return the actuator to the fully closed position. Loosen the crank arm crank pin screws, and the linkage stud-coupling lock nuts. To make fine length adjustments, while rotating the linkage move the crank pin to a shorter radius position.

LINKAGE INSTALLATION

To adjust the linkage length, it is preferable to use the stud couplings. The couplings have right-hand and left-hand threads, so it is not necessary to disconnect the ends to make a length adjustment. Be careful not to expose more than 7" (178 mm) of stud between the rod end and coupling.

CAUTION

The thread engagement depth in the couplings and rod ends must be greater than 1.25 x the thread diameter.

Tighten crank pin screws and linkage lock nuts, and once again, check operation to confirm that no binding occurs between the linkage and crank arm, driven lever arm, or surrounding obstructions. Further travel adjustments can be made by repeating the above steps.

Tighten all lock nuts and screws to the specified torque value (see outline dimension tables).

Do not change limit switch settings to obtain desired valve or damper travel; this will adversely affect actuator operation.

DRAFT

INSTALLATION Electrical

POWER QUALITY

Power quality disturbances such as power outages, transient voltages, harmonic distortions, and electrical noise will adversely affect your actuator performance. Protecting your actuator from these conditions can reduce downtime and promote longer life for the equipment. Following the industry accepted standards below will help protect your actuator.

- Select wiring materials according to the correct ampacity ratings dictated by national and local regulations.
- Shielded, twisted pair cables can be used for signal connections to avoid being affected by electrical noise. These signal wires, based on Noise Susceptibility Level (NSL) per IEEE-518, fall into the level 1 classification. A braided shield will be more effective than a wrapped foil shield. Signal wire shields should be connected to the actuator casting grounding screw. If grounding at the signal source is required, then the shield should not be grounded at the actuator.
- Raceways such as conduits and trays must be grounded at both ends to properly meet immunity requirements.
- An AC power ground connection should be made between the power source and the Beck actuator. Grounding connections including wire and metal conduit are permitted, but the actuator-grounding conductor may not be connected to a structured metal frame of a building.
- Surge suppression equipment that meets Underwriters Laboratory (UL) Standard 1449 may be used to protect against transient voltage conditions.
- Power Conditioners may be used to regulate the supply voltage and maintain a constant voltage level. They are helpful in protection against voltage sags and swells, as well as some measure of electrical noise protection.
- Harmonic filters may be used to minimize the effects of supply voltage waveform distortions and are used in applications that incur a large amount of high-frequency electronic noise.

CAUTION

Always close covers immediately after installation or service to prevent moisture or other foreign matter from entering the actuator.

ELECTRICAL INSTALLATION

Two 1" N.P.T. conduit connections are provided for power and signal wiring to the actuator. Conduits should be routed from below the actuator so that condensation and other contaminants flow away from the conduit. All conduit entrances must be properly sealed in accordance with National Standards or Regulatory Authorities.

Power and signal wires should be routed to the actuator separately and be either shielded cables or installed in conductive conduit and/or cable trays.

Refer to the wiring diagram furnished with your Beck actuator for proper AC power and signal connections. The customer must supply 120 V ac to power the actuator (standard configuration). The 120 V ac line connects to terminal C and neutral to terminal B. Other available power options include 208, 240, 380, 415, 480 & 575 V ac.

It is advisable to provide normal short circuit protection on the AC power line. A copy of the wiring diagram is shipped with each actuator and is fastened to the inside of the terminal block cover. If there is no wiring diagram available, you may obtain a copy from Beck by providing the serial number of your actuator.

Connection of a 4-20 mA Demand signal should be made to terminals AA (+) and BB (–).

For maximum safety, the Beck actuator body should be grounded. Use the green grounding screw in the wiring compartment of the actuator.

TERMINAL SCREW TORQUES

Each terminal screw should be torqued to the proper specification upon landing the wire.

		Torque	
Models	**Terminals**	**(lb-in)**	**(N•m)**
All Models	A–V	16	1.8
	AA–EE	12	1.4
11-159, 11-169	FF–KK*	9	1.0
	1–3*	9	1.0
11-209, 11-269, 11-309, 11-369, 11-409, 11-469	FF–SS*	9	1.0
	1–3*	20	2.3

* Terminals included only with certain optional features.

DRAFT

INSTALLATION Wiring

TERMINAL CONNECTIONS

The terminal block is located in a separate, gasketed compartment at the top of the actuator. Line voltage connections are made on terminal designations A through V and are oriented at a right angle from the low voltage signaling terminals designated AA through EE.

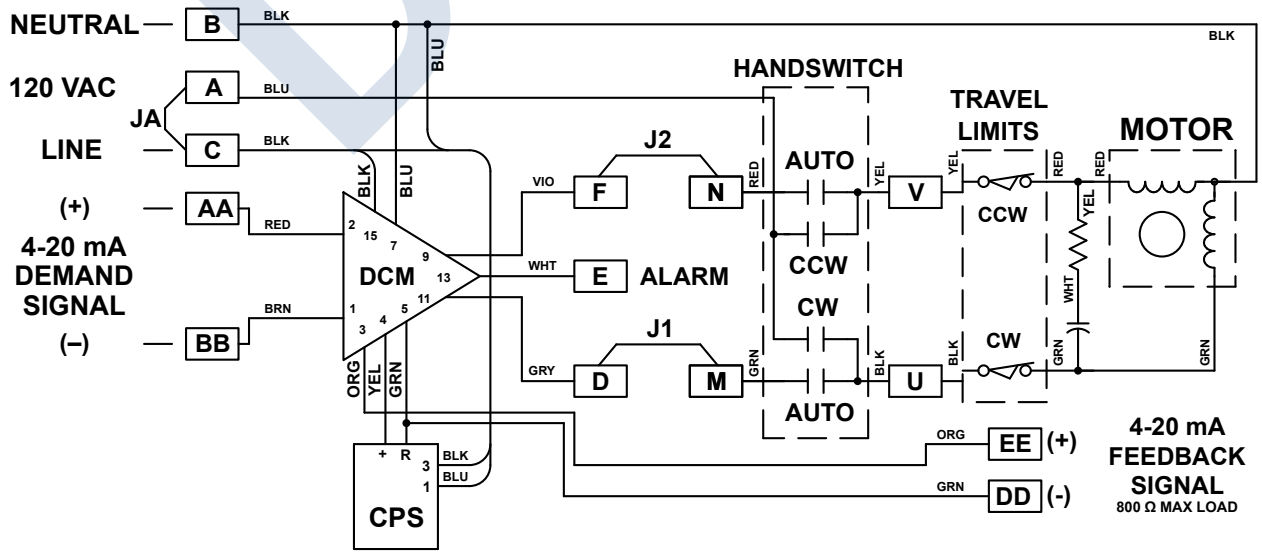
Actuators equipped with optional transformers to accommodate popular voltages include an additional terminal strip and fuse for power wiring (with the exception of the 240 volt option). See optional transformer wiring connections below.

Terminal screws will accept standard spade or ring terminals. Terminals A through V are size #8, and terminals AA through EE are size #6. Optional transformer terminal screws (designated 1, 2, & 3) are size #10 for all models except 11-159/169 which are #6. For wiring versatility, the screw-down clamp design will also accept unterminated wire. All terminals on all actuators will accept up to #12 AWG (3.31 mm^2) with one exception. Actuator models 11-209, 11-269, 11-309, 11-369, 11-409, and 11-469 may use up to #10 AWG wire on the optional transformer terminals (1-3).

Typical wiring connections are shown below. Each actuator can be ordered with up to four optional auxiliary switches (wiring connections are described in the Configuration/Calibration section). Up to six optional auxiliary switches are available with the 11-209, 11-309, and 11-409.

To prevent Handswitch initiated motion, remove jumper (JA) from between terminals A and C.

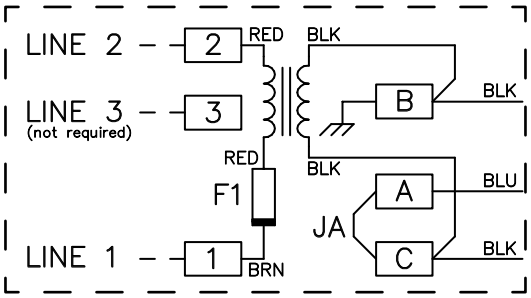
CAUTION



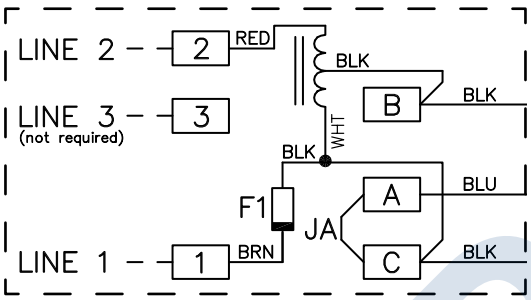
AC power to the actuator must be turned off before removing the jumper (JA).

Three additional terminals and fuse (F1) are provided with 3-phase power options.

TYPICAL WIRING CONNECTIONS

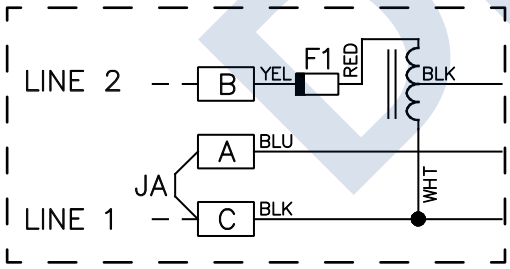


(Each actuator has a specific wiring diagram on the inside of the terminal compartment cover)



DRAFT

POWER CONNECTIONS FOR ALTERNATE POWER OPTIONS



Optional Transformer for 380, 415, 480 & 575 Volts

Optional Transformer for 208 Volts

Optional Transformer for 240 Volts

START-UP

NOTE: All Beck actuators are shipped from the factory ready for installation. Each actuator is set-up and calibrated to the customer's specifications that were written into the equipment order. Electrical adjustments are generally not required before placing the actuator in operation.

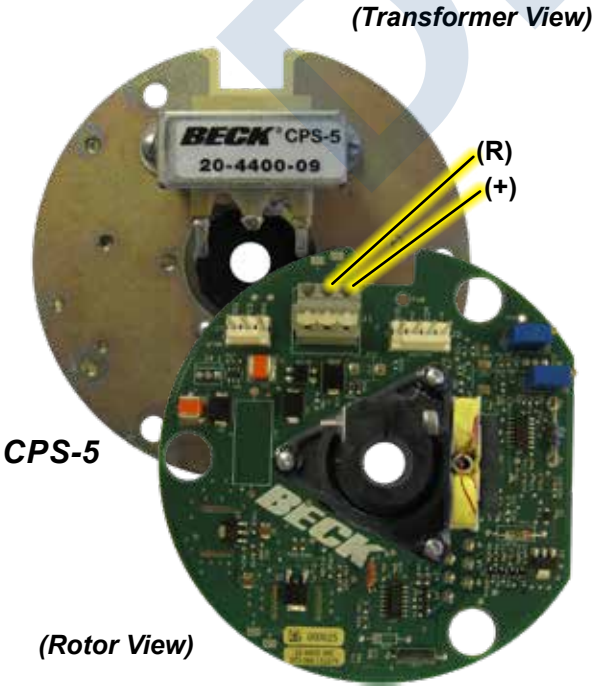
START-UP CHECKLIST

The following list provides some basic checks that should be performed before placing your actuator into operation.

- ☐ Inspect the location and the mounting bolts. Be sure the actuator is securely fastened to its mounting base.
- ☐ On the first start-up, place the Handswitch in a STOP position to ensure that the output shaft will not move and possibly cause personal injury.
- ☐ Confirm the actuator is receiving the appropriate operating voltage as shown on the nameplate.
- ☐ Check the DCM-3 Power LED. It should be pulsing (Dim/Bright) to indicate the board is active.
- ☐ Using the Handswitch, confirm the actuator moves fully to both the CW and CCW ends of travel.
- ☐ Confirm the actuator has a 4–20 mA Demand signal attached to terminals AA (+) and BB (–).
- ☐ Place the Handswitch in AUTO and vary your Demand signal from 0% to 100%.
- ☐ Check for the Status alarm LED on the DCM-3. If it is lit, refer to the Troubleshooting section of this manual.
- ☐ Verify that the output shaft is moving to the desired 0% position with a 0% Demand signal and moving to the 100% position with a 100% Demand signal. If they are reversed, see the Configuration/Calibration section of this manual for instructions on how to change the direction of output shaft rotation.

DRAFT

ELECTRONICS



CONTROL END & CONTACTLESS POSITION SENSOR (CPS-5)

The actuator “control end” houses the limit switch assemblies and the Contactless Position Sensor (CPS-5). The CPS-5 is the electro-mechanical device that provides the DCM-3 with a continuous feedback signal proportional to the position of the actuator’s output shaft.

The control end includes a control shaft, which is geared directly to the output shaft of the actuator. Rotation of the output shaft causes rotation of the control shaft, which in turn moves the limit switch cams and the CPS-5 ferrite rotor. A ferrite magnetic sensing element generates a voltage as the rotor turns. The voltage is translated into a position signal voltage used by the DCM-3 to control the actuator.

The typical position signal voltage of the CPS-5 ranges from 1.0 V dc at the CCW end of travel, to 5.0 V dc at the CW end of travel. The DCM-3 can be calibrated to interpret CPS-5 position signals between 0.3 V dc and 5.3 V dc. Position signal voltages can be measured on the yellow (+) and green (R) position signal wires located on the CPS-5. The CPS-5 power is derived from the blue and black wires on the primary side of the transformer. 120 V ac can be measured across the transformer tabs (blue and black wires).

There are two SPDT over-travel limit switch assemblies (labeled “CW” and “CCW”) and up to four auxiliary switch assemblies (labeled “S1” through “S4”). Up to six optional auxiliary switches are available with models 11-209, 11-309, and 11-409.

CPS-5

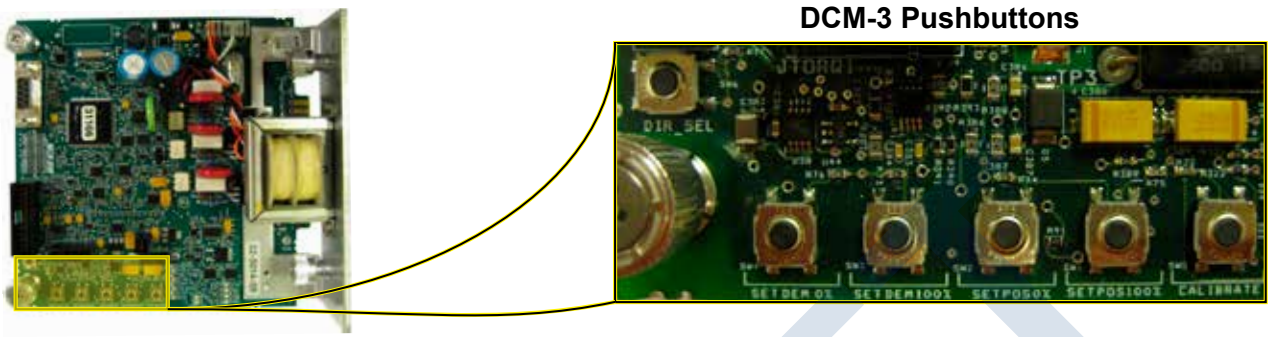
DIGITAL CONTROL MODULE (DCM-3)

The DCM-3 is a micro-processor based circuit board assembly that serves as the actuator’s control center.

The main function of the DCM-3 is to position the actuator’s output shaft. The DCM-3 compares the 4–20 mA Demand signal received at the actuator terminals AA(+) and BB (–) to the actuator position signal, generated from the Contactless Position Sensor (CPS-5). If a difference exists (called error) between the Demand and position signals, the DCM-3 activates triacs that operate the motor. The motor drives the gear train and positions the output shaft until the difference is eliminated.

The DCM-3 layout is illustrated on page 23 and shows the fuse and test point locations. The typical position signal voltage from the CPS-5 (measured from TP1(–) and TP4(+)) ranges from 1.0 V dc at the CCW end of output shaft travel, to 5.0 V dc at the CW end of output shaft travel. Test point voltage levels between TP2(+) and TP3(–) across the input resistor R11 should read between 1 V dc and 5 V dc proportional to the 4–20 mA Demand signal.

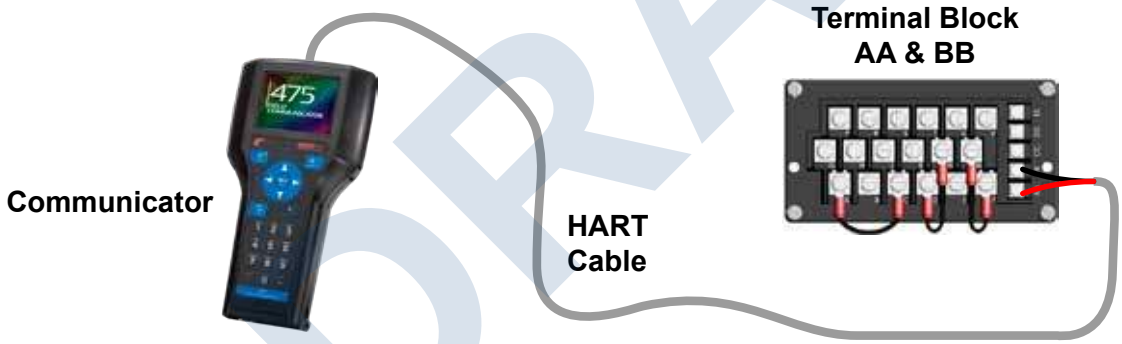
DCM-3



DRAFT

INTERFACES

The DCM-3 has three configuration interfaces: Pushbutton, HART, and Serial Port.



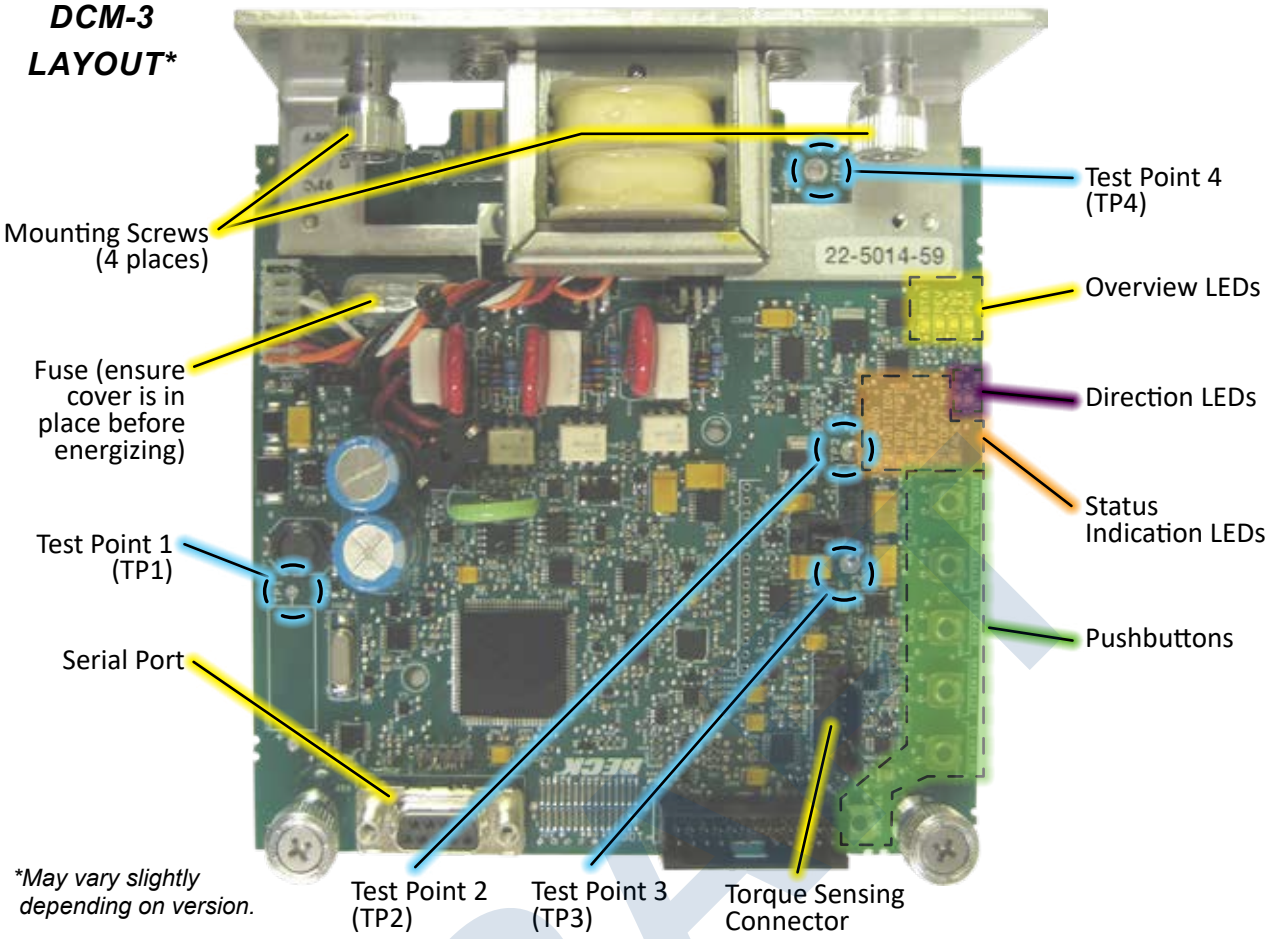
PUSHBUTTON

The DCM-3 board is equipped with pushbuttons that can be used to calibrate the Demand signal and configure 0% and 100% positions. It may also be used to configure the direction of output shaft rotation for increasing Demand. These configurations and calibrations do not require any external equipment to perform.

HART

The HART interface is accessible by connecting a HART capable communication device (such as a handheld communicator) to terminals AA (+) and BB (–) of the terminal block area. A HART-capable, analog output can be used for the Demand signal as well. All electronic calibration and configuration can be accomplished through the HART interface. NOTE: The appropriate HART device descriptions are required.

SERIAL PORT



The Serial port interface is accessible by connecting a computer to the DCM-3 using the DB9 connector. See the Serial Communications appendix for details on connecting via the Serial port. All electronic calibration and configuration can be accomplished through the Serial port interface.

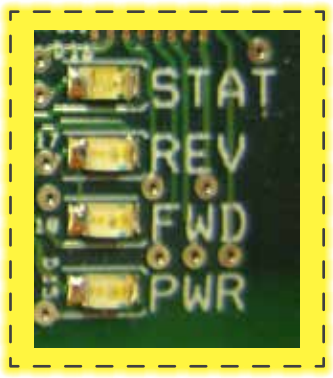
DRAFT

ELECTRONICS

DCM-3 LAYOUT*

**May vary slightly depending on version.*

OVERVIEW LEDs



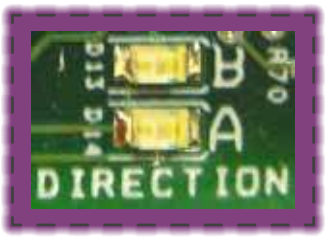
Located on the DCM-3 board (pictured above), these LEDs indicate the basic, real-time state of the actuator. A description of each LED follows.

STAT
This red LED illuminates during a system alarm. Explanation of the specific alarm is available through the Fieldbus or Serial interface. See the Troubleshooting section for additional information.

REV
This green LED illuminates when the actuator is receiving a Demand signal less than its position.

FWD
This green LED illuminates when the actuator is receiving a Demand signal greater than its position.

PWR
This green LED illuminates when power is applied to the actuator. This LED pulses from bright to dim indicating the DCM-3 is operational.



OVERVIEW LEDs

DIRECTION LEDs

These green LEDs indicate the direction of travel resulting from an increasing Demand signal.

DIRECTION LEDs

A = CCW **B** = CW

DRAFT

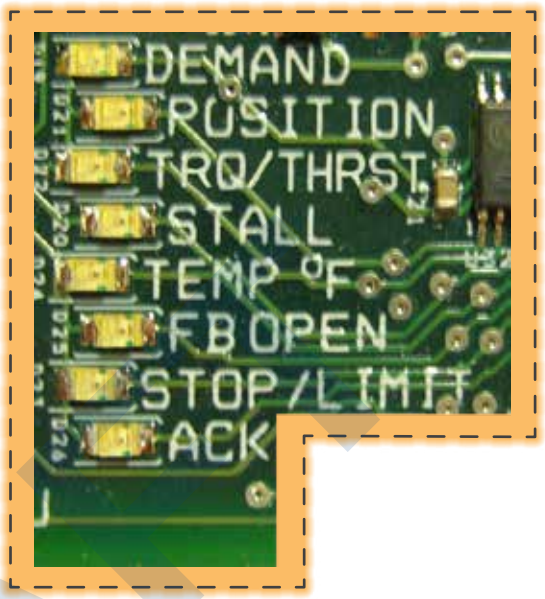
STATUS INDICATION LEDs

When the "STAT" LED is lit, the applicable red indication LED(s) will light to reveal the actuator condition(s). An alarm is also available at terminal E. When the condition is corrected, the status will automatically reset.

DEMAND
Loss of the Demand input signal.

POSITION
The Position signal to the DCM-3 is out of the calibrated range limits. The lower limit is –5% and the upper limit is 105% of the calibrated range. May also indicate a film potentiometer or internal wiring failure.

TRQ/THRST (optional)
This LED indicates that excessive torque is present (over 105% of the actuator rating).



STALL
The actuator is in a stall condition and stall protection has been activated.

TEMP °F.
Drive's internal temperature is outside of rating.

FB OPEN
External position Feedback signal is enabled, but not wired to an external load or the wiring has failed between the actuator and the monitoring device.

STOP/LIMIT
Handswitch is in "STOP" position or the actuator is at a limit and is not in balance.

ACK
Acknowledges when a calibration procedure has been completed.

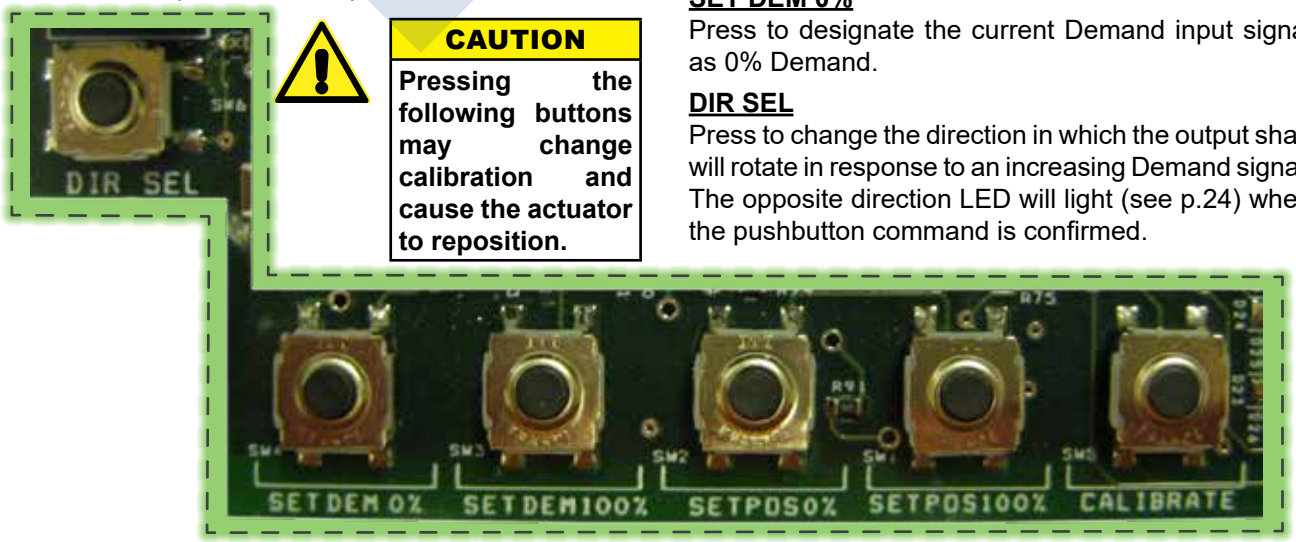
STATUS INDICATION LEDs

PUSHBUTTON CONTROLS

The six pushbuttons (pictured below) on the DCM-3 customer interface panel are used for calibration. When pressing a pushbutton, pressure should be maintained until the "ACK" LED is lit; this confirms receipt of the pushbutton command. See the Configuration/Calibration section of this manual for further explanation of calibration procedures.

CALIBRATE
This button must be pressed and held simultaneously with another pushbutton to perform a calibration.

CAUTION
Pressing the following buttons may change calibration and cause the actuator to reposition.



SET POS 100%
Press to designate the current position of the output shaft as the 100% position for actuator movement (this will correspond to a 100% Demand signal).

SET POS 0%
Press to designate the current position of the output shaft as the 0% position for actuator movement (this will correspond to a 0% Demand signal).

SET DEM 100%
Press to designate the current Demand input signal as 100% Demand.

SET DEM 0%
Press to designate the current Demand input signal as 0% Demand.

DIR SEL
Press to change the direction in which the output shaft will rotate in response to an increasing Demand signal. The opposite direction LED will light (see p.24) when the pushbutton command is confirmed.

PUSHBUTTON CONTROLS

CONFIGURATION/CALIBRATION

NOTE: Your Beck actuator was shipped from the factory ready for installation; no electrical adjustments are required before placing it in operation. Each actuator is set up and calibrated to the specifications that were written into the equipment order.

Under normal operating conditions there is no need to recalibrate the actuator. However, if the application requirements change—or are different than specified on the equipment order—the actuator should be recalibrated according to the following procedures.

LIMIT SWITCHES

Actuators are shipped with over-travel limit switches factory-set for either 101° (11-159, -209, -309, -409) or 91° (11-169, -269, -369, -469) of travel unless otherwise specified at time of order. Limit switches must be set inside the range of the built-in, non-adjustable mechanical stops to prevent the possibility of stalling when operating the actuator with the Handswitch. Limit switches can be reset to limit over-travel of the output shaft when the actuator position calibration has been reduced (60º minimum). See the calibration procedure on page 30. Auxiliary switches are set as shown on the Standard Over-travel Limit and Auxiliary Switch Settings diagram on page 27 unless otherwise specified at time of order.

NOTE: The over-travel limit switches are the switches closest to the actuator body. To adjust the over-travel limit switches, it is necessary to remove the control end cover.

Switches are operated by cams which are clamped onto the control shaft. Setting a switch involves loosening the cam, moving the output shaft to the desired position, and positioning the cam so that it just operates the switch at that point. In the following procedure, the use of a continuity meter is recommended to determine when the switch opens or closes. If such a meter is not available, it is possible to hear the switch click as the contacts open and close.

CAUTION

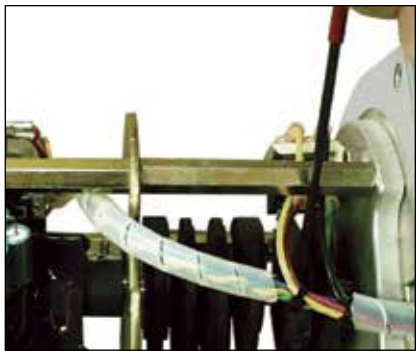
Do not attach the meter or attempt to move the switch cams until the actuator is disconnected from the line voltage and auxiliary switches are disconnected from external power sources.

SETTING OVER-TRAVEL LIMIT SWITCHES CW AND CCW

This procedure should be used if the factory over-travel limit switch settings must be changed in the field. It is advisable to operate the actuator fully in each direction, using the electric Handswitch to check switch settings before attempting to change them. Follow these instructions if they require adjustment:

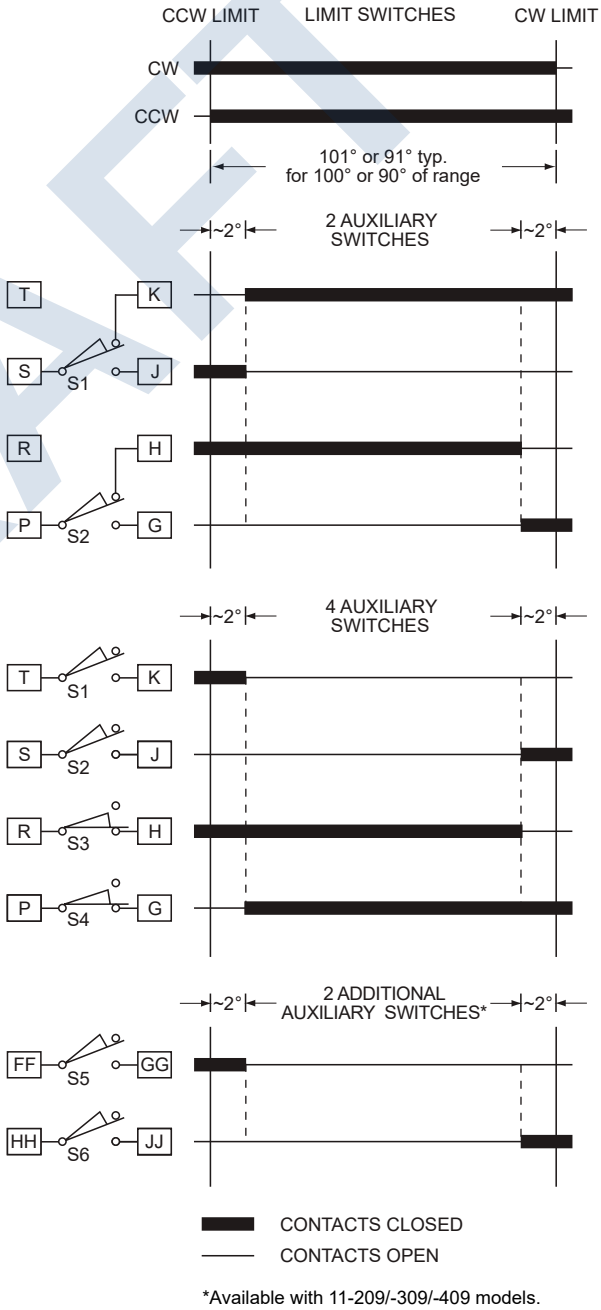
1. Remove the control end cover and terminal block cover (1/2” wrench).
2. Use the electric Handswitch to drive the control shaft so that the CW switch cam screw is accessible. Using a 7/64” hex wrench, loosen the screw so that the cam is just snug on the shaft (see photo, page 27).
3. Move the output shaft to the desired CW limit.
4. Turn the Handswitch to the “STOP” position.
5. ***Disconnect power from the actuator.***
6. Connect a continuity meter across terminals B and U. Rotate the cam until the meter shows no continuity (switch contacts open, switch clicks).
7. Tighten the cam locking screw to 5 lb-in (0.56 N•m) torque.
8. Disconnect meter and ensure the Handswitch is in the “STOP” position.
9. Reconnect actuator power.
10. Rotate the actuator’s output shaft in the CCW direction away from the CW travel limit. Note the direction of rotation on the lobe of the cam. The correct cam lobe motion is away from the switch lever with the switch lever on the lower part of the cam. If not correct, return to step 2 and reset the cam to the proper orientation.
11. Rotate the output shaft again to the desired CW travel limit. If the stopping point is reached, the switch is properly set.
12. Repeat instructions 2–11 for setting the CCW travel limit switch (noting that referenced directions of rotation should be opposite of those used for CW switch setting). Connect continuity meter across terminals B and V.
13. Replace covers and tighten cover bolts to 10 lb-ft (14 N•m) torque.
14. Rotate index (or index pointer on models 11-159 or -169) to correspond with output shaft rotation.

DRAFT



SETTING AUXILIARY LIMIT SWITCHES

Standard switch settings for actuators with 2 or 4 auxiliary switches are shown on the following diagram “Standard Over-travel Limit and Auxiliary Switch Settings”. The heavy line indicates a closed circuit. Follow these instructions to change the operating point of auxiliary switches:



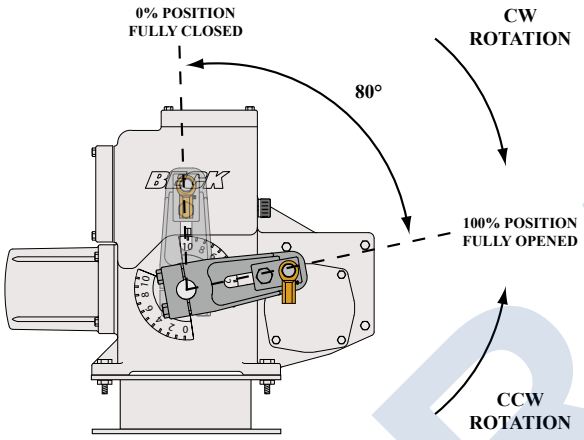
NOTE: When 4 auxiliary switches are installed, it may be necessary to change from normally open to normally closed by moving the wire lead to alternate switch terminals. Be sure to disconnect power from the switch terminals first.

1. Remove the control end cover and the terminal block cover (1/2” wrench).
2. Use the electric Handswitch to drive the shaft so that the switch cam is accessible. Using a 7/64” hex wrench, loosen the screw so that the cam is just snug on the shaft.
3. Move the output shaft to the desired switch trip position.
4. Turn the Handswitch to the “STOP” position.
5. ***Disconnect power from the actuator and switch terminals.***
6. Connect the continuity meter across the appropriate terminals. See the actuator wiring diagram under the terminal block cover (or the diagram at right). Rotate the cam to operate the switch.
7. Tighten the cam locking screw to 5 lb-in (0.56 N•m) torque.
8. Disconnect the meter and reconnect power.
9. Move the actuator’s output shaft in the desired direction to verify that the cam lobe moves away from the switch lever. If not correct, return to step 2 and reset the cam to the proper orientation.
10. Replace covers and tighten cover bolts to 10 lb-ft (14 N•m) torque.

SWITCH CAM ADJUSTMENT

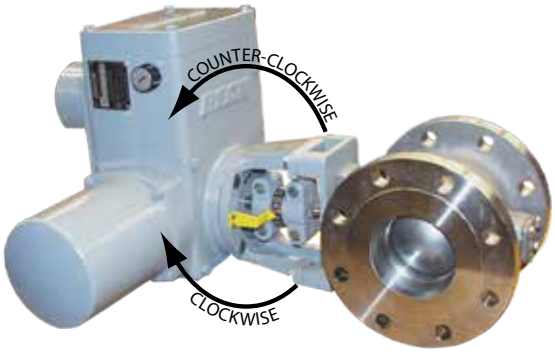
STANDARD LIMIT AND AUXILIARY SWITCH SETTINGS

*Available with 11-209/-309/-409 models.



DRAFT

CONFIGURATION/CALIBRATION



DIRECTION OF OUTPUT SHAFT ROTATION

Rotation direction refers to the direction the output shaft of the actuator rotates in response to an increasing Demand input signal. The rotation is either clockwise (CW) or counterclockwise (CCW) as shown in the figure below. The rotation of the driven load (e.g., damper lever arm) determines the actuator rotation suitable for an application.

Unless otherwise specified at the time of order, the output shaft is factory set to rotate clockwise in response to an increasing Demand signal. The direction of rotation can be changed using one of the following three methods. NOTE: After changing the output shaft rotation, adjust the output shaft travel index to reflect the correct 0% and 100% positions.

NOTE: The crank arm in the figure above may be adjusted to any start angle. The orientation and rotation shown here has been randomly selected for the purpose of this example.

Pushbutton method

1. Remove the DCM-3 cover (1/2" bolt heads).
2. Press and hold the "CALIBRATE" pushbutton, then press the "DIR SEL" pushbutton until the (opposite) "DIRECTION" LED is lit.

—OR—

2. Position the actuator at the current 0% position.
3. Press and hold the "CALIBRATE" pushbutton, then press the "SET POS 100%" pushbutton until the "ACKNOWLEDGE" LED is lit.*

—OR—

2. Position the actuator at the current 100% position.
3. Press and hold the "CALIBRATE" pushbutton, then press the "SET POS 0%" pushbutton until the "ACKNOWLEDGE" LED is lit.*
4. Ensure the actuator operates as desired.
5. Replace the DCM-3 cover and tighten the cover bolts to 10 lb-ft (14 N•m) torque. Reset travel index.

* If the "ACKNOWLEDGE" LED does not light, but the "POSITION" LED does light, the change was not accepted by the DCM-3.

NOTE: When any of the above procedures is performed, both the 0% and 100% positions are automatically set.

HART method

Command: Drive Dir

DD Menu Location: MENU 4B
Functions>Configuration>General Setup

Selections:
CW Incr - select if the desired output shaft rotation is clockwise on increasing Demand signal.
CCW Incr - select if the desired output shaft rotation is counter-clockwise on increasing Demand signal.

Serial command method

Command: drvdir *n*

Arguments: *n*
0: CW - select if the desired output shaft rotation is clockwise on increasing Demand signal.
1: CCW - select if the desired output shaft rotation is counter-clockwise on increasing Demand signal.

DRAFT

STEP SIZE

Step size represents the minimum amount that the Demand signal must change to initiate a change in actuator position.

When the actuator is in AUTO mode, the DCM-3 runs the motor until the output shaft position matches the percentage of Demand signal. When they match, power is removed from the motor. The Demand signal must change by the step size before power is returned to the motor.

The step size is factory set to 0.15% of full travel span, unless otherwise specified at the time of order. The step size is adjustable from 0.1% to 2.5% when the actuator is configured for 100 degrees of travel. Adjustment is typically not required. The minimum step size regardless of travel is 0.1°.

It may be advantageous in certain applications, where noise or other problems exist, to increase the step size slightly to prevent excessive modulation.

The step size can be changed using the following methods.

NOTE: Changing this parameter online could cause the actuator to reposition.

HART method

Command: StepSize

DD Menu Location: MENU 4B
Functions>Configuration>General Setup>

Enter the desired step size between "0.10%" and "2.50%".

Serial command method

Command: stepsize #.##

Arguments: #.## Desired step size (in degrees) of one incremental movement of output shaft travel. Acceptable range is between "0.10" and "2.50".

RESTORE FACTORY SETTINGS

All DCM-3's are shipped from the factory configured per the customer instructions at the time of order. A complete copy of the factory configuration is stored on the DCM-3. You can revert to the factory settings at any time using one of the following methods.

NOTE: When the factory settings are restored, the Operation Mode (HART DD menu location 3E or Serial command "opmode") will not be changed for safety reasons. The operation mode should be set to "Follow" for normal automatic operation.

HART method

Command: Restore to Factory
Running this function will restore all configurable parameters to the original factory settings.

DD Menu Location: MENU 3C
Functions> Configuration

Serial command method

Command: restoremodes *n*

Arguments: *n*

1: Used as a safety measure, the number one must be entered as an argument to prevent someone from running the restoremodes command errantly.

DRAFT

CONFIGURATION/CALIBRATION

TRAVEL (DEGREES ROTATION)

Travel is defined as the number of degrees of rotation by the output shaft between the 0% and 100% positions.

Unless otherwise specified, all models are factory configured for the maximum travel allowable. Linkage-connected actuators (Models 11-159, -209, -309, and -409) have a maximum travel of 100 degrees of output shaft rotation. Direct-coupled actuators (Models 11-169, -269, -369, and -469) have a maximum travel of 90 degrees rotation.

It is recommended that the maximum travel be utilized to obtain full output torque of the actuator and maximum resolution of movement. On linkage-connected actuators it is possible to utilize the maximum travel of the actuator when the driven load rotation is less than 100 degrees; for example 90 degrees of damper or valve travel. A free Link-Assist analysis can be provided by a Beck sales or application engineer. Link-Assist Service information is available for review on the *haroldbeck.com* website.

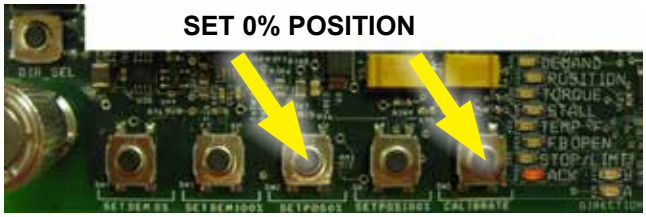
Some exceptional applications may require less actuator travel. Travel calibration can be performed to reduce actuator travel. Travel less than 60 degrees is not recommended.

On all models, the output shaft is limited by mechanical stops located between 106° and 108° of rotation, except the 11-169 which is limited to 98° of rotation.

It is possible to change the full travel of the actuator output shaft if necessary. To change the Beck output shaft full range of rotation, electronic calibration changes can be made by using one of the two procedures below. These procedures can be performed by using the methods that follow.

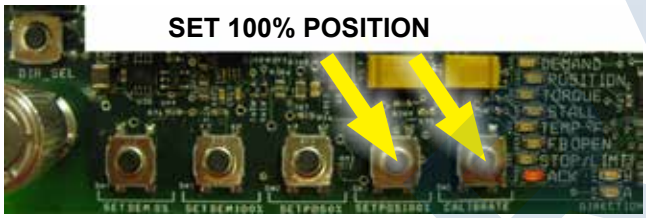
1. **0% and 100% Position Calibration**: Physically drive the actuator to the new 0% and 100% positions. Use the Pushbutton or HART method to set the new end points.
2. **Changing Travel in Degrees**: This allows the calibration to be changed without moving the actuator output shaft. Use the HART or Serial command method to set the desired full travel rotation in degrees (see page 28). The 0% position will remain the same, but the 100% position will change to accommodate the new travel setting.

NOTE: In addition to recalibrating the electronics, the CW / CCW over-travel switches should also be adjusted to open just beyond the new electronic limits; this ensures that manual operation with the Handswitch will not cause over-travel or create a stall condition.



DRAFT

Calibrate the 0% and 100% positions:



Pushbutton method

1. Move the output shaft to the desired 0% position.
2. Press and hold the “CALIBRATE” pushbutton then press the “SET POS 0%” pushbutton until the “ACKNOWLEDGE” LED is lit.
3. Move the output shaft to the desired 100% position.
4. Press and hold the “CALIBRATE” pushbutton then press the “SET POS 100%” pushbutton until the “ACKNOWLEDGE” LED is lit.
5. Adjust over-travel limit switches as necessary to accommodate the new rotation.

SET 0% POSITION

SET 100% POSITION

HART method

Command: Set Pos 0%
Select when the output shaft is at the desired 0% position.

Command: Set Pos 100%
Select when the output shaft is at the desired 100% position.

DD Menu Location: MENU 4C
Functions>Configuration>PositionSensrSetup>

Change Travel Degrees:

HART method

Command: Travel
Enter the desired full stroke rotation in degrees.

HART DD Menu Location: MENU 4B
Functions>Configuration>General Setup>

Serial command method

Command: travel ###

Arguments: ### The desired full-stroke rotation in degrees.

DRAFT

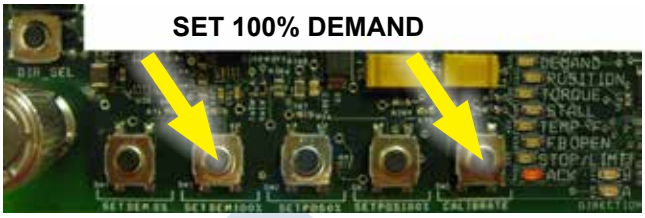
CONFIGURATION/CALIBRATION

DEMAND CALIBRATION

DCM-3 boards are designed to accept a 4–20 mA (or 1–5 V dc) analog Demand signal. The input comes calibrated from the factory for the full range unless otherwise specified by the customer. It is not necessary to calibrate the Demand input when the actuator is installed; however, if the Demand needs to be calibrated to accommodate unusual operating conditions, two guidelines must be followed: First, the value for 0% must be greater than 0.5 mA and the value for 100% must be less than 21 mA. Second, the difference between 0% and 100% (minimum span) must be at least 4 mA. Use any of the following methods to calibrate Demand. Actuators may also be configured for split-range operation—contact the factory for details.

Calibrate the 0% and 100% Demand signal:

Pushbutton method



1. Ensure the Handswitch is in the “STOP” position. This will prevent the actuator from repositioning during this procedure.
2. Apply the desired 0% Demand input signal to the actuator (e.g., 4 mA for 4–20 mA signal).
3. Press and hold the “CALIBRATE” pushbutton, then press the “SET DEM 0%” pushbutton until the “ACKNOWLEDGE” LED is lit.*
4. Apply the desired 100% Demand input signal to the actuator (e.g., 20 mA for 4–20 mA signal).
5. Press and hold the “CALIBRATE” pushbutton, then press the “SET DEM 100%” pushbutton until the “ACKNOWLEDGE” LED is lit.*
6. Turn the Handswitch to the “AUTO” position. NOTE: The actuator may reposition.
7. Run the actuator through its full operational range to ensure proper response to the Demand input signal.
8. Replace the compartment covers and tighten the cover bolts to 10 lb-ft (14 N•m) torque.

*If the “ACKNOWLEDGE” LED does not light, but the “Demand” LED does light, the calibration is out of acceptable range and was not accepted by the DCM-3. This is typically caused by trying to set 0% and 100% values too close together (i.e., less than 4 mA difference).

SET 0% DEMAND

SET 100% DEMAND

HART method

Command: DemRngLwr
Enter the desired 0% Demand signal ("4.00" to "16.00" mA).

Command: DemRngUpr
Enter the desired 100% Demand signal ("8.00" to "20.00" mA).

DD Menu Location: MENU 4D Functions>Configuration>Demand Setup>

Serial command method

Command: dem0pctma **#.##**

Arguments: #.## Desired 0% Demand signal ("4.00" to "16.00" mA).

Command: dem100pctma #.##

Arguments: #.## Desired 100% Demand signal ("8.00" to "20.00" mA).

DRAFT

LOSS OF DEMAND SIGNAL (LOS)

The DCM-3 is capable of determining if the Demand input signal to the actuator is outside of an acceptable range. The DCM-3 uses a configurable loss of signal (LOS) threshold to determine if the Demand signal falls below a minimum value. Unless otherwise specified in the original order, the factory-set threshold is 3.2 mA. When the DCM-3 senses an LOS condition, an alarm condition will result, illuminating the "Demand" status indication LED. The actuator then responds according to the LOS setting. The DCM-3 can be configured for one of two LOS actions:

1. **Stay in Place**—the actuator output shaft stays in place until the Demand signal returns to the acceptable range. This is the factory default.
2. **Go-to-Position**—the actuator output shaft will move to a preset position, designated in percentage of travel. For example, if the LOS action is set for 50%, the actuator output shaft will drive to the 12 mA position (based on a 4-20 mA span).

The LOS parameters can be configured using HART or Serial commands.

CAUTION

The following procedures could cause the actuator to reposition, which can adversely affect the process and cause potentially dangerous conditions.

Configure the LOS threshold:

HART method

Command: DemLimLwr
Enter "0.00" to "12.00" mA. Decimal value of the lower threshold for detecting LOS. (e.g., the typical value for a 4–20 mA system is "3.20").

DD Menu Location: MENU 4D
Functions>Configuration>Demand Setup>

Serial command method

Command: demlos ###

Arguments: ### Enter the desired Demand signal in mA below which LOS occurs (e.g., the typical value for a 4–20 mA system is "3.20").

Configure the LOS mode:

HART method

Command: LOS Mode

DD Menu Location: MENU 4D
Functions>Configuration>Demand Setup>

Selections:

Stay - select if the actuator should hold output shaft position when a loss of signal occurs.

Go-to-Pos - select if the output shaft should go to a specific position when a loss of signal condition occurs. Configure the position with LOS Pos.

Serial command method

Command: demlos *n*

Arguments: *n* Enter the desired mode

sip: (actuator will stay in place).

gtp: (actuator will go to position set in "demlosgtp" command)

pat: (same as "sip", but suppresses the alarm).

Configure the LOS position when Go-to-Pos is selected:

HART method

Command: LOS Pos
Enter "-5.00%" to "105.00%". The percentage of full travel the actuator will move upon LOS.

DD Menu Location: MENU 4D
Functions>Configuration>Demand Setup>

Serial command method

Command: demlosgtp ##.##

Arguments: ##.## Desired position of actuator if "gtp" is selected in "demlos". Position is expressed as a percentage of actuator travel in decimal form (e.g., 50% = "50.00").

Command: demlosgtp delay *n*

Arguments: *n* Time delay in seconds before the actuator will move to the position set in "demlosgtp" (0 to 25.5 seconds). Default is "0".

Entering this command without an argument will return the present GTP and delay settings.

DRAFT

CONFIGURATION/CALIBRATION

DEMAND CHARACTERIZATION CURVES

The DCM-3 can be configured to interpret the applied Demand signal for linear or non-linear output shaft position response. Three predefined Demand signal response curves are available for use including: Linear, Square, and Square Root. A chart of each of these predefined responses is provided for your reference.

In addition to the three predefined characterizer curves, the DCM-3 also allows a custom user-defined curve to be configured. This option is called "Dem Curve Spcl".

The Demand characterization curve type can be configured with the following methods.

Change the Demand characterization curve:

HART method

Command: Dem Curve

DD Menu Location: MENU 4D
Functions>Configuration>Demand Setup

Selections:
Linear - select if the actual position % should match the applied Demand %.

Square Root - select if the actual position % should match the square root of the applied Demand %.*

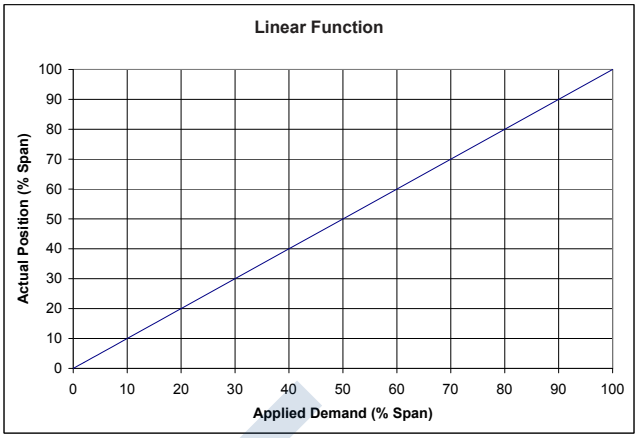
Dem Curve Spcl - select if a user-defined response is desired (see characterization on the following page to define the desired response curve).

Square - select if the actual position % should match the square of the applied Demand %.

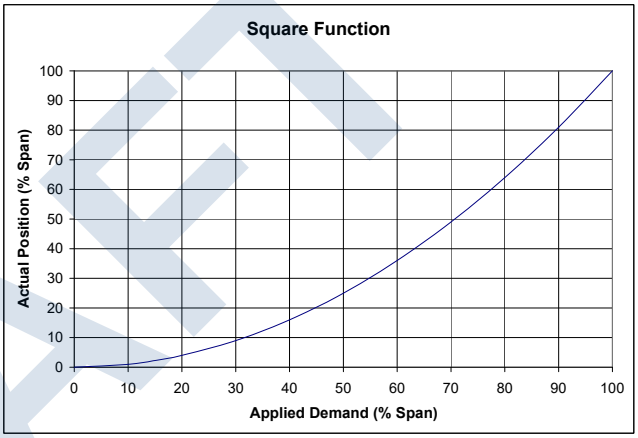
Serial command method

Command: demfunc *n*

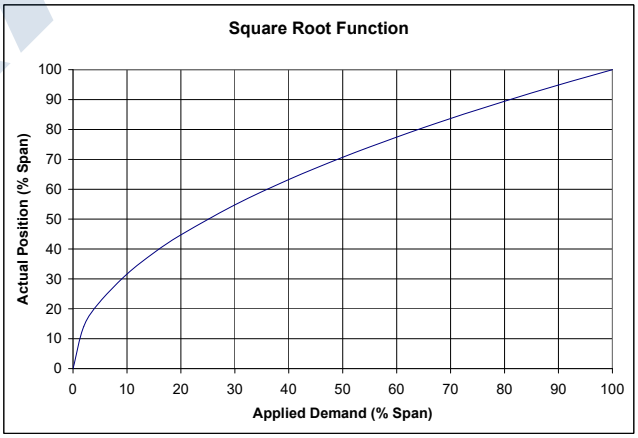
Arguments: ***n*** Enter the integer that represents the desired Demand signal response as follows:



0: Linear - select if the actual position % should match the applied Demand %.



1: Square Root - select if the actual position % should match the square root of the applied Demand %.



4: Special Curve - select if a user-defined response is desired (see characterization on the following page to set the desired response curve).

5: Square - select if the actual position % should match the square of the applied Demand % (e.g., "demfunc 0" sets the actuator to a linear Demand response).

DEMAND SIGNAL RESPONSE CURVES

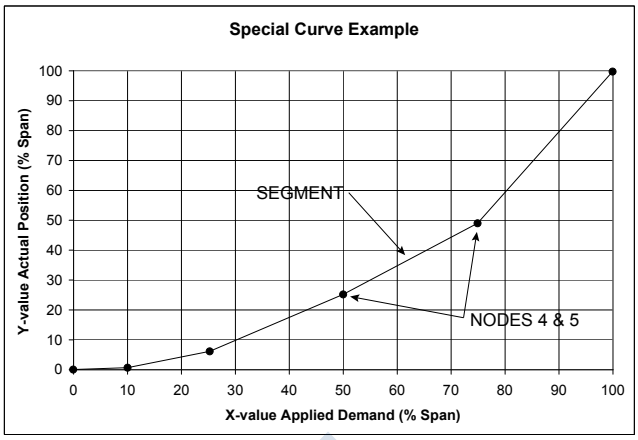
***NOTE**

Implementing a square root characterization creates extremely high gain when the Demand signal is below 10%; this causes instability and is unsuitable for control at this level. Do not apply this curve if the control loop may need to modulate at the lower range of travel.

DRAFT

USER-DEFINED CHARACTERIZATION

Not available with all DCM versions. Special curves may be created from up to 20 segments, each of which has a node for a starting point and a node for an ending point. All 20 segments do not have to be used, but the used segments must be grouped together starting with segment 1. Segments cannot be skipped.



A node is a coordinate comprised of an X,Y point. When defining nodes, X-values and Y-values must increase as the node number increases. For example, the X-value and Y-value of node 2 must be higher than the X-value and Y-value of node 1. Nodes cannot be skipped. Always start at node 1.

Unless otherwise specified, the Special curve ships from the factory defined as a linear function (i.e., one segment beginning with node 1 at X = 0%, Y = 0% and ending with node 2 at X = 100%, Y = 100%). X-values are typically chosen to give a reasonable spacing in Y-values.

The customer may specify a custom characterization by entering X- and Y-value pairs to define line segments between 0% and 100%.

For example, the table at right uses 5 segments to approximate the square function curve (i.e., $y=x^2$). Segments 1 through 5 are needed, so nodes 1 through 6 are used.

The following methods can be used to configure a user-defined characterization curve.

NODE	X-VALUE (DEMAND) % SPAN	Y-VALUE (POSITION) % SPAN
1	0%	0%
2	10%	1%
3	25%	6%
4	50%	25%
5	75%	49%
6	100%	100%

Change the user-defined characterization:

HART method

Command: DemNode1X
Enter desired X-value as a percentage for node 1

Command: DemNode1Y
Enter desired Y-value as a percentage for node 1

Repeat above procedures for each node required.

DD Menu Location: MENU 5A
Functions>Configuration>Demand Setup>Dem Curve Spcl

Serial command method

Change the user-defined characterization:

Command: charset *n1, n2, n3*

Arguments: *n1, n2, n3*
Where:
n1 = node number.
n2 = X-value as a percentage.
n3 = Y-value as a percentage.
Values must be separated by commas as shown.
Repeat procedure for each node required.

View the user-defined characterization:

Command: charlist ###

Arguments: ### Enter node number between 1 and 21 or "all".
Displays defined nodes.

Clear the user-defined characterization:

Command: charclear ###

Arguments: ### Enter node number between 1 and 21.
Clears a defined node by setting it to unused.
Will also clear any node numerically higher.

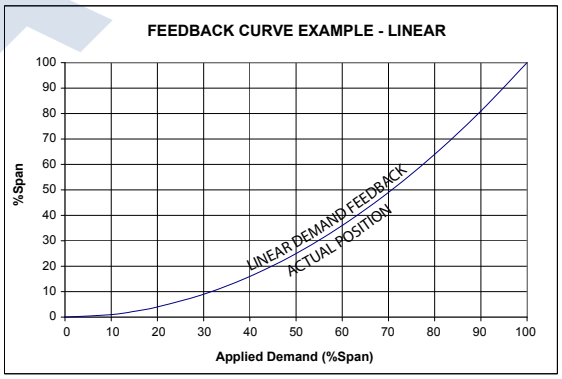
DRAFT

CONFIGURATION/CALIBRATION

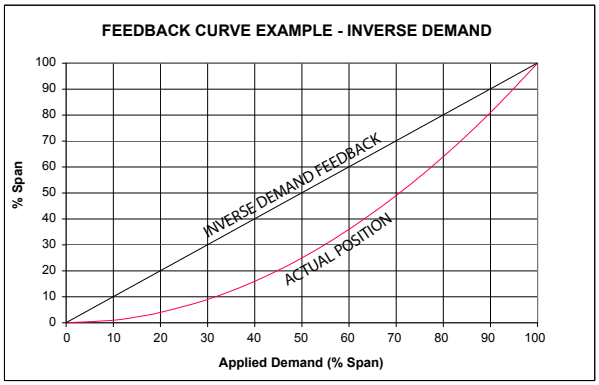
POSITION FEEDBACK SIGNAL

DCM-3 control electronics provide a 4–20 mA analog output signal that represents the actuator output shaft position. The DCM-3 monitors an internal position voltage from the CPS-5, controls the actuator position, and sources a 4–20 mA signal to terminals DD (–) and EE (+). The Feedback will correspond with the 0% and 100% output shaft positions, as determined by the position calibration (page 31). **There is no need for separate Feedback calibration.**

The user has the option of enabling or disabling the position Feedback signal. The factory default configuration will have the Feedback enabled. When the Feedback is enabled, but not in use (i.e., not wired to a load) the "STAT" and "FB OPEN" LEDs will illuminate. This status alarm is helpful in alerting the user to open Feedback wiring, but can be a nuisance when the Feedback is purposely disconnected or unused. Disabling the Feedback signal turns off the output and eliminates the status alarm. If HART or Serial communications are not immediately available to disable the Feedback signal, you can apply a 250 ohm load resistor across the Feedback terminals DD (–) and EE (+) to simulate a Feedback loop and eliminate the alarm.



Use the HART or Serial Commands (detailed on the next page) to set the Feedback signals and corresponding output shaft positions as detailed below.



If desired, the milliamp position Feedback values for 0% and 100% positions can be configured differently than the respective standard factory calibration of 4 mA and 20 mA. A valid 0% position Feedback signal value can be configured anywhere in a 3–16 mA range, while a 100% signal value can be configured from 7–21 mA. The 100% milliamp value must exceed the 0% value by at least 4 mA.

Also, reversed (decreasing direction) Feedback may be selected so that the position resulting from a 4 mA Feedback signal corresponds to the position typically resulting from a 20 mA signal; e.g., 4 mA = 100% position and 20 mA = 0% position. Setting the 0% position to 20 mA will automatically set the 100% position to 4 mA (and vice-versa), and will activate the reverse (decreasing) Feedback function. After accepted, these settings may then be changed as detailed in the paragraph above, only opposite; i.e., a valid 0% position Feedback value is 7–21 mA, while a 100% position may be set at 3–16 mA. The difference between the values can be no less than 4 mA and no greater than 18 mA.

The factory calibrated relationship between the position Feedback signal and the output shaft position is linear (i.e., 0% to 100% Feedback signal corresponds directly with 0% to 100% shaft position). This relationship is suitable for most applications; however, the Feedback to Demand relationship can be changed to compensate for characterized Demand signals. This relationship is called “Inverse Demand”. Configuring this option allows the position Feedback signal to match the uncharacterized Demand signal rather than true output shaft position.

The following example assumes 4–20 mA Demand and position signals. If the Demand is set to a square characterization, then a 12 mA Demand corresponds to 25% position. If the position Feedback curve is set to linear, then Feedback at 25% is 8 mA. For some control systems, having the Demand at 12 mA and the Feedback at 8 mA may cause a deviation alarm. The Feedback curve can be set to "Inverse Demand" so the Demand and Feedback match when the actuator is balanced. In this example, with Feedback set to "Inverse Demand" and the output shaft position at 25%, the Feedback signal would be 12 mA.

DRAFT

The following methods describe how to enable or disable position Feedback, set the 0% and 100% milliamp values and select the desired Feedback response.

Enable/disable the position feedback:

HART method

Command: Feedback

DD Menu Location: MENU 4E
Functions>Configuration>Feedback Setup>

Selections:

Enabled - to enable position Feedback.

Disabled - to disable position Feedback.

Serial command method

Command: iomode *n*

Arguments: *n*

0: Feedback disabled.

1: Feedback enabled.

Set the feedback range lower and upper values:

HART method

Command: FB RngLwr
Enter the milliamp value that corresponds with 0% position. Acceptable range "3.00"–"16.00" (typically, "4.00"). If reversed, the acceptable range is “7.00”–”21.00” (typically, “20.00”).

Command: FB RngUpr
Enter the milliamp value that corresponds with 100% position. Acceptable range "7.00"–"21.00" (typically, "20.00"). If reversed, the acceptable range is “3.00”–”16.00” (typically, “4.00”).

DD Menu Location: MENU 4E
Functions>Configuration>Feedback Setup>

Serial command method

Command: fdbk0pctma #.##

Arguments: #.## Desired Feedback signal in mA at 0% output shaft position. The value limit may be no less than "3.00" or, if reversed (decreasing direction), no greater than “21.00”.

Command: fdbk100pctma #.##

Arguments: #.## Desired Feedback signal in mA at 100% output shaft position. The value limit may be no greater than "21.00" or, if reversed (decreasing direction), no less than “3.00”.

Set the feedback characterization curve:

HART method

Command: FB Curve

DD Menu Location: MENU 4E
Functions>Configuration>Feedback Setup>

Selections:

Linear - to enable a linear feedback signal

InvDem - to enable an inverted Demand feedback signal.

Serial command method

Command: fdbkfunc *n*

Arguments: *n*

0: Linear Feedback signal.

1: Inverse Demand Feedback signal.

DRAFT

CONFIGURATION/CALIBRATION

TORQUE SENSING (Optional)

Torque sensing is an optional feature that measures the output torque of the actuator as a percentage of its rated torque capability. It provides a number of configurable features including live torque measurement, historical peak torque data, overtorque alarm and overtorque protection. Torque sensing cannot be retrofitted into existing actuators.

Actuators equipped with optional torque sensing are calibrated at the factory. There should never be a need to calibrate the torque measurement; however, if the DCM-3 is ever replaced, the torque sensing calibration constants will need to be set. There are two calibration constants consisting of a torque signal null (zero) and a torque signal span. These constants are unique to the actuator and are printed on a label inside the DCM compartment. If these values are no longer legible, contact the factory with the actuator serial number and the constants can be provided.

Although actuators are shipped from the factory with torque sensing enabled, the overtorque protection feature is disabled. Torque sensing and overtorque protection can be either enabled or disabled, as desired. In addition, the torque alarm threshold value can be changed, as can the overtorque protection threshold.

The following methods allow the user to enable/disable torque sensing, set the torque null, and set the torque constant. Methods for using and configuring the other torque features also follow:

Enable / disable torque sensing:

HART method

Command: Trq/Thrust

DD Menu Location:MENU 4F
Functions>Configuration>Torque Setup>

Selections:

Enabled - to enable torque sensing.

Disabled - to disable torque sensing.

Serial command method

Command: torqenable *n*

Arguments: ***n***

0: disables torque sensing and torque alarm.

1: enables torque sensing and torque alarm.

Set the torque null and constant values:

HART method

Command: Trq Null
Number representing 0% torque. Enter the torque null value that is affixed to the actuator body inside the terminal compartment.

Command: Trq Const
Number representing the torque span value. Enter the torque constant value that is affixed to the actuator body inside the terminal compartment.

DD Menu Location:MENU 4F
Functions>Configuration>Torque Setup>

Serial command method

Command: torq0k ###

Arguments: ### Number representing 0% torque. Enter the torque null value that is affixed to the actuator body inside the terminal compartment.

Command: torqconst **###**

Arguments: ### Number representing the torque span value. Enter the torque constant value that is affixed to the actuator body inside the terminal compartment.

LIVE / HISTORICAL TORQUE

The live torque measurement can be accessed through the HART or serial port interface. Historical peak measurements are recorded for 10 equal segments of travel in both the CW and CCW travel directions. Historic data is also available through the HART or serial port interface.

View the live torque measurement:

HART method

Command: Trq/Thrust
Displays the present torque reading as a percentage of the actuator's rated torque.

DD Menu Location: MENU 1

Serial command method

Command: torq
Displays the torque on the output shaft measurement as a percentage of actuator rating.

Arguments: No argument required.

DRAFT

View historical peak torque values:

HART method

Command: Segment 1 through 10
Displays the historical peak torque values. Values are displayed for every 10% segment of full actuator travel and also for both the CW and CCW directions of travel.

DD Menu Location: MENU 4J
Functions>Diagnostics>CW Torque

DD Menu Location: MENU 4K
Functions>Diagnostics>CCW Torque

Serial command method

Command: torqprof

Displays a three table column:
1. Travel divided into 10 segments
2. peak torque measured in each segment with motor running CW
3. peak torque measured in each segment with motor running CCW

Arguments: No argument required.

OVERTORQUE PROTECTION
(Requires Optional Torque Sensing)

Overtorque protection protects both the actuator and driven equipment from damage when the torque exceeds the set threshold (configurable). Actuators normally ship from the factory with this feature disabled, but it can be enabled in the field using either HART or the serial interface. The factory configured threshold is 150% of rated actuator torque, and can be configured as low as 25%.

The following methods show how to enable/disable the overtorque protection and how to set the threshold.

Enable / disable overtorque protection:

HART method

Command: Ovt Prot

DD Menu Location:MENU 4F
Functions>Configuration>Torque Setup>

Selections:

Enabled - to enable overtorque protection.

Disabled - to disable overtorque protection.

Serial command method

Command: ovtstop *n*

Arguments: *n*

0: disables overtorque protection.

1: enables overtorque protection.

Set the overtorque protection threshold:

HART method

Command: ShutDwnTrq
Enter the overtorque protection threshold as a percentage of rated torque (25%–150%).

DD Menu Location:MENU 4F
Functions>Configuration>Torque Setup>

Serial command method

Command: ovtstoplevel ###

Arguments: ### the overtorque protection threshold as a percentage of rated torque (25% to 150%).

OVERTORQUE ALARM
(Requires Optional Torque Sensing)

When the torque reaches an alarm threshold (factory configured for 105% of rated torque), a status alarm will be initiated causing the STAT LED to illuminate. Disabling the torque sensor also disables the torque alarm. When the measured torque drops below the threshold the status alarm is automatically reset.

The following method allows the user to set the torque alarm threshold between 61% and 105%.

Set the torque alarm threshold:

HART method

Command: AlarmLevel
Enter the alarm level as a percentage of torque (61%–105%).

DD Menu Location:MENU 4F
Functions>Configuration>Torque Setup>

Serial command method

Command: torqalarm **###**

Arguments: ### Alarm level as a percentage of torque (61%–105%).

DRAFT

TEMPERATURE SENSING

DCM-3s are equipped with an internal temperature sensing circuit. The real-time temperature and the historical temperature extremes (low and high) are available.

Temperature units can be selected to show either Fahrenheit or Celsius.

An alarm condition initiates if the actuator's real-time temperature falls outside the actuator rating (see "General Specifications", page 4). The STAT LED and the TEMP F LED will light, and will automatically reset when the temperature is once again within the actuator rating.

View real-time temperature & historical extremes:

HART method

Command: Temp
Displays the real-time temperature as read by the DCM-3.

DD Menu Location: MENU 1

Command: High Temp
Displays the historical high temperature.

Command: Low Temp
Displays the historical low temperature.

DD Menu Location: MENU 3D
Functions>Statistics

Serial command method

Command: temperature

Arguments:

When entered with no argument, the command returns the real-time temperature as well as the historical high and low temperatures.

Set temperature units:

HART method

Command: Temperature Unit

DD Menu Location: MENU 4B
Functions>Configuration>General Setup

Selections:

degF - Set the temp. units to degrees Fahrenheit.

degC - Set the temp. units to degrees Celsius.

Serial command method

Command: temperature *n*

Arguments: *n*

F: Set the temp. units to degrees Fahrenheit.

C: Set the temp. units to degrees Celsius.

DRAFT

STALL PROTECTION

The DCM-3 board provides protection for the actuator in the event of a stall. Stall protection is activated when the actuator is unable to achieve the proper position within a defined stall time due to a mechanical impediment or excessive load.

The DCM-3 senses when the motor moves the output shaft in one direction longer than the configured “stall time”. The DCM-3 then shuts off power to the motor, preventing further actuator movement. When the stall condition occurs, the STAT LED will illuminate.

Resetting due to a stall condition is achieved by reversing the Demand signal, cycling the actuator power, or submitting a reset command via HART or Serial port.

The stall protection feature can be enabled or disabled and the stall time may be configured between 30 and 450 seconds. This feature is factory enabled and the default setting is 300 seconds. If reconfiguring, it is advisable to configure the stall time with a value greater than the maximum stroke time to avoid false stall protection events and alarms.

Enable / disable stall protection:

HART method

Command: StallProt

DD Menu Location: MENU 4B
Functions>Configuration>General Setup>

Selections:

Enabled - to enable stall protection.

Disabled - to disable stall protection.

Serial command method

Command: stallprot *n*

Arguments: *n*

0: stall protection disabled.

1: stall protection enabled.

Configure the stall time:

HART method

Command: Stall Time
Enter the stall time in seconds. Valid stall times are 30 to 450 seconds.

DD Menu Location: MENU 4B
Functions>Configuration>General Setup>

Serial command method

Command: stalltime ###

Arguments: ### Enter the stall time in seconds. Valid stall times are "30" to "450".

Reset a stall condition:

HART method

Command: Reset Stall
Select to reset a stall condition.

DD Menu Location: MENU 3E
Functions>Manual Operation>

Serial command method

Command: unstall
Enter to reset a stall condition.

DRAFT

MOTOR ASSEMBLY

The control motor is not field-repairable. **Do not disassemble the motor.** Disassembly of the motor will result in a loss of torque that can only be restored by returning the motor to the factory for re-magnetizing.

Motor assembly replacement instructions follow:

WARNING

Disconnect power before proceeding.

Before removing the motor assembly, block the crank arm (if applicable) to prevent the crank arm and gear train from moving when the motor is removed.

REMOVE THE MOTOR ASSEMBLY:

Disconnect the motor wires in the terminal compartment of the actuator. The terminal block, along with the barrier plate or chassis (depending upon the model), should be removed as an assembly from the actuator body to access the wires beneath.

After lifting the chassis or barrier plate assembly, the three motor wires may now be disconnected. Remove the black motor wire from the terminal "B" post, cut the red motor wire near the red-yellow-red butt joint and disconnect the green wire from the motor capacitor. Remove the mounting screws and then carefully slide the motor assembly out of the actuator body.

INSTALL THE NEW MOTOR ASSEMBLY:

First, insert the three-wire sleeve through the wire hole in the motor mount and into the terminal compartment. Carefully slide the motor into the actuator body. Rotate the motor shaft, if necessary, to engage the pinion with the first combination gear. Install new motor assembly mounting screws (provided) and torque to recommended values (shown in torque tables pages 6-11). Reconnect the motor wires per your actuator specific wiring diagram (under terminal compartment cover).

Inspect the barrier plate gasket (if applicable) and replace if necessary (see GASKETS in this section). To ensure a watertight seal between the plate and gasket, coat the gasket with a thin film of grease before replacing the terminal plate. Torque the screws to 3 lb-ft (4 N•m).

MOTOR RESISTOR AND CAPACITOR NETWORK

There is no recommended replacement interval for the R-C) components. Nonetheless, it may be advisable to replace these parts as a preventative measure when motors are replaced on older actuators; this is why they are recommended spare parts.

The R-C values and part numbers for each motor assembly are shown in the "Gaskets, Motors, Resistors & Capacitors" table on page 54. The resistor and capacitor are located in the wiring compartment below the terminal block.

To replace a resistor or capacitor, first remove the terminal cover, then follow the model specific directions below.

WARNING

Electrical shock hazard. Disconnect power before proceeding.

11-1_9:

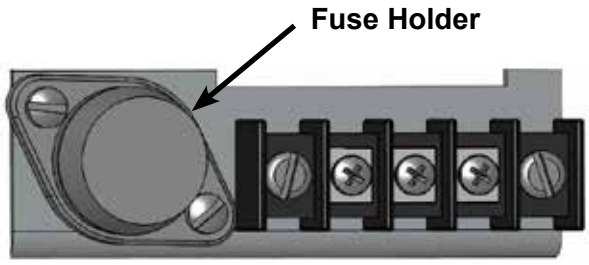
Remove the terminal block and chassis assembly. The capacitor is fastened to the underside of the chassis with a panduit strap next to the resistor, which is fastened to the chassis with screws. Remove the panduit strap or screws securing the existing part. Transfer the wires one at a time from the existing part to the new replacement part. Fasten the new part with a new panduit strap or screws.

11-2_9, 11-3_9, 11-4_9:

Remove the terminal block and barrier plate as an assembly to access the resistor and capacitor components. The capacitor(s) is fastened to the actuator body wall with a bracket and screws. The resistor assembly plate is also fastened to the body wall with screws. After removing the mounting screws (and bracket, if necessary), remove the existing part and transfer the wires one at a time from the existing part to the new replacement part (in some configurations, access to the screws may require removal of the DCM-3 compartment cover). Fasten the new parts in the same manner as the replaced parts.

Inspect the terminal plate gasket and replace if necessary (see GASKETS in this section). To ensure a watertight seal between the plate and gasket, coat the gasket with a thin film of grease before replacing the terminal plate. Torque the screws to 3 lb-ft (4 N•m).

DRAFT



FUSE (F1) REPLACEMENT (FOR ACTUATORS EQUIPPED WITH OPTIONAL 208V OR HIGHER POWER SUPPLY)

If it is necessary to replace the power fuse (F1), use the following procedure:

WARNING

Electrical shock hazard. Disconnect power before proceeding.

Remove the terminal block cover. Locate the fuse holder (similar to the illustration below).

Turn the fuse holder CCW while pressing down. The fuse holder should spring loose when free. Remove the fuse holder from the actuator. Pull the fuse free from the holder. Replace the fuse with the same type (see table below) by pushing it into place.

Reinsert the fuse holder into the actuator. Turn the fuse holder CW while pressing down to tighten. Replace the terminal block cover. Tighten the cover screws to 6 lb-ft (8 N•m) torque.

REPLACEMENT FUSES (F1)

Actuator	Input Voltage	Amps	Volts	Type	Part No.
11-150 -160	208	0.75	250	Time Delay	11-1370-23
	240	0.75	250	Time Delay	11-1370-23
	380	0.4	600	Time Delay	11-1372-18
	415	0.3	600	Time Delay	11-1372-17
	480	0.3	600	Time Delay	11-1372-17
	575	0.25	600	Time Delay	11-1372-28

LUBRICATION / GEARING

Periodic lubrication is not required on Beck actuators. However, if your actuator has a linkage with rod ends supplied by Beck, the rod ends should be included in your scheduled lubrication program.

During major maintenance outages, it is recommended that older actuators should be inspected to ensure that the gearing is not worn or damaged.

To inspect the gears, remove the gear module assembly on the 11-209/-269, -309/-369 and -409/-469. On Model 11-159/-169, the motor must be removed to access the gears. Clean the gears, removing as much old lubrication as possible.

Examine the gear teeth, shaft bore, and gear shafts for signs of excessive wear, scoring, or other damage. If there is no evidence of damage to the gearing, recoat the teeth and shaft bores of all gears with a heavy layer of Fiske Lubriplate GR-132 or equivalent (GR-132 is an extreme pressure grease with polymer additives). The ball bearing on the output shaft and crown gear shaft have double grease seals and require no maintenance for the life of the bearings. Inspect all other grease seals and replace any that show wear. Reassemble the actuator, referencing the outline dimension drawings beginning on page 6 for appropriate bolt torques.

If it should ever be necessary to replace the output shaft assembly, 3rd combination gear, or output shaft bearings, a major overhaul is required and the actuator must be returned to the factory for a repair evaluation.

CAUTION

Before removing the gear module assembly from the actuator body, secure the output shaft to prevent movement.

11-409 Gear Module

DRAFT

MAINTENANCE

SELF LOCKING MECHANISM (SLM)

The Self Locking Mechanism (SLM) is assembled to the front of the motor and couples the motor to the gear train. The primary function of the SLM is to lock the gear train in place when the motor is de-energized. When the motor is energized, the SLM releases and allows the motor to drive the gearing.

There is no recommended maintenance interval for the SLM. The SLM can last for many years in normal service. SLM wear is a function of loading and the number of starts/stops the motor experiences over time. Overloading or stalling the actuator will accelerate SLM wear.

Signs of wear include the inability of the actuator to hold position when the motor is de-energized. This could result in persistent on-off oscillation. Severe SLM wear or damage may result in a loss of torque at the output shaft.

It is often possible to confirm SLM wear or damage by checking motor operation with the Handwheel. Place the Handswitch in the STOP position, and rotate the motor Handwheel back and forth. There should be free play before the motor pinion/gearing turns (up to one tenth of a full Handwheel rotation). Lack of free play or rough motor movement may indicate the need for SLM reconditioning.

Disassembly and close inspection of the SLM components is required to fully evaluate its condition.

WARNING

Electrical shock hazard. Disconnect power before proceeding.

Support the load before removing the motor/SLM from the actuator.

DRAFT

DISASSEMBLY AND CLEANING

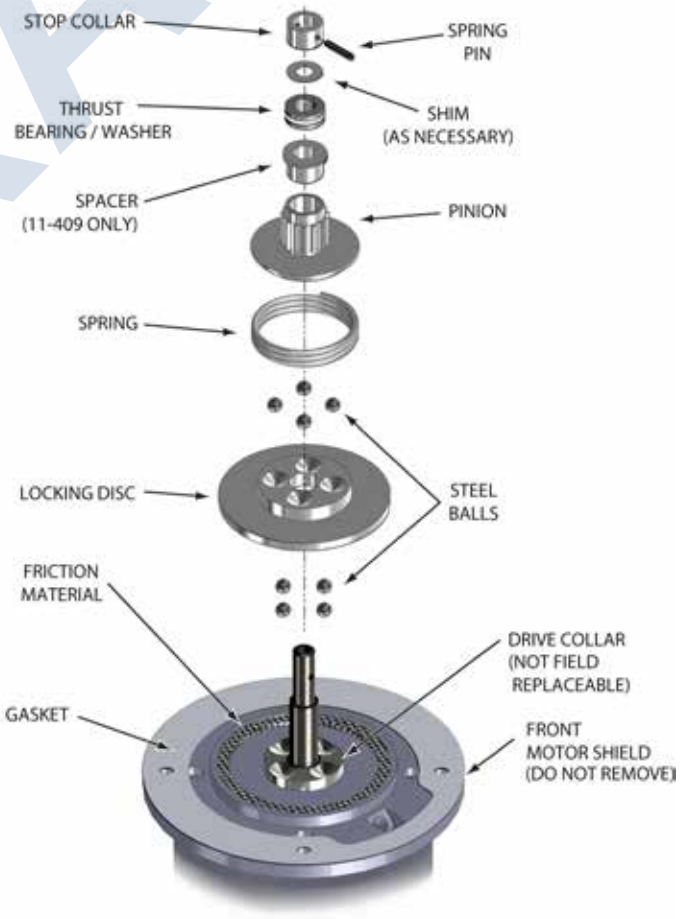
When wear or damage is suspected, disassembly and cleaning may be required to determine the extent of needed repairs. Individual parts may be replaced, with the exception of the drive collar, which is not field replaceable. Refer to the illustration at right.

For SLM disassembly and inspection:

1. Disconnect power from the actuator.
2. Secure the actuator load, and remove the motor assembly (see page 42). Handle the motor with care so as not to damage the rotor shaft.
3. Pushing down firmly on the pinion, measure the gap between the stop collar and the thrust washer. This distance should measure 0.015 ± 0.005" for motors on models 11-1_9, 11-2_9, and 11-3_9. This distance should measure 0.025 ± .005" for motors on models 11-4_9. An excessive gap indicates worn SLM components.
4. Use a felt tip pen to mark the location of the stop collar (or castle nut) on the shaft. Support the end of the rotor shaft to prevent it from bending, and drive the 1/8" spring pin out. Carefully (the spring assembly is spring-loaded), remove the stop collar (or unthread the castle nut), thrust washer/bearing, spacer (models 11-4_9 only), pinion, spring, and steel balls. On 11-4_9 models, remove the (4) 1/4-20 screws and the front motor end (see the 11-4_9 SLM Components figure on page 45). DO NOT remove the front motor shield or the rotor from the stator on any model.

CAUTION

Do not disassemble the motor any further, as it has no other user serviceable parts. Further disassembly will result in demagnetization of the motor and loss of the required torque.



5. Clean grease from the pinion and locking disc for inspection. A small amount of dust residue from the friction material is normal. Clean the drive collar detents with a rag and inspect for wear. Inspect the friction material for excessive wear or damage. If the friction material does not appear to be damaged, clean with alcohol to remove any contaminants.
6. Identify worn parts and replace as needed. Note, wear on the pinion teeth may indicate wear on the meshing gear. Further inspection of the gear module assembly is recommended. Drive collar detent wear will require factory repair of the motor.

REPLACEMENT AND REBUILD INSTRUCTIONS

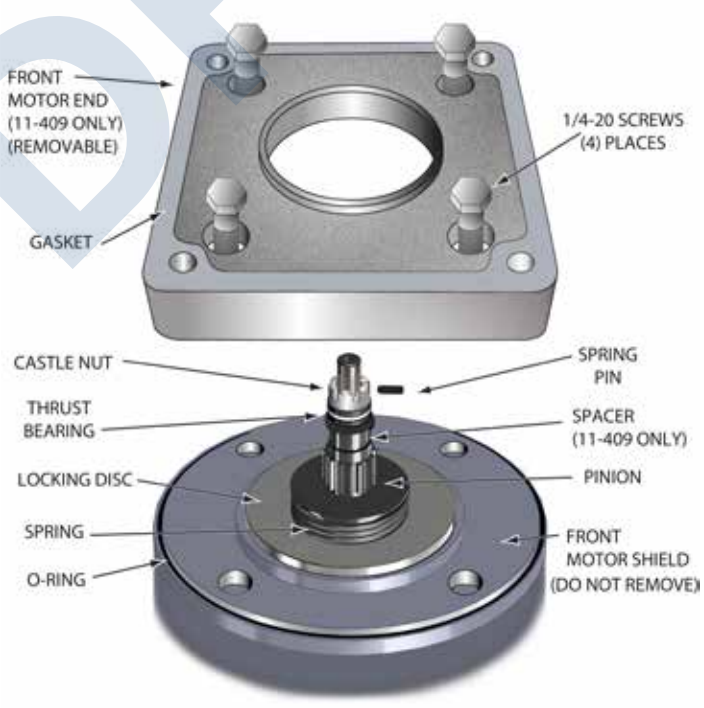
1. If the friction material requires replacement, scrape off the old friction material and thoroughly clean the bonding surface to ensure flatness for the new friction material. Glue the new friction material in place with Loctite 454 Instant Adhesive or equivalent, taking care to keep the material flat and clean.
2. Apply a film of grease (Fiske Lubriplate GR-132 or equivalent) to the surface of the ball detents (12 or 16 places depending on the model). Apply a *thin* film of grease to the inner diameter of the locking disc bore. Do not let the grease contact any friction surfaces. Excess grease can contaminate the friction surface and reduce SLM effectiveness.
3. With the motor shaft pointed up, place a steel ball into each of the drive collar detents. Install the locking disc and place a steel ball into each of the detents on the top of the locking disc.

Continue with the appropriate steps for your model number on the next page.

Continued

11-1/2/3__ SLM COMPONENTS

DRAFT



Replacement & Rebuild (cont'd)

Models 11-1_9, 11-2_9 & 11-3_9

4. Install the pinion, thrust bearing/washer, and stop collar as follows: On model 11-1_9 actuators, the white side of the thrust washer should face the pinion. Make sure all steel balls are properly seated in the detents of the drive collar, locking disc, and pinion. Align the stop collar with the shaft marks made during disassembly and insert a 1/8" pilot punch through the stop collar hole and into the motor shaft to hold it in place.
5. Pushing down firmly on the pinion, measure the gap between the stop collar and the thrust bearing/washer. This distance should measure 0.015 ± .005". This space is necessary to ensure proper operation. Add/remove shims as necessary. Install the new 1/8" spring pin while supporting the shaft.
6. Install the spring by slipping it over the pinion flange and twisting it into place.
7. On model 11-1_9 actuators, reassemble combination gears onto the motor end. On all models, recoat the gear teeth and components above the pinion liberally with a layer of Fiske Lubriplate GR-132 or equivalent.

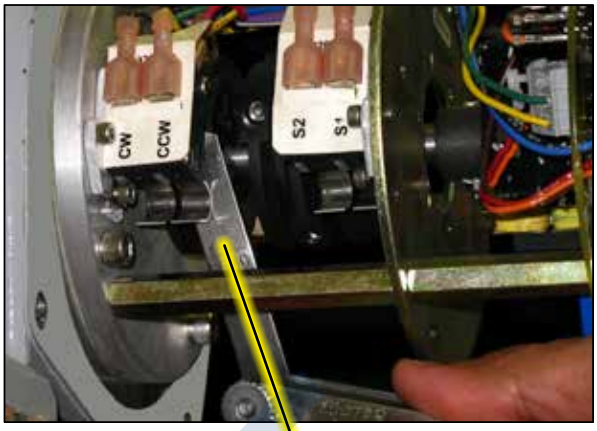
Models 11-4_9

4. Install the spring on top of the locking disc. Compress the spring by pushing down with the pinion. While holding the pinion in place, install the spacer, thrust bearing, and castle nut (stop collar). Note: The grooved washers on each end of the thrust bearing have differently sized holes; the end with the washer having the smallest hole should be installed next to the castle nut. Thread the castle nut onto the shaft to hold the spring in compression.
5. Replace the front motor end O-ring (see figure below) and install the front motor end with the (4) 1/4-20 screws in a crisscross pattern, torquing to 6 lb-ft (8 N•m). Place RTV around the wire entry into the motor.
6. Pushing down firmly on the pinion, measure the gap between the castle nut and the thrust bearing. This distance should measure 0.025 ± .005". This space is necessary to ensure proper operation. Tighten or loosen the castle nut as necessary to achieve the proper gap and simultaneously align one of the slots with the hole in the motor shaft. One complete slot rotation will change the gap by 0.009". Install the new 1/8" spring pin while supporting the shaft.
7. Recoat the gear teeth and components above the pinion liberally with a layer of Fiske Lubriplate GR-132 or equivalent.

11-4_9 SLM COMPONENTS

DRAFT

OVER-TRAVEL LIMIT AND AUXILIARY SWITCHES



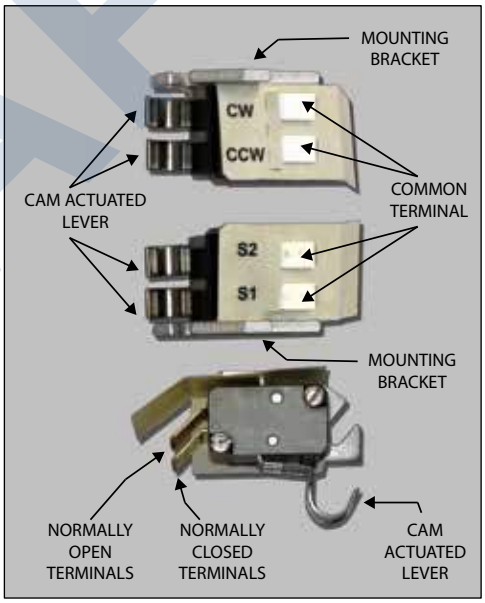
Complete switch assemblies may be replaced. It is not possible to replace individual switches. To replace switch assemblies, follow the instructions below.

WARNING

Electrical shock hazard. Disconnect power before proceeding.

Remove the control end cover by loosening the four captive, socket head cap screws (1/2" wrench). Remove the screws holding the switch assembly to the switch plate and slide it out to the side.

Transfer the wires to the terminals of the replacement assembly, ensuring the correct wire is transferred to the correct replacement assembly terminal (wires have push-on lugs). Install the replacement assembly and note that it rotates around one screw to permit an adjustment of the cam-to-switch lever spacing and switch operating point. To set the switch, place a .030" (.75 mm) shim between the cam and switch lever (see photo to right). The switch lever should be on the low or minimum radius portion of the cam when setting the switches. Position the switch assembly so that the switch is just actuated. DO NOT overstress the switch lever. Tighten both screws to 10 lb-ft (14 N•m) torque and remove the shim.



.030" (.75 MM) SHIM SHOULD BE INSERTED BETWEEN ALL LEVERS AND CAMS WHEN SETTING SWITCHES.

ADDING AUXILIARY SWITCHES

It is sometimes possible to add auxiliary switches in the field. If the actuator was built with two or less auxiliary switches, they may be added in multiples of two, for a total of up to four auxiliary switches. See the table at right for part numbers.

Install wiring onto the switch push-on lugs and route the wires into the actuator terminal area. Remove the terminal compartment cover and solder wires to the underside of the terminal board according to the wiring diagram included with the new switch assembly. Install the new switch assembly and adjust according to the preceding instructions.

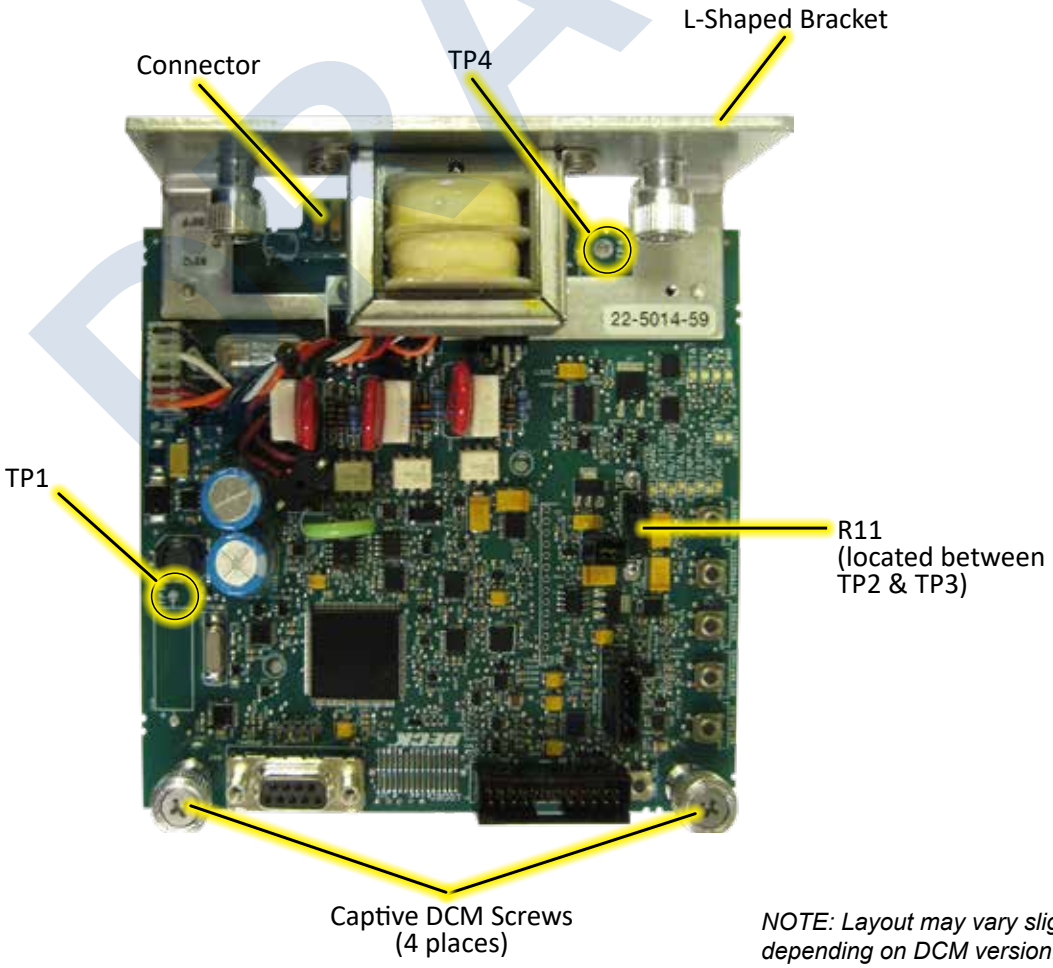
SWITCH PARTS

Description	*Part Number*
Over-travel limit switch assembly (CW/CCW)	20-3202-10
Auxiliary limit switch assembly, (2) switches (S1/S2)	20-3202-11
Auxiliary limit switch assembly, (4) switches (S1/S2/S3/S4)	20-3202-12
Limit switch cam assembly	11-0931-02

DRAFT

DCM-3 BOARD

Field repair of the DCM-3 board is not recommended.



WARNING

Electrical shock hazard. Disconnect power before proceeding.

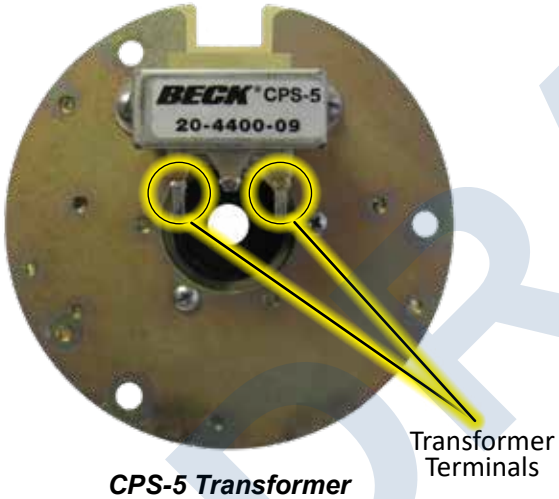
To replace the DCM-3 board, remove the Digital Control Module compartment cover (four captive, 5/16” hex head screws (1/2" hex wrench)). Loosen the four captive screws holding the board to its mounting pads. Note the “L” shaped mounting bracket on the end of the board. To remove the board, pull the mounting bracket away from its mating surface and connector receptacle.

To install a DCM-3 board, lightly press the board connector into its receptacle until the mounting bracket is flush with its mating surface. Tighten the four captive screws to 8 lb-in (0.9 N•m). Replace the DCM-3 compartment cover and tighten the cover screws to 10 lb-ft (14 N•m) of torque.

NOTE: Layout may vary slightly depending on DCM version.

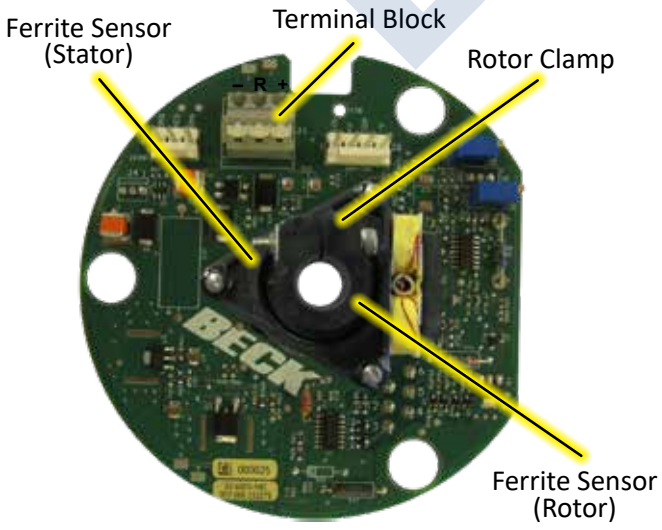
DRAFT

CPS-5



Field repair of the CPS-5 is not recommended.

WARNING



Electrical shock hazard. Disconnect power before replacing the CPS-5.

To replace the CPS-5, both the rotor and stator/circuit board assembly should be replaced. When returning the CPS-5 to the factory for service, do not separate the rotor and stator/circuit board assemblies from their mounting plates. The rotor should be held inside the stator with rubber bands when shipping.

The CPS-5 is configured to produce a position signal voltage between 1 and 5 volts over 100 degrees of travel; units configured for 90 degrees of travel will produce a position voltage between 1.2 and 4.8 volts. Configured properly, the CPS-5 raw position signal (measured at TP1 & TP4) increases as the output shaft rotates clockwise.

CPS-5 Transformer

CPS-5 Transducer Board

REMOVE THE EXISTING CPS-5 ASSEMBLY:

1. Run the actuator to its midpoint of travel with the local Handswitch.
2. Disconnect 120 V ac power to the drive. Remove the terminal, DCM-3 compartment and control end covers (1/2" wrench).
3. Record the wire colors on the terminal block of the CPS-5 (see illustration, this page), then disconnect the wires. The terminals are spring-loaded. To remove a wire, press the tip of a small screwdriver into the slot at the top of the small lever. Push down to open the spring-loaded contact and release the wire.
4. Pull the wires from the transformer (see illustration, this page) back through the wire hole in the CPS-5.
5. Loosen and remove the 3 hex studs that clamp the CPS-5 in place. Ensure that the inboard hex stud is not loosened as the outboard stud is loosened.
6. Slide the CPS-5 stator assembly off the three mounting bolts.
7. Note the position of the rotor clamp, then loosen the rotor clamp screw and remove the rotor from the shaft.

INSTALL THE NEW CPS-5 ASSEMBLY:

8. Remove the rotor from the replacement CPS-5 assembly. Slide the rotor, clamp end first, onto the control shaft as close to the mounting plate as possible. Leave the clamp loose. Position the clamp in the same general location as the one removed previously.
9. Slide the new CPS-5 assembly over the studs and rotor. Replace the hex nuts but do not tighten. Carefully slide the rotor back into the CPS-5 assembly. Twist the rotor while sliding to prevent damage to the assembly. Tighten hex nuts to 5 lb-ft (7 N•m).
10. Thread the wires through the wire holes in the CPS-5 and reconnect them to the transformer and terminal block.
11. Restore 120 V ac power to the actuator and connect a meter to the output.
12. Insert a 0.031" (.80 mm) feeler gauge between the rotor clamp and stator. Position the clamp 0.031" (.80 mm) from the stator.
13. Rotate the rotor (only a minor adjustment should be necessary) on the control shaft until the output voltage measured across TP4 and TP1 (see illustration at right) reads 50% (approx. 3 volts) of the signal span. Tighten clamp to 5 lb-in (.6 N•m) torque.
14. Perform a position calibration procedure (p. 31).

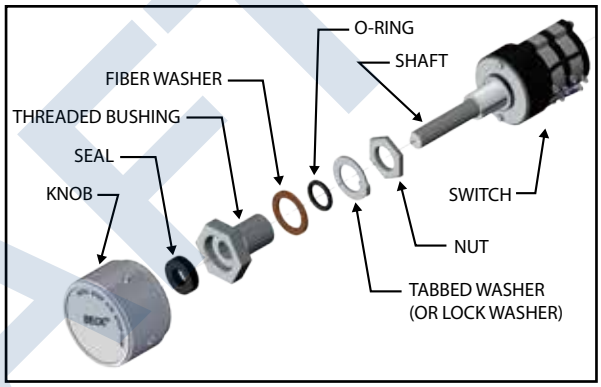
DRAFT

MAINTENANCE

HANDSWITCH

WARNING

Electrical shock hazard. Disconnect power before proceeding.



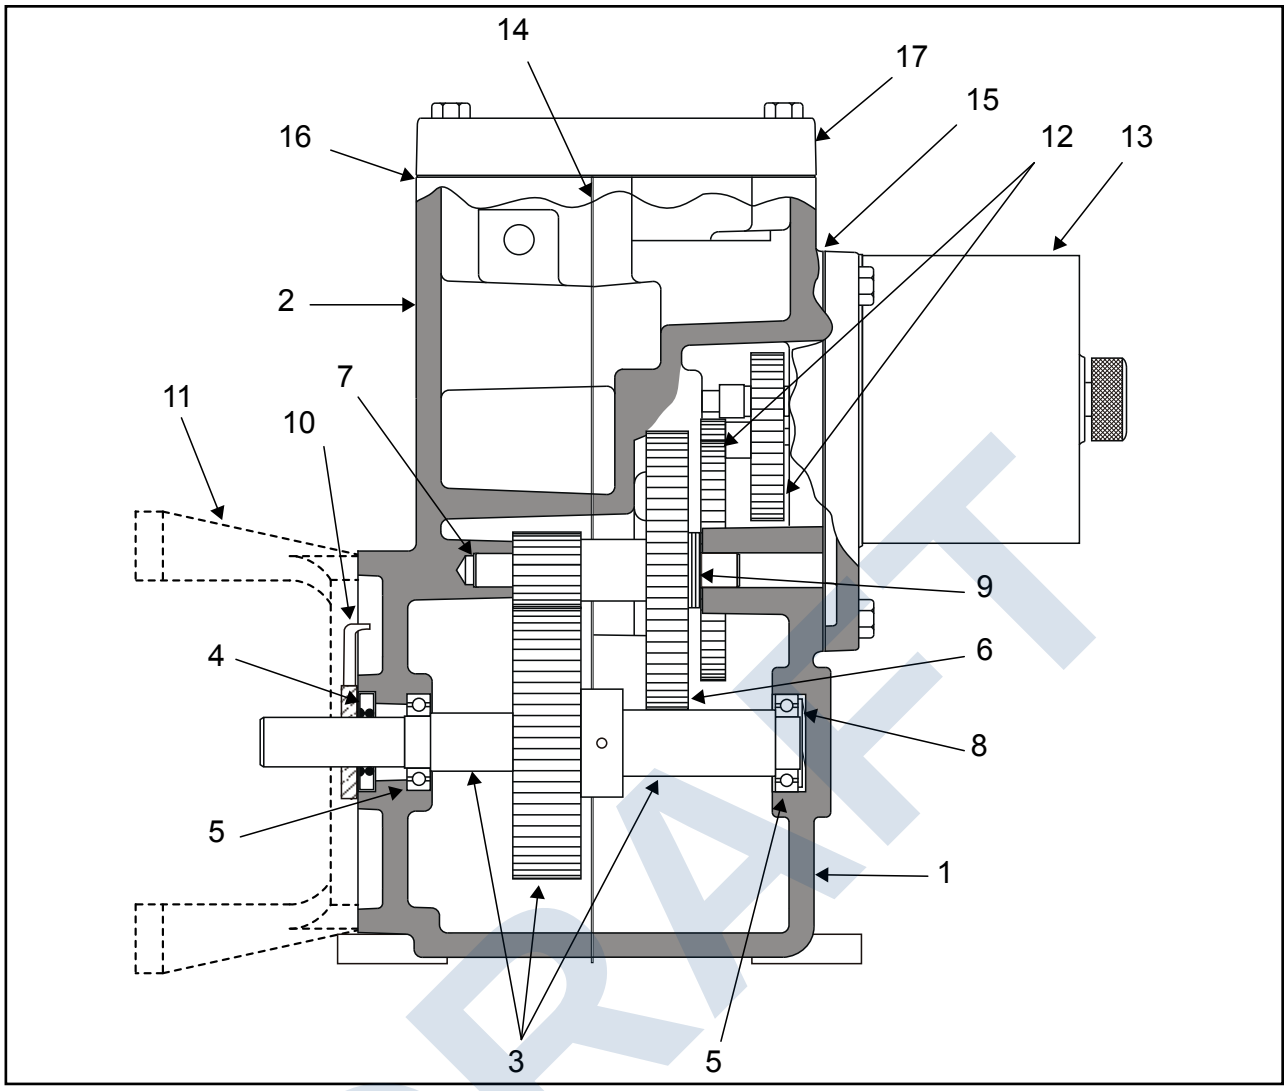
REMOVE THE EXISTING HANDSWITCH:

1. Remove power from the actuator.
2. Remove the terminal cover (1/2” wrench).
3. To access the Handswitch, the terminal barrier plate must be removed on all models except the 11-1_9.
4. Clip the five wires from the old Handswitch (removing any tie wraps or sleeving that may interfere).
5. Remove the Handswitch knob by loosening the two inset screws (5/64" hex wrench).
6. Remove the threaded bushing behind the Handswitch knob. The remaining Handswitch assembly components may now be removed from the terminal compartment.

INSTALL THE NEW HANDSWITCH:

7. Insert the new threaded bushing through the actuator onto the shaft, then attach the components leading to the switch as shown in the illustration below.
8. Place the seal in the bushing, then insert the knob over the bushing. Tighten the two inset screws to 3 lb-ft (4 N•m).
9. Splice the wires from the new Handswitch assembly to the wires from the actuator, color to color. Ensure the wiring is not exposed after splicing.
10. Replace the terminal cover, tightening the captive screws to 10 lb-ft (14 N•m).

NOTE: When the Handswitch is turned fully clockwise, “AUTO” should be indicated. Be sure to place the tab on the tabbed washer into the slot in the actuator body to secure the Handswitch in place.



HANDSWITCH COMPONENTS

GASKETS

During routine service, inspect removed cover gaskets for wear or damage. In order to protect internal components, worn or damaged gaskets and O-rings should be replaced.

To remove, scrape all of the old adhesive and gasket material from the body housing and cover, if necessary. Replacement gaskets are self-adhering, silicone rubber. Peel the backing off the replacement gasket and carefully apply to the actuator body.

MAINTENANCE

RECOMMENDED SPARE PARTS

The table to the right indicates the common recommended spare parts that may be utilized across many Group 11 actuator models.

The Beck website (www.haroldbeck.com) provides an actuator serial number lookup tool. The tool will display the actuator torque and timing which can be cross-referenced to a motor part number on the “Torque & Timing” table (page 55) if the part numbers are not known.

***Note that motor replacement part numbers will include the suffix “KIT”; e.g., 20-2700-20-KIT.**

COMMON RECOMMENDED SPARE PARTS

[a] All motors listed are rated 120 V ac regardless of operating voltages using optional transformers.
[b] This is a resistor assembly.
[c] 50 Hz currents do not exceed 120% of the 60 Hz levels.
[d] Alternate power options (other than 120 or 240 V ac) require (2) 110Ω resistors, part no. 11-5802-05, in lieu of resistor shown.

DRAFT

TORQUE & TIMING LISTED BY MOTOR AND GEAR MODULE ASSEMBLY

Actuator Model No.	Motor Part No.	Motor Current (Amps at 120 Vac, 60 Hz[1])	Gear Module Assy. No.*	Torque (lb-ft)	Timing @ 60 hz[2]	
					Models 11-159, -209, -309, -409 (sec./100°)	Models 11-169, -269, -369, -469 (sec./90°)

			14-9732-07	1,000 (1356 N•m)	40	36
			14-9732-02	1,800 (2440 N•m)	60	54
	20-2201-33	3.0	14-9732-07	1,000 (1356 N•m)	24	22
			14-9732-02	1,800 (2440 N•m)	36	32

CAUTION: Use only the motor and gear module combinations listed above; other combinations may cause internal damage to the actuator and/or damage to the external equipment.

[1] 50 Hz currents do not exceed 120% of 60 Hz levels.

[2] 50 Hz timing = 1.2 x 60 Hz timing.

* Note that gear module replacement part numbers will include the suffix "KIT"; e.g., 14-9733-04-KIT.

** This gear module assembly is integral to the motor -- field replacement is not recommended.

DRAFT

TROUBLESHOOTING

The DCM-3 features diagnostics to help troubleshoot problems.

The following list provides a systematic method for isolating any actuator problems.

1. Operating Voltage
2. Handswitch Operation
3. DCM-3 Status Indication LEDs
4. DCM-3 Testpoints
5. DCM-3 Configuration
6. Shaft Position
7. Inhibitors / Statistics

VERIFY OPERATING VOLTAGE

To check the input power supply, view the Overview LEDs on the DCM-3 board (see illustration on page 24). This requires removing the DCM compartment cover (see page 13 for location).

The PWR LED should pulse from dim to bright, which indicates that power is applied to the actuator and the DCM-3 is successfully completing (continuous) self-tests. If the PWR LED is not lit or pulsing, there may be a problem with the AC power supply to the actuator.

Ensure the actuator is receiving the proper operating voltage (listed on the actuator nameplate). To check the voltage, locate the power terminals on the terminal block (see wiring diagram on the underside of the terminal compartment cover). Using a voltmeter, measure the voltage applied to those terminals. If the voltage is correct, continue troubleshooting; if the voltage is not correct, apply the proper power.

CHECK HANDSWITCH OPERATION

Verify proper operation of the Handswitch, which bypasses the actuator control electronics and switches power directly to the motor windings. Operate the actuator in both directions of travel using the Handswitch. If the actuator responds as expected, electro-mechanical problems with the motor and gearing may be eliminated. The trouble may lie with the electronics.

CHECK DCM-3 STATUS INDICATION LEDS

The DCM-3 has seven Status Indication LEDs that provide specific information about the actuator's state (page 25). A lit LED indicates that a condition exists.

CHECK DCM-3 TESTPOINTS

The DCM-3 controls actuator output position by comparing the actuator's Demand input signal with the internal Position feedback signal generated by the actuator's position sensor (CPS-5). The integrity of these signals is critical to actuator performance. The signals should be verified whenever there are actuator problems. There are four test points provided on the DCM-3 board (see illustration on page 24 for locations) that are used to measure the Demand input and internal Position signals directly at the DCM-3.

Measure the Demand signal voltage across TP2(+) and TP3(–) (see page 24 for location). A typical 4–20 mA input signal will measure a proportional 1–5 V dc across the test points. It is important to verify that the measured voltage corresponds correctly to the signal that is being applied. If there is a mismatch, further troubleshooting is required.

The Position signal to the DCM-3 is generated by the actuator's CPS-5. The CPS-5 is designed to provide a 1–5 V dc signal to the DCM-3 corresponding to 100 degrees of actuator output shaft rotation (for 90° rotation, the signal is 1.2–4.8 V dc). The Position signal can be determined at the DCM-3 by measuring the voltage across TP4(+) and TP1(–) (see page 24). Verify that this signal matches Demand and the position of the output shaft (see chart below).

Both the Demand and Position signals can also be checked at the appropriate terminals in the terminal block, via HART communications or through the Serial port. All values should agree with test point values. Any differences will require further troubleshooting.

CPS-5 POSITION SIGNAL VOLTAGES

Shaft Position	100° Rotation		90° Rotation	
	CW	CCW	CW	CCW
0%	1.0	5.0	1.2	4.8
25%	2.0	4.0	2.1	3.9
50%	3.0	3.0	3.0	3.0
75%	4.0	2.0	3.9	2.1
100%	5.0	1.0	4.8	1.2

CHECK DCM-3 OPERATION MODE SETTING

The DCM-3 can be configured for several operational modes as shown in HART menu 3E (page 66) or Serial command "opmode" (page 74).

The factory configuration is the "Follow" mode. In this mode, the actuator is positioned by the 4–20 mA Demand signal when the Handswitch is set to AUTO.

The “Hold” mode causes positioning according to the HART Interface Demand Value (HART menu 3E).

DRAFT

The “Stay" mode causes the output shaft to remain stationary and maintain its present position. In "Stay" mode, the Handwheel cannot be freely turned as it will move back to the position where the "Stay" mode was activated.

The "Stop" mode removes power from the motor. In "Stop" mode the Handwheel can be freely turned. All operating modes can be overridden by the actuator Handswitch. If the operation mode is (inadvertently) switched to a mode other than "Follow" there will not be an outward indicator. ***Note that resetting the DCM-3 to factory settings does <u>not</u> change the operational mode back to "Follow" for safety purposes.***

CHECK SHAFT POSITION

The output shaft position (%) can be viewed in HART (menu 1) or by running the Serial command "stat".

If the Position value (%) does not appear to match the physical output shaft position, a CPS-5 rotor adjustment may be required. Follow these directions to correct positioning (see page 49 for component identification):

1. Rotate the rotor on the control end shaft until the dc voltage measured across terminals + and R reads 50% of the signal span (approx. 3 volts). Tighten clamp to 5 lb-in (0.6 N•m) torque.
2. Using the Handswitch, rotate the output shaft of the actuator in the clockwise direction. The dc voltage measurement across the + and R (–) terminals should increase, in which case the rotor adjustment is complete. If the voltage decreases, however, the rotor is out of phase with the actuator travel and will require adjustment, continue to step 3.
3. Position the actuator with the Handswitch until the voltage reading across terminals + and R (–) is approximately 3 volts.
4. Loosen the rotor clamp screw and rotate the rotor 180 degrees. Verify the voltage is 3.0 volts and tighten the rotor clamp screw. Repeat step 2.

Note: The position signal can also be measured across DCM-3 test points TP4 (+) and TP1 (–) rather than CPS-5 terminals (+) and R (–).

CHECK DCM-3 INHIBITORS / STATISTICS

Conditions that prevent the DCM-3 from positioning the actuator are called inhibitors. HART MENUS 5F and 5G list the CW and CCW inhibitors respectively. Inhibitors may also be reviewed by running the Serial command "stat" (see page 75). The following list indicates why the inhibitor would be in the “ON” state. Note that not all conditions are present in all DCM versions.

<u>Balance</u>
Demand and position are balanced.

<u>Supervisory</u>
DCM-3 is initializing.

<u>Stall</u>
A stall condition has been detected.

<u>OverTrq/Thr</u>
Excessive torque load on output shaft.

<u>Switch Block</u>
Not applicable for Group 11 actuators.

<u>Bad Pos Sig</u>
The position signal is out of range.

<u>Bad Dem Sig</u>
The Demand signal is out of range.

<u>Local Cal</u>
The calibrate button is being pressed on the pushbutton panel.

The factory can assist with troubleshooting—please provide the results of the above review to expedite assistance.

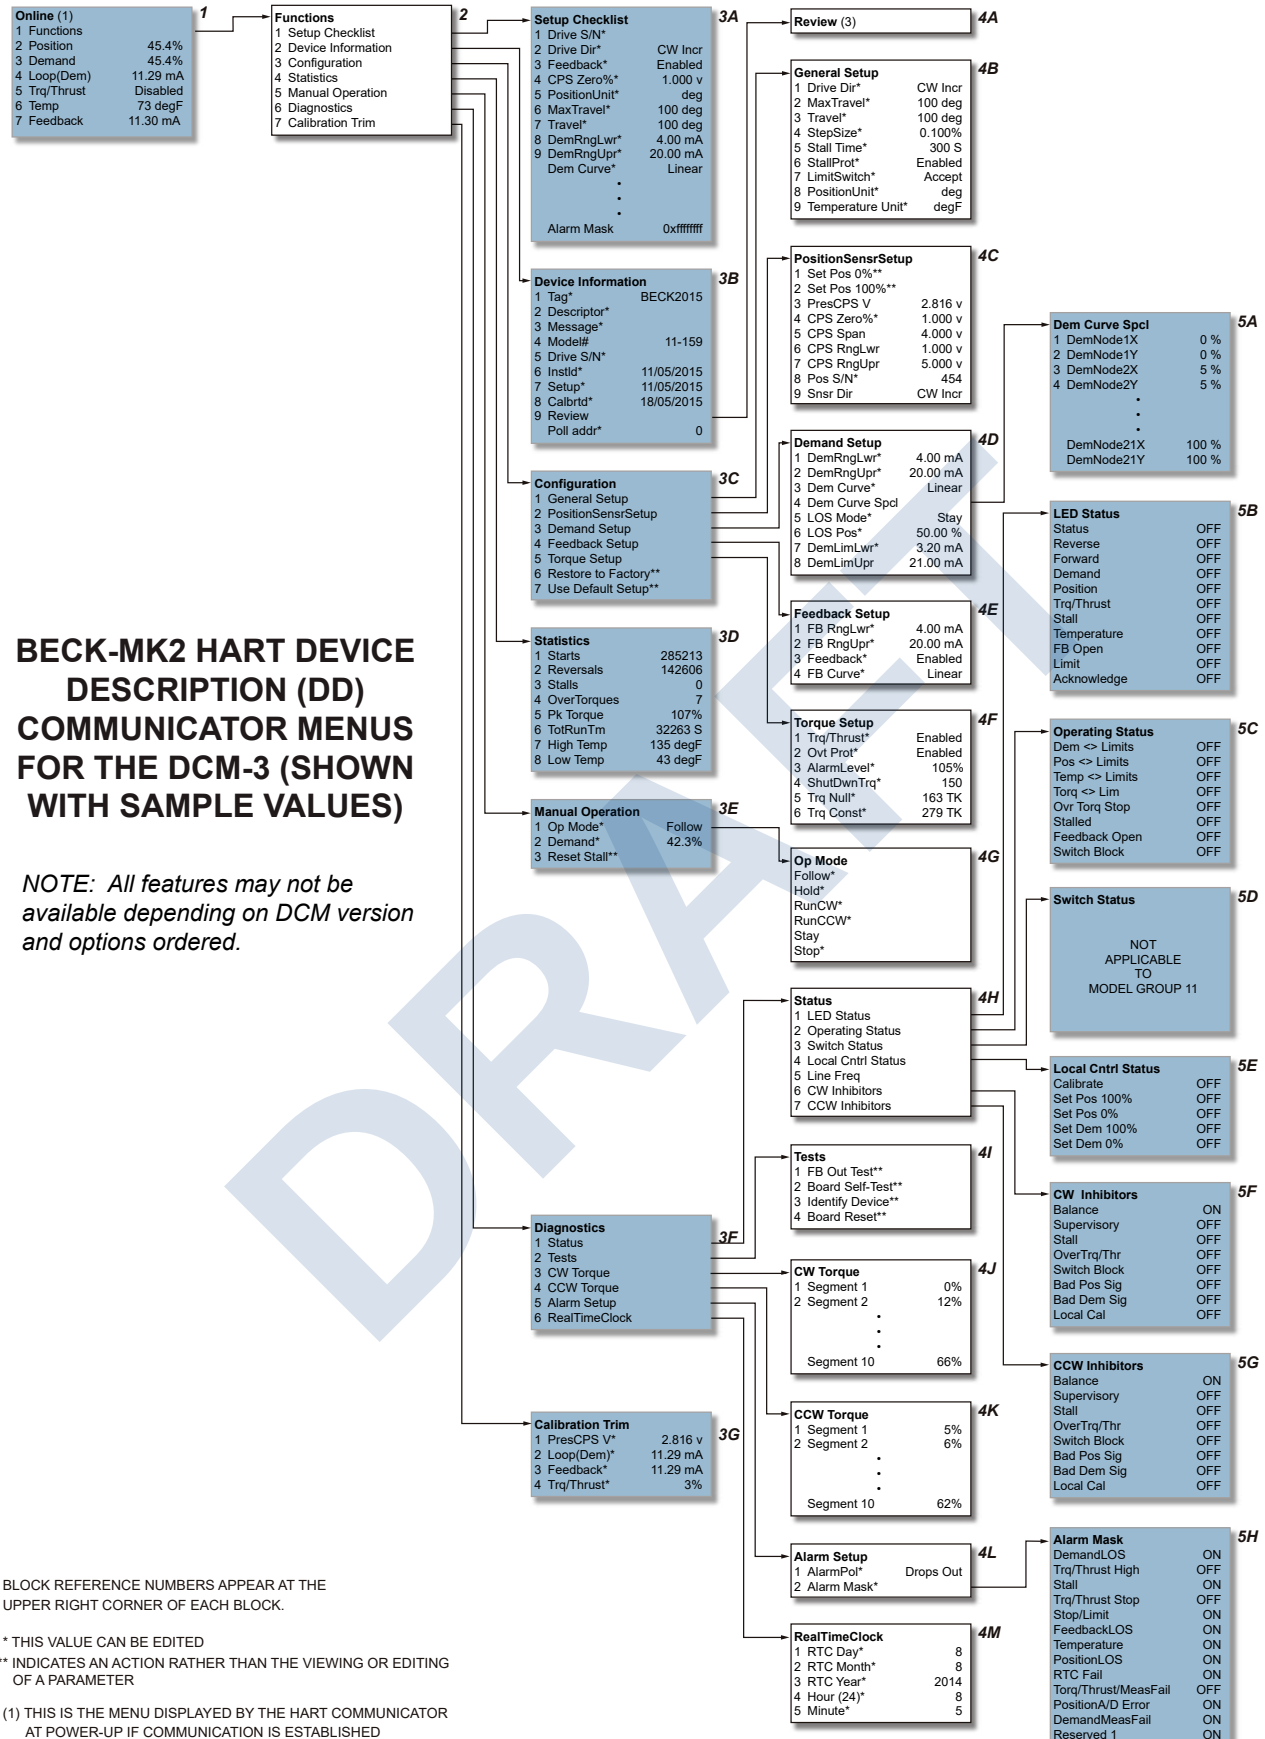
DRAFT

TROUBLESHOOTING

CONDITIONS	POSSIBLE CAUSES	CORRECTIONS
1. No DCM-3 LEDs are illuminated.	a. No power is applied to the actuator. b. Incorrect power is applied to the actuator. c. Main power fuse/breaker is blown. d. DCM-3 malfunction.	a. Apply operating voltage to the operating voltage terminals. b. Verify correct voltage on actuator nameplate and ensure that it is applied at the operating voltage terminals. c. Verify fuse/breaker integrity. Replace/reset if blown. Find cause of short circuit. d. Replace DCM-3.
2. STAT LED is illuminated.	a. A status alarm is active.	a. Check the status indication LEDs on the DCM-3. Continue troubleshooting based on the LEDs that are illuminated.
3. Demand LED is illuminated.	a. No Demand signal. b. Applied Demand signal is outside of configured range. c. Polarity of applied signal wires is reversed.	a. Apply a Demand signal to terminals AA (+) & BB (–). b. Confirm Demand signal value via HART or by measuring DC voltage across DCM-3 test points TP3(+) & TP2(–). Should be 1–5 volts for 4–20 mA applied signal. c. Correct the polarity of the applied control signal wires on terminals AA (+) & BB (–).
4. POSITION LED is illuminated.	a. Position signal voltage generated by CPS-5 read by the DCM-3 is outside of the configured range. b. CPS-5 malfunction. c. DCM-3 malfunction.	a. Using the HART communicator check the Position Sensor Setup menu to verify the Present CPS voltage falls within the configured CPS Zero% and Span (typical range 1–5 volts); OR measure DC voltage between DCM-3 test points TP4 (+) and TP1 (–) to verify Present CPS voltage. If the voltage is outside of 1–5 volts, recalibrate or replace the CPS-5. b. Replace CPS-5. c. Replace DCM-3.
5. TORQUE LED is illuminated (applicable only to actuators equipped with optional torque sensing).	a. Torque exceeding configured limit (typically over 150% of rated torque) is being applied to the output shaft. b. Torque Null and Torque Constant values are not set correctly. c. Torque cable is not connected to DCM-3.	a. Eliminate cause of excessive torque (i.e., binding damper, improper linkage, etc.). b. Locate Torque Null and Constant values inside DCM compartment and set via HART or Serial port. c. Reconnect torque cable to DCM-3.
6. STALL LED is illuminated.	a. Actuator has stalled—unable to achieve desired position within the configured “STALL TIME”. b. The configured stall time is less than the configured Max Travel Time.	a. Eliminate the obstruction and reset the stall by reversing direction on your Demand signal, cycling the power, or issuing the stall reset from HART or Serial command. b. Configure the stall time to exceed the Max Travel Time via HART or Serial command.
7. TEMP F LED is illuminated.	a. The measured temperature at the DCM-3 is outside of the normal operating range of -40° to 185° F.	a. Protect the actuator from the extreme temperatures below or above the operating range to eliminate the alarm.
8. FB OPEN LED is illuminated.	a. The position Feedback circuit current loop is not complete. b. The position Feedback is enabled, but not in use.	a. Ensure the device measuring the 4–20 mA Feedback is properly terminated on terminals DD (–) and EE (+) and is applying a 0–800 ohm load resistance. b. Disable Feedback via HART or Serial command; OR terminate the Feedback loop by applying a 0–800 ohm load resistance across terminals DD and EE.

DRAFT

CONDITIONS	POSSIBLE CAUSES	CORRECTIONS
9. STOP/LIMIT LED is illuminated.	a. The applied power is below the tolerance (-15%) of the nameplate operating voltage. b. A DCM-3 fuse is open. c. A component failure has occurred on the DCM-3. d. The Handswitch is in STOP. e. The actuator has traveled to an over-travel limit switch. f. The actuator is not at an over-travel limit switch, but the limit switch is open.	a. Apply the correct operating voltage to the actuator per the voltage stamped on the nameplate. b. Replace the open fuse. c. Replace the DCM-3. d. Place the Handswitch in AUTO. e. Verify if the limit switch is set outside of the electrically calibrated limits. Readjust, if necessary, or replace. f. Replace the over-travel limit switch (CW/CCW) assembly.
10. Power LED is pulsing bright to dim.	a. This indicates normal function.	a. No action required.
11. All LEDs are illuminated or flashing.	a. A component failure has occurred on the DCM-3.	a. Replace the DCM-3.
12. REV LED is illuminated, actuator is not moving, and there are no other status alarms.	a. Operation mode is set to “STOP”.	a. Using HART (operation mode menu) OR using Serial command “opmode”, change operation mode to “Follow”.
13. Actuator will not hold position with Handswitch in STOP.	a. Self Locking Mechanism (SLM) is worn or damaged.	a. Rebuild the SLM assembly.
14. Motor runs, but the output shaft does not move in one or both directions.	a. Self Locking Mechanism (SLM) has failed.	a. Rebuild the SLM assembly.
15. PWR LED is flashing, no status LED’s are lit and does not respond to Demand signal or Handswitch.	a. The Handswitch is damaged. b. The Handswitch jumper between terminal A and C is missing or faulty.	a. Check continuity from terminals N to V and M to U with Handswitch in AUTO position. If either does not show continuity, replace Handswitch. b. Install a wire jumper between terminals A and C.
16. PWR LED is flashing, no status LED’s are lit, actuator functions with the Handswitch, but does not respond to Demand signal.	a. A plug-in jumper has been installed in the 24-pin connector (J2) of the DCM-3 board.	a. Remove any jumpers from the J2 connector on the DCM-3.
17. HART communications cannot be established with the DCM-3.	a. The device description (DD) file is not installed. b. The HART communicator is not compatible with Beck equipment. c. The HART communications circuit on the DCM-3 is damaged.	a. Install the Beck MK-2 DD on your HART device. b. Utilize a compatible HART communicator or configure the actuator through the Serial port. c. Replace the DCM-3.
18. Position voltage on DCM-3 testpoints TP4 and TP1 is within 1–5 volts DC following the actuator position, but the position Feedback signal at terminals DD and EE remains constant or is erratic.	a. The position Feedback circuit on the DCM-3 is damaged.	a. Replace the DCM-3.



DRAFT

TROUBLESHOOTING

CONDITIONS	POSSIBLE CAUSES	CORRECTIONS
19. Output shaft rotates opposite of desired direction when applying a 4–20 mA Demand signal.	a. The rotation direction is incorrectly configured.	a. Configure the rotation direction using pushbutton, HART, or Serial method.
20. Motor erratic or runs in wrong direction in AUTO or using Handswitch.	a. Motor winding is open. b. Motor capacitor is shorted or open. c. Motor resistor is open.	a. Replace motor assembly. b. Replace capacitor. c. Replace resistor assembly.
21. Actuator does not follow input signal until maximum or minimum is reached, then drives uncontrollably to limit.	a. Wire jumpers on terminals M and N are reversed. b. CPS-5 is not calibrated.	a. Connect terminal jumpers from M to D and from N to F. b. Recalibrate the CPS-5.
22. Actuator oscillates in AUTO mode.	a. Excessive noise on the input signal. b. Physical obstruction causing a stall condition (e.g., valve jammed or load greatly exceeds actuator rating.) c. The DCM-3 is malfunctioning. d. Excessive wear in the gear train or bearings. e. CPS-5 Failure. f. Self Locking Mechanism (SLM) is worn or damaged.	a. Eliminate noise or increase actuator step size. b. Check operation with Handswitch and remove obstruction if present. Handswitch bypasses the DCM-3 board. c. Replace the DCM-3 board. d. Replace worn actuator parts. e. Replace the CPS-5 board. f. Rebuild the SLM.
23. Actuator will not run in either direction or one direction in AUTO or using Handswitch.	a. Over-travel limit switch failure. b. Handswitch failure.	a. Replace over-travel limit switch assembly (CW/CCW). b. Replace Handswitch assembly.
24. Actuator does not stop at normal or desired limit of shaft travel.	a. DCM-3 position calibrated incorrectly. b. Limit switches set incorrectly. c. Over-travel limit switch failure.	a. Calibrate DCM-3 0% and 100% positions. b. Readjust the limit switches. c. Replace the over-travel limit switch assembly (CW/CCW).
25. Position Feedback signal does not reach maximum signal, but low end calibration is correct.	a. Feedback loop is overloaded.	a. Make sure that the load resistance is between 0 and 800 ohms total across terminals DD and EE.
26. Actuator runs uncontrolled to one end of travel.	a. Handswitch Failure. b. The DCM-3 is malfunctioning. c. The CPS-5 is malfunctioning. d. Terminal block jumpers F to N and D to M not connected. e. The actuator has detected a loss of Demand signal (LOS) and is configured for GTP 0% or 100%. f. Handswitch in CW or CCW position.	a. Check continuity from terminals A–V and A–U with Handswitch in AUTO and actuator power disconnected. If either shows continuity, replace Handswitch. b. Verify CPS-5 voltage signal at DCM-3 test points TP4 and TP1 for 1–5 volts DC corresponding with output shaft position. If signal is valid, replace DCM-3. c. Verify CPS-5 wire connections, check voltage at DCM-3 test points TP4 and TP1 for 1–5 volts DC corresponding with output shaft position. Replace CPS-5 if voltage does not change with position. d. Install jumpers. e. See troubleshooting condition no. 3 (Demand LED is illuminated). f. Return Handswitch to AUTO position.

DRAFT

APPENDIX HART® Communication

BECK-MK2 HART DEVICE DESCRIPTION (DD) COMMUNICATOR MENUS FOR THE DCM-3 (SHOWN WITH SAMPLE VALUES)

NOTE: All features may not be available depending on DCM version and options ordered.

DRAFT

BLOCK REFERENCE NUMBERS APPEAR AT THE UPPER RIGHT CORNER OF EACH BLOCK.

* THIS VALUE CAN BE EDITED

** INDICATES AN ACTION RATHER THAN THE VIEWING OR EDITING OF A PARAMETER

(1) THIS IS THE MENU DISPLAYED BY THE HART COMMUNICATOR AT POWER-UP IF COMMUNICATION IS ESTABLISHED

(2) THIS AND OTHER OFFLINE MENUS ARE COMMON TO ALL HART COMMUNICATOR APPLICATIONS - MANY SUBMENUS EXIST

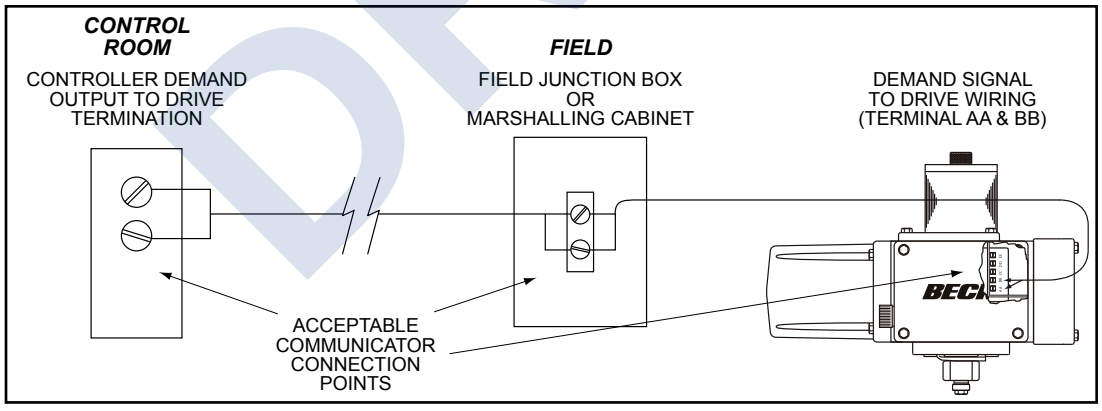
(3) PROVIDES AN EXTENDED LIST OF DRIVE PARAMETERS

The DCM-3 board is the control center of the actuator—configuration and calibration are accessed and set through the DCM-3 board. Using the HART interface requires a HART compatible communicator or any device, computer or controller capable of communicating with HART devices and supporting the Beck DCM-3 device description. This instruction supports actuators equipped with a DCM-3 (p/n 22-5014-59). This DCM-3 interfaces with the BECK-MK2 Device Description.

HART® INTERFACE

The interface menu tree for communicating with a DCM-3 using the BECK-MK2 Device Description is located on the previous page. This menu tree summarizes possible setup options, features and available information.

HART® COMMUNICATORS FOR BECK-MK2



The BECK-MK2 Device Description requires a HART Communicator that is HART 5 capable and has the ability to import Device Description Language Files (DDL) that are certified by the HART Communications Foundation.

USING THE 275, 375 OR 475 HART® COMMUNICATOR

The HART Communicator leads should be connected in parallel with the analog Demand signal wiring. This allows the communicator to simultaneously communicate over the analog input wires. This does not disturb the analog Demand signal, or disrupt the DCM-3 functions. However, any program changes to the DCM-3 will momentarily suspend the operation of the board (maintains last state) while the change is implemented. Typically, this is only for a second or two.

With the communicator connected in parallel anywhere across the analog Demand wires (see illustration below), it is ready to communicate. Turn on the communicator and wait for communications to be established. When communications are established, the “Online” display will appear. If the actuator is multidropped with other devices on a HART network, the first display screen will list all devices and require a selection before the “Online” display is shown. Follow the HART DD menu on the previous page to navigate.

NOTE: If the communicator is unable to communicate with the DCM-3, it displays the message, “No Device Found”. If this occurs, check to make sure the leads are securely connected to the Demand wiring and retry. If communications still do not occur, the communicator polling setup may be improperly set. Check the “utility” menu and make sure communications polling is set to “always poll”.

MENU DESCRIPTIONS

(See HART Communicator Menu on page 60)

MENU 1 -- Online

When communications are established with the communicator, the Online menu is displayed.

1 **Functions**: The link to the menu tree.

2 **Position**: The output shaft position displayed as a percent of range.

3 **Demand**: The Demand signal displayed as a percent of range.

4 **Loop (Dem)**: The Demand signal measured in mA.

5 **Trq/Thrust**: The present torque value as applied to the output shaft (optional).

6 **Temp**: The ambient temperature of the DCM-3.

7 **Feedback**: The milliamp output signal representing the present position of the output shaft.

DRAFT

MENU 2 -- Functions

From the Functions menu, any of the DCM-3 functional menus can be selected and accessed. There are seven functional areas: Setup Checklist, Device Information, Configuration, Statistics, Manual Operation, Diagnostics, and Calibration Trim.

MENU 3A -- Setup Checklist

The Setup Checklist provides a quick way for the user to setup the most important items necessary for basic actuator operation without having to move through multiple sub-menus. These items are defined on the following pages in their specific menu locations.

MENU 3B -- Device Information

The Device Information menu provides information about the actuator. There are ten useful information entries that may be viewed and/or edited.

1 **Tag**: An 8 character entry that can be used to identify a specific field device label.

2 **Descriptor**: A 16 character field that can be used to provide any description desired.

3 **Message**: A 32 character field that can be used to provide any message desired.

4 **Model#**: Displays the model number of the actuator in which the DCM-3 is installed. This field may be edited. Note that changing this field may cause the “Use Default Setup” command to not function.

5 **Drive S/N**: The Serial number as shown on the actuator nameplate.

6 **InstId**: Installation date of the actuator or DCM-3.

7 **Setup**: The setup date has no affect on actuator operation.

8 **Calbrtd**: The calibration date has no affect on actuator operation.

9 **Review**: Link to the Review menu.

10 **Poll addr**: Used to find the actuator. Most configurations should use "0".

MENU 3C -- Configuration

The Configuration menu serves as the gateway to all of the actuator operating parameters that can be used to configure the actuator based on the desired operation.

1 **General Setup:** Link to General Setup menu.

2 **PositionSensrSetup:** Link to PositionSensrSetup menu.

3 **Demand Setup**: Link to Demand Setup menu.

4 **Feedback Setup**: Link to Feedback Setup menu.

5 **Torque Setup (optional)**: Link to Torque Setup menu.

6 **Restore to Factory**: Restores field-configurable parameters back to the settings in effect when the DCM-3 was shipped from the factory.

7 **Use Default Setup**: Changes the DCM-3 position sensing voltage ranges to the proper ranges for the actuator model.

MENU 4B -- General Setup

This menu sets actuator operating parameters. The nine parameter entries are as follows:

1 **Drive Dir**: The direction the output shaft rotates (looking into the output shaft) in response to an increasing Demand signal.

2 **MaxTravel**: The maximum available travel distance of the output shaft in degrees. This number corresponds to the actuator design—if the correct Serial Number is entered, this parameter should not be changed.

3 **Travel**: The number of degrees of output shaft travel for 100% span.

4 **StepSize**: The smallest Demand change that will cause an output shaft movement.

5 **Stall Time**: The amount of time the motor will run before Stall Protection is initiated.

6 **StallProt**: This entry is set as either “Enabled” or “Disabled”.

7 **LimitSwitch**: This entry is set as either “Accept” or “Alert” and defines whether or not contacting an overtravel limit switch outside of the normal 0% to 100% travel range will cause an alarm condition.

8 **PositionUnit**: The numeric unit of measure for the output shaft position in angular degrees.

9 **Temperature Unit**: The unit of measure for temperature sensing. May be “degF” (fahrenheit) or “degC” (celsius).

MENU 4C -- PositionSensrSetup

This menu contains parameters that determine how the DCM-3 interprets the output shaft position signal from the CPS-5.

1 **Set Pos 0%**: Sets the 0% position to match the present output shaft position. This does not change the 100% position.

2 **Set Pos 100% Span**: Sets the 100% position

DRAFT

to match the present output shaft position. Also instructs the DCM-3 to change "Travel" span based on the 0% position. This does not change the 0% position.

3 **PresCPS V**: Displays the CPS-5 signal voltage at the present output shaft position. Not editable.

4 **CPS Zero%**: Displays the CPS-5 voltage at the 0% output shaft position. May be edited to define the voltage at the lowest operating point of travel.

5 **CPS Span**: Displays the voltage signal span from the CPS-5 for maximum possible rotation of the output shaft. This is the upper range voltage minus the lower range voltage. Not editable.

6 **CPS RngLwr**: Displays the CPS-5 voltage signal at the lowest possible point of travel. Not editable.

7 **CPS RngUpr**: Displays the CPS-5 voltage signal at the highest possible point of travel. Not editable.

8 **Pos S/N**: Displays the Serial number of the CPS-5 and has no effect on actuator function.

9 **Snsr Dir**: The direction of output shaft rotation that causes the CPS-5 signal to increase. This direction is typically CW and is not editable.

MENU 4D -- Demand Setup

The parameters on this menu determine the range and characterization of the Demand signal. It also includes parameters that determine behavior when the Demand signal is absent.

1 **DemRngLwr**: Sets and displays the signal value in mA that represents 0% Demand (default is 4.00 mA, minimum is 0.5 mA). This value should be set above "DemLimLwr".

2 **DemRngUpr**: Sets and displays the signal value in mA that represents 100% Demand (default is 20.00 mA, maximum is 21.00 mA). This value should be set below "DemLimUpr".

3 **Dem Curve**: Determines the relationship between the Demand signal and the position of the output shaft. Typically set to Linear, but may also be set to Square, Square Root or customized Special Curve.

4 **Dem Curve Spcl**: Link to the "Dem Curve Spcl" menu. (Not available with all DCM versions).

5 **LOS Mode**: Action on loss of Demand signal.

6 **LOS Pos**: If the "LOS Mode" has been set to "Go-to-Pos", this defines where the output shaft will move (in percent of travel) during loss of Demand signal conditions.

7 **DemLimLwr**: Sets the threshold (in mA) below which the Demand signal is considered lost. This value should be set below "DemRngLwr".

8 **DemLimUpr**: Sets the threshold (in mA) above which the Demand signal is considered invalid. The Demand alarm will activate until the signal is brought below this level. This value should be set above "DemRngUpr".

MENU 5A -- Dem Curve Spcl

This menu allows setting the Demand signal characterization curve.

MENU 4E -- Feedback Setup

This menu is where all the Feedback signal related actuator parameters are set.

1 **FBRngLwr**: The value of the Feedback signal (in mA) that corresponds to a 0% output shaft position. This value can range between 3.00 mA and 16.00 mA (default = 4.00 mA).

2 **FBRngUpr**: The value of the Feedback signal (in mA) that corresponds to a 100% output shaft position. This value can range between 7.00 mA and 21.00 mA (default = 20.00 mA).

3 **Feedback**: Enables or Disables the Feedback signal.

4 **FB Curve**: Allows a choice between a Feedback signal that linearly represents true shaft position or a characterized Feedback signal that inverts the effect of a characterized Demand signal.

MENU 4F -- Torque Setup (optional)

This menu is where all Torque related actuator parameters are set. NOTE: Torque features require torque sensing hardware. This is an extra-cost option that must be specified at time of order.

1 **Trq/Thrust**: Enables or disables torque sensing.

2 **Ovt Prot**: Enables or disables overtorque protection which will remove power from the motor if excessive torque is detected.

3 **AlarmLevel**: Sets the value that, if exceeded, will cause the Torque Alarm to activate.

4 **ShutDwnTrq**: Sets the output shaft torque in percentage of actuator rating that, if exceeded, removes power from the motor.

5 **Trq Null**: The torque sensor value that represents 0% output shaft torque.

6 **Trq Const**: The internal DCM-3 signal span associated with the output shaft torque. This value is determined during manufacture and is noted on a label inside the DCM-3 cover.

DRAFT

MENU 3D -- Statistics

This menu is where all the actuator's stored operating statistics are available.

1 Starts: The total number of motor starts.

2 Reversals: The total number of times the motor has started in the direction opposite to the previous start.

3 Stalls: The total number of times the stall time has been exceeded.

4 OverTorques (optional): The total number of times that excessive torque was detected at the output shaft.

5 Pk Torque (optional): The highest recorded torque on the output shaft.

6 TotRunTm: Total amount of time the motor has been powered (in seconds).

7 High Temp: Highest temperature recorded in the DCM-3 compartment (in degrees fahrenheit).

8 Low Temp: Lowest temperature recorded in the DCM-3 compartment (in degrees fahrenheit).

MENU 3E -- Manual Operation

This menu is used to allow manual operation using HART® communications. There are three manual operation procedures available:

1 Op mode (Menu 4G): Selects the operating mode of the DCM-3. There are six possible choices: "Follow", "Hold", "RunCW", "RunCCW", "Stay" and "Stop". "Follow" mode is the normal state of operation and allows the DCM-3 control in response to the analog input Demand signal. "Hold" mode forces the DCM-3 to position according to the HART Demand value (see right). "RunCW" mode forces the actuator to move CW. "RunCCW" forces the actuator to move CCW. The "Stay" mode forces the actuator to maintain its present position. Note that in "Stay" mode, the Handwheel cannot be freely turned. The "Stop" mode removes power from the motor. Note that in "Stop" mode the Handwheel can be freely turned. Note that the Handswitch overrides all operating modes.

2 Demand: This procedure sets the effective Demand signal. If "Op mode" is set to "Hold", entering a valid value (-5% to 105%) will control the motor. If "Op mode" is set to "Follow", the analog Demand signal is displayed (unless an alarm condition exists).

3 Reset Stall: This procedure resets normal actuator operation after a stall condition has caused the motor to shut down. Note that stall conditions can also be reset by simply reversing the input Demand signal or cycling the actuator AC power.

MENU 3F -- Diagnostics

This menu provides access to all DCM-3 stored diagnostic information concerning actuator operation.

MENU 4H -- Status

This menu provides links to menus that monitor the operational status of the actuator. It also displays one parameter, line frequency.

5 Line Freq: The power line frequency as measured by the DCM-3.

MENU 5B -- LED Status

The LED Status parameter allows remote checking of which LED's on the DCM-3 are illuminated.

MENU 5C -- Operating Status

The Operating Status parameter is a summary of whether process-related conditions are inside or outside of anticipated limits. These conditions control the Status Indication LEDs.

1 Demand: Caused by the Demand signal falling below or above acceptable levels.

2 Position: Caused by the CPS-5 signal being outside the range anticipated by the DCM-3.

3 Temperature: The ambient temperature of the DCM-3 is outside of the rating.

4 Torque (optiona): Warns that torque is high.

5 Overtorque Stop (optional): Overtorque protection is preventing the DCM-3 from running the motor.

6 Stalled: A Stall alarm is active.

7 Feedback Open: The Feedback signal is enabled, but cannot follow the proper current.

8 Switch Block: The DCM-3 cannot power the motor due to an electro-mechanical switch. Check the Handswitch and over-travel limit switches.

MENU 5D -- Switch Status

Not applicable to Group 11 actuators.

DRAFT

MENU 5E -- Local Cntrl Status

This parameter allows remote monitoring of which buttons on the local configuration interface are being pressed.

MENU 5F -- CW Inhibitors

Allows viewing of the DCM-3 condition that is preventing the actuator motor from running in the CW direction.

MENU 5G -- CCW Inhibitors

Allows viewing of the DCM-3 condition that is preventing the actuator motor from running in the CCW direction.

MENU 4I -- Tests

This menu provides access to some routines that help determine if the actuator is functioning properly.

1 FB Out Test: Allows manual verification of the Feedback output signal to check operation and accuracy.

2 Board Self-Test: Instructs the DCM-3 to check various power and sensing circuits. This test will cause the actuator to reposition, so it should be run offline and only when a DCM-3 problem is suspected.

3 Identify Device: Causes the ACK LED on the DCM-3 to flash for two seconds. Ensures the HART system is addressing the correct actuator.

4 Board Reset: Causes the DCM-3 to initiate a reset cycle similar to a power-up reset. This manual reset will cause the actuator to reposition. This procedure is not typically necessary.

MENU 4J -- CW Torque (optional)

This menu displays the peak output shaft torque measured for 10 segments. These torque values are measured with the motor running and moving the output shaft CW.

MENU 4K -- CCW Torque (optional)

This menu displays the peak output shaft torque measured for 10 segments. These torque values are measured with the motor running and moving the output shaft CCW.

MENU 4L -- Alarm Setup

The Alarm Setup menu parameters allow modification of the behavior of the alarm.

1 AlarmPol: Whether the solid state relay opens on alarm or closes on alarm.

2 Alarm Mask: Link to the Alarm Mask menu which allows specific alarm conditions to be ignored.

MENU 5H -- Alarm Mask

Allows selection of alarm conditions that will not cause an alarm at terminal E.

MENU 4M -- RealTimeClock

This menu allows the date and time to be set.

1 RTC Day: Day of the month (numeric value).

2 RTC Month: Month (numeric value).

3 RTC Year: Year (4 digits).

4 Hour (24): Hour of the day (24 hour format).

5 Minute: Minute of the hour (0 through 59).

MENU 3G -- Calibration Trim

The Calibration Trim menu sets and displays actuator calibration values. **Note that changing the calibration trim can cause signal measurement difficulties if performed improperly.**

1 PresCPS V: Displays and/or trims the present voltage of the position signal. This value may also be measured at DCM-3 test points TP1(–) and TP4(+). This trim is set and tested at the factory. Changing this value can cause voltage measurement errors.

2 Loop(Dem): Displays the Demand signal as measured at the field wiring terminals. When the Demand control loop signal is being overridden by a special mode of operation, the effective Demand will not correspond to the mA value. This value can be edited to trim the Demand to ensure accurate measurement of the analog signal. Demand can only be trimmed at 4.0 mA and 20.0 mA.

3 Feedback: Displays the mA signal representing the output shaft position as measured at the field wiring terminals. This value can be edited.

4 Trq/Thrust (optional): Displays the load measured at the output shaft as a percentage. This is also a short cut to set the 0% torque parameter (“Trq Null”) by removing load from the output shaft, then writing a “0” to this value.

DRAFT

APPENDIX HART® Messages

COMMON HART® MESSAGES

HART® protocol maintains both standard and device specific informational messages that are displayed on the Communicator when various conditions occur.

Below is a table of typical Beck actuator messages and message sequences. It does not include all possible messages, only the most common. (NOTE: Not all messages are applicable to all DCM versions).

Output Shaft Position Measurement Messages

Message	Description
"Process applied to the primary variable is outside the operating limits of the field device."	This is a standard HART-defined message that appears whenever the HART primary variable (Position signal) is outside the design or calibrated range. This message should be accompanied by a Beck-specific message with more detail.
"The Position Signal is less than -5% or greater than 105%."	This Beck-specific message indicates the DCM-3 is reading a Position signal not within the calibration range limits.
"Position signal in LOS."	This is a Beck-specific message. The DCM-3 is indicating that the Position signal is a problem and is intended to identify a CPS-5 or wiring failure. This is triggered when the Position signal is outside the minimum and maximum voltage limits.
"Position out of accurate measurement range."	This is a Beck-specific message. The DCM-3 indicates the Position signal is outside of the design range.
"Position sensing error."	This is a Beck-specific message. The DCM-3 circuitry for measuring the Position signal does not appear to be functioning properly.
"Analog output 1 and its digital representation are outside the operating range limits, and not responding to input."	This is a standard HART-defined message that appears whenever the position signal to the DCM-3 is outside the design or calibrated range. This message should be accompanied by a Beck-specific message with more detail.

Handswitch and Over-travel Limit Switch Message

Message	Description
"Motor power is blocked, check switches."	This message will appear if the DCM-3 detects a condition that prevents current flow to the motor.

Stall Protection Message

Message	Description
"Stall condition has been detected (see 'Stall Time' in the 'General Setup' menu)."	This is a Beck-specific message indicating that the actuator is in a stalled condition. This occurs if the actuator cannot reach the Demand position in the time allotted by the stall time setting (configurable from 30–450 seconds).

DRAFT

Demand, Torque and Temperature Measurement Messages

Message	Description
"Process applied to the non-primary variable is outside the operating limits of the field device."	This is a standard HART-defined message that appears whenever the Demand signal or Temperature are outside their design or calibrated ranges. This message should be accompanied by a Beck-specific message with more detail.
"The Demand Signal is outside of the intended limits (see Demand Setup menu)."	This Beck-specific message indicates the Demand signal is invalid.
"Demand out of accurate measurement range."	This is a Beck-specific message that the Demand signal is not only out of the calibrated range, but also out of the design range of the actuator. The lower and upper limits are 0.1 V dc and 5.5 V dc, respectively. Note that current input DCM-3 boards utilize a 250 Ohm input resistor to convert the current signal to voltage.
Demand Signal is out of limit.	This Beck-specific message indicates the Demand signal is too high to measure accurately. The upper limit is 5.5 V dc. Note that current input DCM-3 boards utilize a 250 Ohm input resistor to convert the current signal to voltage.
Demand sensing error.	This is a Beck-specific message. The Demand sensing circuitry does not appear to be functioning properly.
The Torque/Thrust is greater than the output rating.	This Beck-specific message defines an output shaft torque overload problem.
Motor power has been removed due to excessive output torque.	This Beck-specific message indicates the DCM-3 has removed power from the motor due to excessive output shaft torque load. The Handswitch must be in AUTO mode for this alarm to be accurate.
Torque/Thrust out of accurate measurement range.	This is a Beck-specific message. The DCM-3 is not able to read a valid signal from the Torque sensor.
Torque/Thrust sensing error.	This is a Beck-specific message. The DCM-3 circuitry for measuring the Torque signal does not appear to be functioning properly.
The temperature is outside of -40°F to 185°F.	This is a Beck-specific message indicating that the temperature at the DCM-3 is outside of the acceptable range.
Temperature out of accurate measurement range.	This is a Beck-specific message. The DCM-3 ambient temperature reading is extreme and cannot be accurately measured.
Temperature A/D Fail.	This is a Beck-specific message. The DCM-3 circuitry for measuring the ambient temperature does not appear to be functioning properly.
The Feedback Signal is enabled but the loop is open.	This is a Beck-specific message indicating that the Feedback sourcing circuit is unable to create the proper signal current. This message could result from the signal not being wired to an external load, or a wiring failure has occurred at some point between the actuator and the monitoring device.

DRAFT

Questionable Configuration Messages

Message	Description
Analog output 1 and its digital representation are in fixed mode, and not responsive to input changes.	Standard HART-defined message that appears whenever the Feedback signal has been manually assigned a value. This message should be accompanied by a Beck specific message with more detail.
Feedback is in fixed mode.	A Beck-specific message indicating that the Feedback signal has been manually set to a fixed value and is not following the Position value.
Local control button pressed while locked-out.	A Beck-specific message indicating an incorrect combination of pushbuttons is being pressed on the local configuration interface, or the local control interface is disabled and a pushbutton is being pressed.
Loop Current Detected while under HART/FF Control.	A Beck specific alarm message that alerts the user that analog current is present on the Demand terminals, but the DCM-3 is in an Op Mode expecting digital control. Make certain the Op Mode parameter is set properly.
Loop Current Detected while set for LOS PAT.	A Beck specific alarm message that alerts the user that analog current is present on the Demand terminals, but the DCM-3 is set to a LOS mode intended to be used without an analog signal.

DCM-3 Failure Messages

Message	Description
Real-time Clock hardware failure.	This is a Beck-specific message. The data in the Real-time Clock appears invalid.
FRAM Memory has failed.	A Beck-specific message. The continuous built-in self-test cannot verify the memory for statistics information is operating properly.
Memory failure.	This is a Beck-specific message. The continuous built-in self-test cannot verify the microcomputer is operating properly.

Miscellaneous HART-Defined Messages

Message	Description
Field device has more status available.	This is a standard HART-defined message that appears whenever the DCM-3 signals the HART master that an alarm or other undesirable status exists. This is the HART protocol mechanism for displaying the other messages in this section. If this message is displayed without an additional message, the status cleared before the HART master read the additional status.
A reset or self-test of the field device has occurred, or power has been removed and reapplied.	This message is presented by the HART master if the DCM-3 has gone through a power-up reset sequence since the last communication with the master. This message is only displayed once after a reset.
A modification has been made to the configuration of the field device.	This message indicates that the DCM-3 has undergone a configuration change since the last time the HART master has reset the change flag. Many HART masters disregard the flag and do not report this message.
Field device has malfunctioned due to a hardware error or failure.	This message indicates that the continuous built-in self-test cannot verify the microcomputer is operating properly.

DRAFT

APPENDIX Serial Communication

COMMUNICATIONS

Local configuration of the Beck actuator can be accomplished using Serial commands through the DCM-3 Serial port.

CAUTION

Changes made to the actuator through Serial communications may not necessarily be reflected in asset management systems. Be sure to verify any changes made serially and make manual corrections to the asset management system if necessary.

The Beck Digital Control Module (DCM-3) is equipped with a Serial interface which allows for direct communication with a computer. Using a standard DB9 to USB cable, connect the DCM-3 to the computer using the DCM-3's DB9 connector (see below for location) and one of the computer's USB ports. Note: If your computer is equipped with an active COM port, a DB9 to DB9 cable may be utilized. See below for part numbers of cables available from Beck.

Once connected, communication can be established between the DCM-3 and the computer using a terminal emulation program, such as HyperTerminal®. This method of communication will allow for configuration, calibration and verification of actuator DCM-3 settings without the use of custom software applications.

Hyperterminal® is a product of Hilgraeve, Inc.

HyperTerminal® SOFTWARE

HyperTerminal is the standard ASCII terminal emulation software provided with Microsoft® Windows®. If using HyperTerminal®, the following instructions will assist in setup. Note that some variation to these instructions may be necessary depending on the version of HyperTerminal® being used.

After connecting the DCM-3 to the (Windows®-based) computer, access HyperTerminal® by clicking first on "Start", then "Programs", then "Accessories", then "Communications", then "HyperTerminal". Double-click on the "Hypertrm.exe" icon to start the program. Once HyperTerminal® is running, it is necessary to set up a file with the proper settings to communicate with the DCM-3. Proceed as follows:

1. If prompted to install a modem, answer "no". Proceed to enter a name (e.g., "DCM-3") and select an icon (any will suffice) in the "Connection Description" box. Click the "OK" button.
2. The "Connect to" box should open next. At the bottom of the box, set the "Connect using" selection to the appropriate USB (or COM) port that has been connected to the DCM-3. Click the "OK" button.
3. The port properties box should open next; this is where the communication settings are established. The correct settings are:
   a. Bits per second = "1200"
   b. Data bits = "8"
   c. Parity = "none"
   d. Stop bits = "1"
   e. Flow control = "none"
4. With the appropriate settings entered from Step 3, above, click "OK". Communications should now be enabled.
5. Press the "Enter" key twice. "OK" should be displayed indicating that HyperTerminal® is communicating with the DCM-3.

Beck Serial Communications Cables

DB9 to USB-A
P/N 20-0511-60

DB9 to DB9
P/N 20-0511-14

*Note cables may differ in appearance from depiction.

DRAFT

APPENDIX Serial Commands

COMMANDS AND ARGUMENTS

Commands can be used for a variety of functions including changing the operating configuration of the actuator, verifying operation settings, calibration and accessing diagnostic information. There are essentially four different types of commands:

1. Dual-purpose commands. These commands can be used to either modify actuator configuration settings or display the settings already set in the actuator. In order to set or make a change to the settings, the command requires an argument (***n***). If the command is used for display purposes only, the argument is omitted. Examples of these commands include "temperature" and "demlos".
2. Display only commands. These commands are used to display diagnostic or operating information such as present signal values. No arguments are required. Examples include the "stat" command and the "signals" command.
3. Set only commands. These commands serve only to make a parameter change. Typically, they apply to the actuator calibration. This type of command requires an argument, but unlike dual-purpose commands, they return an error message when entered without an argument. Examples include the “charset” and “trimfdbk4mA” command.
4. Execute action commands. These commands serve to reset, enable or disable features. Entering these commands produces an immediate action. Examples include the "reset" and "restoremodes" command.

The available commands are listed on the next several pages and each is described in detail. The command description explains the use or uses of the command, while the argument column describes any applicable arguments. Arguments are denoted as ***n***. Note that the commands described as "sets and/or displays" signify dual-purpose commands that can be used with or without an argument for setting or verifying configuration settings.

DRAFT

APPENDIX Serial Commands

SERIAL COMMANDS

The following is a categorized list of Serial commands available through the DB9 interface. These commands are described in detail on the pages that follow.

Output Shaft Position Sensing Commands

cpsvat0pct	travel

General Configuration Commands

alarmout	restoremodes
alarmoutmask	sernum
configformodel	stallprot
drvdir	stalltime
limitalarm	stepsize
opmode	

Torque Sensing Commands (optional)

ovtstop	torqalarm
ovtstoplevel	torqconst
torq	torqenable
torq0k	torqprof
torq0pct	

HART® Configuration Commands

harttype	polladdr

Diagnostic and Information Commands

demsource	signals
help	stat
ledtest	temperature
reset	unstall

Demand Signal Commands

dem0pctma	demlosgtp delay
dem100pctma	trimdem4ma
demlos	trimdem20ma
demlosgtp	

Demand Characterizer Commands

charclear	charset
charlist	demfunc

Feedback Signal Commands

fdbk0pctma	trimfdbk4ma
fdbk100pctma	trimfdbk20ma
fdbkfunc	iomode

DRAFT

Output Shaft Position Sensing Commands

Command	Description	Argument *n* and Information
cpsvat0pct ***n***	Sets/displays the DCM-3 voltage setting used to determine 0% signal from the CPS-5. Voltage is dependent upon the actuator model. Typically, this setting does not need to be changed.	***n*** = desired voltage as a decimal (carried out to 3 decimal places). The standard signal range for an actuator configured for 100 degrees of output shaft rotation is approx. 1.000–5.000 V.
travel ***n***	Sets/displays the number of degrees that represents 100% travel. This command does not shift the 0% position; when increasing travel from a reduced travel setting, the 0% position may need to be changed first to keep travel within acceptable end points. The end points are defined by the CPS-5 voltage range.	***n*** = desired length of travel in degrees. This value cannot exceed the maximum output shaft rotation of the actuator.

General Configuration Commands

Command	Description	Argument *n* and Information
alarmout ***n***	Sets/displays the polarity of the alarm output solid state relay.	***n*** = "0": open on Alarm ***n*** = "1": closed on Alarm Upon loss of power, the relay is open regardless of the setting.
alarmoutmask ***n***	Sets/displays (in hexadecimal format) which conditions will cause an alarm: 0x00000001 - Demand Loss of Signal 0x00000002 - Torque High 0x00000004 - Stall Condition 0x00000008 - Torque Stop 0x00000010 - Stop/Limit 0x00000020 - Feedback Loss of Signal 0x00000040 - Temperature too High/Low 0x00000080 - Position Outside of Limits 0x00000100 - Real-time Clock Failure 0x00000200 - Torque Measurement Failure 0x00000400 - Position Analog/Digital Circuit Failure 0x00000800 - Demand Measurement Failure 0x00002000 - Position Loss of Signal 0x00004000 - Temperature Measurement Failure 0x00008000 - Memory Failure 0x00010000 - Invalid Button Pressed 0x00020000 - Demand too High	***n*** = "0x0": no listed condition causes a status alarm ***n*** = "0xffffffff": all listed conditions cause a status alarm ***n*** = hexadecimal value for specific condition(s) which will cause an alarm. Multiple conditions may be selected by performing a hexadecimal addition of the condition values; e.g., Stall Condition and Torque Stop alarms -- *hex* 0x04 + 0x08 = 0x0C.
configformodel ***n***	Sets certain DCM-3 default values based on the actuator Serial number. These values are direction rotation for an increasing CPS-5 signal, expected range of CPS-5 signal, and the maximum travel.	***n*** = "1": executes command
drvdir ***n***	Sets/displays the actuator output shaft rotation direction resulting from an increasing Demand signal.	***n*** = "0": CW rotation ***n*** = "1": CCW rotation
limitalarm ***n****	Sets/displays alarm action if the actuator travels outside of the electronic limits and contacts an over-travel limit switch.	***n*** = "0": mute (no alarm) ***n*** = "1": always
opmode ***n***	Sets/displays the mode that controls the Demand signal source. This mode selects analog or digital control.	***n*** = "0": analog Demand ***n*** = "1": digital Demand ***n*** = "2": run CW ***n*** = "3": run CCW ***n*** = "4": stay ***n*** = "5": stop
restoremodes ***n***	Returns the DCM-3 settings to the original factory configuration.	***n*** = "1": executes command
sernum ***n***	Sets the actuator Serial number.	***n*** = Serial number
stallprot ***n***	Sets/displays stall protection state.	***n*** = "0": disabled ***n*** = "1": enabled
stalltime ***n***	Sets/displays time the actuator runs in one direction before stall alarm is activated.	***n*** = seconds: acceptable range is 30–450 seconds.
stepsize ***n***%	Sets/displays the size of one incremental movement of the output shaft.	***n*** = % of travel desired: acceptable range is 0.10%–2.5%. Include the "%" symbol after the number, otherwise the unit of measure will be degrees.

*Not available with all DCM versions.

DRAFT

Torque Sensing Commands (available with optional hardware)

Command	Description	Argument *n* and Information
ovtstop *n*	Sets/displays whether motor power will be removed during severe overtorque conditions. Torque sensing must be installed and enabled.	*n* = “0”: disabled *n* = “1”: enabled
ovtstoplevel *n*	Sets/displays the torque magnitude associated with severe output shaft torque conditions.	*n* = allowable torque magnitude (without stopping motor) in percent of actuator rating. May be set from 25% to 150% (factory set to 150%).
torq	Displays the torque on the output shaft measurement as a percentage of actuator rating. Also displays related values such as torq0k and torqconst.	No argument.
torq0k *n*	Sets/displays the value of DCM-3 internal measurement corresponding to 0% torque on the output shaft.	*n* = the zero torque value in counts (noted on label inside DCM-3 cover).
torq0pct *n*	This is an alternate method for setting torq0k, and is useful when the correct torq0k value is not already known. To use this command, remove all load from the output shaft, then execute torq0pct with argument “0” to let the DCM-3 know that the torque sensing should be reading 0%.	*n* = “0”
torqalarm *n*	Sets and/or displays the torque magnitude associated with the first level of alarm.	*n* = allowable torque magnitude without alarm, in percent of actuator rating.
torqconst *n*	Sets/displays the value of DCM-3 internal measurement corresponding to the torque span (the measurement at 100% minus the measurement at 0%).	*n* = the torque span value in counts (noted on label inside DCM-3 cover).
torqenable *n*	Sets/displays the enabled or disabled status of torque sensing.	*n* = “0”: disabled *n* = “1”: enabled
torqprof	Displays a three table column: 1. Maximum travel divided into 10 segments 2. peak torque measured in each segment with motor running CW 3. peak torque measured in each segment with motor running CCW	No argument.

HART® Configuration Commands

Command	Description	Argument *n* and Information
harttype ***n***	Sets/displays the DCM-3 HART DD (Device Description). "239" is the proper DD; other DDs are for temporary use if the new DD is not available.	***n*** = "1": ESR-D ***n*** = "10": Beck DCM ***n*** = "239": Beck MK2
polladdr ***n***	Sets/displays the polling address used by the HART master to find individual devices if the HART bus has more than one device.	***n*** = the polling address (a number between "0" and "15"). Unless multiple HART devices are connected in parallel on a single bus, the polling address should be set to "0".

DRAFT

Diagnostic and Information Commands

Command	Description	Argument *n* and Information
demsource	Provides a readout of information regarding the Demand on the actuator including the source of the Demand signal (Handswitch, demlos or Analog I/P), mode (follow, hold, CW, CCW, Stay or Stop), currently applied Demand signal as a %, the Demand function (linear, square root, square, or special), and the Demand out as a % (dem out shows the signal adjusted when using a non-linear Demand function (demfunc command)).	No Argument
help ***n***	Displays help text for a specific command or lists all available Serial commands.	***n*** = command name ***n*** = "all"
ledtest ***n***	Tests the functionality of the DCM-3 LEDs individually or as a group. If "all" is selected, the command will consecutively cycle through each LED twice. If an individual LED is selected, it will flash 12 times.	***n*** = "1": DEMAND ***n*** = "2": POSITION ***n*** = "3": TRQ/THRUST ***n*** = "4": STALL ***n*** = "5": TEMP ºF ***n*** = "6": FB OPEN ***n*** = "7": STOP/LIMIT ***n*** = "8": ACKNOWLEDGE ***n*** = "100": FWD ***n*** = "101": REV ***n*** = "102": STAT ***n*** = "All"
reset ***n***	Performs the same reset sequence as when power is removed and reapplied.	***n*** = "1": must equal "1" for command to execute.
signals	Displays the present DCM-3 readings of four signals: Position signal from CPS-5 Demand Feedback Torque	No argument = signal readings are displayed. ***n*** = "all": an extended set of data is displayed.
stat	Displays information on the status of the actuator, including: Time / Date, Demand, Position, Error (Demand minus Position), Step size, Dead band, Motor Status, Motor Run Time, Line Frequency, Motor Starts, Motor Reversals/Stalls, Number of Overtorque conditions, Positive & Negative Peak Torque (%), CW and CCW Inhibitor Status, Alarms	No argument
temperature ***n***	Displays three values describing the ambient temperature in the actuator. Low extreme, present, high extreme. Can also change the temperature units.	No argument = temperatures are displayed. ***n*** = "F": changes units to Fahrenheit ***n*** = "C": changes units to Celsius
unstall	Resets the Stall Protection alarm to restore power to the motor. If the motor is still physically stalled, the Stall Protection alarm will recur.	No argument.

DRAFT

Demand Signal Commands

Command	Description	Argument *n* and Information
dem0pctma ***n***	Sets/displays the Demand signal value that corresponds to 0% actuator position.	***n*** = Demand signal as a decimal in mA. Minimum value is 0.50; maximum value is 100% Demand less 4.00 mA (e.g., if 100% Demand is 20.00 mA, the 0% value must be set for 16.00 mA or less).
dem100pctma ***n***	Sets/displays the Demand signal value that corresponds to 100% actuator position.	***n*** = Demand signal as a decimal in mA. Minimum value is 0% Demand plus 4.00 mA (e.g., if 0% Demand is 4.00 mA, the 100% value must be set for 8.00 mA or greater). Maximum value is 21.00 mA.
demlos ***n***	Sets/displays the Demand signal threshold, below which the DCM-3 recognizes the signal has been lost. The threshold is entered as a value in mA. This command also sets/displays the action initiated by the actuator during LOS (Loss Of Signal). LOS action options are "sip" (stay in place) or "gtp" (go to position). Demlos always reports both settings, but only sets one argument at a time. Demlos must be used twice to set both the threshold and action.	***n*** = Demand signal in mA below which LOS occurs (e.g., the typical value for a 4–20 mA system is 3.20). **-OR-** ***n*** = "sip", "gtp" or "pat". The "pat" argument acts the same as "sip", but also suppresses the alarm--this is used in some pulsed applications.
demlosgtp ***n***	Sets/displays the position to which the actuator will run upon loss of the Demand signal (LOS). This command has no effect if the actuator is set to "sip" (stay in place).	***n*** = desired position of actuator expressed as a percentage of actuator travel in decimal form (e.g., 50% = 50.00).
demlosgtp delay ***n***	Sets the time delay in seconds before the actuator will move to the position set in “demlosgtp”. Entering this command without an argument will return the present gtp and delay settings.	***n*** = time delay in seconds. Acceptable values are 0 (default) to 25.5.
trimdem4ma *4*	Trims the Demand analog-to-digital sensing circuit to be accurate at 4 mA. This command should only be used when the Demand signal at the actuator is exactly 4.0 mA. Trim is factory set and should not normally require recalibration.	"*4*" is the only acceptable value; this trim can only be performed at 4 mA.
trimdem20ma *20*	Trims the Demand analog-to-digital sensing circuit to be accurate at 20 mA. This command should only be used when the Demand signal at the actuator is exactly 20.0 mA. Trim is factory set and should not normally require recalibration.	"*20*" is the only acceptable value; this trim can only be performed at 20 mA.

DRAFT

Demand Characterizer Commands

Command	Description	Argument *n* and Information
charclear ***n****	Clears a preconfigured Demand characterizer curve node by setting it to "unused". Any node numerically higher will be set to "unused" also.	***n*** = node number: between 1 and 21.
charlist ***n****	Displays the X-values and Y-values of Demand characterizer curve node(s).	***n*** = node number: between 1 and 21. ***n*** = "all": displays all nodes
charset ***n1***, ***n2***, ***n3****	Sets the X-values and Y-values of a specific node of the characterizer curve. The three arguments must be separated by commas.	***n1***,***n2***,***n3*** = (n1 is node number to modify, n2 is X-value as a percentage, n3 is Y-value as a percentage)
demfunc ***n***	Sets/displays the Demand signal characterization function.	***n*** = "0": linear ***n*** = "1": square root ***n*** = "4": special curve* ***n*** = "5": square

*Not available with all DCM versions.

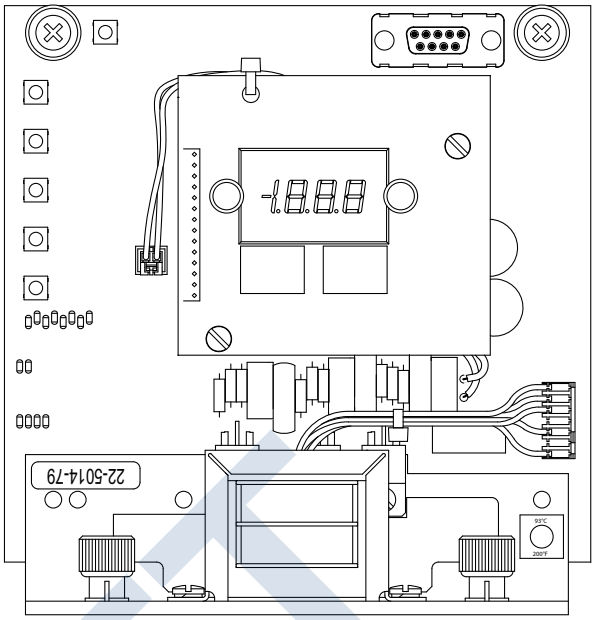
Feedback Signal Commands

Command	Description	Argument *n* and Information
fdbk0pctma *n*	Sets/displays the mA value of the Feedback signal that represents the 0% output shaft position. May also be set for decreasing direction of Feedback. See page 36.	n = desired Feedback signal in mA at 0% output shaft position. Minimum value is 3.00 mA and the maximum must be at least 4.00 mA less than the Feedback signal value for the 100% output shaft position.
fdbk100pctma *n*	Sets/displays the mA value of the Feedback signal that represents the 100% output shaft position. May also be set for decreasing direction of Feedback. See page 36.	*n* = desired Feedback signal in mA at 100% output shaft position. Minimum value must be at least 4.00 mA greater than the Feedback signal value for the 0% output shaft position. Maximum value is 21.00 mA.
fdbkfunc *n*	Sets/displays the curve used to calculate the Feedback signal.	*n* = "0": linear *n* = "1": inverse Demand (curve enabled)
trimfdbk4mA *n*	Trims the Feedback signal at 4 mA. Calibrated at the factory, should not normally require calibration.	*n* = present Feedback signal from the DCM-3 in mA.
trimfdbk20mA *n*	Trims the Feedback signal at 20 mA. Calibrated at the factory, should not normally require calibration.	*n* = present Feedback signal from the DCM-3 in mA.
iomode *n*	Sets/displays the function of a DCM-3 connector pin. May be enabled for Feedback or potentiometer.	*n* = "0": none *n* = "1": Feedback enabled *n* = "2": potentiometer power enabled.

DRAFT

APPENDIX Optional DCM-3 w/ Feedback Display

The DCM-3 Feedback display is an illuminated, numerical readout showing the actuator's position as a percentage of full travel. This display is viewed through a tempered glass window in the electronics compartment. There are also two configurable LEDs visible—a red LED and a green LED.



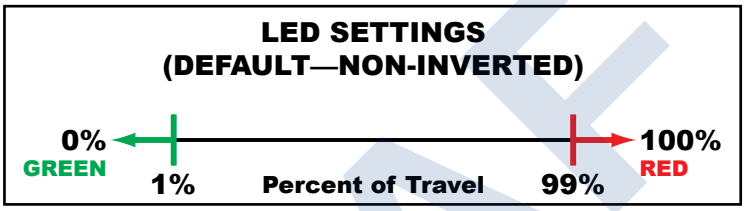
The DCM-3 display has been calibrated at the factory and should not require any further adjustments.

The display is dependent on the Feedback loop current and will not operate until the loop is closed. If not utilizing external Feedback, a jumper must be installed between terminals DD and EE on the terminal block to activate the display. The Feedback output maximum loop resistance is 500Ω.

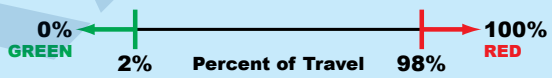
The configuration for the Feedback display is 4 mA = 00.0(%) and 20 mA = 100.0(%). By default, the green LED will light when the Feedback is indicated at less than 1(%). The red LED will light when the Feedback is indicated at greater than 99(%).

The illumination points for the LEDs may be modified using a serial command (see next page).

For information on serial communication and commands, see page 70.



DCM-3 with Feedback Display
Part No. 22-5014-79



DRAFT

Command	Description	Argument *n* and Information
ledconfig ***n1 n2***	Changes the point within the position of travel that causes the LEDs to light. May also be used to swap the LED end point assignments (see Example 2, below) or to individually turn off each LED.	***n1*** = "red": sets the red LED to the ***n2*** argument. "green": sets the green LED to the ***n2*** argument. "inverted": swaps the LED end point assignments (see Example 2, below). "noninverted": sets both LED end points to the default setting (see below). ***n2*** = argument defining position of travel at which the selected LED (***n1***) will light. Accepts any number representing a valid percentage of travel position. "off": turns off the LED defined in ***n1***.

Example 1: Make the "CLOSED" green LED light at 2.0% and the "OPEN" red LED light at 98.0%.

COMMAND	RESULTING LED BEHAVIOR
ledconfig *green 2* **ledconfig *red 98***	

Example 2: Invert the LED assignments from the default configuration.

COMMAND	RESULTING LED BEHAVIOR
ledconfig *inverted*	

Example 3: Make the "OPEN" red LED light at 1.0% and greater, and the "CLOSED" green LED light at less than 1.0%.

COMMAND	RESULTING LED BEHAVIOR
ledconfig *green 1* **ledconfig *red 1***	

NOTE: Both LEDs will not light at the same time; in the event of overlap, the red LED will light.

SERVICES

PRODUCT DEMONSTRATIONS

Each of Beck's Sales Engineers has access to a complete set of actuator models so that he can demonstrate virtually any of their features at your location. In order to arrange to see a Beck actuator in your plant or office, contact Beck's Sales Department.

SITE SURVEYS

Beck Sales Engineers are available to discuss your process control requirements. Often a visit to your location is the best way to gain a thorough understanding of your needs, in order to meet them most accurately and completely.

Mounting hardware, torque requirements, linkage, control signal information, and optional equipment can be analyzed most effectively at the work site. Beck's analysis at the job site can help ensure that specifications are accurate, especially in the case of complex applications.

APPLICATION REVIEWS

By sharing your needs with a Beck Sales Engineer you can take advantage of the best application advice for the type of control you need. This review will yield a better understanding of the versatility of Beck actuators for your installations, as well as complete details on options and accessories to make the process as effective as possible.

SPECIFICATION WRITING

Beck provides specification writing assistance in order to help you specify and order the right actuators for your applications. Beck Sales Engineers will work with you to make it easier for you to obtain the proper equipment and give you confidence that no details are overlooked.

HOW TO OBTAIN SERVICE

Factory repair of actuators or subassemblies is available for both normal and emergency service. To assure prompt processing, contact the factory to receive a Returned Material Authorization (RMA) number. If a repair estimation is desired, please send the name and phone number of your contact for service authorization. It is helpful to include a description of the work desired with the shipment or, in the event of a problem, the malfunction being experienced.

DRAFT

THREE YEAR LIMITED WARRANTY STATEMENT*

Harold Beck & Sons, Inc. (Beck) warrants that our equipment shall conform to Beck's standard specifications. Beck warrants said equipment to be free from defects in materials and workmanship. This warranty applies to normal recommended use and service for three years from the date on which the equipment is shipped. Improper installation, misuse, improper maintenance, and normal wear and tear are not covered.

The Buyer must notify Beck of any warranty issues within 37 months of original shipment date and return the goods in question, at Buyer's expense, to Beck for evaluation. If the product fails to conform to the warranty, Beck's sole obligation and the Buyer's exclusive remedy will be: 1) the repair or replacement, without charge, at Beck's factory, of any defective equipment covered by this warranty, or 2) at Beck's option, a full refund of the purchase price. In no event will Beck's liability exceed the contract price for the goods claimed to be defective.

THIS WARRANTY IS EXPRESSLY IN LIEU OF ANY OTHER EXPRESS OR IMPLIED WARRANTY, INCLUDING IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, AND ALL OTHER OBLIGATIONS OR LIABILITIES OF BECK. In no case shall Beck be liable for any special, incidental or consequential damages based upon breach of warranty, breach of contract, negligence, strict tort, or any other legal theory. Such damages include, but are not limited to, loss of profits, loss of revenue, loss of use of the equipment or any associated equipment, cost of capital, cost of any substitute equipment, facilities or service, downtime, the claims of third parties including customers and injury to property.

Buyer acknowledges its responsibilities under OSHA, related laws and regulations, and other safety laws, regulations, standards, practices or recommendations that are principally directed to the use of equipment in its operating environment. Buyer acknowledges that the conditions under which the equipment will be used, its use or combination with, or proximity to, other equipment, and other circumstances of the operation of such equipment are matters beyond Beck's control. **Buyer hereby agrees to indemnify Beck against all claims, damages, costs or liabilities (including but not limited to, attorney's fees and other legal expenses), whether on account of negligence or otherwise, except those claims based solely upon the negligence of Beck and those claims asserted by Beck's employees which arise out of or result from the operation or use of the equipment by Beck's employees.**

***Note: Internal water damage is not covered by warranty.**

MPI

THE INTEGRATED SOLUTION FOR TREATMENT PLANT NEEDS

Combining expertise from eight key water infrastructure brands in the McWane family of companies, McWane Plant & Industrial (MPI) provides a singular access point for the essential products and service required for any water or wastewater plant project.

WHY MPI?

We're a new kind of company formed in service of three simple goals:

- To provide a primary source for best-in-class products from time-tested brands
- Offer veteran specialists as resources for any plant project of any scale
- Increase the ease and efficiency of the planning and completion of our clients' projects

Our dedicated team is comprised of dozens of treatment plant specialists with decades of experience. We work cooperatively with industry partners to give each project the attention it deserves, providing unprecedented levels of communication, access and collaboration. Our support teams work within dedicated services regions allowing our experts to apply regionally specific knowledge, including state regulations, codes and environmental specifications. Our nationally certified Associate Design-Build Professionals are a valuable asset to Design-Build projects.

The extended manufacturing capabilities of MPI mean your precise requirements are closer in reach and delivered faster with less legwork from you. We offer products that conform to rigorous industry standards and can work with your team to customize and fulfill unique requests. As part of our commitment to American workers and industries, we're proud of our ability to provide products from domestic facilities and to meet all domestic funding requirements.

MPI – One smart source, ready to work for you.

ENGINEERING FEATURES

SERIES 4700

SIZES 3"-24"

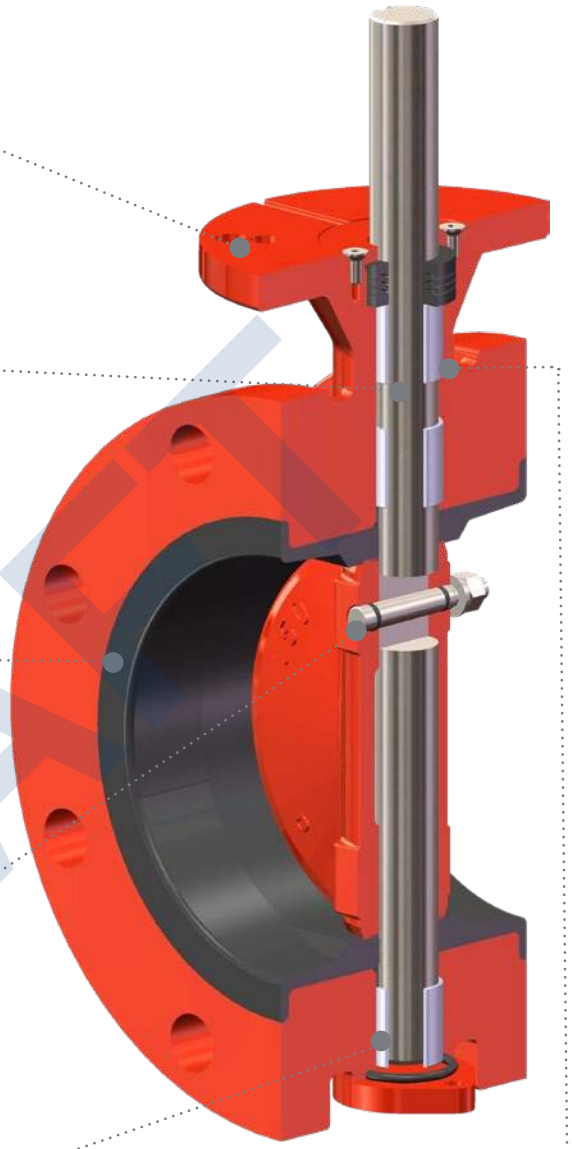
ACTUATOR MOUNTING PAD

Butterfly valves come standard with an integrally cast actuator mounting pad; machined and drilled in accordance with ISO-5211 and MSS SP-101. For buried service valves, this allows for direct mounting of manual and automate actuators without the need of additional plates, brackets or adapters, providing a more compact and rigid arrangement. Above ground service valves come standard with adjustable packing.

STAINLESS STEEL SHAFT

Our butterfly valves utilize stainless steel shafts to resist corrosion and ensure long valve, bearing, and packing life. 316SS is the standard shaft material for CL 150B, while 630SS (17-4) stainless steel is utilized for CL 250B.

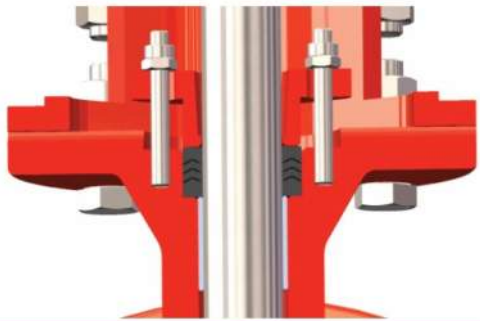
FULL RUBBER LINED BODY



Our fully rubber-lined bodies for 3"-24" valves eliminates the need for inner body coating and effectively prevent abrasion from particulate in the media.

PINNED SHAFT CONNECTION

Our disc-to-shaft pinning connections are built in accordance with AWWA C504. We utilize a 630SS (17-4) pin that is held in place with stainless steel nuts, creating a strong and reliable connection. This ensures that our customers will get many years of dependable, backlash-free service from their valve.

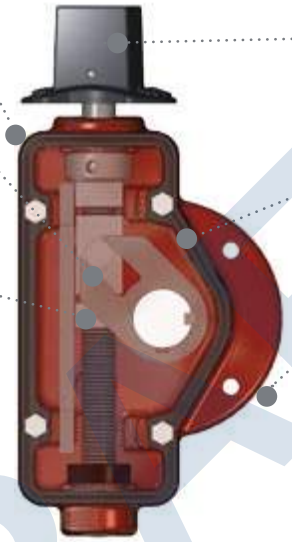


LONG LIFE BEARINGS

PTFE-lined fiberglass bearings are designed to provide low friction and long life, reducing the required maintenance and requiring no lubrication.

FIELD ADJUSTABLE PACKING

Our above ground service valves feature field- adjustable, V-type (chevron) packing, allowing for quick packing adjustments without disassembling the valve. It's a highly practical feature that streamlines the process of packing adjustments and ensures minimal disruptions to your operations.



DRAFT

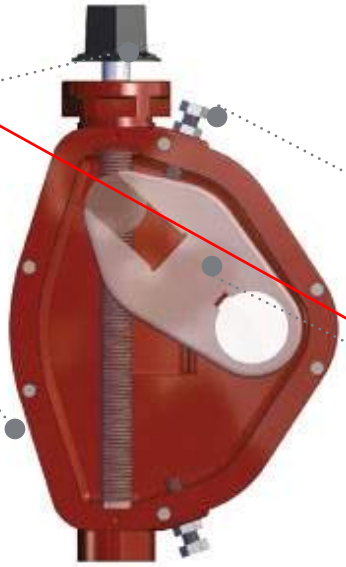
TRAVELING NUT ACTUATORS

MPI style 4700 seat-on-body butterfly valves use slotted-lever traveling nut actuators for smooth operation. Traveling nut actuators were developed to match the torque characteristics and provide greater mechanical advantage near the valve open and close positions where it is most needed. The actuator slows down near the close position to help seat the disc, and the slower opening/closure reduces shocks to the connected piping system.

Model 450 (sizes 3"–12")

DUCTILE IRON HOUSING
Includes a four bolt ISO-5211 & MSS-101 compliant connection.

LEVER & TRAVELING NUT
Ductile Iron construction, precision machined to transmit torque seamlessly. Contains multiple keyways to change the opening direction.



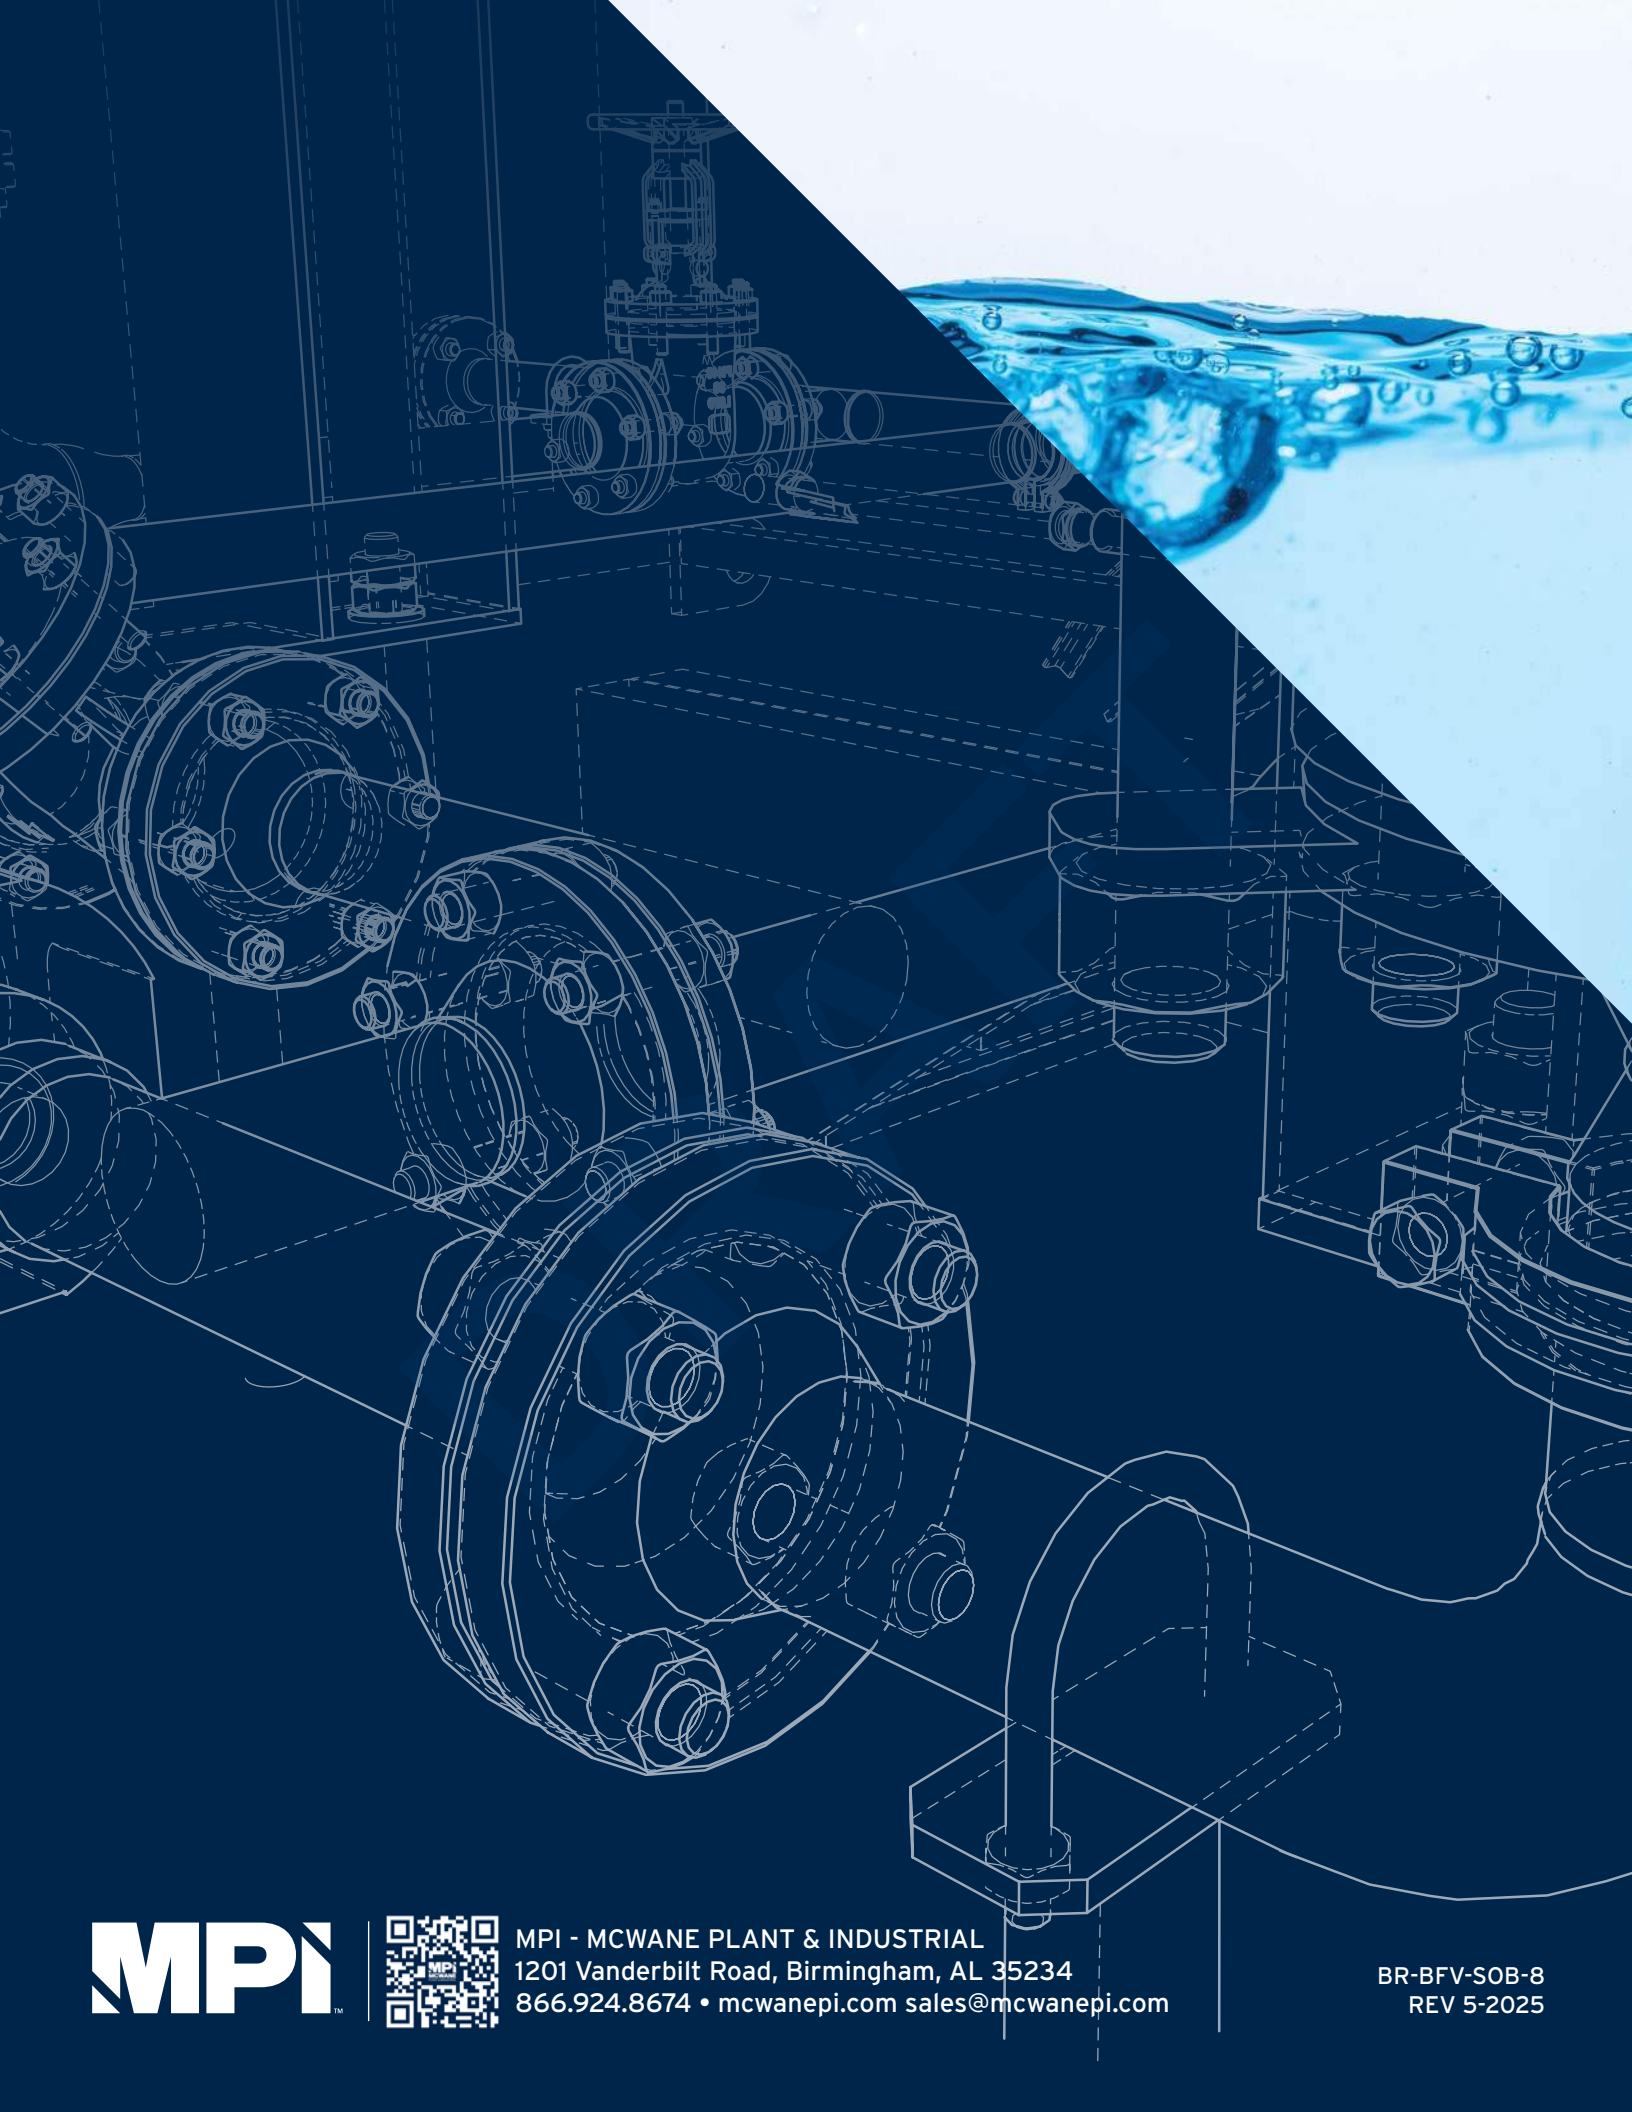
POSITION STOP NUTS
Factory preset internal adjusters prevent the actuator from going beyond the open and closed positions of the valve.

OVERLOAD PROTECTION
Up to 450 ft-lbs of input torque protection to prevent damage to the valve and actuator.

SEALS
Actuator is fully greased and utilizes a reusable rubber gasket in the housing cover and O-rings to seal the input shaft.

360° ROTATION
Actuator can be mounted in 90-degree increments for easy installation and operation without the need of adapter plates and additional parts.

Model 1250 (sizes 14"-20") • Model 2200 (sizes 24")



OVERLOAD PROTECTION
Up to 450 ft-lbs of input torque against the stops (open/close) to prevent damage to the valve and actuator.

DUCTILE IRON HOUSING
Proven strength, permanently lubricated and sealed to protect from the elements and groundwater.

POSITION STOP
Factory preset prevents the actuator from going beyond the open and closed positions of the valve.

LEVER
Ductile Iron construction, precision machined to transmit torque seamlessly. Contains multiple keyways to change the opening direction.

INTRODUCTION

Butterfly Valves are commonly used in water transmission and distribution. This manual will provide you with the information needed to properly install, operate, and maintain the valve and to provide long service life.
The rubber seat provides a drip-tight alternative to metal-seated valves. BFVs offer flow control advantages and economy vs. gate valves, which become increasingly more significant with larger sizes.

For pump station and treatment plant applications, BFVs offer flow control advantages (such as throttling) over gate valves. BFVs are manufactured in accordance with the current version of the American Water Works Association (AWWA) C504 standard. BFVs are constructed of ductile iron, stainless steel, rubber seats & seals. The strength of ductile iron along with stainless steel components provide corrosion resistance for buried service applications.

RECEIVING & STORAGE

Inspect valves upon receipt to ensure correct material, quantity, and any optional equipment has been received. Also inspect all received equipment for any damage which may have occurred during shipment. Contact the McWane Plant & Industrial sales team to report any issues with materials received.

Unload all valves safely to protect both the materials and workers. For valves 36" and larger, use forklifts or slings under skids. Do not lift valves with slings or chains around the operating shaft, operator, or through waterway. Lift smaller valves with eyebolts or rods through the flange holes.

Protect the valve and operators from weather and the accumulation of dirt, rocks, and debris. For long term storage, valves should be kept indoors with the valve disc slightly open (4-6 degrees). When valves fitted with power operators and controls are stored, energize electric operators or otherwise protect electrical control equipment to prevent corrosion of electrical contacts due to condensation resulting from temperature variation. If outdoor storage is required valves need to be protected from weather and foreign materials.

INSTALLATION

WARNING: Installation of valves should be performed by experienced installers. Valves should never be used as structural supports and movement into place. Valves are heavy and may include accessories or bolt on pieces which should be handled with caution.

NOTE: BEFORE INSTALLING THE VALVE:

1. Prior to installation check that the valve and end joints are clean. Check for damage to the valve.

2. Open and close the valve to ensure proper operation.

3. The inside diameter (ID) of the mating of the piping system should be considered BEFORE installing the valve. When BFVs open, the vane will extend into the mating piping system.

It is recommended for valves to be installed into piping system in accordance with AWWA M-11 to prevent any undue piping stress, deflection or bending that may affect the performance of the valve.

1. Place valve into position carefully to avoid impact with trench walls or vault walls.

2. When connecting pipe to the BFV, do not deflect the pipe to connect the valve. Do not use the valve as a jack to pull into alignment. As much as reasonably possible, the BFV should be in an "unconstrained" position with the weight of the valve being supported independently of the pipe connection. Pipe connections can put undue stress on the valve pulling the valve body out of shape and causing it not to seal properly. This becomes increasingly important as the piping size gets larger.

MECHANICAL JOINT INSTALLATION:
When connecting BFV mechanical joints (MJs) bolting torques should not exceed the recommended torque limits in the appendix of AWWA C-111.

A. The use of an NSF 61 approved pipe grade lubricant is recommended to minimize gasket to pipe binding.

B. The most important factor is pulling the gland down uniformly so that the face of the gland follower remains parallel to the face of the valve flange throughout the tightening cycle. The torque on the nuts should be uniform, utilizing an alternating star pattern with as many as five repetitions of tightening to assure even torque stress.

C. The MJ bolts should be torqued in accordance with the AWWA C111 specification. See the chart below for a quick reference. Torques in excess of the recommendations below may damage the BFV, the mechanical joint gland or both.

Valve Size	Bolt Size		Range of Torque	
	in.	mm.	lbf-ft	N-m
3"	5/8	15.9	45-60	61-81
4"-24"	3/4	19.1	75-90	102-122
30"-36"	1	25.4	100-120	136-163
42"-54"	1-1/4	31.8	120-150	163-203

*AWWA C111-17, Table A.1, Mechanical-joint torque loads

DRAFT

FLANGED ENDS INSTALLATION:

1. The weight of the valve should be supported independent of the pipe connection. Provisions for thrust restraint must be adequate to absorb closing thrust.

2. Prior to assembly, flange faces must be cleaned to remove rust, paint runs, or other impediments to smooth surfaces.

3. All bolting patterns are in accordance with ANSI B16.1. Bolt torques for flanged valves should be based on the yield strength of the bolt. Due to size and casting restrictions, BFV sizes 18" and larger for ANSI Class 125# and 10" and larger for ANSI Class 250# have some tapped holes (instead of thru holes) in the flanges. These are located around the operator or thrust ends. The charts below shows thread depth / flange thickness, thread size, and # of threaded holes per flange. NOTE: To determine the total required length of the stud, add this dimension to the thickness of the adjoining flange plus the thickness of the appropriate nut.

ANSI CLASS 125# FLANGES

Valve Size	Thread Depth / Flange Thickness	Thread Size	# of Threaded Holes per Flange
18″	1-9/16″	1-1/8″-7 UNC	4
20″	1-11/16″	1-1/8″-7 UNC	4
24"	1-7/8"	1 1/4"-7 UNC	4
30"	2-1/8"	1 1/4"-7 UNC	4
36"	2-3/8"	1 1/2"-6 UNC	4

ANSI CLASS 250# FLANGES

Valve Size	Thread Depth / Flange Thickness	Thread Size	# of Threaded Holes per Flange
10″	1-7/8″	1″-8 UNC	4
12″	2″	1-1/8″-7 UNC	4
14"	2-1/8"	1-1/8″-7 UNC	4
16"	2-1/4"	1-1/4"-7 UNC	4
18"	2-3/8"	1-1/4"-7 UNC	4
20"	2-1/2"	1-1/4"-7 UNC	4
24"	2-3/4"	1-1/2" -6 UNC	4
30"	2-3/4"	1-3/4" -5 UNC	4
36	2-15/16"	2"-4.5 UNC	4

4. If it is determined to use a bolt rather than a stud, add the tapped bore dimension plus the adjoining flange dimension to acquire the required bolt length.(Bolt length as measured from the base of the bearing surface - or head - to the end of threads). Check the adjoining fitting and flange clearances to confirm there is enough room to swing the bolt into place.

NOTE: Butterfly valves should not be installed at a dead end or near a bend in a pipeline without proper & adequate restraint to support the valve and prevent it from blowing off the end of the line. It is good engineering practice to consider whether thrust blocks, restrained joints, or other means of restraint are needed on or adjacent to valves on pipelines and/or where unusual conditions exist, such as high internal pressures, adjacent fittings, or unsuitable soils. Buried valves installed with valve boxes shall be installed so that the valve box does not transmit shock or stress to the valve operator as a result of shifting soil or traffic load.

OPERATION

Operational criteria for rubber seated BFV are covered in the appendix section of AWWA C504. DO NOT operate any valve at pressures above the rated pressure of the valve. DO NOT exceed 300 ft-lbs input torque on operation with wrench nuts and do not exceed 200 lb. rim pull for hand-wheel or chainwheels against the open or closed stops.

Do not remove a BFV operator while under flow and pressure. Without an operator in place holding the vane, a BFV will try to close in the presence of flow and can create a hazardous water hammer situation. BFVs can be operated manually by rotating the handwheel, chainwheel, or nut. Do not force the handwheel, chainwheel, or nut to close faster. This can cause damage to the gearing.

BFV traveling nut operators are designed to open and close the valve at LESS THAN 150ft-lbs. of input torque. Torque in excess of these limits may damage the valve or operator or both. Maintenance personnel should be aware of the type of operators being used before actuating the valves.

Cylinder operators are base mounted and operated automatically by pneumatic or hydraulic pressure to either side of the power cylinder. Cylinder operators use solenoid valves to direct fluid to the cylinder ports based on electrical power signals.

Motor actuators are designed to open and close the valve through its ¼ turn of rotation. They contain gearing that slowly moves the valve from open to close position. Electrical controls are included in the motor actuator for local electrical control. The positioning of the valve disc will be done by limit switches in the motor actuator. Instructions for adjustment of limit switches or mechanical stops can be found in the motor manual.

BFVs can be automated to suit virtually all control even those with very specific design criteria.

MAINTENANCE

Before any maintenance or service work is conducted on a BFV, whether above or below ground, all potential safety issues should be considered. Prior to maintenance, properly identify the BFV model and its operator then obtain the correct service information.

Annual maintenance of the BFV includes the following:

1. Cycle the valve to verify operation and no interference in line.
2. Close the valve and check for any leaks.

PACKING ADJUSTMENTS:

On valves with adjustable packing, if leakage past the packing occurs, tighten the packing nuts just enough to stop the

DRAFT

leakage. Over-tightening will cause excessive operating torques and premature packing wear. If packing leakage cannot be stopped by tightening the packing nuts, the packing must be replaced.

PACKING REPLACEMENT:
To replace the packing you will need:
- New packing rings
- NSF 61 approved lubricant

1. Close the valve, relieve pipeline pressure and drain portion of the system where valve is located.

!!! Warning: Moving parts from accidental operation of power actuator can cause personal injury or equipment damage. Disconnect and lock out power to actuator before servicing.

2. If the actuator is powered, disconnect and lock out the pneumatic, hydraulic, or electrical power to prevent accidental operation of the actuator.

3. Remove the actuator from the valve.

4. Remove the gear stand from the top of the valve. (Gear stand not present on buried service valves.)

5. Remove the gland off the valve.

6. Pull all of the packing rings from the packing chamber with a hooked tool.

7. Apply a paint-like coat of an NSF 61 approved lubricant to the inside and outside diameters of the new packing rings, then install the new packing rings one ring at a time.
Note: Push the packing firmly into place, but do not use a sharp or pointed tool.

8. Install gland.

9. Install the gear stand on top of the valve. (Gear stand not present on buried service valves.)

10. Install the actuator on the valve.

DISASSEMBLING VALVE
Before disassembly, remove the valve from the pipe line, open the valve and remove actuator (and adapter, if included) from the valve.

For valve reassembly you will need:
-New packing rings
-New bottom cover seals (V-rings 10"-24"", O-ring 3"-8", 30" and larger)
-New valve seat (30" and larger)
-New shaft pins, nuts, washers, o-rings
-NSF 61 approved lubricant.
-Loctite 680
!!! Warning: Moving parts from accidental operation of power actuator can cause personal injury or equipment damage. Disconnect and lock out power to actuator before servicing.

Removing the Disc/Shaft from Body
1. If the valve has packing gland, remove the screws, the washers and the gland.

2. Pull all the packing out using hooked tool.

3. Remove bottom cover and seal (V-rings 10"-24", O-ring 3"-8", 30"and larger)

4. Remove pins holding the disc to shaft with a hammer. Caution- Secure the disc before moving to the next step of removing the shaft.

5. Remove shaft (single-piece shaft up to 24", upper and lower shaft 30" and larger.

6. Remove the disc.

7. For 30" and larger, remove retaining segments and valve seat.

8. Remove bearings.

VALVE CLEANING RECOMMENDATIONS
1. Remove all dirt and chips from all parts.
2. Remove all grease and oil from all surfaces of seat.
3. Remove all rust from the seat groove in body.

LUBRICATION
1. Apply a paint-like coat of an NSF 61 approved lubricant to the following surfaces:
a. The inside and outside diameters of each rubber packing ring
b. The O-ring(s)
c. All surfaces of the keyseat in the shaft
d. The disc sealing surface on the seat
e. For 30" valves and larger apply grease to the disc seat.

2. Apply a light coat of an anti-seize compound to the inside diameter of the bushings, and all surfaces of the key.

REASSEMBLING THE VALVE
1. Block the body in a horizontal position with the seat facing down.

2. For 30" and larger valves, insert seat retaining segments into the valve. Insert seat into seat groove, and tighten the retaining segments to hold the seat in place utilizing a cross over pattern.

3. Apply the Loctite 680 on the outside surface of the bushings. Insert the bushings into the shaft bores

4. Holding the disc in a horizontal position with the shaft connection toward the top of body. Insert the disc into the seat opening and align the shaft holes in the disc with the shaft holes in the body.

5. Insert the shaft through the top of the body and into the top of the disc. Align the holes in the disc with the pin

DRAFT

holes in the stem.

a. Note: Insert the shaft carefully so that the upper bearing is not damaged or moved out of position.

6. For 30" valves and larger, insert the lower shaft through the bottom of the body and into the bottom of the disc. Align the holes in the disc with the pin holes in the stem.

a. Note: Insert the shaft carefully so that the lower bearing is not damaged, or moved out of position.

7. Assemble the pins to connect the disc to the valve shaft(s).

8. Insert the packing rings into the top of the valve, and reinstall the gland.

9. Assemble the bottom cover. For 8" valves and smaller insert the o-ring, 10"-24" valves and larger insert the v-ring seals. For valves 30" and larger install the thrust plate and o-ring. Assemble the bottom cover.

10. Mount the actuator to the valve.

11. Turn the disc to the full close position.

a. Ensure the same depth measurement on the disc to flange face on both sides of the disc to set the close limit on the actuator.

b. Turn the disc to the full open position, set the open limit for the actuator.

b. Cycle the valve full open and full close 5 times, and recheck the depth measurements.

VALVE REMOVAL:

To remove the entire valve assembly from the pipeline, follow these steps carefully.

1. Relieve pipeline pressure and drain portion of the system where valve is located.

!!! Warning: Moving parts from accidental operation of power actuator can cause personal injury or equipment damage. Disconnect and lock out power to actuator before servicing.

2. Close the valve.

3. If the actuator is powered, disconnect and lock out the pneumatic, hydraulic, or electrical power to prevent accidental operation of the actuator.

4. Support the valve assembly, then remove the flange bolts or mechanical joint connector.

5. Remove the valve from the pipeline.

a. Note: Failure to lift the valve properly may cause damage. Lift the valve with slings fastened around the valve body, or attach them to bolts or rods run through the bolt holes for the pipeline flanges. Do not fasten lifting devices to the actuator or disc, or through the seat opening in the body.

SEAT ADJUSTMENTS:

Seat adjustments on 30" and larger are possible by adjusting the tightness of the retaining segments in areas that experience leakage in the valve.

SEAT REPLACEMENT:

For seat replacements please contact the MPI Service department

TROUBLESHOOTING

PROBLEM	CAUSE	SOLUTION
Valve leaks when closed	*Disc not fully closed or past fully closed*	*Adjust actuator closed position stop*
	Disc edge wear or damage	*Clean and/or replace disc edge*
	Rubber seat wear or damage	*Adjust or replace valve seat*
Chainwheel jam	*Poorly fitting chain*	*Replace with correct chain*
Valve hard to operate	*Foreign material in valve*	*Remove obstructions*
	Corroded actuator parts	*Clean and grease actuator*
	Loose Actuator	*Apply locking compound and tighten bolts*
Internal operator obstruction	*Debris in threaded components*	*Work Input shaft in the open or closed direction several times until full travel is permitted*
Internal to the Valve Obstruction	*Vane interference*	*Remove valve from line to modify mating pipe ID*
	Internal obstruction	*Access vane and physically remove obstruction*
External Obstruction	*Op. nut interference*	*Check Op. Nut clearances in buried service valve boxes*
	Binding of operational accessories	*Adjust as needed to resolve binding*
	Thrust plate not mounted securely	*Fully thread the input shaft into the operator housing and tighten*
Packing Leaks	*Packing is loose* *Packing is worn*	*Adjust Packing* *Replace Packing*

**Inspection for the above should be done semi annually at a minimum.

PARTS & SERVICE

Parts and service are available from your local representative or the factory. For availability and pricing of spare parts please contact the MPI sales team:

Solitax ts-line sc Turbidity (0.001-4000 NTU) and Suspended Solids (0.001-50 g/L) immersion probe, with wiper, stainless steel

Product #: **LXV423.99.00100**

Accurate, colour-independent suspended solids and turbidity measurements

The Solitax ts-line sc turbidity and suspended solids immersion probe provides high-precision results in clear to strongly turbid liquids as well as in low and medium concentrated sludges. Turbidity measurement performance is certified to MCERTS regulation and the probe operates with a 90° measuring method according to DIN EN ISO 7027. The suspended solids measurement by a colour-independent method with an infrared duo scattered light photometer is in accordance with DIN 38414. A proven automatic wiper cleaning system allows sustained performance quality in drinking water as well as in waste water applications. The Solitax ts-line sc probe material is stainless steel and measurement data is displayed and processed with the help of a digital Hach SC200 or SC1000 controller.

Furthermore, the Solitax ts-line sc turbidity immersion probe is compatible for Prognosys which is a predictive diagnostic system that allows you to be proactive in your maintenance, by alerting you to upcoming instrument issues. Know with confidence whether changes in your measurements are due to changes in your instrument or your water.

Please contact Hach for further information. Request for a quote today!

This instrument connects to Claros, Hach's innovative Water Intelligence System, enabling you to seamlessly connect and manage instruments, data, and process – anywhere, anytime. The result is greater confidence in your data and improved efficiency in your operations. To unlock the full potential of Claros, insist on Claros Enabled instruments.

Greater accuracy, less maintenance
Hach Solitax sc sensors provide accurate, colour-independent measurement of turbidity and suspended solids in drinking water, wastewater and industrial process applications. A self-cleaning device prevents biological growth and interference of gas bubbles. This system's reliable performance and full data communication capability help improve process control and reduce treatment costs associated with polymer use, digester volume, and sludge handling.

Excellent correlation to laboratory analysis
Solitax sc sensors show an exceptional correlation to laboratory analysis. On-line measurement not only saves time on manual analysis, but also provides critical real-time measurements that can be used to operate the plant more efficiently.

Fully serviceable sensors
Conventional turbidity and suspended solids sensors are potted and are discarded when they no longer function. Solitax sc sensors are fully serviceable, which often doubles the useful life of the sensor.

Easy one-point calibration
Factory calibrated in conformity with DIN EN ISO 7027 for long-term calibration stability. Calibration is easy with a simple correction factor procedure.

Multi-channel, multi-parameter system
Multiple Solitax sc sensors can be installed on one Hach SC Controller. The same controller can also accommodate any combination of parameters. All of Hach's model sc sensors are "plug and play" with no complicated wiring or set-up procedure necessary.

Specifications

DRAFT

Accuracy:	Turbidity up to 1000 NTU: without calibration < 5% of the measured value ±0.01 NTU with calibration < 1% of the measured value ±0.01 NTU
Automatic Wiper:	Yes
Body Material:	Stainless Steel
Cable Length:	10 m (optional extension cables available)
Calibration Method:	Turbidity: Formazin or STABLCAL Standard (at 800 NTU). Suspended Solids: Sample specific, based on gravimetric TSS analysis with a correction factor procedure.
Certifications:	CE
Configurations:	Sensor only
Controller:	Sensor only
Diameter Sensor:	60 mm
Flow:	Max. 3 m/s (the presence of air bubbles affects the measurement)
Length:	200 mm
Maintenance Interval:	1 h/month
Material:	Optics Carrier and Sleeve: stainless steel 1.4571; Wiper Arm: stainless steel 1.4581; Wiper Rubber: silicone rubber (standard) Optional: Viton (LZX578); Wiper Shaft: stainless steel 1.4571
Max. cable length Sensor-to-Controller:	100 m
Measuring Principle:	Infrared Duo scattered light technique for color-independent turbidity measurement Turbidity in accordance with DIN EN ISO 7027 / TS equivalent DIN 38414
Model:	Solitax ts-line sc
Mounting:	Immersion
Operating Temperature Range:	0 - 40 °C
Parameter:	Suspended Solids, Turbidity
Pressure Range:	Stainless steel immersion sensor: <6 bar or <60 m
Range:	TSS-content: 0.001 mg/L - 50 g/L Turbidity: 0.001 - 4000 NTU
Repeatability:	TSS content: < 3 % Turbidity: < 1 %
Response Time T90:	1 - 300 s adjustable
Special notes:	installation note: distance sensorwall > 50 cm (Turbidity); distance sensorwall>10 cm (TSS),
Warranty:	12 months
Weight:	1.38 kg
What's included?:	Turbidity/Suspended Solids probe, user manual

What's included?

Turbidity/Suspended Solids probe, user manual

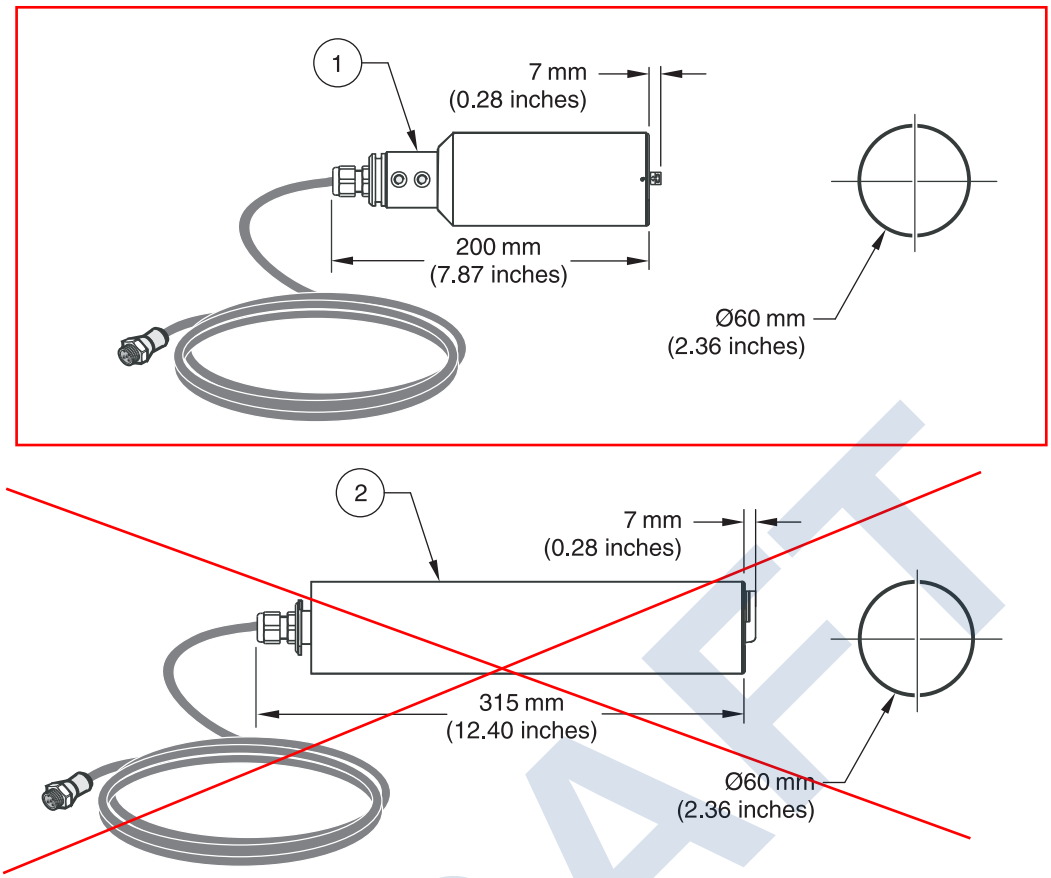
Section 1 Specifications



Specifications are subject to change without notice.

Measuring Technique	Infrared Duo scattered light technique for color-independent turbidity measurement Turbidity in accordance with DIN EN 27027 / TS equivalent DIN 38414
Measuring Range	~~t-line turbidity: 0.001–4000 FNU/NTU~~ ts-line, inline turbidity: 0.001–4000 FNU/NTU; TSS content: 0.001 mg/L–50 g/L ~~hs-line, highline turbidity: 0.001–4000 FNU/NTU; TSS content: 0.001 mg/L–500 g/L TSS~~
Reproducibility	Turbidity < 1 %, Total Suspended Solids (TSS) < 3 %
Measuring Accuracy	Turbidity up to 1000 FNU/NTU: without calibration < 5 % of the measured value ± 0.01 FNU/NTU with calibration < 1 % of the measured value ± 0.01 FNU/NTU
Technique variation coefficient	1 % in accordance with DIN 38402
Response Time	1 s ≤ T90 ≤ 300 s (adjustable)
Calibration	Zero point permanently set from the factory, gradient once for the TS content
Cable Length	10 m (33 ft), max. 100 m (328 ft) with extension cable
Ambient Temperature	0 to +40 °C (32 to 104 °F)
Pressure Range	Stainless steel: ≤ 6 bar or ≤ 60 m (87 psi) ~~PVC: ≤ 1 bar or ≤ 10 m (14,5 psi)~~
Flow Velocity	Max. 3 m/s (the presence of air bubbles affects the measurement)
Materials	Optics carrier and sleeve: stainless steel 1.4571 ~~or PVC black~~
	Wiper shaft: stainless steel 1.4104
	Wiper arm: stainless steel 1.4581
	Wiper rubber: silicone rubber (standard) ~~Optional: Viton[1] (LZX578)~~
	Windows and light guide: quartz glass
	O-rings (optics carrier, wiper, windows): NBR (acrylonitrile butadiene rubber)
	Housing seals: NBR 70
	Sensor connecting cable (hard-wired): 1 cable pair AWG 22 / 12 V DC twisted, 1 cable pair AWG 24 / data twisted, common cable screen, Semoflex (PUR)
	Sensor connection plug (hard-wired): type M12 enclosure rating IP 67
	Threaded cable fitting: stainless steel 1.4305
Inspection interval	On request 1/year service contract with guarantee extension to 5 years
Dimensions	Tank probe: D x L 60 mm x 200 mm (2 x 8 in.) ~~Probe for pipe installation: D x L 60 mm x 315 mm (2 x 12.4 in.)~~ ~~(Pipe installation fitting: DN 65 / PN 16 DIN 2633; < 5 bar (73 psi); for pipes from DN 80)~~ Distance sensor - wall (floor): TS > 10 cm (4 in.), turbidity > 50 cm (20 in.)
Weight	Tank probe: approx. 1.8 kg (63 oz) (t-line: approx. 0.6 kg (21 oz)) ~~Probe for pipe installation: approx. 2.4 kg (85 oz)~~ ~~Pipe installation fitting: approx. 2.7 kg (95 oz) (without probe)~~ ~~Pipe installation safety fitting:approx. 18 kg (40 lb) (without probe)~~
User Maintenance	1 h / month, typical
Certifications	CE

DRAFT

Section 2 General Information

2.1 Safety Information

Please read this entire manual before unpacking, setting up, or operating this equipment. Pay attention to all danger and caution statements. Failure to do so could result in serious injury to the operator or damage to the equipment.

Make sure that the protection provided by this equipment is not impaired, do not use or install this equipment in any manner other than that specified in this manual.

2.1.1 Use of Hazard Information

DANGER
Indicates a potentially or imminently hazardous situation which, if not avoided, will result in death or serious injury.

CAUTION
Indicates a potentially hazardous situation that may result in minor or moderate injury.

Important Note: *Information that requires special emphasis.*

Note: *Information that supplements points in the main text.*

2.1.2 Precautionary Labels

Read all labels and tags attached to the instrument. Personal injury or damage to the instrument could occur if not observed

	This symbol, if noted on the instrument, references the instruction manual for operation and/or safety information.
	This symbol indicates that a risk of electrical shock and/or electrocution exists.
	Electrical equipment marked with this symbol may not be disposed of in European public disposal systems after 12 August of 2005. In conformity with European local and national regulations (EU Directive 2002/96/EC), European electrical equipment users must now return old or end-of life equipment to the Producer for disposal at no charge to the user. ***Note:*** *For return for recycling, please contact the equipment producer or supplier for instructions on how to return end-of-life equipment, producer-supplied electrical accessories, and all auxiliary items for proper disposal.*

DRAFT

2.2 Sensor Overview

Note: *All sensors are also available without wipers for special applications.*

t-line: 0.001–4000 FNU/NTU

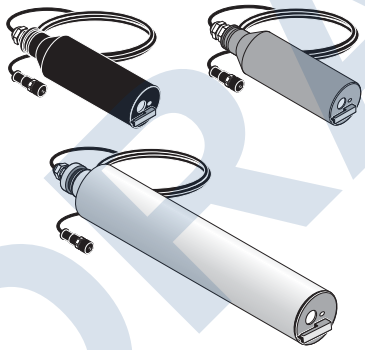
High-resolution turbidity probe made of plastic for the outlets of sewage treatment plants and bodies of water.

ts-line: 0.001–4000 FNU/NTU; 0.001 mg/L–50.0 g/L

High-precision turbidity and solids probe made of stainless steel or plastic for color-independent measurement of fine turbidities and sludges.

hs-line: 0.001–4000 FNU/NTU; 0.001 mg/L–500.0 g/L

High-precision turbidity and solids probe made of stainless steel or plastic for color-independent measurement of highly concentrated sludges.



inline: 0.001–4000 FNU/NTU; 0.001 mg/L–50.0 g/L

High-precision pipe installation probe for turbidity and solids made of stainless steel for color-independent measurement of fine turbidities and sludges.

highline: 0.001–4000 FNU/NTU; 0.001 mg/L–500.0 g/L

High-precision pipe installation probe for turbidity and suspended solids made of stainless steel for color-independent measurement of highly concentrated sludges.

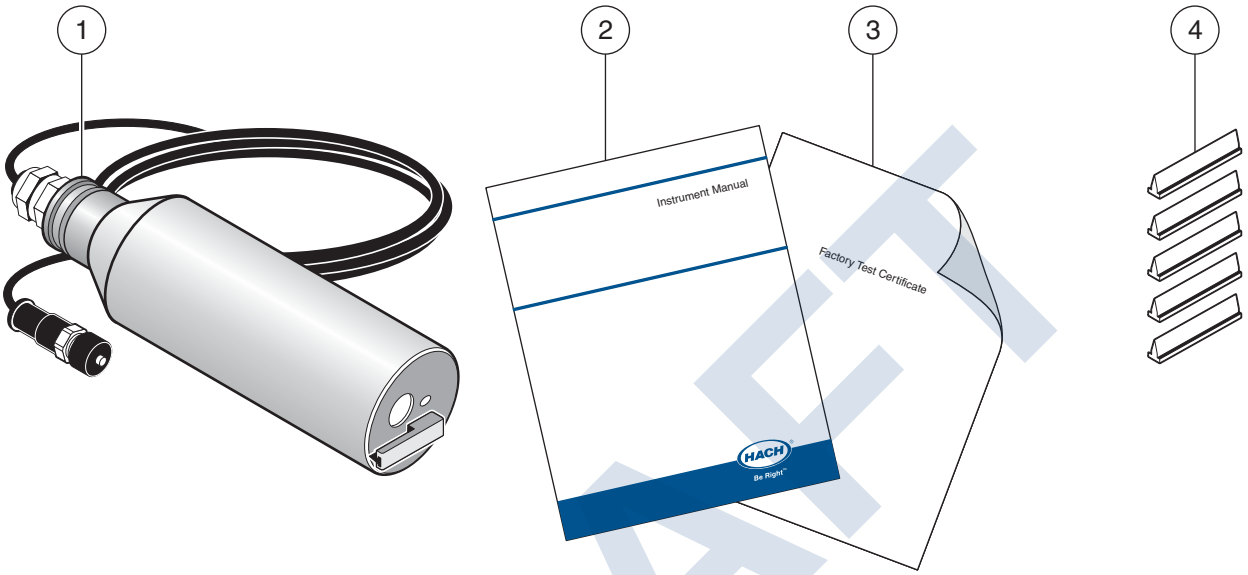
Figure 2 Solitax sc Sensors

DRAFT

2.3 Measuring Principle

The measuring principle is based on a combined infrared absorption scattered light technique that measures the lowest turbidity values in accordance with DIN EN 27027 just as precisely and continuously as high sludge content. Using this method, the light scattered sideways by the turbidity particles is measured over an angle of 90°.

2.4 Handling



The sensor contains high-quality optical and electronic assemblies. Make sure the sensor is not subjected to any hard mechanical knocks. There are no customer-serviceable items inside the sensor.

Section 3 Installation

DANGER
Only qualified personnel should conduct the tasks described in this section of the manual.

3.1 Unpacking the Instrument

Figure 3 Items Supplied with Sensorl

1.	SOLITAX sc Sensor	**3.**	Factory Test Certificate
2.	User Manual	**4.**	Wiper Set (for 5 changes) LZX050

3.1.1 Function Check

After unpacking, both components should be checked for any transport damage and a short function check performed prior to installation.

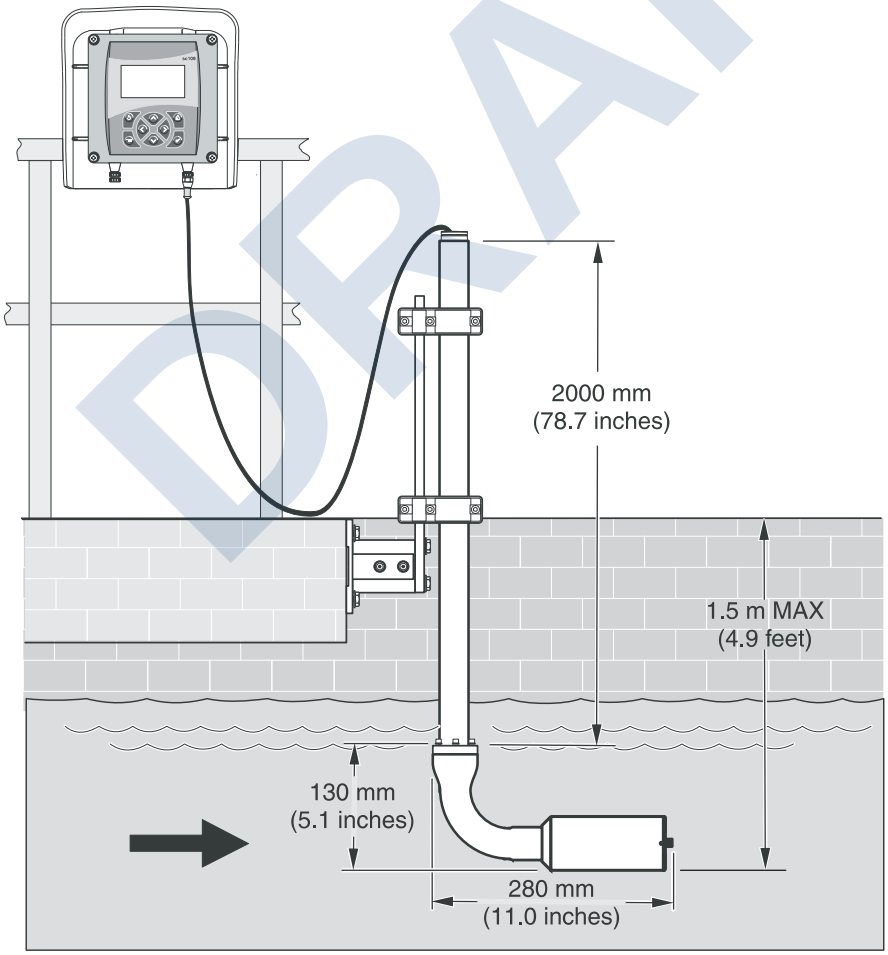
To perform a function check, connect the sensor to the display unit and power the unit. Shortly after the unit is plugged in, the display is activated and the instrument switches to the measurement display. Measured values taken in air is meaningless.

If no messages appear in the lower part of the display, the function check is then complete.

DRAFT

3.2 Sensor Installation

Figure 4 on page 10 illustrates the installation overview for Solitax sc Models t-line, ts-line, and hs-line for immersion in open tanks.



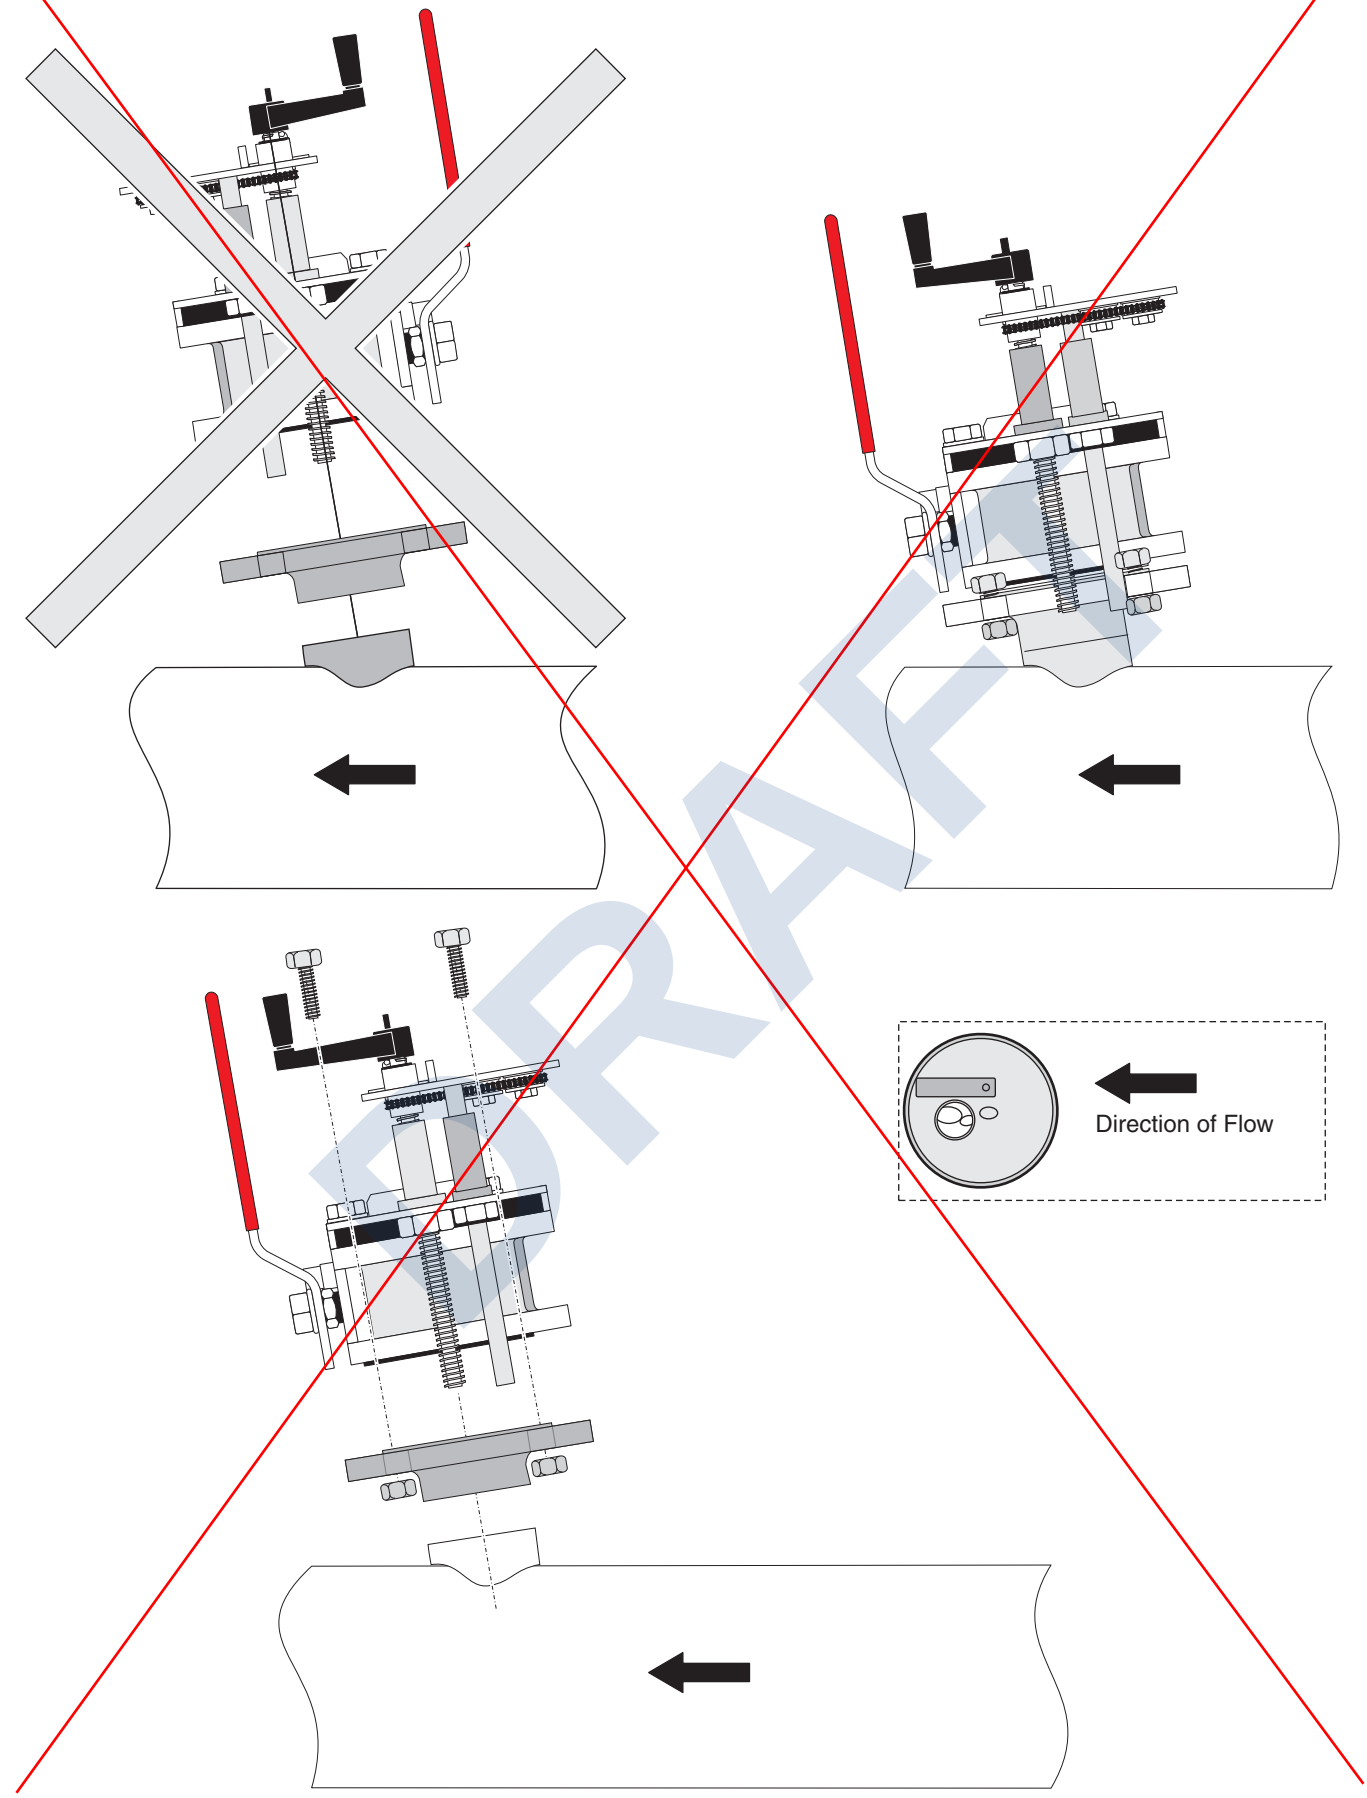
The maximum distance from the mounting surface to the sensor without the use of an extension tube is 1.5 m (4.9 ft). When that distance exceeds 1.5 m (4.9 ft), one of the following extension tubes is required and can be ordered separately:

- 1.0 m (3.28 ft) extension pipe LZY413
- 1.8 m (5.90 ft) extension pipe LZY414

To ensure a suitable measuring position, install the probe to the following conditions:

- The probe optical window must have a ground clearance of at least 30 cm (11.8 in.).
- Install the probe with the optical window facing (downstream) in the direction of the flow to minimize the risk of fouling.
- Avoid installation sites where air bubbles are inconsistent. If this not possible, try moving the probe slightly or adjusting its alignment to minimize the bubble effect.
- Protect the probe against the oncoming flow of large objects, such as branches or ice and against flow surges.
- Avoid installing the probe with the optical window facing into direct light or facing a highly-reflective surface.

Figure 4 Sensor Installation Overview



DRAFT

3.3 Pipe Installation

- Install the sensor in an up-flow pipe section for best results. Do not mount the sensor in a down-flow pipe section.
- Mounting in a horizontal pipe section is acceptable if the sensor is fully immersed at all times. Usually, mounting 90 degrees from the top of the pipe guarantees full immersion. Do not mount on the top or bottom of a horizontal pipe section.
- Install the sensor in a pipe that is equal to or greater than 4 inches in diameter.
- Install the sensor at least 1.5 m (5 ft.) or three times the pipe diameter (whichever is greater) downstream of pumps, valves, or pipe elbows.
- Install the sensor on the discharge side of a pump, if possible, with a dilution or flush valve installed on the suction side of the pump.
- If the sensor is to be used to measure sludge with significant amounts of debris, install it after a sludge grinding pump or after a pump with a grinding/comminuting unit in front of it.
- Install the sensor within 7.8 m (25 ft.) of the controller with the standard probe cable. Optional cable extensions can be added for a maximum combined distance of 100 meters (330 ft.).
- If the flange cannot be welded to the pipe due to incompatibility of materials between the stud and the pipe, it is recommended that a stainless steel pipe section be fabricated. Weld the flange onto the stainless steel pipe section and attach the stainless steel section as a segment of the process pipe.

DRAFT

Figure 5 Proper Positioning for Insertion into Pipe

DRAFT

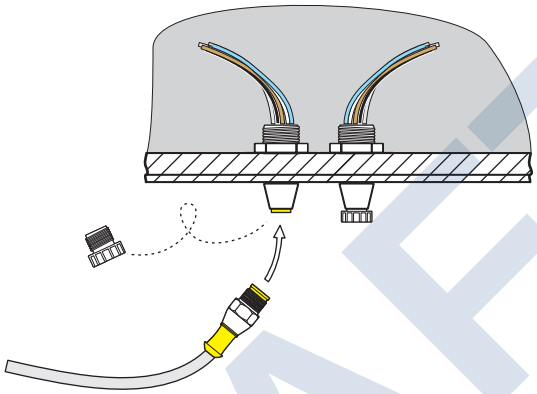
3.4 Connecting sensor cable

CAUTION
Always lay cables and hoses so they do not pose a trip hazard and are not bent.

1. Unscrew the protective cap on the controller socket and retain it.
2. Pay attention to the guide in the plug and push the plug into the socket.
3. Tighten the nuts.

Connector cables are available in various lengths (refer to Section 7 Replacement Parts and Accessories on page 23). Maximum overall cable length: 50 m (165 ft).

Figure 6 Connection of the sensor plug to the controller



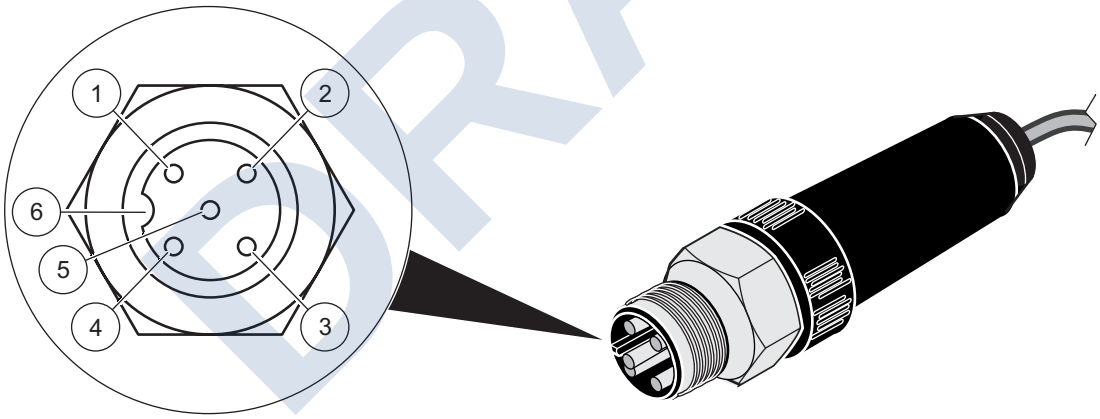


Figure 7 Sensor connector pin assignment

Number	Description	Cable colour (Standard-Cable)

2	Ground	black
3	Data (+)	blue
4	Data (–)	white
5	Screen	Screen (grey)
6	Notch	–

DRAFT

Section 4 Operations

4.1 Use of an sc controller

Before using the sensor in combination with an sc controller, refer to the controller user manual for navigation information.

4.2 Sensor Setup

When a sensor is initially installed, the serial number of the sensor will be displayed as the sensor name. To change the sensor name refer to the following instructions:

1. Select Main Menu.
2. From the Main Menu, select SENSOR SETUP and confirm.
3. Highlight the appropriate sensor if more than one sensor is attached and confirm.
4. Select CONFIGURE and confirm.
5. Select EDIT NAME and edit the name. Confirm or cancel to return to the Sensor Setup menu.

4.3 Sensor Data Logging

A data memory and event memory per sensor are available via the sc controller. While measured data are saved in the data memory at stipulated intervals, the event memory collects numerous events such as configuration changes, alarms and warning conditions. Both the data memory and the event memory can be read out in CSV format. For information on how you can download the data, please see the controller manual.

4.4 Sensor Diagnostics Menu for pH and ORP

SELECT SENSOR (if more than one sensor is attached)

STATUS	
ERROR LIST	See section 6.1 on page 21.
WARNING LIST	See section 6.2 on page 21..

4.5 Sensor Setup Menu

SELECT SENSOR (if more than one sensor is attached)

WIPE	
Initiates a wiping action on the sensor window.	
CALIBRATE	
SET OUTMODE	Select the behavior of the outputs during calibration for zero point setting (Hold, Active, Transfer, Selection). Hold maintains the last reading prior to going into the menu. Active transmits the current level readings, corrected with previous calibration data until new data is entered. Set Transfer transmits the value designated during the system setup
SENSOR MEASURE	Displays the current, uncorrected measured value.
CONFIGURE	Select the calibration type and follow the calibration steps for 2 point, 3 point, 4 point, and 5 point calibration.
FACTOR/2 POINTS/ 3 POINTS/4 POINTS/ 5 POINTS	Display depends on the selection in configuration.
SET CAL DEFAULT	Return the instrument to the default calibration settings.

DRAFT

4.5 Sensor Setup Menu (continued)

CONFIGURE	
EDIT NAME	Enter up to a 10-digit name in any combination of symbols and alpha or numeric characters.
SET PARAMETER	This setting configures the Solitax to measure turbidity or suspended solids. The Solitax cannot simultaneously measure both. Choose “TRB” for turbidity measurements, or “TS” for suspended solids measurement. This selection determines which units may be selected in the “Meas Units” menu.
MEAS UNITS	Choose from the displayed units. TRB (FNU, EBC, TE/F, NTU); TS (mg/L, g/L, ppm, %) Default: FNU If TRB was selected in set parameter, select “NTU” (commonly used in the U.S.), FNU, EBC, or TE/F. If TS was selected, choose mg/L, g/L, ppm, or %. Press enter to choose the selection. If the units selected result in a reading that exceeds 4 digits, the display will only show dashes. For example, if mg/L were selected, and the measurement was 10,500 mg/L, the display will show dashes until the reading drops to 9999 or lower.
CLEAN INTERVAL	Select the cleaning interval (1, 5, 15 or 30 minutes; 1, 4, or 12 hours; 1, 3, 7 days) Default: 12 hours This is the interval between wiper cleaning of the sensor window. It is recommended to start with a setting of 30 minutes. This time may be adjusted according to the application. If readings continue to be accurate, try a longer interval. If not, shorten the interval.
RESPONSE TIME	This is a damping function. While the Solitax takes readings continually, it will average them together over the period of the response time. Once the response time has elapsed, the displayed reading, 4-20 outputs, and alarm status are updated. (0 to 300 seconds) Default: 3 seconds
LOGGER INTERVAL	This is the datalog interval, with options from 1–15 minutes. Values logged are the average of the all readings during the previous logging interval. The controller will hold approximately 360 days of readings for one sensor at 15 minute intervals, or 24 days at 1 minute intervals (and proportional in between). Default:10 minutes
SET DEFAULTS	Resets all user-editable options to the factory-defaults.
TEST/MAIN	
PROBE INFO	Displays the sensor type, entered name of the sensor (Default: sensor serial number), the sensor serial number, the software version number, and the sensor driver version number.
PROFILE	Select Profile Counter to display the number of wipes made (from 20000 backwards). Select Reset Config to manually reset the profile counter.
COUNTER	Shows the number of hours or cycles left for operating hours, test/maint, gasket, and the motor.
TEST/MAIN	WIPE—Initiates the wiping action of the wiper.
	SIGNALS—displays the signal outputs for the device.
	OUTPUT MODE—Select the behavior of the instrument outputs (Hold, Active, Transfer, Selection)
	DEFAULT SETUP—Resets all user-editable options to the factory defaults.

4.6 Calibration

There are two calibration techniques; depending on whether turbidity or suspended solid is required (refer to section 4.6.2 or section 4.6.3 on page 18). Before calibration, determine the behavior of the 4–20 outputs and alarm relays while the user is in the CALIBRATE menu (refer to section 4.6.1).

DRAFT

4.6.1 Setting the Outmode

1. From the Main Menu, select SENSOR SETUP and press confirm.
2. Select the appropriate sensor if more than one is attached and confirm.
3. Select CALIBRATE and press confirm.
4. Select SET OUTMODE. Select the available Out Mode (Active, Hold, Transfer) and confirm.

4.6.2 Calibration for Turbidity

Turbidity calibration requires the use of a Turbidity Standard Solution. The manufacturer recommends the 800 NTU Turbidity Standard Solution (part of the calibration kit No. 57330-00). A zero-point calibration using deionized water is also recommended.

1. From the Main Menu, select SENSOR SETUP and press confirm.
2. Select the appropriate sensor if more than one is attached and confirm.
3. Select CALIBRATE and press confirm.
4. Select SENSOR MEASURE and confirm.
5. Place the sensor in the calibration cylinder with deionized water, mounting it with the supplied clamp. The tip of the probe should be approximately 1-inch below the surface of the water. Record the reading from the sensor measure display.
6. Select OFFSET. Multiply the reading obtained in step 5 and enter the value.
7. Select SENSOR MEASURE.
8. Rinse the outside of the StablCal® 800 NTU standard with water to remove any dust or debris adhering to the surface of the bottle. Gently invert both StablCal standard bottles a minimum of 50 times. Remove the lid and seal from each bottle. Slowly (to avoid creating bubbles) pour the contents of the bottles into the calibration cylinder. Immediately place the tip of the probe into the positioning bracket in the calibration cylinder. The tip of the probe should be approximately 1-inch below the surface standard. Allow the reading to become stable on the SENSOR MEASURE screen. Record the value (measured value). Calculate the factor. Refer to section 4.6.2.1.
9. Select FACTOR to display the corrected measurement.

4.6.2.1 Calculating the Factor

$$\text{New Factor} = \frac{\text{800 NTU Standard}}{\text{measured value}}$$

For example, if a sample measures 750 NTU using the sensor and the standard is 800 NTU, the new factor would be calculated as follows:

$$\text{New Factor} = \frac{\text{800 NTU}}{\text{750 NTU}} = 1.07$$

DRAFT

4.6.3 Calibration for Suspended Solids

Suspended solids calibration requires calibration to the actual sample. This optimizes the compensation for the particle size and shape typical at a measuring site. It is best performed by mounting the sensor as usual for normal measurement, and then grab samples collected and evaluated by laboratory methods. While a single point calibration is usually sufficient to provide accuracy, the SOLITAX does offer the ability to calibrate with up to 5 calibration points.

1. From the Main Menu, select SENSOR SETUP and press confirm.
2. Select the appropriate sensor if more than one is attached and confirm.
3. Select CALIBRATE and press confirm.
4. Select CONFIGURE and confirm.
5. Select the number of points desired for calibration (the unit with linearly interpolate values between calibration points). Select Factor for a single point calibration.
6. Mount the sensor as is during normal operation. Alternatively, place the sensor in the calibration cylinder (or a container with dark, non-reflective walls) 2 inches of clearance from the probe face with the probe face submerged by 1 inch or more.
7. Select SENSOR MEASURE and record the reading.
8. Immediately take a grab sample. Determine the total suspended solids using a gravimetric method such as Method 2540 D in *Standards Methods for the Examination of Water and WasteWater.*
9. Calculate the new factor. Refer to section 4.6.3.1 for single point (Factor) calibration. Refer section 4.6.3.2 on page 18 for multiple point calibrations.
10. Select FACTOR and press confirm. The corrected measurement should be displayed.

4.6.3.1 For Single Point (Factor) Calibration

Calculate the new factor:

$$\text{New Factor} = \frac{\text{Determined gravimetric value}}{\text{measured value}}$$

For example, if a sample measures 2.3 g/L using the SS sensor and the gravimetric value was 2.0 g/L, the new factor would be calculated as follows:

$$\text{New Factor} = \frac{2.0\ \text{g/L}}{2.3\ \text{g/L}} = 0.87$$

4.6.3.2 Multi-point Calibration

1. Repeat steps 6–8 in section 4.6.3 on page 18 at different times to obtain different measurements.
2. From the CONFIGURE menu, select the appropriate calibration point menu.
3. Enter the pairs of values for each reading, the target value being the laboratory determined value, and the actual value being the reading that the SOLITAX produced in step 5. The pairs should be entered in order from lowest values to highest.

DRAFT

Section 5 Maintenance

DANGER
Only qualified personnel should conduct the tasks described in this section of the manual.

Proper maintenance of the measuring windows in the sensor is critical for accurate measurements. The measuring windows should be checked monthly for soiling and the wiper checked for wear.

Important Note: *The seals must be replaced every 2 years by the Service Department. If the seals are not changed regularly, water may enter the probe head and seriously damage the instrument.*

5.1 Maintenance Schedule

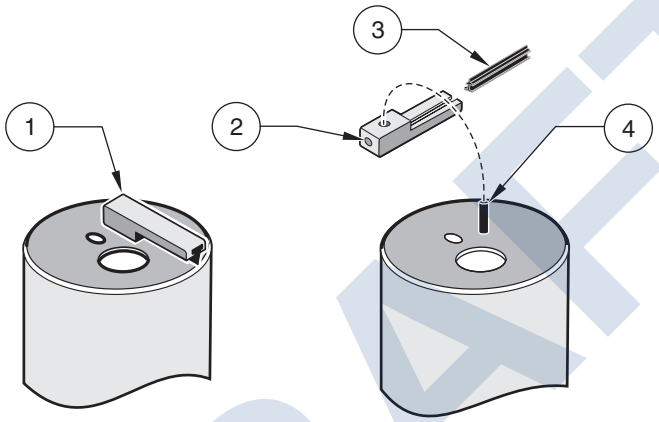
Maintenance Task	Duration
Visual inspection	monthly
Check calibration	monthly *(depending on the ambient conditions)*
Inspection	six months (counter)
Seal change	every 2 years (counter)
Change wiper and reset counter	as per counter (20000 cycles)

5.2 Cleaning the Sensor Measuring Windows

CAUTION
Always were
- ***Safety glasses,***
- ***Gloves and***
- ***Overal***

handling hydrochloric acid and observe safety regulations.

The measuring windows are made of quartz glass. If necessary, they can be cleaned with a cleaning agent and a cloth.



DRAFT

5.3 Replacing the Wiper

The life of the wiper is dependent on the number of cleaning actions performed and the type of deposits to be removed. The life of the wiper varies. The wipers supplied with the instrument should last for approximately one year.

1. From the Main Menu, select SENSOR SETUP and press confirm.
2. Select the appropriate sensor if more than one is attached and confirm.
3. Select TEST/MAINT and press confirm.
4. Select PROFILE and confirm. Change the wiper, see section 5.3 on page 20.
5. Select RESET CONFIG and confirm.
6. Select MAN. RESET ARE YOU SURE? and confirm.

Figure 8 Wiper Replacement

1.	Wiper arm	**3.**	Wiper
2.	M4 hex socket head bolt	**4.**	Wiper axle

DRAFT

Section 6 Troubleshooting

6.1 Error Codes

In the case of an error, the indication of the measured value flashes on the display and all the contacts and current outputs allocated to this sensor are placed on hold. The following conditions will result in flashing measured values:

- Data transmission between controller and sensor interrupted

On the Main menu open the SENSOR DIAG menu using **ENTER** and determine the cause of the fault.

Table 1 Error Messages

Error Displayed	Cause	Solution
POS. UNKNOWN	Wiper position unknown	Open the TEST/MAINT menu and trigger the ”WIPE” function, if the problem persists contact the manufacturer's customer service
LED FAULTY	Faulty LED	Contact customer service
MOIST	Moisture value > 10	Remove the sensor immediately and store in a dry place, contact customer service
CAL. DATA	Factory calibration data lost	Contact customer service

6.2 Warnings

A warning results in a flashing warning icon on the right of the display, all menus, contacts and outputs remain unaffected and continue to work normally. On the Main menu open the SENSOR DIAG menu using **ENTER** and determine the cause of the warning.

A warning may be used to trigger a relay and users can set warning levels to define the severity of the warning.

Table 2 Warnings

Warning Displayed	Cause	Solution
WARNING	Cause	Action
REPLACE WIPER	Counter elapsed	Replace wiper, reset counter
TEST/MAINT	Counter elapsed	Contact customer service
GASKET	Counter elapsed	Contact customer service

DRAFT

Section 9 Limited warranty

Hach Company warrants its products to the original purchaser against any defects that are due to faulty material or workmanship for a period of one year from date of shipment unless otherwise noted in the product manual.

In the event that a defect is discovered during the warranty period, Hach Company agrees that, at its option, it will repair or replace the defective product or refund the purchase price excluding original shipping and handling charges. Any product repaired or replaced under this warranty will be warranted only for the remainder of the original product warranty period.

This warranty does not apply to consumable products such as chemical reagents; or consumable components of a product, such as, but not limited to, lamps and tubing.

Contact Hach Company or your distributor to initiate warranty support. Products may not be returned without authorization from Hach Company.

Limitations

This warranty does not cover:

- Damage caused by acts of God, natural disaster, labor unrest, acts of war (declared or undeclared), terrorism, civil strife or acts of any governmental jurisdiction
- Damage caused by misuse, neglect, accident or improper application or installation
- Damage caused by any repair or attempted repair not authorized by Hach Company
- Any product not used in accordance with the instructions furnished by Hach Company
- Freight charges to return merchandise to Hach Company
- Freight charges on expedited or express shipment of warranted parts or product
- Travel fees associated with on-site warranty repair

This warranty contains the sole express warranty made by Hach Company in connection with its products. All implied warranties, including without limitation, the warranties of merchantability and fitness for a particular purpose, are expressly disclaimed.

Some states within the United States do not allow the disclaimer of implied warranties and if this is true in your state the above limitation may not apply to you. This warranty gives you specific rights, and you may also have other rights that vary from state to state.

This warranty constitutes the final, complete, and exclusive statement of warranty terms and no person is authorized to make any other warranties or representations on behalf of Hach Company.

Limitation of Remedies

The remedies of repair, replacement or refund of purchase price as stated above are the exclusive remedies for the breach of this warranty. On the basis of strict liability or under any other legal theory, in no event shall Hach Company be liable for any incidental or consequential damages of any kind for breach of warranty or negligence.

DRAFT

Ready for Now. Ready for the Future.

Technologies are advancing rapidly, providing new levels of convenience, accuracy, and efficiency. Which is exactly why the SC4500 Controller from Hach® is designed to integrate easily into your current system while allowing you to upgrade as your capabilities advance, without having to replace inventory. With a wide range of analog and digital connectivity options and the availability of intelligent instrument and data management features, the SC4500 unlocks the future, today.

Easy Adoption

The familiar experience of a modern touchscreen, the ability to use your current Hach sensors, and the same footprint as the SC200, make installation and integration of the SC4500 Controller seamless.

No Time for Downtime

The SC4500's built-in predictive diagnostic software ensures measurement confidence and reduces the risk of unexpected equipment downtime by enabling proactive maintenance planning via MSM, including step-by-step instructions.

The Connectivity Options You Need

The Controller provides local communication to SCADA or a PLC, as well as remote access through a secure, cloud-based connectivity option to integrate with Claros™, the Water Intelligence System from Hach. From analog and advanced digital protocols to wi-fi, cellular or LAN, the SC4500 gives you the flexibility to adapt in a rapidly changing world.

Technical Data*

Description	Microprocessor-controlled and menu-driven controller that operates the sensor
Dimensions	½ DIN - 144 x 144 x 192 mm (5.7 x 5.7 x 7.6 in.)
Weight	3.7 lb (controller only, w/o modules)
Display	3.5-inch TFT color display with capacitive touchpad
Enclosure Rating	UL50E type 4X, IEC/EN 60529–IP 66, NEMA 250 type 4X Metal enclosure with a corrosion-resistant finish
Operating Temperature Range	-20 to 60 °C (-4 to 140 °F) (8 W (AC)/9 W (DC) sensor load) -20 to 45 °C (-4 to 113 °F) (28 W (AC)/20 W (DC) sensor load) Linear derating between 45 and 60 °C (-1.33 W/°C)
Storage Conditions	-20 - 70 °C (-4 - 158 °F), 0 - 95% relative humidity, non-condensing
Altitude	2000 m (6562 ft) maximum
Installation Category	Category II
Pollution Degree	4
Protection Class	I, connected to protective earth
Power requirements	AC controller: 100-240 VAC ±10%, 50/60 Hz; 1 A (28 W sensor load) DC controller: 24 VDC +15% -20%; 2.5 A (20 W sensor load)
Measurements	Two device digital SC connectors
Relays	Two relays (SPDT); Wire gauge: 0.75 to 1.5 mm^2 (18 to 16 AWG) AC controller Maximum switching voltage: 100 - 240 VAC Maximum switching current: 5 A Resistive/1 A Pilot Duty Maximum switching power: 1200 VA Resistive/360 VA Pilot Duty DC controller Maximum switching voltage: 30 VAC or 42 VDC Maximum switching current: 4 A Resistive/1 A Pilot Duty Maximum switching power: 125 W Resistive/28 W Pilot Duty
Communication (optional)	Analog: Five 0-20 mA or 4-20 mA analog outputs on each analog output module Up to two analog Input modules (0-20 mA or 4-20 mA). Each input module replaces a digital sensor input. Digital: Profibus DPV1 module Modbus TCP Profinet IO module Ethernet IP module
Network Connectivity	LAN: Two Ethernet connectors (10/100 Mbps) Cellular: External 4G Wi-Fi
USB Port	Used for data download and software upload. The controller records approximately 20,000 data points for each connected sensor.
Compliance Certifications	CE. ETL certified to UL and CSA safety standards (with all sensor types), FCC, ISED, KC, RCM, EAC, UKCA, SABS, C (Morocco)
Warranty	12 months
Compatible Network Technologies	GSM 3G/4G (e.g. AT&T, T-Mobile, Rogers, Vodafone etc.) CDMA (e.g. Verizon)

**Subject to change without notice.*

Claros Enabled

This instrument connects to Claros, Hach's innovative Water Intelligence System. Claros allows you to seamlessly connect and manage instruments, data, and process – anywhere, anytime. The result is greater confidence in your data and improved efficiencies in your operations. To unlock the full potential of Claros, insist on Claros Enabled instruments.

Service Protected

With Hach Service, you have a global partner who understands your needs and cares about delivering timely, high-quality service you can trust. Our Service Team brings unique expertise to help you maximize instrument uptime, ensure data integrity, maintain operational stability, and reduce compliance risk.

SHOP DRAWING REVIEW

Project: **San Luis West WWTP Improvements**

Submittal No. **#X2-001 Instrument List**

Vendor No. **X2 Instrument List**

Date Received: **11/25/2025**

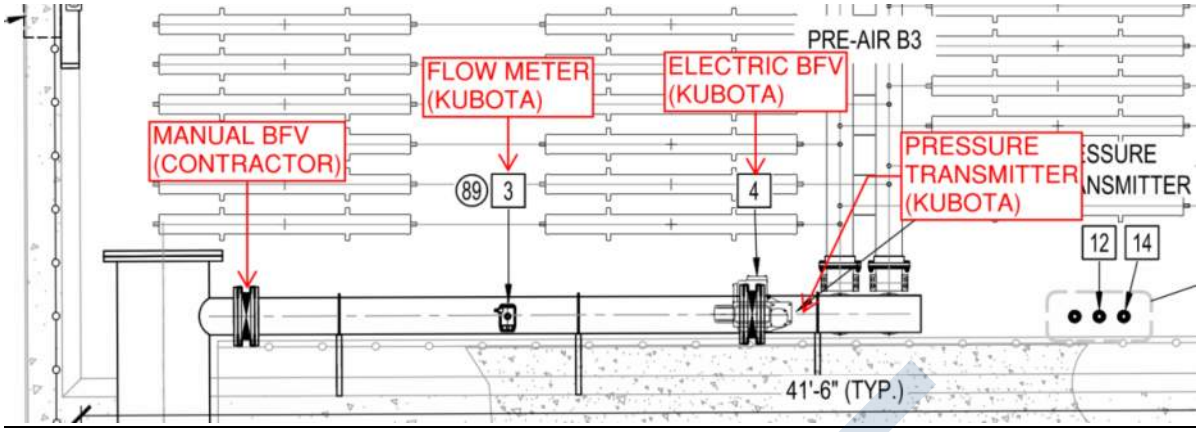
Job #: **B777**

Comments:

No Exceptions Taken..... ☐
Submit Specific Item ..... ☐
Accepted with Corrections Noted..... ☒
Revise and Resubmit..... ☐
Rejected ..... ☐

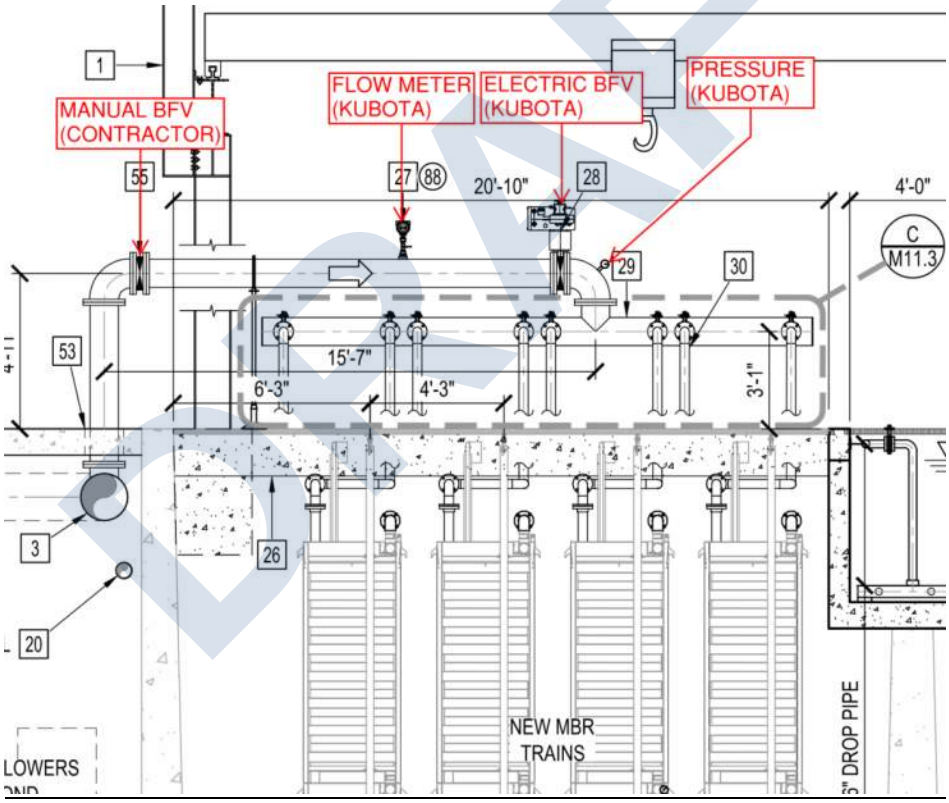
Note:
Review is only for general conformance with the design concept of the project and general compliance with the information included in the Contract Documents. Any action shown is subjected to the requirements of the drawings and the specifications. Contractor is responsible for correlating and confirming dimensions at the job site, choice of fabrication processes and techniques of construction: coordination of his work with that of other trades; and performing the work in a safe satisfactory manner.

DATE: 1/13/2026 BY: NT/DD



Contractor to Note:

Submittal Comments:



1. Vendor to update P&ID tags within the Instrument List. See marked up PDF.
2. Vendor to provide pole mount kits for pH and DO probes.
3. Due to the outdoor installations; please include, at a minimum, the Sunroof with Visor accessory for the SC4500 Controllers.
4. ID# 77,78,79 (all PMC21 pressure transmitters), please verify if isolation valves are being provided by Kubota. If isolation valves are being provided, please verify required connection tap required (size, FNPT, MNPT)
5. ID# 77, 78, 79 (PMC 21 pressure transmitters), verify if vertical installation is acceptable for pressure measurement in liquids. See cutsheet pages 22 & 23.
6. Please verify that the Process Air Piping manifold instrument layout is acceptable as it differs from the Kubota provided P&IDs
    a. Kubota P&IDs show Electric BFV > Flow Meter > Pressure Transmitter

DRAFT

b. PACE proposes Manual BFV (by Contractor) > Flow Meter > Electric BFV > Pressure Transmitter

7. Please verify the MBR Air Scour manifold instrument layout is acceptable as it differs from the Kubota provided P&IDs
   a. Kubota P&IDs show Electric BFV > Flow Meter > Pressure Transmitter
   b. PACE proposes Manual BFV (by Contractor) > Flow Meter > Electric BFV > Pressure Transmitter

8. Please verify that the selected air flow meter is acceptable at either location (MBR Scour and PA) as inlet/outlet runs specified within the Cut Sheet (Page 39) can not be met.
9. The 6" sludge flow meter to the digesters (FM-06040) is missing from Instrument List, please address.
10. Although the TSS Probe and SC4500 (for the MLSS channel) was provided under a separate submittal, please include the instruments within future Instrument Lists for clarity.

SURVEYOR'S NOTES

THE SUBJECT PROPERTY IS LOCATED WITHIN AN AREA HAVING A FLOOD ZONE A DESIGNATION. ZONE A - THE 1% ANNUAL CHANCE FLOOD (100-YEAR FLOOD), ALSO KNOWN AS THE BASE FLOOD, IS THE FLOOD THAT HAS A 1% CHANCE OF BEING EQUALED OR EXCEEDED IN ANY GIVEN YEAR. THE SPECIAL FLOOD HAZARD AREA IS THE AREA SUBJECT TO FLOODING BY THE 1% ANNUAL CHANCE FLOOD. AREAS OF SPECIAL FLOOD HAZARD INCLUDE ZONES A, AE, AH, AO, AR, A99, V, AND VE. THE BASE FLOOD ELEVATION IS THE WATER-SURFACE ELEVATION OF THE 1% ANNUAL CHANCE FLOOD. REFERENCE - FLOOD INSURANCE RATE MAP (FIRM), MAP NUMBER 04027C2135F DATED JANUARY 16, 2014, WHICH IS THE FLOOD INSURANCE RATE MAP FOR THE COMMUNITY IN WHICH THIS PROJECT IS SITUATED. THE TITLE REPORT WITH A OUR NO. 91400359 ISSUED BY PIONEER TITLE AGENCY, INC AND COMMITMENT DATE JULY 22, 2024 AT 7:30 AM WAS REFERENCED DURING THE PREPARATION OF THIS ALTA SURVEY.

BASIS OF BEARING

BEARINGS ARE RELATIVE TO NAD 83 ARIZONA WEST STATE PLANE COORDINATE SYSTEM AS MEASURED BY GPS KINEMATIC SURVEY AS OBSERVED CONTROL POINTS.

LEGAL DESCRIPTION

LOTS 2 AND 3, SECTION 2, AND LOT 27, SECTION 11, ALL IN TOWNSHIP 11 SOUTH, RANGE 25 WEST OF THE GILA AND SALT RIVER BASE AND MERIDIAN, YUMA COUNTY, ARIZONA; EXCEPT ALL MINERAL DEPOSITS AS RESERVED IN THE PATENT FROM THE UNITED STATES OF AMERICA, RECORDED IN DOCUMENT NO. 2001-14799 AND IN DOCUMENT NO. 2004-39688, RECORDS OF YUMA COUNTY, ARIZONA.

JOB NO. B777

FINAL PLANS ISSUED FOR BID

W:\B777\Engineering\B777 - 3MGD Exp\3MGD FINAL DS\Arbeit\B777 - G1.1-SHEET INDEX.dwg - Tab: G1.1 - by wwright on 02/25/26 at 2:02:21 PM

SCOPE OF WORK

1. WWTP PROCESS UPGRADES THROUGH THE CONVERSION OF THE EXISTING 1.5 MGD SBRs TO NEW 3.0 MGD MBR TREATMENT PLANT, INCLUDING CIVIL, MECHANICAL, STRUCTURAL, ELECTRICAL, AND CONTROLS FOR THE CONSTRUCTION OF NEW PROCESS BASINS; INSTALLATION OF NEW MEMBRANE CASSETTES; INSTALLATION OF NEW HEADWORKS, DEWATERING, AND EQUALIZATION EQUIPMENT; AND ASSOCIATED EQUIPMENT, PIPING, AND APPURTENANCES.

GENERAL NOTES

1. ALL WORK ON THIS PROJECT SHALL BE PERFORMED IN ACCORDANCE WITH 1. THESE PLANS AND SPECIFICATIONS; 2. THE LATEST 2016 CITY OF SAN LUIS SUPPLEMENTAL TO THE 2015 MAG UNIFORM STANDARD SPECIFICATIONS AND DETAILS FOR PUBLIC WORKS CONSTRUCTION; CITY OF YUMA CONSTRUCTION STANDARD DETAIL DRAWINGS; MAG UNIFORM STANDARD SPECIFICATIONS AND DETAILS FOR PUBLIC WORKS CONSTRUCTION; AND THE CITY OF YUMA CONSTRUCTION STANDARD DETAIL DRAWINGS - EDITION 2019. IN THE EVENT OF CONFLICT, THE MOST STRINGENT SHALL GOVERN. THE PERFORMANCE AND COMPLETION OF ALL WORK MUST MEET THE REQUIREMENTS OF THE CONTRACT DOCUMENTS.
2. ALL SITE GRADING, TANK FOUNDATION EXCAVATION, BACKFILL MATERIALS, PLACEMENT AND COMPACTION SHALL COMPLY WITH GEOTECHNICAL EVALUATION PREPARED BY GEOTECHNICAL TESTING SERVICES, INC., DATED 06/12/2025.
3. ALL CONSTRUCTION SHALL BE IN ACCORDANCE WITH UNITED STATES ENVIRONMENTAL PROTECTION AGENCY STANDARDS AND POLICIES FOR WASTEWATER SYSTEMS AND CURRENT SUPPLEMENTS THERETO.
4. HORIZONTAL DATUM IS NAD 83 (2007) ARIZONA STATE PLANE GRID COORDINATE SYSTEM EAST ZONE. VERTICAL DATUM IS NAVD 88.
5. THE CONTRACTOR SHALL LOCATE EXISTING SURVEY MARKERS OR MONUMENTS. ANY SURVEY MARKERS/MONUMENTS DISTURBED OR DAMAGED DURING CONSTRUCTION SHALL BE REPLACED IN KIND BY A REGISTERED LAND SURVEYOR AND SHALL BE INCIDENTAL TO THE OTHER PAY ITEMS.
6. THE CONTRACTOR IS RESPONSIBLE FOR PROVIDING ALL MATERIALS, EQUIPMENT, AND PERSONNEL REQUIRED FOR CONSTRUCTION OF A FULLY FUNCTIONAL SEWER SYSTEM IN ACCORDANCE WITH THESE PLANS AND SPECIFICATIONS.
7. THE CONTRACTOR SHALL VERIFY THAT ALL NECESSARY PERMITS HAVE BEEN OBTAINED PRIOR TO CONSTRUCTION.
8. ANY WORK PERFORMED WITHOUT THE APPROVAL OF THE ENGINEER AND/OR ALL WORK AND MATERIAL NOT IN CONFORMANCE WITH THE SPECIFICATIONS IS SUBJECT TO REMOVAL AND REPLACEMENT AT THE CONTRACTOR'S EXPENSE.
9. DEBRIS SHALL BE DISPOSED OF WITHIN APPROVED DISPOSAL FACILITIES.
10. THE CONTRACTOR SHALL PROVIDE ADEQUATE MEANS FOR CLEANING TRUCKS AND/OR OTHER EQUIPMENT FOR MUD REMOVAL PRIOR TO ENTERING PUBLIC STREETS. IT IS THE CONTRACTOR'S RESPONSIBILITY TO CLEAN STREETS, ALLEY DUST, AND TAKE WHATEVER MEASURES ARE NECESSARY TO INSURE THAT ALL ADJACENT ROADS ARE MAINTAINED IN A CLEAN, MUD AND DUST FREE CONDITION AT ALL TIMES.
11. AN APPROVED SET OF PLANS SHALL BE KEPT ON THE JOB SITE AT ALL TIMES WORK IS IN PROGRESS. DEVIATION FROM THE PLANS WILL NOT BE ALLOWED WITHOUT AN APPROVED PLAN REVISION OR AUTHORIZATION FROM THE ENGINEER.
12. THE CONTRACTOR SHALL TAKE MEASURES TO CONTROL DUST AND FUGITIVE EMISSIONS, INCLUDING BUT NOT LIMITED TO WATERING THE SITE TWICE DAILY DURING GRADING TO CONTROL DUST.
13. ALL CONSTRUCTION VEHICLES OR EQUIPMENT, MOBILE OR FIXED OPERATED, SHALL BE EQUIPPED WITH PROPERLY OPERATING AND MAINTAINED MUFFLERS IN ACCORDANCE WITH THE LOCAL NOISE ORDINANCES.
14. ALL PIPE SUPPORTS SPACING SHALL MEET PIPING MANUFACTURER'S REQUIREMENTS.
15. THE WORK AREA SHALL BE LIMITED TO THE PUBLIC RIGHT-OF-WAY, PERMANENT EASEMENTS, AND TEMPORARY CONSTRUCTION EASEMENTS AS SHOWN ON THESE PLANS FOR CONSTRUCTION OF THE PROJECT. NO TEMPORARY CONSTRUCTION EASEMENTS EXIST UNLESS INDICATED ON THE PLANS.
16. THE LOCATION OF RIGHT-OF-WAY RELATIVE TO AERIAL PHOTOS OF THE DRAWINGS MAY NOT MATCH FIELD CONDITIONS.
17. IT IS NOT THE INTENT OF THE SPECIFICATIONS TO SUPERSEDE ANY FEDERAL, STATE, OR LOCAL LAWS, REGULATIONS, AND/OR ORDINANCES, WHICH SHALL GOVERN IN ALL INSTANCES. IT IS THE CONTRACTOR'S RESPONSIBILITY TO SHOW A GOOD FAITH EFFORT AND TO PROTECT ALL EXISTING UTILITIES AND STRUCTURES AND TO ABIDE BY ALL FEDERAL, STATE AND LOCAL LAWS AND ORDINANCES IN THIS PROJECT.
18. THE CONTRACTOR SHALL TAKE APPROPRIATE STEPS TO PREVENT EROSION OF MATERIAL FROM THE WORK AREA AND DEPOSITION OF SEDIMENTS INTO WATER COURSES OR DRAINAGE SWALES. THE CONTRACTOR SHALL SUBMIT AND EROSION CONTROL PLAN AND SWPPP TO THE CITY'S REPRESENTATIVE AND ADEQ PRIOR TO THE START OF ANY EXCAVATION. ALL EROSION AND SEDIMENT CONTROL WORK SHALL BE INCIDENTAL TO THE OTHER PAY ITEMS.
19. ALL EQUIPMENT MATERIAL DEMO'D WILL BE OFFERED TO THE CITY FOR FIRST REFUSAL PRIOR TO CONTRACTOR DISPOSAL.

ENGINEER'S NOTES

1. THE ENGINEER WILL NOT BE RESPONSIBLE FOR CONSTRUCTION MEANS, METHODS, TECHNIQUES, SEQUENCES, OR PROCEDURES OR FOR SAFETY PRECAUTIONS OR PROGRAMS UTILIZED IN CONNECTION WITH THE WORK, AND HE WILL NOT BE RESPONSIBLE FOR THE CONTRACTOR'S FAILURE TO CARRY OUT THE WORK IN ACCORDANCE WITH THE CONTRACT DOCUMENTS.
2. THE ENGINEER AND APPLICABLE AGENCY MUST APPROVE, PRIOR TO CONSTRUCTION, ANY ALTERATION OR VARIANCE FROM THESE PLANS. ANY VARIATION FROM THESE PLANS SHALL BE PROPOSED ON CONSTRUCTION FIELD PRINTS AND TRANSMITTED TO THE ENGINEER.
3. THE CONTRACTOR SHALL PROTECT AND MAINTAIN ALL EXISTING UTILITIES ON THE SITE. ANY DAMAGE TO EXISTING UTILITIES, WHETHER SHOWN OR NOT ON THE DRAWINGS SHALL BE REPAIRED OR REPLACED AT THE CONTRACTOR'S EXPENSE. EXISTING SURFACE FEATURES AND FENCING SHALL BE REPLACED IN KIND.
4. ANY INSPECTION BY THE CITY OR THE ENGINEER SHALL NOT IN ANY WAY RELIEVE THE CONTRACTOR FROM ANY OBLIGATION TO PERFORM THE WORK IN STRICT COMPLIANCE WITH THE APPLICABLE CODES AND AGENCY REQUIREMENTS.
5. NOTHING CONTAINED IN THE CONTRACT DOCUMENTS SHALL CREATE, NOR SHALL BE CONSTRUED TO CREATE, ANY CONTRACTUAL RELATIONSHIP BETWEEN THE ENGINEER AND THE CONTRACTOR OR ANY SUBCONTRACTOR.
6. THE CONTRACTOR SHALL MAKE NO CLAIM AGAINST THE OWNER OR THE ENGINEER REGARDING ALEGED INACCURACY OF CONSTRUCTION STAKES SET BY THE ENGINEER UNLESS ALL STAKES SET BY THE ENGINEER ARE MAINTAINED INTACT AND CAN BE VERIFIED AS TO THEIR ORIGIN. IF IN THE OPINION OF THE ENGINEER, THE STAKES ARE NOT MAINTAINED INTACT AND CANNOT BE VERIFIED AS TO THEIR ORIGIN, ANY REMEDIAL WORK REQUIRED TO CORRECT ANY ITEM OR IMPROPER CONSTRUCTION WORK IN THIS DEVELOPMENT SHALL BE PERFORMED AT THE SOLE EXPENSE OF THE RESPONSIBLE CONTRACTOR OR SUBCONTRACTOR.
7. TRAFFIC CONTROL SHALL BE MAINTAINED IN ACCORDANCE WITH CITY MUNICIPAL CODES.
8. PRIOR TO FINAL APPROVAL AND ACCEPTANCE OF THE WORK, THE CONTRACTOR WILL BE REQUIRED TO CLEAN AND REPAIR ADJACENT (OFF-PROJECT) ROADWAYS USED OR DAMAGED DURING THE COURSE OF CONSTRUCTION.
9. ANY CONSTRUCTION WATER OBTAINED FROM THE CITY WATER SOURCE MUST BE METERED. CONTACT CITY TO REQUEST A METER.

CIVIL CONSTRUCTION NOTES

1. CONTRACTOR SHALL FIELD VERIFY EXISTING CONDITIONS PRIOR TO THE START OF CONSTRUCTION.
2. EXISTING UTILITIES LOCATIONS SHOWN ON THESE PLANS ARE APPROXIMATE ONLY, AND ARE NOT RELIABLE FOR CONSTRUCTION PURPOSES.
3. ALL YARD PIPING SHALL BE SURVEYED FOR VERTICAL AND HORIZONTAL ALIGNMENT PRIOR TO BACKFILL. ALL SURVEYING DATA SHALL BE PROVIDED TO THE ENGINEER FOR RECORD DRAWINGS.
4. ALL BURIED DUCTILE IRON PIPE SHALL BE FULLY ENCASED IN POLYETHYLENE FILM OR CORROSION PROTECTION, PER AWWA C105/A21.5, MAG STANDARDS, AND SUPPLEMENTAL STANDARDS.
5. ALL YARD PIPING SHALL BE INSTALLED WITH TRACER WIRE PER MAG STANDARD DETAILS.
6. CONTRACTOR SHALL RAISE OR LOWER ALL EXISTING MANHOLES, VALVE WELLS AND UTILITY IMPROVEMENTS TO FINISH GRADE.

MECHANICAL CONSTRUCTION NOTES

1. CONTRACTOR TO PROVIDE AND INSTALL PIPE SUPPORTS PER MANUFACTURER'S REQUIREMENTS AND SPECIFICATIONS. ALL DRY AREA PIPE SUPPORTS SHALL BE GALVANIZED STEEL U.N.O. ALL SUBMERGED PIPE SUPPORTS SHALL BE SS 316.
2. CONTRACTOR TO INSTALL PUMP BASE, GUIDE RAILS, AND BRACKETS PER MANUFACTURER'S REQUIREMENTS. CONTRACTOR SHALL CONFIRM SUPPLY OF PUMP MOUNTING EQUIPMENT WITH PUMP SUPPLIER.
3. CONTRACTOR TO PROVIDE MECHANICAL JOINT WALL PIPE FITTING WITH INTEGRAL WATER STOP COLLAR, LINK SEAL, OR EQUAL FOR ALL SUBSURFACE WALL PENETRATIONS.
4. ALL PROCESS PIPES SHALL BE COLOR COATED PER THE SPECIFICATIONS WITH THE EXCEPTION OF STAINLESS STEEL PIPES. ALL ABOVE GROUND PIPES SHALL ALSO BE OUTFITTED WITH A FLOW DIRECTION ARROW.
5. ALL ANCHORING/FASTENING SYSTEMS SHALL BE SS 316 REGARDLESS OF LOCATION, U.N.O.
6. CONTRACTOR SHALL SUBMIT SHOP DRAWINGS FOR REVIEW AND APPROVAL FOR EACH EQUIPMENT ITEM PRIOR TO INSTALLATION. INSTALLATION DETAILS FOR ALL EQUIPMENT ITEMS SHALL BE PER RESPECTIVE EQUIPMENT MANUFACTURER'S SHOP DRAWINGS AND RECOMMENDED INSTALLATION REQUIREMENTS.
7. DUCTILE IRON PIPE 12" AND LESS SHALL BE PRESSURE CLASS 350. DIP PIPE GREATER THAN 12" DIAMETER SHALL BE PRESSURE CLASS 250, U.N.O. ALL UNDERGROUND DUCTILE IRON PIPE SHALL BE POLYETHYLENE WRAPPED.
8. C900 PVC PRESSURE PIPE SHALL BE CLASS 235 (DR 18). C900 PVC GRAVITY PIPE SHALL BE AT A MINIMUM CLASS 165 (SDR 35).
9. ELEVATIONS OF EXISTING STRUCTURES, PIPING, AND COMPONENTS ARE APPROXIMATE. CONTRACTOR TO FIELD VERIFY PRIOR TO CONSTRUCTION.
10. PRECAST SUPPLIER TO PROVIDE STRUCTURAL CALCULATIONS STAMPED BY A REGISTERED ENGINEER IN AZ TO DOCUMENT DESIGN OF PRECAST STRUCTURE.
11. GROOVE FITTINGS MAY BE USED N LIEU OF FLANGE FITTINGS FOR ALL ABOVE GROUND DUCTILE IRON PIPING.
12. CONTRACTOR SHALL BE RESPONSIBLE FOR ALL TEMPORARY PIPING AND EQUIPMENT NEEDED FOR PROCESS ISOLATION, BYPASS, AND TRANSITION.
13. "±" INDICATES ASSUMED ELEVATION. CONTRACTOR TO FIELD VERIFY PRIOR TO CONSTRUCTION COORDINATE WITH ENGINEER FOR ALL DISCREPANCIES.
14. ALL YARD PIPING SHALL BE SURVEYED AT ALL FITTINGS PRIOR TO BACKFILL.
15. THE CONTRACTOR IS RESPONSIBLE FOR ALL TRENCHING MEANS AND METHODS. NO CONTRACT CHANGE ORDERS WILL BE ALLOWED FOR CHANGES IN TRENCH SUPPORT/PROTECTION DUE TO DIFFERING SOIL CONDITIONS.
16. ALL NEW SEWER LINE ALIGNMENTS, LATERALS, CLEAN-OUTS, AND OTHER APPURTENANCES SHALL BE SURVEYED PRIOR TO BACKFILL.
17. ALL NEW MANHOLE CENTERLINES, RIM ELEVATIONS, AND INLET/OUTLET INVERTS SHALL BE SURVEYED.
18. CONTRACTOR TO PROVIDE ALL FITTINGS AND APPURTENANCES NEEDED AT ALL POINTS OF CONNECTION.
19. CONTRACTOR TO PROVIDE DEFERRED SUBMITTALS FOR THE FOLLOWING ITEMS: MBR REMOVABLE COVERS, ACCESS GRATING (TYP. ACROSS SITE), HANDRAILS, HEADWORKS SHADE CANOPY, METAL STAIRS, PIPE SUPPORTS, ODOR CONTROL PIPING LAYOUT, MBR OVERHEAD CRANE SYSTEM, STRUCTURAL CANOPIES, AND MISCELLANEOUS METALS.

UTILITY AND OWNER TELEPHONE INDEX

SAN LUIS UTILITIES DEPARTMENT (WATER DIVISION)	(928)-341-8577
ARIZONA PUBLIC SERVICE (APS) ELECTRICITY	(602) 371-7171

SEQUENCE OF CONSTRUCTION

CONTRACTOR TO PROVIDE A SEQUENCE OF CONSTRUCTION FOR CITY REVIEW AND APPROVAL PRIOR TO COMMENCEMENT OF WORK. ALL TEMPORARY BYPASS WORK SHALL BE PERFORMED BY THE CONTRACTOR. THE CITY'S OPERATION STAFF SHALL BE AVAILABLE DURING NORMAL WORKING TIME TO PROVIDE LABOR FROM DRAINING AND CLEANING OF THE TANKS. ALL EQUIPMENT, PIPING, AND APPURTENANCES SHALL BE PROVIDED BY THE CONTRACTOR.

CONTRACTOR SHALL ASSIST THE CITY'S OPERATIONS STAFF DURING THE SEEDING PROCESS.

BASIS OF BEARINGS

BEARINGS ARE RELATIVE TO NAD 83 ARIZONA WEST STATE PLANE COORDINATE SYSTEM AS MEASURED BY GPS KINEMATIC SURVEY AS OBSERVED CONTROL POINTS.

SURVEYOR'S NOTES

1. THE SUBJECT PROPERTY IS LOCATED WITHIN AN AREA HAVING A FLOOD ZONE A DESIGNATION.
   ZONE A – THE 1% ANNUAL CHANCE FLOOD (100–YEAR FLOOD), ALSO KNOWN AS THE BASE FLOOD, IS THE FLOOD THAT HAS A 1% CHANCE OF BEING EQUALED OR EXCEEDED IN ANY GIVEN YEAR. THE SPECIAL FLOOD HAZARD AREA IS THE AREA SUBJECT TO FLOODING BY THE 1% ANNUAL CHANCE FLOOD. AREAS OF SPECIAL FLOOD HAZARD INCLUDE ZONES A, AE, AH, AO, AR, A99, V, AND VE. THE BASE FLOOD ELEVATION IS THE WATER–SURFACE ELEVATION OF THE 1% ANNUAL CHANCE FLOOD.
   REFERENCE – FLOOD INSURANCE RATE MAP (FIRM), MAP NUMBER 04027C2135F DATED JANUARY 16, 2014, WHICH IS THE FLOOD INSURANCE RATE MAP FOR THE COMMUNITY IN WHICH THIS PROJECT IS SITUATED.
2. THE TITLE REPORT WITH A OUR NO. 91400359 ISSUED BY PIONEER TITLE AGENCY, INC AND COMMITMENT DATE JULY 22, 2024 AT 7:30 AM WAS REFERENCED DURING THE PREPARATION OF THIS ALTA SURVEY.

LEGAL DESCRIPTION

LOTS 2 AND 3, SECTION 2, AND LOT 27, SECTION 11, ALL IN TOWNSHIP 11 SOUTH, RANGE 25 WEST OF THE GILA AND SALT RIVER BASE AND MERIDIAN, YUMA COUNTY, ARIZONA;

EXCEPT ALL MINERAL DEPOSITS AS RESERVED IN THE PATENT FROM THE UNITED STATES OF AMERICA, RECORDED IN DOCUMENT NO. 2001–14799 AND IN DOCUMENT NO. 2004–39688, RECORDS OF YUMA COUNTY, ARIZONA.

SCHEDULE OF EXCEPTIONS

ESCROW/TITLE No. 91400359 SCHEDULE B

1 RESERVATIONS, RIGHTS, EASEMENTS OR OTHER MATTERS AS MAY BE SET FORTH IN THE PATENT TO SAID LAND RECORDED IN THE OFFICE OF THE COUNTY RECORDER, OR IN ACTS AUTHORIZING THE ISSUANCE THEREOF.

2 WATER RIGHTS, CLAIMS OR TITLE TO WATER, AND AGREEMENTS, COVENANTS, CONDITIONS OR RIGHTS INCIDENT THERETO, WHETHER OR NOT SHOWN BY THE PUBLIC RECORDS.

THIS EXCEPTION IS NOT LIMITED BY REASON OF THE DISCLOSURE OF ANY MATTER RELATING TO WATER RIGHTS AS MAY BE SET FORTH ELSEWHERE IN SCHEDULE B.

3 THE RIGHT OF ENTRY TO PROSPECT FOR, MINE AND REMOVE ALL MINERALS AS RESERVED IN PATENT TO SAID LAND RECORDED IN DOCUMENT NO. 2001–14799 AND IN DOCUMENT NO. 2004–39688.
(AFFECTS THE SUBJECT PROPERTY, HOWEVER, IS NOT PLOTTABLE.)

4 RIGHT–OF–WAY FOR CANALS, LATERAL AND DITCHES CONSTRUCTED BY THE AUTHORITY OF THE UNITED STATES AS SET FORTH IN INSTRUMENT RECORDED IN DOCUMENT NO. 2001–14799 AND IN DOCUMENT NO. 2004–39688.
(AFFECTS THE SUBJECT PROPERTY, HOWEVER, IS NOT PLOTTABLE.)

5 RIGHT–OF–WAY FOR BORDER PATROL, FOR A CAMERA SITE, WASTEWATER PIPELINE PURPOSES, AND TERMS AND CONDITIONS RELATING TO HAZARDOUS WASTE AS SET FORTH IN DOCUMENT NO. 2001–14799 AND IN DOCUMENT NO. 2004–39688.
(AFFECTS THE SUBJECT PROPERTY, HOWEVER, IS NOT PLOTTABLE.)

6 WASTEWATER TREATMENT PLANT GROUND LEASE UNDER THE TERMS AND CONDITIONS CONTAINED THEREIN MADE BY:

LESSOR	CITY OF SAN LUIS, ARIZONA, A MUNICIPAL CORPORATION OF THE STATE OF ARIZONA
LESSEE	SAN LUIS CIVIC IMPROVEMENT CORPORATION, A NONPROFIT CORPORATION
DATED	10–4–02
TERM EXPIRES	10–4–2042
RECORDED	11–1–02
DOCUMENT NO.	2002–31209

(NOT A SURVEY MATTER)

7 WASTEWATER TREATMENT PLANT CITY LEASE UNDER THE TERMS AND CONDITIONS CONTAINED THEREIN MADE BY:

LESSOR	SAN LUIS CIVIC IMPROVEMENT CORPORATION, A NONPROFIT CORPORATION
LESSEE	CITY OF SAN LUIS, ARIZONA, A MUNICIPAL CORPORATION OF THE STATE OF ARIZONA
DATED	10–4–02
TERM EXPIRES	10–4–2042
RECORDED	11–1–02
DOCUMENT NO.	2002–31213

(NOT A SURVEY MATTER)

8 TERMS AND CONDITIONS OF RESOLUTION NO. 454, RECORDED IN DOCUMENT NO. 2017–16631, FOR USE OF THE LEVEE ROAD.
(AFFECTS THE SUBJECT PROPERTY, HOWEVER, IS NOT PLOTTABLE.)

9 UNRECORDED LEASE UNDER THE TERMS AND CONDITIONS CONTAINED THEREIN MADE BY:

LESSOR	CITY OF SAN LUIS, AN ARIZONA MUNICIPALITY
LESSEE	ARTEMIS SUN INSTITUTIONAL SOLAR, INC., A TEXAS CORPORATION
DATED	1–30–14
TERM	UNDISCLOSED
AS DISCLOSED BY	THIRD AMENDMENT TO SITE LEASE
RECORDED	6–27–18
DOCUMENT NO.	2018–16580

AND THEREAFTER, LESSEE'S INTEREST WAS ASSIGNED TO LUIS SPEAR POINT SOLAR I, LLC, A DELAWARE LIMITED LIABILITY COMPANY BY UNRECORDED INSTRUMENT;

AND THEREAFTER, A FOURTH AMENDMENT RECORDED IN DOCUMENT NO. 2018–16581.
(NOT A SURVEY MATTER)

10 TERMS AND CONDITIONS OF CONTRACT NO. 18–07–34–L 1933 BY AND BETWEEN THE CITY OF SAN LUIS AND THE UNITED STATES DEPARTMENT OF THE INTERIOR, BUREAU OF RECLAMATION, AS SET FORTH IN DOCUMENT NO. 2022–31612.
(NOT A SURVEY MATTER)

17 EASEMENTS AND RIGHTS INCIDENT THERETO, AS SET FORTH IN INSTRUMENT:

RECORDED IN	DOCUMENT NO. 2023–21631
PURPOSE	CONSTRUCTION, OPERATION AND MAINTENANCE OF NEW UNDERGROUND FIBER–OPTIC CABLE AND APPURTENANT FACILITIES

(AFFECTS THE SUBJECT PROPERTY, HOWEVER, IS NOT PLOTTABLE.)

SURVEY CERTIFICATE

To
CITY OF SAN LUIS, ARIZONA

This is to certify that this map or plat and the survey on which it is based were made in accordance with the 2021 Minimum Standard Detail Requirements for ALTA/NSPS Land Title Surveys, jointly established and adopted by ALTA and NSPS and includes items 1, 3, 4, 8, 13 and 18 from Table A thereof.
The fieldwork was completed on 08/10/2024.

Date of Plat or Map: 08/19/2024

REGISTERED LAND SURVEYOR CERTIFICATE NO. 31018 KEVIN A. DAHL Date Signed 08/19/24 ARIZONA U.S.A.
